LPASS_CDC_IIRn_GAIN_TIMER_CTL

Bits	Name	Description
7:0	TIMER	Specifies the timeout period in Fs cycles for all Volume Controllers.

0x0771C0E8+LPASS_CDC_IIRn_COEF_B1_CTL, n=[1..2]**0x40*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_IIRn_COEF_B1_CTL**

Bits	Name	Description
7	BYPASS	Set (1) to disable automatic pointer incrementing 0x0: AUTOINC 0x1: BYPASS

LPASS_CDC_IIRn_COEF_B1_CTL (cont.)

Bits	Name	Description
6:0	ADDR	Pointer to internal register bank to store the Sidetone IIR filter coefficients. This register auto increments every time CDC_IIRn_COEF_B2_CTL is written. The maximum allowed value is 0x18. Any value above this will corrupt the coefficient bank. Data is LSB first. IIR co-efficients are 30-bits long, the co-efficients are written in a bank of registers 1-byte at a time. Since only 30 bits are needed, the top 2 MSB bits of every 4th byte is dropped in the design. 0x0: BIQ_STG0_COEFF_B0 0x4: BIQ_STG0_COEFF_B1 0x8: BIQ_STG0_COEFF_B2 0xC: BIQ_STG0_COEFF_A1 0x10: BIQ_STG0_COEFF_A2 0x14: BIQ_STG1_COEFF_B0 0x18: BIQ_STG1_COEFF_B1 0x1C: BIQ_STG1_COEFF_B2 0x20: BIQ_STG1_COEFF_A1 0x24: BIQ_STG1_COEFF_A2 0x28: BIQ_STG2_COEFF_B0 0x2C: BIQ_STG2_COEFF_B1 0x30: BIQ_STG2_COEFF_B2 0x34: BIQ_STG2_COEFF_A1 0x38: BIQ_STG2_COEFF_A2 0x3C: BIQ_STG3_COEFF_B0 0x40: BIQ_STG3_COEFF_B1 0x44: BIQ_STG3_COEFF_B2 0x48: BIQ_STG3_COEFF_A1 0x4C: BIQ_STG3_COEFF_A2 0x50: BIQ_STG4_COEFF_B0 0x54: BIQ_STG4_COEFF_B1 0x58: BIQ_STG4_COEFF_B2 0x5C: BIQ_STG4_COEFF_A1 0x60: BIQ_STG4_COEFF_A2

0x20*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

TX Timeout value for gain multipliers.

At 48KHz sampling rate (Fs), the maximum timeout is 1.37s $((256 * \text{TIMER_VAL} + 255) / F_s)$ 11111111 => $(256 * 255 + 255) / 48k = 1.365s$; $(256 * 255 + 255) / 8k = 8.19s$ 10000000 => $(256 * 128 + 255) / 48k = 0.69s$; $(256 * 128 + 255) / 8k = 4.13s$ 01000000 => $(256 * 64 + 255) / 48k = 0.347s$; $(256 * 64 + 255) / 8k = 2.08s$

00000000 => Immediate gain update without timer expiration and zero crossing detection. SW control mode.

LPASS_CDC_TXn_VOL_CTL_TIMER

Bits	Name	Description
7:0	PGA_TIMER	Specifies the Volume Controller timeout period in Fs cycles.

0x0771C264+ LPASS_CDC_TXn_VOL_CTL_GAIN, n=[1..2]
0x20*n
Type: RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

TX Channel Gain. The gain is approximate to +/- 0.3dB.

LPASS_CDC_TXn_VOL_CTL_GAIN

Bits	Name	Description
7:0	PGA_GAIN	Specifies the Volume Controller gain. The value is a twos complement number.

0x0771C268+ LPASS_CDC_TXn_VOL_CTL_CFG, n=[1..2]
0x20*n
Type: RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

Specifies the enable signals for the Gain multiplier (Volume controller). This register should be updated only once per 5 mclk cycles for well-defined operation.

LPASS_CDC_TXn_VOL_CTL_CFG

Bits	Name	Type	Description
3	GAIN_UPD_STATUS	R	Specifies if the gain update has been completed. Automatically resets to IN_PROCESS when gain is updated. When the gain has been applied, changes state to COMPLETE. Read only bit. 0x0: IN_PROCESS 0x1: COMPLETE
2	MODE	RW	Specifies the mode in which gain is updated. 0x0: AUTOMATIC 0x1: MANUAL
1	HALF_DB	RW	Specifies the addition of a half db to the original gain. When set(1) and If the actual gain is 1, a gain of 1.5dB is applied. When set(1) and If the actual gain is -1, a gain of -0.5dB is applied. 0x0: DISABLE 0x1: ENABLE

LPASS_CDC_TXn_VOL_CTL_CFG (cont.)

Bits	Name	Type	Description
0	MUTE_EN	RW	Specifies if the output of the volume controller needs to be muted. 0x0: DISABLE 0x1: ENABLE

**0x0771C26C+LPASS_CDC_TXn_MUX_CTL, n=[1..2]
0x20*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

Specifies the control signals for Multiplexer inputs in TX path.

LPASS_CDC_TXn_MUX_CTL

Bits	Name	Description
5:4	CUT_OFF_FREQ	Specifies the Cutoff frequency to be used by the High pass filter block. 0x0: CF_NEG_3DB_4HZ 0x1: CF_NEG_3DB_75HZ 0x2: CF_NEG_3DB_150HZ
3	HPF_BP_SEL	Specifies if the high pass controller needs to be bypassed or not. 0x0: NO_BYPASS 0x1: BYPASS
2:1	RESERVED	Reserved
0	ADC_DMIC_SEL	Specifies ADCMIC source selection path in CIC filter. 0x0: ADC 0x1: DMIC

**0x0771C270+ LPASS_CDC_TXn_CLK_FS_CTL, n=[1..2]
0x20*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000003

Specifies the sampling rate of the PCM signal.

LPASS_CDC_TXn_CLK_FS_CTL

Bits	Name	Description
2:0	FS_RATE	Specifies the sampling rate of the PCM signal. 0x0: F_8_KHZ 0x1: F_16_KHZ 0x2: F_32_KHZ 0x3: F_48_KHZ

0x0771C274+ LPASS_CDC_TXn_DMIC_CTL, n=[1..2]**0x20*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_TXn_DMIC_CTL**

Bits	Name	Description
2:0	CLK_SEL	Specifies the clock frequency of the input DMIC data samples in the TX/ANC path. Div6 is only valid for mclk=12.288 0x0: DIV2 0x1: DIV3 0x2: DIV4 0x3: DIV6 0x4: DIV16

0x01A011E0 MDSS_MDP_QOS_REMAPPER_CLASS_0**Type:** RW**Reset State:** 0x000000E4

QoS remapper to translate health level to priority levels on the bus

Class 0 is used by the real time clients in the system (i.e. ViG/RGB/DMA pipes in line mode)

Class 1 is used by the non-real time clients in the system (i.e. DMA pipes in block mode)

WB modules are completely SW configurable and dont rely on watermarks.

Therefore they do NOT go through the remapper

double buffered: NO

MDSS_MDP_QOS_REMAPPER_CLASS_0

Bits	Name	Description
7:6	REQPRIORITY_3	Remapping ID for priority 3 onto the client port
5:4	REQPRIORITY_2	Remapping ID for priority 0 onto the client port
3:2	REQPRIORITY_1	Remapping ID for priority 1 onto the client port
1:0	REQPRIORITY_0	Remapping ID for priority 0 onto the client port

0x01A011E4 MDSS_MDP_QOS_REMAPPER_CLASS_1**Type:** RW**Reset State:** 0x000000E4

VIDEO_INTF_UNDERFLOW_CTRL register controls the auto recovery mechanism on underflow case. Register reprogramming is not allowed when each video interface is running.

double buffered: NO

MDSS_MDP_VIDEO_INTF_UNDERFLOW_CTL

Bits	Name	Description
4	INTF_1_ERR_RECOVERY_EN	Enable auto recovery during underflow case in interface 1 if NEWROI_PRIOR_TO_START is disabled. 0x0 : Disalbe. SW is required to apply SW reset when underflow interrupt occurs 0x1 : Enable. No SW reset is required. Underflow interrupt is generated after auto recovery is finished

0x01A012F4 MDSS_MDP_SPLIT_DISPLAY_EN**Type:** RW**Reset State:** 0x00000000

Split display on/off control register. This register bit is not double buffered.

MDSS_MDP_SPLIT_DISPLAY_EN

Bits	Name	Description
0	ENABLE	Turning on/off split display configuration 0x0 : Enable 0x1 : Disable

0x01A012F8 MDSS_MDP_SPLIT_DISPLAY_UPPER_PIPE_CTRL**Type:** RW**Reset State:** 0x00000000

Main configuration of split display in mdp upper pipeline. This register are not double buffered.

MDSS_MDP_SPLIT_DISPLAY_UPPER_PIPE_CTRL

Bits	Name	Description
4	INTF_1_SW_TRG_MUX	Control SW trigger mux of interface 1 0x0 : No SW trigger change 0x1 : Use SW trigger of interface 2 for interface 1
2	SMART_PANEL_FREE_RUN	Select split display mode for smart panel. This register value should be identical to lower pipe's same name bit before enabling split display. 0x1 : Free running mode between panels 0x0 : Synchronous mode between panels
1	SPLIT_DISPLAY_TYPE	Specify panel type. This register value should be identical to lower pipe's same name bit before enabling split display. 0x1 : Smart Panel 0x0 : Dumb Panel

0x01A01300 MDSS_MDP_DSPP_IGC_COLOR0_RAM_LUTN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_DSPP_IGC_COLOR0_RAM_LUTN**

Bits	Name	Description

11:0	VALUE	

0x01A01330 MDSS_MDP_MDP_VSYNC_SEL**Type:** RW**Reset State:** 0x00000000

MDP_VSYNC_SEL register is used to select either the vsyncs from GPIOs or DSI blocks to be used internally as primary, secondary and external vsyncs

double buffered: NO

MDSS_MDP_MDP_VSYNC_SEL

Bits	Name	Description
18	VSYNC_INVERT_0	0=Vsync for stream of Ping-pong 0 is active high; 1=Vsync for stream of Ping-pong 0 is active low
17	VSYNC_INVERT_1	0=Vsync for stream of Ping-pong 1 is active high; 1=Vsync for stream of Ping-pong 0 is active low
16	VSYNC_INVERT_2	0=Vsync for stream of Ping-pong 2 is active high; 1=Vsync for stream of Ping-pong 0 is active low

MDSS_MDP_MDP_VSYNC_SEL (cont.)

Bits	Name	Description
15:12	PING_PONG_0	0x0: Vsync0 from GPIO 0x1: Vsync1 from GPIO 0x2: Vsync2 from GPIO 0x3: Vsync(TE) from INTF_0 panel 0x4: Vsync(TE) from INTF_1 panel 0x5: Vsync(TE) from INTF_2 panel 0x6: Vsync(TE) from INTF_3 panel

0x01A01350 MDSS_MDP_LP_MISR_SEL**Type:** RW**Reset State:** 0x00000000

select Upper pipe MISR

MDSS_MDP_LP_MISR_SEL

Bits	Name	Description
7:0	BLOCK_ID	MISR block select for the MDP clock domain MISR The following are the block select encodings 0x00:cursor_unpack_0 0x01:cursor_unpack_1 0x02:cursor_unpack_2 0x03_0x07:unused 0x08:LMIX0_blend 0x09:LMIX0_GC 0x0a:LMIX1_blend 0x0b:LMIX1_GC 0x0c:LMIX2_blend 0x0d:LMIX2_GC 0x0e:LMIX3_blend 0x0f:LMIX3_GC 0x10:LMIX4_blend 0x11:LMIX4_GC 0x12:DSPP0_PA 0x13:DSPP0_IGC 0x14:DSPP0_GamutM 0x15:DSPP0_PCC 0x16:DSPP0_panelC_LUT 0x17:DSPP0_dither 0x18:DSPP1_PA 0x19:DSPP1_IGC 0x1a:DSPP1_GamutM 0x1b:DSPP1_PCC 0x1c:DSPP1_panelC_LUT 0x1d:DSPP1_dither 0x1e:DSPP2_PA 0x1f:DSPP2_IGC 0x20:DSPP2_GamutM 0x21:DSPP2_PCC 0x22:DSPP2_panelC_LUT 0x23:DSPP2_dither 0x24:ppb0_0 0x25:ppb0_1 0x26:ppb1_0 0x27:ppb1_1 0x28:ppb2_0 0x29:ppb2_1 0x2a:rot0_csc 0x2b:rot0_chromaD 0x2c:rot0_dither 0x2d:rot0_packer(remove) 0x30:rot0_rotate_0 0x31:rot0_rotate_1 0x32:rot0_rotate_2

0x01A01354 MDSS_MDP_LP_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

Misr control MDP

MDSS_MDP_LP_MISR_CTRL

Bits	Name	Type	Description
10	MISR_STATUS_CLEAR	W	misr status is cleared by writing 1 to this field
9	MISR_STATUS	R	set to 1 when misr signature is updated
8	MISR_ENABLE	RW	1: enable the misr on next vsync 0: disable the misr. 1 to 0 transition will reset the misr logic
7:0	MISR_FRAME_COUNT	RW	number of frames of data to be input to misr before capturing the signature

0x01A01358 MDSS_MDP_LP_MISR_CTRL_HDMI**Type:** RW**Reset State:** 0x00000000

Misr control hdmi

MDSS_MDP_LP_MISR_CTRL_HDMI

Bits	Name	Type	Description
10	MISR_STATUS_CLEAR	W	misr status is cleared by writing 1 to this field
9	MISR_STATUS	R	set to 1 when misr signature is updated
8	MISR_ENABLE	RW	1: enable the misr on next vsync 0: disable the misr. 1 to 0 transition will reset the misr logic
7:0	MISR_FRAME_COUNT	RW	number of frames of data to be input to misr before capturing the signature

0x01A0135C MDSS_MDP_LP_MISR_CTRL_EDP**Type:** RW**Reset State:** 0x00000000

Misr control edp

MDSS_MDP_LP_MISR_CTRL_EDP

Bits	Name	Type	Description
10	MISR_STATUS_CLEAR	W	misr status is cleared by writing 1 to this field
9	MISR_STATUS	R	set to 1 when misr signature is updated
8	MISR_ENABLE	RW	1: enable the misr on next vsync 0: disable the misr. 1 to 0 transition will reset the misr logic
7:0	MISR_FRAME_COUNT	RW	number of frames of data to be input to misr before capturing the signature

0x01A01360 MDSS_MDP_LP_MISR_CTRL_DSI0**Type:** RW**Reset State:** 0x00000000

Misr control DSI0

MDSS_MDP_LP_MISR_CTRL_DSI0

Bits	Name	Type	Description
10	MISR_STATUS_CLEAR	W	misr status is cleared by writing 1 to this field
9	MISR_STATUS	R	set to 1 when misr signature is updated
8	MISR_ENABLE	RW	1: enable the misr on next vsync 0: disable the misr. 1 to 0 transition will reset the misr logic
7:0	MISR_FRAME_COUNT	RW	number of frames of data to be input to misr before capturing the signature

0x01A01364 MDSS_MDP_LP_MISR_CTRL_DSI1**Type:** RW**Reset State:** 0x00000000

Misr control DSI1

MDSS_MDP_LP_MISR_CTRL_DSI1

Bits	Name	Type	Description
10	MISR_STATUS_CLEAR	W	misr status is cleared by writing 1 to this field
9	MISR_STATUS	R	set to 1 when misr signature is updated
8	MISR_ENABLE	RW	1: enable the misr on next vsync 0: disable the misr. 1 to 0 transition will reset the misr logic
7:0	MISR_FRAME_COUNT	RW	number of frames of data to be input to misr before capturing the signature

0x01A01368 MDSS_MDP_LP_MISR_SIGN_MDP**Type:** R**Reset State:** 0x00000000

MISR Signature for blocks in MDP domain

MDSS_MDP_LP_MISR_SIGN_MDP

Bits	Name	Description
31:0	MISR_CAPTURED	32 bit CRC value from MISR

0x01A0136C MDSS_MDP_LP_MISR_SIGN_EDP**Type:** R**Reset State:** 0x00000000

MISR Signature for blocks in EDP domain

MDSS_MDP_LP_MISR_SIGN_EDP

Bits	Name	Description
31:0	MISR_CAPTURED	32 bit CRC value from MISR

0x01A01370 MDSS_MDP_LP_MISR_SIGN_HDMI**Type:** R**Reset State:** 0x00000000

MISR Signature for blocks in HDMI P clock domain

MDSS_MDP_LP_MISR_SIGN_HDMI

Bits	Name	Description
31:0	MISR_CAPTURED	32 bit CRC value from MISR

0x01A01374 MDSS_MDP_LP_MISR_SIGN_DSI0**Type:** R**Reset State:** 0x00000000

MISR Signature for blocks in DSI0 domain

MDSS_MDP_LP_MISR_SIGN_DSI0

Bits	Name	Description
31:0	MISR_CAPTURED	32 bit CRC value from MISR

0x01A01378 MDSS_MDP_LP_MISR_SIGN_DSI1**Type:** R**Reset State:** 0x00000000

MISR Signature for blocks in DSI1 domain

MDSS_MDP_LP_MISR_SIGN_DSI1

Bits	Name	Description
31:0	MISR_CAPTURED	32 bit CRC value from MISR

0x01A01380 MDSS_MDP_WD_TIMER_0_CTL**Type:** W**Reset State:** 0x00000000

This register is used to control Watchdog Timer 0 in mdp

MDSS_MDP_WD_TIMER_0_CTL

Bits	Name	Description
0	WD_TIMER_0_CLEAR	Clear the timer

0x01A01384 MDSS_MDP_WD_TIMER_0_CTL2**Type:** RW**Reset State:** 0x00000002

This register is used to control Watchdog Timer 0 in mdp

MDSS_MDP_WD_TIMER_0_CTL2

Bits	Name	Description
4:1	WD_TIMER_0_GRANULARITY	Configurable # of clock ticks granularity per main counter increment 0x0: 8 clock ticks 0x1: 16 clock ticks (default) 0x2: 24 clock ticks 0x3: 32 clock ticks 0x4: 40 clock ticks 0x5: 48 clock ticks 0x6: 56 clock ticks 0x7: 64 clock ticks 0x8: 72 clock ticks 0x9: 80 clock ticks 0xa: 88 clock ticks 0xb: 96 clock ticks 0xc: 104 clock ticks 0xd: 112 clock ticks 0xe: 120 clock ticks 0xf: 128 clock ticks

MDSS_MDP_WD_TIMER_0_CTL2 (cont.)

Bits	Name	Description
0	WD_TIMER_0_ENABLE	Enable the timer

0x01A01388 MDSS_MDP_WD_TIMER_0_LOAD_VALUE**Type:** RW**Reset State:** 0x00000000

The timer count up to value that would trigger WD interrupt

MDSS_MDP_WD_TIMER_0_LOAD_VALUE

Bits	Name	Description
31:0	WD_TIMER_0_LOAD_VALUE	Timer count value 0x0 : Free running mode, timer counter wraps Others: Timer count up to value in granularity of 16 clock tick periods eg. 0x2 : Translates into 2*16=32 clock tick periods

0x01A0138C MDSS_MDP_WD_TIMER_0_STATUS_VALUE**Type:** R**Reset State:** 0x00000000

The current timer count value

MDSS_MDP_WD_TIMER_0_STATUS_VALUE

Bits	Name	Description
31:0	WD_TIMER_0_STATUS_VALUE	

0x01A01390 MDSS_MDP_WD_TIMER_1_CTL**Type:** W**Reset State:** 0x00000000

This register is used to control Watchdog Timer 1 in mdp

MDSS_MDP_WD_TIMER_1_CTL

Bits	Name	Description
0	WD_TIMER_1_CLEAR	Clear the timer

0x01A01394 MDSS_MDP_WD_TIMER_1_CTL2**Type:** RW**Reset State:** 0x00000002

This register is used to control Watchdog Timer 1 in mdp

MDSS_MDP_WD_TIMER_1_CTL2

Bits	Name	Description
4:1	WD_TIMER_1_GRANULARITY	Configurable # of clock ticks granularity per main counter increment 0x0: 8 clock ticks 0x1: 16 clock ticks (default) 0x2: 24 clock ticks 0x3: 32 clock ticks 0x4: 40 clock ticks 0x5: 48 clock ticks 0x6: 56 clock ticks 0x7: 64 clock ticks 0x8: 72 clock ticks 0x9: 80 clock ticks 0xa: 88 clock ticks 0xb: 96 clock ticks 0xc: 104 clock ticks 0xd: 112 clock ticks 0xe: 120 clock ticks 0xf: 128 clock ticks
0	WD_TIMER_1_ENABLE	Enable the timer

0x01A01398 MDSS_MDP_WD_TIMER_1_LOAD_VALUE**Type:** RW**Reset State:** 0x00000000

The timer count up to value that would trigger WD interrupt

MDSS_MDP_WD_TIMER_1_LOAD_VALUE

Bits	Name	Description
31:0	WD_TIMER_1_LOAD_VALUE	Timer count value 0x0 : Free running mode, timer counter wraps Others: Timer count up to value in granularity of 16 clock tick periods eg. 0x2 : Translates into 2*16=32 clock tick periods

0x01A0139C MDSS_MDP_WD_TIMER_1_STATUS_VALUE**Type:** R**Reset State:** 0x00000000

The current timer count value

MDSS_MDP_WD_TIMER_1_STATUS_VALUE

Bits	Name	Description
31:0	WD_TIMER_1_STATUS_VALUE	

0x01A013A8 MDSS_MDP_CLK_CTRL3**Type:** RW**Reset State:** 0x00000000

Clock Gating Control

MDSS_MDP_CLK_CTRL3

Bits	Name	Description
27:26	ROT0_CLK_HYSTERISIS_CTRL	0x0 : Clock will run for extra 4 cycles before is gated OFF 0x1 : Clock will run for extra 8 cycles before is gated OFF 0x2 : Clock will run for extra 16 cycles before is gated OFF 0x3 : Clock will run for extra 32 cycles before is gated OFF
25	ROT0_CLK_FORCE_OFF	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch OFF if CLK_FORCE_ON=0, otherwise setting is ignored
24	ROT0_CLK_FORCE_ON	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch ON

MDSS_MDP_CLK_CTRL3 (cont.)

Bits	Name	Description
23:22	PP0_CLK_HYSTERISIS_CTRL	0x0 : Clock will run for extra 4 cycles before is gated OFF 0x1 : Clock will run for extra 8 cycles before is gated OFF 0x2 : Clock will run for extra 16 cycles before is gated OFF 0x3 : Clock will run for extra 32 cycles before is gated OFF
21	PP0_CLK_FORCE_OFF	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch OFF if CLK_FORCE_ON=0, otherwise setting is ignored
20	PP0_CLK_FORCE_ON	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch ON
19:18	CURSOR0_CLK_HYSTERISIS_CTRL	0x0 : Clock will run for extra 4 cycles before is gated OFF 0x1 : Clock will run for extra 8 cycles before is gated OFF 0x2 : Clock will run for extra 16 cycles before is gated OFF 0x3 : Clock will run for extra 32 cycles before is gated OFF
17	CURSOR0_CLK_FORCE_OFF	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch OFF if CLK_FORCE_ON=0, otherwise setting is ignored
16	CURSOR0_CLK_FORCE_ON	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch ON
15:14	LM_DSPP0_CLK_HYSTERISIS_CTRL	0x0 : Clock will run for extra 4 cycles before is gated OFF 0x1 : Clock will run for extra 8 cycles before is gated OFF 0x2 : Clock will run for extra 16 cycles before is gated OFF 0x3 : Clock will run for extra 32 cycles before is gated OFF
13	LM_DSPP0_CLK_FORCE_OFF	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch OFF if CLK_FORCE_ON=0, otherwise setting is ignored
12	LM_DSPP0_CLK_FORCE_ON	0x0 : Clock gating is active if CLK_FORCE_ON=0 and CLK_FORCE_OFF=0 0x1 : Force clock branch ON

0x01A013AC MDSS_MDP_CLK_STATUS3**Type:** R**Reset State:** 0x00000000

Status of gated clock branches

MDSS_MDP_CLK_STATUS3

3:2	VBIF_CLI_CORE_CLK_HYSTERISIS_CTRL	

MDSS_MDP_CLK_CTRL5 (cont.)

Bits	Name	Description
1	VBIF_CLI_CORE_CLK_FOR CE_OFF	

0x01A013BC MDSS_MDP_CLK_STATUS5**Type:** R**Reset State:** 0x00000000

Status of gated clock branches

MDSS_MDP_CLK_STATUS5

Bits	Name	Description
24	VBIF_CLI_CORE_CLK_ACTIVE	
23	VBIF_ARB_CLK_ACTIVE	
22	WB2_BLK_CLK_ACTIVE	
21	WB2_LINE_CLK_ACTIVE	
20	WB2_CLK_ACTIVE	

0x01A013E0 MDSS_MDP_QOS_REMAPPER_LOWER_CLASS_0**Type:** RW**Reset State:** 0x000000E4

QoS remapper to translate health level to priority levels on the bus

Class 0 is used by the real time clients in the system (i.e. ViG/RGB/DMA pipes in line mode)

Class 1 is used by the non-real time clients in the system (i.e. DMA pipes in block mode)

WB modules are completely SW configurable and dont rely on watermarks.

Therefore they do NOT go through the remapper

double buffered: NO

MDSS_MDP_QOS_REMAPPER_LOWER_CLASS_0

Bits	Name	Description
7:6	REQPRIORITY_3	Remapping ID for priority 3 onto the client port
5:4	REQPRIORITY_2	Remapping ID for priority 0 onto the client port

MDSS_MDP_QOS_REMAPPER_LOWER_CLASS_0 (cont.)

Bits	Name	Description
3:2	REQPRIORITY_1	Remapping ID for priority 1 onto the client port
1:0	REQPRIORITY_0	Remapping ID for priority 0 onto the client port

0x01A013E4 MDSS_MDP_QOS_REMAPPER_LOWER_CLASS_1**Type:** RW**Reset State:** 0x000000E4

QoS remapper to translate health level to priority levels on the bus

Class 0 is used by the real time clients in the system (i.e. ViG/RGB/DMA pipes in line mode)

Class 1 is used by the non-real time clients in the system (i.e. DMA pipes in block mode)

WB modules are completely SW configurable and dont rely on watermarks.

Therefore they do NOT go through the remapper

MDSS_MDP_QOS_REMAPPER_LOWER_CLASS_1

Bits	Name	Description
7:6	REQPRIORITY_3	Remapping ID for priority 3 onto the client port
5:4	REQPRIORITY_2	Remapping ID for priority 2 onto the client port
3:2	REQPRIORITY_1	Remapping ID for priority 1 onto the client port
1:0	REQPRIORITY_0	Remapping ID for priority 0 onto the client port

0x01A013F0 MDSS_MDP_SPLIT_DISPLAY_LOWER_PIPE_CTRL**Type:** RW**Reset State:** 0x00000000

Main configuration of split display in mdp lower pipeline. This register are not double buffered.

MDSS_MDP_SPLIT_DISPLAY_LOWER_PIPE_CTRL

Bits	Name	Description
31:16	TE_LINE_INTERVAL_WATERMARK	TE interval interrupt is generated if smart panels for split display are not synchronized as many lines as this watermark value.

MDSS_MDP_SPLIT_DISPLAY_LOWER_PIPE_CTRL (cont.)

Bits	Name	Description
8	INTF_2_TIM_GEN_SYNC_MODE	Control synchronization mode for timing generator in interface 2 0x0 : No sync mode 0x1 : Use INTF_1's enable signal for interface 2
4	INTF_1_TIM_GEN_SYNC_MODE	Control synchronization mode for timing generator in interface 1 0x0 : No SW trigger change 0x1 : Use INTF_2's enable signal for interface 1
2	SMART_PANEL_FREE_RUNNING	Select split display mode for smart panel. This register value should be identical to upper pipe's same name bit before enabling split display. 0x1 : Free running mode between panels 0x0 : Synchronous mode between panels
1	SPLIT_DISPLAY_TYPE	Specify panel type. This register value should be identical to upper pipe's same name bit before enabling split display. 0x1 : Smart Panel 0x0 : Dumb Panel

0x01A013F4 MDSS_MDP_SPLIT_DISPLAY_TE_LINE_INTERVAL**Type:** R**Reset State:** 0x00000000

This indicates how many lines smart panels are not synced for split display

MDSS_MDP_SPLIT_DISPLAY_TE_LINE_INTERVAL

Bits	Name	Description
15:0	VALUE	The number of line interval for smart panel in split display mode

0x01A013F8 MDSS_MDP_LOWER_NEWROI_PRIOR_TO_START**Type:** RW**Reset State:** 0x00000001

The newroi prior to start is used to flush out incorrect states and such between frames. The newroi is sent prior to the start signals from the PMU's. This field is for the PMU's in the lower pipeline only - there exists a separate register for the upper pipeline (UPPER_NEWROI_PRIOR_TO_START)

MDSS_MDP_LOWER_NEWROI_PRIOR_TO_START

Bits	Name	Description
0	ENABLE	Enable the mode to send out newroi prior to start

0x01A013FC MDSS_MDP_INTF_SW_RESET_MASK**Type:** RW**Reset State:** 0x00000000

This register is used to mask the video/cmd mode SW_RESET within the disp_intf.

MDSS_MDP_INTF_SW_RESET_MASK

Bits	Name	Description
1:0	INTF_1_SW_RESET_MASK	Control mask for intf_1 (DSIO) 0x0 : Resets for both video and command modes 0x1 : Reset for video mode only 0x2 : Reset for command mode only 0x3 : No resets to both video and command

17.2.2 MDSS_MDP_CTL_0

0x01A02014 MDSS_MDP_CTL_0_TOP**Type:** RW**Reset State:** 0x00001F00**Operation Mode Configuration for the Pipeline**

The purpose of the register is to define the complete data path of this operation and that includes all the way to the interfaces such as DSI/HDMI/eDP

Changing of the data path dynamically is NOT supported and requires stopping that data path, reconfiguring the connections, and restarting the datapath

MDSS_MDP_CTL_0_TOP

Bits	Name	Description
17	MODE_SEL	Interface Mode of the destination interface Needed to distinguish interfaces such as DSI that can be either mode DSI can also interleave streams of different types (i.e. command and video) to a single core 0x0: Video Mode 0x1: Command Mode1
16:15	STREAM_SEL	Stream Identification Used For Interleaving of Command Streams This field is a dont care for video mode streams 0x0: Stream 0 0x1: Stream 1 0x2: Stream 2
7:4	OUT_SEL	Output Ping-Pong Interface Connection to external display interface 0x0: No connection from Ping-Pong buffers to output interfaces 0x1: Interface 0 0x2: Interface 1 0x3: Interface 2 0x4: Interface 3
3:0	MEM_SEL	Memory Output Connection 0x0: NO memory output selected 0x1: Memory BLOCK mode output selected for rotation 0 0x2: Memory BLOCK mode output selected for rotation 1 0x3: Memory LINE mode output selected for rotation 0 0x4: Memory LINE mode output selected for rotation 1 0x5: Memory LINE mode output selected for linear memory writeback

0x01A02018 MDSS_MDP_CTL_0_FLUSH**Type:** RW**Reset State:** 0x00000000

Register Flush register

The flush register is used to indicate a pipe/layermixers registers are all programmed, and are safe to update to the back copy of the double buffered registers.

Each pipes/layermixers flush mask bit will be used only when the associated pipe/layermixer is running at active refresh pull mode, e.g., direct out going to LCDC/HDMI/DSI Video.

In such operation mode, the associated pipe/layermixers double buffered registers back copies are updated with the new values at the vsync boundary only when the flush mask bit has already been written a 1.

Each flush mask bit would also returned a 0 once the back copies are updated.

Before the back copies are updated, the associate mask bit would returned a 1 if it has been previously written a 1.

MDSS_MDP_CTL_0_FLUSH

Bits	Name	Description
30	TIMING_1	Timing Interface 1 are ready for flush
17	CTL	Control Pipe register is ready for flush This applies to upper pipe ONLY to change the adding/removal of layers
16	WB	Write Back registers are ready for flush
15	DSPP_2	DSPP2 registers are ready for flush
14	DSPP_1	DSPP1 registers are ready for flush
13	DSPP_0	DSPP0 registers are ready for flush
12	DMA_1	DMA_1 registers are ready for flush
11	DMA_0	DMA_0 registers are ready for flush
10	LAYER_MIXER_4	Layer Mixer4 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
9	LAYER_MIXER_3	Layer Mixer3 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
8	LAYER_MIXER_2	Layer Mixer2 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
7	LAYER_MIXER_1	Layer Mixer1 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
6	LAYER_MIXER_0	Layer Mixer0 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
5	RGB_2	RGB2 registers are ready for flush
4	RGB_1	RGB1 registers are ready for flush
3	RGB_0	RGB0 registers are ready for flush

MDSS_MDP_CTL_0_FLUSH (cont.)

Bits	Name	Description
2	VIG_2	VIG2 registers are ready for flush
1	VIG_1	VIG1 registers are ready for flush
0	VIG_0	VIG0 registers are ready for flush

0x01A0201C MDSS_MDP_CTL_0_CTL_START**Type:** W**Reset State:** 0x00000000

Overlay Processor Start Signal for the given Control Operation

MDSS_MDP_CTL_0_CTL_START

Bits	Name	Description
0	START	A write to this register will kick off operation for the given operation control and activate all layers

0x01A02030 MDSS_MDP_CTL_0_SW_RESET**Type:** RW**Reset State:** 0x00000000

Software Reset of the given control operation

MDSS_MDP_CTL_0_SW_RESET

Bits	Name	Description
0	RESET	Writing to this bit will trigger a soft reset for the described data path This register is self-clearing and will return 0x1 if soft reset sequence is not complete Upon completion, this will return 0x0 Note that this will soft reset the peripheral display interfaces that are described in this path i.e. if driving intf_0 it will reset the pixel clock domain of intf_0 as well

0x01A02034 MDSS_MDP_CTL_0_SW_RESET_OVERRIDE**Type:** RW**Reset State:** 0x00000000

Software Reset Override of the given control operation

MDSS_MDP_CTL_0_SW_RESET_OVERRIDE

Bits	Name	Description
0	RESET	Writing to this bit will assert reset for the described data path This value contained in this register will be forced onto the datapath It will reset the state machines within the scheduler as well for the given datapath To use this register sequence, SW shall write a value of 0x1 to this register to assert reset Once SW wants to de-assert reset, SW shall write a value of 0x0 SW will need to ensure the duration of the value 0x1 is long enough to ensure the path is clean and all memory reads are complete The datapath will not be triggered if this bit is asserted

0x01A02214 MDSS_MDP_CTL_1_TOP**Type:** RW**Reset State:** 0x00001F00**Operation Mode Configuration for the Pipeline**

The purpose of the register is to define the complete data path of this operation and that includes all the way to the interfaces such as DSI/HDMI/eDP

Changing of the data path dynamically is NOT supported and requires stopping that data path, reconfiguring the connections, and restarting the datapath

MDSS_MDP_CTL_1_TOP

Bits	Name	Description
17	MODE_SEL	Interface Mode of the destination interface Needed to distinguish interfaces such as DSI that can be either mode DSI can also interleave streams of different types (i.e. command and video) to a single core 0x0: Video Mode 0x1: Command Mode1
16:15	STREAM_SEL	Stream Identification Used For Interleaving of Command Streams This field is a dont care for video mode streams 0x0: Stream 0 0x1: Stream 1 0x2: Stream 2
7:4	OUT_SEL	Output Ping-Pong Interface Connection to external display interface 0x0: No connection from Ping-Pong buffers to output interfaces 0x1: Interface 0 0x2: Interface 1 0x3: Interface 2 0x4: Interface 3
3:0	MEM_SEL	Memory Output Connection 0x0: NO memory output selected 0x1: Memory BLOCK mode output selected for rotation 0 0x2: Memory BLOCK mode output selected for rotation 1 0x3: Memory LINE mode output selected for rotation 0 0x4: Memory LINE mode output selected for rotation 1 0x5: Memory LINE mode output selected for linear memory writeback

0x01A02218 MDSS_MDP_CTL_1_FLUSH**Type:** RW**Reset State:** 0x00000000

Register Flush register

The flush register is used to indicate a pipe/layermixers registers are all programmed, and are safe to update to the back copy of the double buffered registers.

Each pipes/layermixers flush mask bit will be used only when the associated pipe/layermixer is running at active refresh pull mode, e.g., direct out going to LCDC/HDMI/DSI Video.

In such operation mode, the associated pipe/layermixers double buffered registers back copies are updated with the new values at the vsync boundary only when the flush mask bit has already been written a 1.

Each flush mask bit would also returned a 0 once the back copies are updated.

Before the back copies are updated, the associate mask bit would returned a 1 if it has been previously written a 1.

MDSS_MDP_CTL_1_FLUSH

Bits	Name	Description
30	TIMING_1	Timing Interface 1 are ready for flush
17	CTL	Control Pipe register is ready for flush This applies to upper pipe ONLY to change the adding/removal of layers
16	WB	Write Back registers are ready for flush
15	DSPP_2	DSPP2 registers are ready for flush
14	DSPP_1	DSPP1 registers are ready for flush
13	DSPP_0	DSPP0 registers are ready for flush
12	DMA_1	DMA_1 registers are ready for flush
11	DMA_0	DMA_0 registers are ready for flush
10	LAYER_MIXER_4	Layer Mixer4 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
9	LAYER_MIXER_3	Layer Mixer3 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
8	LAYER_MIXER_2	Layer Mixer2 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
7	LAYER_MIXER_1	Layer Mixer1 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
6	LAYER_MIXER_0	Layer Mixer0 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
5	RGB_2	RGB2 registers are ready for flush
4	RGB_1	RGB1 registers are ready for flush
3	RGB_0	RGB0 registers are ready for flush

MDSS_MDP_CTL_1_FLUSH (cont.)

Bits	Name	Description
2	VIG_2	VIG2 registers are ready for flush
1	VIG_1	VIG1 registers are ready for flush
0	VIG_0	VIG0 registers are ready for flush

0x01A0221C MDSS_MDP_CTL_1_CTL_START**Type:** W**Reset State:** 0x00000000

Overlay Processor Start Signal for the given Control Operation

MDSS_MDP_CTL_1_CTL_START

Bits	Name	Description
0	START	A write to this register will kick off operation for the given operation control and activate all layers

0x01A02230 MDSS_MDP_CTL_1_SW_RESET**Type:** RW**Reset State:** 0x00000000

Software Reset of the given control operation

MDSS_MDP_CTL_1_SW_RESET

Bits	Name	Description
0	RESET	Writing to this bit will trigger a soft reset for the described data path This register is self-clearing and will return 0x1 if soft reset sequence is not complete Upon completion, this will return 0x0 Note that this will soft reset the peripheral display interfaces that are described in this path i.e. if driving intf_0 it will reset the pixel clock domain of intf_0 as well

0x01A02234 MDSS_MDP_CTL_1_SW_RESET_OVERRIDE**Type:** RW**Reset State:** 0x00000000

Software Reset Override of the given control operation

MDSS_MDP_CTL_1_SW_RESET_OVERRIDE

Bits	Name	Description
0	RESET	Writing to this bit will assert reset for the described data path This value contained in this register will be forced onto the datapath It will reset the state machines within the scheduler as well for the given datapath To use this register sequence, SW shall write a value of 0x1 to this register to assert reset Once SW wants to de-assert reset, SW shall write a value of 0x0 SW will need to ensure the duration of the value 0x1 is long enough to ensure the path is clean and all memory reads are complete The datapath will not be triggered if this bit is asserted

0x01A02414 MDSS_MDP_CTL_2_TOP**Type:** RW**Reset State:** 0x00001F00**Operation Mode Configuration for the Pipeline**

The purpose of the register is to define the complete data path of this operation and that includes all the way to the interfaces such as DSI/HDMI/eDP

Changing of the data path dynamically is NOT supported and requires stopping that data path, reconfiguring the connections, and restarting the datapath

MDSS_MDP_CTL_2_TOP

Bits	Name	Description
17	MODE_SEL	Interface Mode of the destination interface Needed to distinguish interfaces such as DSI that can be either mode DSI can also interleave streams of different types (i.e. command and video) to a single core 0x0: Video Mode 0x1: Command Mode1
16:15	STREAM_SEL	Stream Identification Used For Interleaving of Command Streams This field is a dont care for video mode streams 0x0: Stream 0 0x1: Stream 1 0x2: Stream 2
7:4	OUT_SEL	Output Ping-Pong Interface Connection to external display interface 0x0: No connection from Ping-Pong buffers to output interfaces 0x1: Interface 0 0x2: Interface 1 0x3: Interface 2 0x4: Interface 3
3:0	MEM_SEL	Memory Output Connection 0x0: NO memory output selected 0x1: Memory BLOCK mode output selected for rotation 0 0x2: Memory BLOCK mode output selected for rotation 1 0x3: Memory LINE mode output selected for rotation 0 0x4: Memory LINE mode output selected for rotation 1 0x5: Memory LINE mode output selected for linear memory writeback

0x01A02418 MDSS_MDP_CTL_2_FLUSH**Type:** RW**Reset State:** 0x00000000

Register Flush register

The flush register is used to indicate a pipe/layermixers registers are all programmed, and are safe to update to the back copy of the double buffered registers.

Each pipes/layermixers flush mask bit will be used only when the associated pipe/layermixer is running at active refresh pull mode, e.g., direct out going to LCDC/HDMI/DSI Video.

In such operation mode, the associated pipe/layermixers double buffered registers back copies are updated with the new values at the vsync boundary only when the flush mask bit has already been written a 1.

Each flush mask bit would also returned a 0 once the back copies are updated.

Before the back copies are updated, the associate mask bit would returned a 1 if it has been previously written a 1.

MDSS_MDP_CTL_2_FLUSH

Bits	Name	Description
30	TIMING_1	Timing Interface 1 are ready for flush
17	CTL	Control Pipe register is ready for flush This applies to upper pipe ONLY to change the adding/removal of layers
16	WB	Write Back registers are ready for flush
15	DSPP_2	DSPP2 registers are ready for flush
14	DSPP_1	DSPP1 registers are ready for flush
13	DSPP_0	DSPP0 registers are ready for flush
12	DMA_1	DMA_1 registers are ready for flush
11	DMA_0	DMA_0 registers are ready for flush
10	LAYER_MIXER_4	Layer Mixer4 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
9	LAYER_MIXER_3	Layer Mixer3 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
8	LAYER_MIXER_2	Layer Mixer2 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
7	LAYER_MIXER_1	Layer Mixer1 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
6	LAYER_MIXER_0	Layer Mixer0 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
5	RGB_2	RGB2 registers are ready for flush
4	RGB_1	RGB1 registers are ready for flush
3	RGB_0	RGB0 registers are ready for flush

MDSS_MDP_CTL_2_FLUSH (cont.)

Bits	Name	Description
2	VIG_2	VIG2 registers are ready for flush
1	VIG_1	VIG1 registers are ready for flush
0	VIG_0	VIG0 registers are ready for flush

0x01A0241C MDSS_MDP_CTL_2_CTL_START**Type:** W**Reset State:** 0x00000000

Overlay Processor Start Signal for the given Control Operation

MDSS_MDP_CTL_2_CTL_START

Bits	Name	Description
0	START	A write to this register will kick off operation for the given operation control and activate all layers

0x01A02430 MDSS_MDP_CTL_2_SW_RESET**Type:** RW**Reset State:** 0x00000000

Software Reset of the given control operation

MDSS_MDP_CTL_2_SW_RESET

Bits	Name	Description
0	RESET	Writing to this bit will trigger a soft reset for the described data path This register is self-clearing and will return 0x1 if soft reset sequence is not complete Upon completion, this will return 0x0 Note that this will soft reset the peripheral display interfaces that are described in this path i.e. if driving intf_0 it will reset the pixel clock domain of intf_0 as well

0x01A02434 MDSS_MDP_CTL_2_SW_RESET_OVERRIDE**Type:** RW**Reset State:** 0x00000000

Software Reset Override of the given control operation

MDSS_MDP_CTL_2_SW_RESET_OVERRIDE

Bits	Name	Description
0	RESET	Writing to this bit will assert reset for the described data path This value contained in this register will be forced onto the datapath It will reset the state machines within the scheduler as well for the given datapath To use this register sequence, SW shall write a value of 0x1 to this register to assert reset Once SW wants to de-assert reset, SW shall write a value of 0x0 SW will need to ensure the duration of the value 0x1 is long enough to ensure the path is clean and all memory reads are complete The datapath will not be triggered if this bit is asserted

0x01A02614 MDSS_MDP_CTL_3_TOP**Type:** RW**Reset State:** 0x00001F00**Operation Mode Configuration for the Pipeline**

The purpose of the register is to define the complete data path of this operation and that includes all the way to the interfaces such as DSI/HDMI/eDP

Changing of the data path dynamically is NOT supported and requires stopping that data path, reconfiguring the connections, and restarting the datapath

MDSS_MDP_CTL_3_TOP

Bits	Name	Description
17	MODE_SEL	Interface Mode of the destination interface Needed to distinguish interfaces such as DSI that can be either mode DSI can also interleave streams of different types (i.e. command and video) to a single core 0x0: Video Mode 0x1: Command Mode1
16:15	STREAM_SEL	Stream Identification Used For Interleaving of Command Streams This field is a dont care for video mode streams 0x0: Stream 0 0x1: Stream 1 0x2: Stream 2
7:4	OUT_SEL	Output Ping-Pong Interface Connection to external display interface 0x0: No connection from Ping-Pong buffers to output interfaces 0x1: Interface 0 0x2: Interface 1 0x3: Interface 2 0x4: Interface 3
3:0	MEM_SEL	Memory Output Connection 0x0: NO memory output selected 0x1: Memory BLOCK mode output selected for rotation 0 0x2: Memory BLOCK mode output selected for rotation 1 0x3: Memory LINE mode output selected for rotation 0 0x4: Memory LINE mode output selected for rotation 1 0x5: Memory LINE mode output selected for linear memory writeback

0x01A02618 MDSS_MDP_CTL_3_FLUSH**Type:** RW**Reset State:** 0x00000000

Register Flush register

The flush register is used to indicate a pipe/layermixers registers are all programmed, and are safe to update to the back copy of the double buffered registers.

Each pipes/layermixers flush mask bit will be used only when the associated pipe/layermixer is running at active refresh pull mode, e.g., direct out going to LCDC/HDMI/DSI Video.

In such operation mode, the associated pipe/layermixers double buffered registers back copies are updated with the new values at the vsync boundary only when the flush mask bit has already been written a 1.

Each flush mask bit would also returned a 0 once the back copies are updated.

Before the back copies are updated, the associate mask bit would returned a 1 if it has been previously written a 1.

MDSS_MDP_CTL_3_FLUSH

Bits	Name	Description
30	TIMING_1	Timing Interface 1 are ready for flush
17	CTL	Control Pipe register is ready for flush This applies to upper pipe ONLY to change the adding/removal of layers
16	WB	Write Back registers are ready for flush
15	DSPP_2	DSPP2 registers are ready for flush
14	DSPP_1	DSPP1 registers are ready for flush
13	DSPP_0	DSPP0 registers are ready for flush
12	DMA_1	DMA_1 registers are ready for flush
11	DMA_0	DMA_0 registers are ready for flush
10	LAYER_MIXER_4	Layer Mixer4 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
9	LAYER_MIXER_3	Layer Mixer3 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
8	LAYER_MIXER_2	Layer Mixer2 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
7	LAYER_MIXER_1	Layer Mixer1 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
6	LAYER_MIXER_0	Layer Mixer0 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
5	RGB_2	RGB2 registers are ready for flush
4	RGB_1	RGB1 registers are ready for flush
3	RGB_0	RGB0 registers are ready for flush

MDSS_MDP_CTL_3_FLUSH (cont.)

Bits	Name	Description
2	VIG_2	VIG2 registers are ready for flush
1	VIG_1	VIG1 registers are ready for flush
0	VIG_0	VIG0 registers are ready for flush

0x01A0261C MDSS_MDP_CTL_3_CTL_START**Type:** W**Reset State:** 0x00000000

Overlay Processor Start Signal for the given Control Operation

MDSS_MDP_CTL_3_CTL_START

Bits	Name	Description
0	START	A write to this register will kick off operation for the given operation control and activate all layers

0x01A02630 MDSS_MDP_CTL_3_SW_RESET**Type:** RW**Reset State:** 0x00000000

Software Reset of the given control operation

MDSS_MDP_CTL_3_SW_RESET

Bits	Name	Description
0	RESET	Writing to this bit will trigger a soft reset for the described data path This register is self-clearing and will return 0x1 if soft reset sequence is not complete Upon completion, this will return 0x0 Note that this will soft reset the peripheral display interfaces that are described in this path i.e. if driving intf_0 it will reset the pixel clock domain of intf_0 as well

0x01A02634 MDSS_MDP_CTL_3_SW_RESET_OVERRIDE**Type:** RW**Reset State:** 0x00000000

Software Reset Override of the given control operation

MDSS_MDP_CTL_3_SW_RESET_OVERRIDE

Bits	Name	Description
0	RESET	Writing to this bit will assert reset for the described data path This value contained in this register will be forced onto the datapath It will reset the state machines within the scheduler as well for the given datapath To use this register sequence, SW shall write a value of 0x1 to this register to assert reset Once SW wants to de-assert reset, SW shall write a value of 0x0 SW will need to ensure the duration of the value 0x1 is long enough to ensure the path is clean and all memory reads are complete The datapath will not be triggered if this bit is asserted

0x01A02814 MDSS_MDP_CTL_4_TOP**Type:** RW**Reset State:** 0x00001F00**Operation Mode Configuration for the Pipeline**

The purpose of the register is to define the complete data path of this operation and that includes all the way to the interfaces such as DSI/HDMI/eDP

Changing of the data path dynamically is NOT supported and requires stopping that data path, reconfiguring the connections, and restarting the datapath

MDSS_MDP_CTL_4_TOP

Bits	Name	Description
17	MODE_SEL	Interface Mode of the destination interface Needed to distinguish interfaces such as DSI that can be either mode DSI can also interleave streams of different types (i.e. command and video) to a single core 0x0: Video Mode 0x1: Command Mode1
16:15	STREAM_SEL	Stream Identification Used For Interleaving of Command Streams This field is a dont care for video mode streams 0x0: Stream 0 0x1: Stream 1 0x2: Stream 2
7:4	OUT_SEL	Output Ping-Pong Interface Connection to external display interface 0x0: No connection from Ping-Pong buffers to output interfaces 0x1: Interface 0 0x2: Interface 1 0x3: Interface 2 0x4: Interface 3
3:0	MEM_SEL	Memory Output Connection 0x0: NO memory output selected 0x1: Memory BLOCK mode output selected for rotation 0 0x2: Memory BLOCK mode output selected for rotation 1 0x3: Memory LINE mode output selected for rotation 0 0x4: Memory LINE mode output selected for rotation 1 0x5: Memory LINE mode output selected for linear memory writeback

0x01A02818 MDSS_MDP_CTL_4_FLUSH**Type:** RW**Reset State:** 0x00000000

Register Flush register

The flush register is used to indicate a pipe/layermixers registers are all programmed, and are safe to update to the back copy of the double buffered registers.

Each pipes/layermixers flush mask bit will be used only when the associated pipe/layermixer is running at active refresh pull mode, e.g., direct out going to LCDC/HDMI/DSI Video.

In such operation mode, the associated pipe/layermixers double buffered registers back copies are updated with the new values at the vsync boundary only when the flush mask bit has already been written a 1.

Each flush mask bit would also returned a 0 once the back copies are updated.

Before the back copies are updated, the associate mask bit would returned a 1 if it has been previously written a 1.

MDSS_MDP_CTL_4_FLUSH

Bits	Name	Description
30	TIMING_1	Timing Interface 1 are ready for flush
17	CTL	Control Pipe register is ready for flush This applies to upper pipe ONLY to change the adding/removal of layers
16	WB	Write Back registers are ready for flush
15	DSPP_2	DSPP2 registers are ready for flush
14	DSPP_1	DSPP1 registers are ready for flush
13	DSPP_0	DSPP0 registers are ready for flush
12	DMA_1	DMA_1 registers are ready for flush
11	DMA_0	DMA_0 registers are ready for flush
10	LAYER_MIXER_4	Layer Mixer4 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
9	LAYER_MIXER_3	Layer Mixer3 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
8	LAYER_MIXER_2	Layer Mixer2 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
7	LAYER_MIXER_1	Layer Mixer1 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
6	LAYER_MIXER_0	Layer Mixer0 registers are ready for flush This includes the cursor registers stored in the layer mixer register space
5	RGB_2	RGB2 registers are ready for flush
4	RGB_1	RGB1 registers are ready for flush
3	RGB_0	RGB0 registers are ready for flush

MDSS_MDP_CTL_4_FLUSH (cont.)

Bits	Name	Description
2	VIG_2	VIG2 registers are ready for flush
1	VIG_1	VIG1 registers are ready for flush
0	VIG_0	VIG0 registers are ready for flush

0x01A0281C MDSS_MDP_CTL_4_CTL_START**Type:** W**Reset State:** 0x00000000

Overlay Processor Start Signal for the given Control Operation

MDSS_MDP_CTL_4_CTL_START

Bits	Name	Description
0	START	A write to this register will kick off operation for the given operation control and activate all layers

0x01A02830 MDSS_MDP_CTL_4_SW_RESET**Type:** RW**Reset State:** 0x00000000

Software Reset of the given control operation

MDSS_MDP_CTL_4_SW_RESET

Bits	Name	Description
0	RESET	Writing to this bit will trigger a soft reset for the described data path This register is self-clearing and will return 0x1 if soft reset sequence is not complete Upon completion, this will return 0x0 Note that this will soft reset the peripheral display interfaces that are described in this path i.e. if driving intf_0 it will reset the pixel clock domain of intf_0 as well

0x01A02834 MDSS_MDP_CTL_4_SW_RESET_OVERRIDE**Type:** RW**Reset State:** 0x00000000

Software Reset Override of the given control operation

MDSS_MDP_CTL_4_SW_RESET_OVERRIDE

Bits	Name	Description
0	RESET	Writing to this bit will assert reset for the described data path This value contained in this register will be forced onto the datapath It will reset the state machines within the scheduler as well for the given datapath To use this register sequence, SW shall write a value of 0x1 to this register to assert reset Once SW wants to de-assert reset, SW shall write a value of 0x0 SW will need to ensure the duration of the value 0x1 is long enough to ensure the path is clean and all memory reads are complete The datapath will not be triggered if this bit is asserted

0x01A052C4 MDSS_MDP_VP_0_VIG_0_HIST_COLLECT_CTL**Type:** W**Reset State:** 0x00000000

Histogram Collection Control

double buffered: YES

except for LOCK

MDSS_MDP_VP_0_VIG_0_HIST_COLLECT_CTL

Bits	Name	Description
0	LOCK	0: SW and HW swap their access on the 2 histogram tables; HW collects on a new table on the new frame, while SW accesses the histogram of the last frame on the table just swapped out by HW 1: current table will be overwritten for new collection on the next frame, the other table remains untouched for SW to continue to access

0x01A052C8 MDSS_MDP_VP_0_VIG_0_HIST_MIN_MAX**Type:** R**Reset State:** 0x00000000

MIN and MAX V value over the entire frame

double buffered: NO

MDSS_MDP_VP_0_VIG_0_HIST_MIN_MAX

Bits	Name	Description
23:16	MAX	Maximum V value of the last collected frame
7:0	MIN	Minimum V value of the last collected frame

0x01A052CC MDSS_MDP_VP_0_VIG_0_HIST_FRAME_COLLECTED**Type:** R**Reset State:** 0x00000000

Histogram Frame Number since the last rising START

double buffered: NO

MDSS_MDP_VP_0_VIG_0_HIST_FRAME_COLLECTED

Bits	Name	Description
31:0	FRAME_NUM	The frame number that the current histogram accessible by SW was collected from

0x01A052D0 MDSS_MDP_VP_0_VIG_0_HIST_SEL**Type:** R**Reset State:** 0x00000000

PA LUTV and Histogram Table Selection

double buffered: NO

MDSS_MDP_VP_0_VIG_0_HIST_SEL

Bits	Name	Description
4	HIST_SEL	0x0: Table 0 is available for SW and Table 1 is available for HW 0x1: Table 1 is available for SW and Table 0 is available for HW
0	PA_LUTV_SEL	0x0: LUT0 is available for SW and LUT1 is available for HW 0x1: LUT1 is available for SW and LUT0 is available for HW

0x01A052D4 MDSS_MDP_VP_0_VIG_0_HIST_SUM**Type:** R**Reset State:** 0x00000000

Accumulated V Value of the frame

double buffered: NO

MDSS_MDP_VP_0_VIG_0_HIST_SUM

Bits	Name	Description
31:0	HIST_SUM	This sum matches the histogram currently accessible by SW

0x01A052E0 MDSS_MDP_VP_0_VIG_0_HIST_V_DATAN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_0_HIST_V_DATAN**

Bits	Name	Type	Description
31:24	INDEX	RW	
23:0	VALUE	R	

0x01A052F0 MDSS_MDP_VP_0_VIG_0_PA_LUTV**Type:** RW**Reset State:** 0x00000000

PA LUTV data

Auto-incremented by hardware or by software

256 entries are available for reading

double buffered: NO. Hardware maintains 2 copies

MDSS_MDP_VP_0_VIG_0_PA_LUTV

Bits	Name	Description
17	VALUE_UPDATEN	Software issue an write to the LUT 0: VALUE will be written to RAM at INDEX if INDEX_UPDATE=1 or at INDEX+1 if INDEX_UPDATE=0 1: VALUE will not be written to RAM, this setting is appropriate for example when INDEX needs to be updated for read
16	INDEX_UPDATE	Software issue an index update 0: No index update by software 1: Update LUT index to value specified by INDEX
15:8	INDEX	VALUE is stored in this INDEX of the HIST_LUTn, next write will be stored to the next higher INDEX
7:0	VALUE	Value read depends on the LUT select and which one is available for reading by software The read sequence should always begin with WR INDEX_UPDATE=1, INDEX=<rptr start location> subsequent RD will start from the start location and every read will auto-increment the rptr

0x01A05300 MDSS_MDP_VP_0_VIG_0_PA_LUTV_SWAP**Type:** W**Reset State:** 0x00000000

Histogram SWAP signal to indicate that the HIST_LUTn contents should be swapped.

Software accesses one LUT while HW accesses the other LUT

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_PA_LUTV_SWAP

Bits	Name	Description
0	SWAP	SWAP signal to flip buffers accessible by SW and made available to HW Achieves double buffering of the LUT values

0x01A05310 MDSS_MDP_VP_0_VIG_0_SPA_HUE_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture HUE Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_0_SPA_HUE_ADJUST

Bits	Name	Description
11:0	VALUE	Value in S12, recommend to be within exclusive range xA00 to x600 (i.e. -360 to +360 degree) x600 is equivalent to a shift of 360 degree if VALUE > x5FF in either negative or positive direction, it is circularly clipped (i.e. VALUE + x600 or VALUE - x600)

0x01A05314 MDSS_MDP_VP_0_VIG_0_SPA_SAT_ADJUST**Type:** RW**Reset State:** 0x00001A00

Source Picture Saturation Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_0_SPA_SAT_ADJUST

Bits	Name	Description
15:8	THRSHLD	Below this threshold of saturation, no adjustment is applied to saturation. This field is in U8
7:0	VALUE	Value in S8

0x01A05318 MDSS_MDP_VP_0_VIG_0_SPA_VAL_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_0_SPA_VAL_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A0531C MDSS_MDP_VP_0_VIG_0_SPA_CONT_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture Contrast Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_0_SPA_CONT_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A05320 MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_0**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_0

Bits	Name	Description
28:16	COEFF_12	Coefficient value in S4.9 format Row 1 Column 2
12:0	COEFF_11	Coefficient value in S4.9 format Row 1 Column 1

0x01A05324 MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_1**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_1

Bits	Name	Description
28:16	COEFF_21	Coefficient value in S4.9 format Row 2 Column 1
12:0	COEFF_13	Coefficient value in S4.9 format Row 1 Column 3

0x01A05328 MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_2**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_2

Bits	Name	Description
28:16	COEFF_23	Coefficient value in S4.9 format Row 2 Column 3
12:0	COEFF_22	Coefficient value in S4.9 format Row 2 Column 2

0x01A0532C MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_3**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_3

Bits	Name	Description
28:16	COEFF_32	Coefficient value in S4.9 format Row 3 Column 2
12:0	COEFF_31	Coefficient value in S4.9 format Row 3 Column 1

0x01A05330 MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_4**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_MATRIX_COEFF_4

Bits	Name	Description
12:0	COEFF_33	Coefficient value in S4.9 format Row 3 Column 3

0x01A05334 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_PRE_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A05338 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_PRE_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A0533C MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_PRE_CLAMP

Type: RW

Reset State: 0x000000FF

Component 2 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A05340 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_POST_CLAMP

Type: RW

Reset State: 0x000000FF

Component 0 post-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_POST_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A05344 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_POST_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 post-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_POST_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A05348 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_POST_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 post-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_POST_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A0534C MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_PRE_BIAS**Type:** RW**Reset State:** 0x00000000

Component 0 pre-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_PRE_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A05350 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_PRE_BIAS**Type:** RW**Reset State:** 0x00000000

Component 1 pre-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_PRE_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A05354 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_PRE_BIAS**Type:** RW**Reset State:** 0x00000000

Component 2 pre-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_PRE_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A05358 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_POST_BIAS**Type:** RW**Reset State:** 0x00000000

Component 0 post-bias value

N double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_0_POST_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A0535C MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_POST_BIAS**Type:** RW**Reset State:** 0x00000000

Component 1 post-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_1_POST_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A05360 MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_POST_BIAS**Type:** RW**Reset State:** 0x00000000

Component 2 post-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_0_CSC_1_COMP_2_POST_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A05370 MDSS_MDP_VP_0_VIG_0_QSEED2_MISR_CTRL**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_0_QSEED2_MISR_CTRL**

Bits	Name	Type	Description
31	RUN_MODE	RW	
27:24	INPUT_SEL	RW	
10	STATUS_CLEAR	W	
9	STATUS	R	
8	ENABLE	RW	
7:0	FRAME_COUNT	RW	

0x01A05374 MDSS_MDP_VP_0_VIG_0_QSEED2_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_0_QSEED2_MISR_SIGNATURE**

Bits	Name	Description
31:0	CAPTURED	

**0x01A06000+ MDSS_MDP_VP_0_VIG_0_HIST_V_DATAn_BIN_i, i=[0..255]
4*i****Type:** R**Reset State:** 0x00000000

Direct Register Mapped Histogram data collection

256 bins

double buffered: NO

MDSS_MDP_VP_0_VIG_0_HIST_V_DATAn_BIN_i

Bits	Name	Description
23:0	VALUE	Value

**0x01A06400+ MDSS_MDP_VP_0_VIG_0_PA_LUTV_IDX_i, i=[0..127]
4*i****Type:** RW**Reset State:** 0x00000000

Direct Register Mapped PA LUTV data

256 entries are available for writing and reading

double buffered: NO. Hardware maintains 2 copies

MDSS_MDP_VP_0_VIG_0_PA_LUTV_IDX_i

Bits	Name	Description
23:16	VALUE_UPPER	LUT content at location 2*IDX+1 to be written/read to/from the LUT accessible by software at the moment
7:0	VALUE_LOWER	LUT content at location 2*IDX to be written/read to/from the LUT accessible by software at the moment

17.2.7.1.2 MDSS_MDP_VP_0_VIG_0_SSPP

SSPP hardware register description

37.17.7.1.2.1 MDSS_MDP_VP_0_VIG_0_SSPP_SSPP

SSPP

SSPP hardware register description

0x01A05000 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the region of interest source image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_SIZE

Bits	Name	Description
31:16	ROI_H	Source Height of the Region Of Interest (ROI)
15:0	ROI_W	Source Width of the Region Of Interest (ROI) The exact supported size depends on the width of line buffers allocated for MDP.

0x01A05004 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_IMG_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the image in which the ROI resides

This value along with SRC_SIZE and SRC_XY will be used by hardware to calculate whether pixel repeat or overfetch is required along the ROI border.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_IMG_SIZE

Bits	Name	Description
31:16	SRC_H	Source Height. Note that this is NOT the ROI height

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_IMG_SIZE (cont.)

Bits	Name	Description
15:0	SRC_W	Source Width. Note that this is NOT the ROI width

0x01A05008 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_XY**Type:** RW**Reset State:** 0x00000000

Source Offset from the top-left corner of the source image for each of the region of interest dimensions

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_XY

Bits	Name	Description
31:16	SRC_Y	Y-offset of source ROI in the source image
15:0	SRC_X	X-offset of source ROI in the source image

0x01A0500C MDSS_MDP_VP_0_VIG_0_SSPP_OUT_SIZE**Type:** RW**Reset State:** 0x00000000

Output Size of the layer.

Should be same as source size if scaling is NOT enabled.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Height of Output ROI
15:0	DST_W	Width of Output ROI

0x01A05010 MDSS_MDP_VP_0_VIG_0_SSPP_OUT_XY**Type:** RW**Reset State:** 0x00000000

Output Offset from the top-left corner of the output image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_OUT_XY

Bits	Name	Description
31:16	DST_Y	Height of Output ROI
15:0	DST_X	Width of Output ROI

0x01A05014 MDSS_MDP_VP_0_VIG_0_SSPP_SRC0_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 0 base address

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_0_SSPP_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A05018 MDSS_MDP_VP_0_VIG_0_SSPP_SRC1_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 1 base address

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_0_SSPP_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A0501C MDSS_MDP_VP_0_VIG_0_SSPP_SRC2_ADDR

Type: RW

Reset State: 0x00000000

Plane 2 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_0_SSPP_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A05020 MDSS_MDP_VP_0_VIG_0_SSPP_SRC3_ADDR

Type: RW

Reset State: 0x00000000

Plane 3 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_0_SSPP_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A05024 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_YSTRIDE0**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_YSTRIDE0

Bits	Name	Description
31:16	SRCP1_YSTRIDE	Plane 1 Y stride in bytes
15:0	SRCP0_YSTRIDE	Plane 0 Y stride in bytes

0x01A05028 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_YSTRIDE1**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_YSTRIDE1

Bits	Name	Description
31:16	SRCP3_YSTRIDE	Plane 3 Y stride in bytes
15:0	SRCP2_YSTRIDE	Plane 2 Y stride in bytes

0x01A05030 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_FORMAT**Type:** RW**Reset State:** 0x00000000

Source Format Configuration for each virtual pipeline.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_FORMAT

Bits	Name	Description
31:30	FRAME_FORMAT	Frame format In the current revision, there is no support for tiled formats 0x0: Linear, no tile 0x1: Tiled, 4x4
25:23	SRC_CHROMA_SAMP	Source Chroma Sampling 0x0: RGB/YUV 4:4:4 0x1: 4:2:2 - H2V1 0x2: 4:2:2 - H1V2 0x3: 4:2:0 - N2V1 0x4: 4:2:0 - N1V2
22	SOLID_FILL	Fetch feeds the lower pipeline with the CONSTANT_COLOR register as its output value. NOTHING is fetched Note that in order to use this feature then Interleaved FETCH_PLANES must be set as well and no chroma sub-sampling enabled
21	VC1_REDUCE	VC1 range reduction enable for YUV sources The reduce range is set by separate register VC1_RANGE
20:19	FETCH_PLANES	Determines the number of planes to fetch 0x0: Interleaved 0x1: Planar 0x2: Pseudo-planar
18	UNPACK_ALIGN	0x0: TO LSB 0x1: TO MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
13:12	UNPACK_COUNT	Valid unpacking pattern count 0x0 = 1 component 0x1 = 2 components ... 0x3 = 4 components Unpacking applies to interleaved plane (chroma plane in pseudo-planar)
11	ROT90	Source image is to be rotated 90 degrees
10:9	SRC_BPP	Effective source byte per pixel 0x0: 1 byte 0x1: 2 bytes 0x2: 3 bytes 0x3: 4 bytes This is used ONLY when unpacking the interleaved plane

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
8	SRCC3_EN	Alpha Enable 0x0: Source has NO alpha 0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (Alpha) 0x0: 1 bits 0x1: 4 bits 0x2: 6 bits 0x3: 8 bits
5:4	SRCC2	Number of bits for component 2 (R/Cr) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	SRCC1	Number of bits for component 1 (B/Cb) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	SRCC0	Number of bits for component 0 (G/Luma) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A05034 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_UNPACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4).

Default is ARGB or C3-C2-C0-C1.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_UNPACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_UNPACK_PATTERN (cont.)

Bits	Name	Description
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A05038 MDSS_MDP_VP_0_VIG_0_SSPP_SRC_OP_MODE**Type:** RW**Reset State:** 0x00000000

Operation Mode for each SSPP pipeline

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_OP_MODE

Bits	Name	Description
31	SW_PIX_EXT_OVERRIDE	SW override for pixel extension values. 0x0: Use HW calculated pixel extensions 0x1: Use SW programmed pixel extensions
16	IGC_LUT_EN	Inverse Gamma Correction LUT Enable 0x0: Disabled - mapped Linearly from 8-bit to 12-bit 0x1: Enabled
14:13	FLIP_MODE	Flip Operation Lower Bit: Left/Right flip Upper Bit: Up/Down flip

0x01A0503C MDSS_MDP_VP_0_VIG_0_SSPP_SRC_CONSTANT_COLOR**Type:** RW**Reset State:** 0x00000000

Constant Color Register during solid fill mode

double buffered: NO

MDSS_MDP_VP_0_VIG_0_SSPP_SRC_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x01A05048 MDSS_MDP_VP_0_VIG_0_SSPP_FETCH_CONFIG

Type: RW

Reset State: 0x00000087

SSPP Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_VIG_0_SSPP_FETCH_CONFIG

Bits	Name	Description
22	PRI_ARB_DIS	
21	PMARK_DIS	
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 Others: ILLEGAL / Not Supported
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line

MDSS_MDP_VP_0_VIG_0_SSPP_FETCH_CONFIG (cont.)

Bits	Name	Description
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A0504C MDSS_MDP_VP_0_VIG_0_SSPP_VC1_RANGE**Type:** RW**Reset State:** 0x00000707

VC1 Range Map for each virtual pipeline

ONLY valid for pipelines that suport YUV formats

double buffered: NO

MDSS_MDP_VP_0_VIG_0_SSPP_VC1_RANGE

Bits	Name	Description
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x01A05050 MDSS_MDP_VP_0_VIG_0_SSPP_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000040

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_VIG_0_SSPP_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A05054 MDSS_MDP_VP_0_VIG_0_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000080

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the middle FIFO depth and should not be programmed higher than
REQPRIORITY_FIFO_WATERMARK_2 or lower than
REQPRIORITY_FIFO_WATERMARK_0

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

15:14	COMP1_2_VERT_FILTER_MODE	Component 1/2 (CrCb or RB) vertical filtering mode 0x0: Nearest Neighbor 0x1: Bilinear 0x2: PCMN
13:12	COMP1_2_HORZ_FILTER_MODE	Component 1/2 (CrCb or RB) horizontal filtering mode 0x0: Nearest Neighbor 0x1: Bilinear 0x2: PCMN
11:10	COMP0_VERT_FILTER_MODE	Component 0 (Y or G) vertical filtering mode 0x0: Nearest Neighbor 0x1: Bilinear 0x2: PCMN 0x3: Content Adaptive
9:8	COMP0_HORZ_FILTER_MODE	Component 0 (Y or G) horizontal filtering mode 0x0: Nearest Neighbor 0x1: Bilinear 0x2: PCMN 0x3: Content Adaptive

MDSS_MDP_VP_0_VIG_1_QSEED2_CONFIG (cont.)

Bits	Name	Description
1	SCALEY_EN	Scaling Enable in the Y-direction 0x0: Disabled 0x1: Enabled
0	SCALEX_EN	Scaling Enable in the X-direction 0x0: Disabled 0x1: Enabled

0x01A07210 MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_PHASE_STEP_X**Type:** RW**Reset State:** 0x00000000

QSEED component 0 and 3 phase step for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_PHASE_STEP_X

Bits	Name	Description
25:0	PHASE_STEP_X	Unsigned Phase Step in the X-direction

0x01A07214 MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_PHASE_STEP_Y**Type:** RW**Reset State:** 0x00000000

QSEED component 0 and 3 phase step for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_PHASE_STEP_Y

Bits	Name	Description
25:0	PHASE_STEP_Y	Unsigned Phase Step in the Y-direction

0x01A07218 MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_PHASE_STEP_X**Type:** RW**Reset State:** 0x00000000

QSEED component 1 and 2 phase step for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_PHASE_STEP_X

Bits	Name	Description
25:0	PHASE_STEP_X	Unsigned Phase Step in the X-direction

0x01A0721C MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_PHASE_STEP_Y**Type:** RW**Reset State:** 0x00000000

QSEED component 1 and 2 phase step for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_PHASE_STEP_Y

Bits	Name	Description
25:0	PHASE_STEP_Y	Unsigned Phase Step in the Y-direction

0x01A07220 MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_INIT_PHASE_X**Type:** RW**Reset State:** 0x00000000

QSEED component 0 and 3 init phase for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_INIT_PHASE_X

Bits	Name	Description
25:0	INIT_PHASE_X	Signed INIT Phase in the X-direction

0x01A07224 MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_INIT_PHASE_Y**Type:** RW**Reset State:** 0x00000000

QSEED component 0 and 3 init phase for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP0_3_INIT_PHASE_Y

Bits	Name	Description
25:0	INIT_PHASE_Y	Signed INIT Phase in the Y-direction

0x01A07228 MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_INIT_PHASE_X**Type:** RW**Reset State:** 0x00000000

QSEED component 1 and 2 init phase for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_INIT_PHASE_X

Bits	Name	Description
25:0	INIT_PHASE_X	Signed INIT Phase in the X-direction

0x01A0722C MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_INIT_PHASE_Y**Type:** RW**Reset State:** 0x00000000

QSEED component 1 and 2 init phase for each of the Virtual Pipelines

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_QSEED2_COMP1_2_INIT_PHASE_Y

Bits	Name	Description
25:0	INIT_PHASE_Y	Signed INIT Phase in the Y-direction

0x01A07230 MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_SMOOTH_STRENGTH**Type:** RW**Reset State:** 0x00000000

QSEED configuration for each of the Virtual Pipelines

double buffered: YES

MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_SMOOTH_STRENGTH

Bits	Name	Description
8:0	STRENGTH	Sharpening/Smooth Strength used for content Adaptive Filtering S9 notation with a range from -256 to 255 0x0: No sharpening and No smoothing +ve: sharpening -ve: smoothing

0x01A07234 MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_THRESHOLD_EDGE**Type:** RW**Reset State:** 0x00000000

QSEED configuration for each of the Virtual Pipelines

double buffered: YES

MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_THRESHOLD_EDGE

Bits	Name	Description
9:0	THRESHOLD	Unsigned Threshold to select Edge/Normal Filter for Content Adaptive Filter

0x01A07238 MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_THRESHOLD_SMOOTH**Type:** RW**Reset State:** 0x00000000

QSEED configuration for each of the Virtual Pipelines

double buffered: YES

MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_THRESHOLD_SMOOTH

Bits	Name	Description
9:0	THRESHOLD	Unsigned Threshold to select Normal/Smooth Filter for Content Adaptive Filter

0x01A0723C MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_THRESHOLD_NOISE**Type:** RW**Reset State:** 0x00000000

QSEED configuration for each of the Virtual Pipelines

double buffered: YES

MDSS_MDP_VP_0_VIG_1_QSEED2_SHARP_THRESHOLD_NOISE

Bits	Name	Description
7:0	THRESHOLD	Unsigned Threshold to select Normal/Smooth Filter for Content Adaptive Filter

0x01A07250 MDSS_MDP_VP_0_VIG_1_QSEED2_NORMAL_FILTER_COEFF_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_1_QSEED2_NORMAL_FILTER_COEFF_N**

Bits	Name	Description
11:0	VALUE	

0x01A07260 MDSS_MDP_VP_0_VIG_1_QSEED2_SMOOTH_FILTER_COEFF_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_1_QSEED2_SMOOTH_FILTER_COEFF_N**

Bits	Name	Description
11:0	VALUE	

0x01A07270 MDSS_MDP_VP_0_VIG_1_QSEED2_EDGE_FILTER_COEFF_START**Type:** W**Reset State:** 0x00000000

QSEED SW trigger to calculate the edge filter coefficients

double buffered: NO

MDSS_MDP_VP_0_VIG_1_QSEED2_EDGE_FILTER_COEFF_START

Bits	Name	Description
0	START	SW trigger to initiate the calculate of edge coefficients in hardware The pipeline should be idle as smooth/normal filter coefficients are required This implies that the QSEED2 is not active during the trigger

0x01A07288 MDSS_MDP_VP_0_VIG_1_SKIN_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKIN_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A0728C MDSS_MDP_VP_0_VIG_1_SKIN_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKIN_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A07290 MDSS_MDP_VP_0_VIG_1_SKIN_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKIN_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x17ff (i.e. 360 degree), the behaviour will be same as MAX = x1800
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for skin tone adjustment on the pixel if MIN > x17ff (i.e. 360 degree), the behaviour will be same as MIN = x1800

0x01A07294 MDSS_MDP_VP_0_VIG_1_SKIN_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKIN_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A07298 MDSS_MDP_VP_0_VIG_1_SKIN_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKIN_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A0729C MDSS_MDP_VP_0_VIG_1_SKY_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKY_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A072A0 MDSS_MDP_VP_0_VIG_1_SKY_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKY_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A072A4 MDSS_MDP_VP_0_VIG_1_SKY_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKY_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x17ff (i.e. 360 degree), the behaviour will be same as MAX = x1800
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX (U13) to qualify for sky tone adjustment on the pixel if MIN > x17ff (i.e. 360 degree), the behaviour will be same as MIN = x1800

0x01A072A8 MDSS_MDP_VP_0_VIG_1_SKY_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKY_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A072AC MDSS_MDP_VP_0_VIG_1_SKY_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_SKY_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A072B0 MDSS_MDP_VP_0_VIG_1_FOLIAGE_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_1_FOLIAGE_ADJUST_PWL0**

Bits	Name	Description
31:16	HUE_GAIN	
10:0	HUE_MID	

0x01A072B4 MDSS_MDP_VP_0_VIG_1_FOLIAGE_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_1_FOLIAGE_ADJUST_PWL1**

Bits	Name	Description
31:16	VAL_GAIN	
15:0	SAT_GAIN	

0x01A072B8 MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Foliage Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x17ff (i.e. 360 degree), the behaviour will be same as MAX = x1800
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for foliage tone adjustment on the pixel if MIN > x17ff (i.e. 360 degree), the behaviour will be same as MIN = x1800

0x01A072BC MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Foliage Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for foliage adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for foliage adjustment on the pixel

0x01A072C0 MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Foliage Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for foliage adjustment on the pixel

MDSS_MDP_VP_0_VIG_1_FOLIAGE_REGION_VAL (cont.)

Bits	Name	Description
7:0	MIN	U8, Value has to be above or equal to this to qualify for foilage adjustment on the pixel

0x01A072C4 MDSS_MDP_VP_0_VIG_1_HIST_COLLECT_CTL**Type:** W**Reset State:** 0x00000000

Histogram Collection Control

double buffered: YES

except for LOCK

MDSS_MDP_VP_0_VIG_1_HIST_COLLECT_CTL

Bits	Name	Description
0	LOCK	0: SW and HW swap their access on the 2 histogram tables; HW collects on a new table on the new frame, while SW accesses the histogram of the last frame on the table just swapped out by HW 1: current table will be overwritten for new collection on the next frame, the other table remains untouched for SW to continue to access

0x01A072C8 MDSS_MDP_VP_0_VIG_1_HIST_MIN_MAX**Type:** R**Reset State:** 0x00000000

MIN and MAX V value over the entire frame

double buffered: NO

MDSS_MDP_VP_0_VIG_1_HIST_MIN_MAX

Bits	Name	Description
23:16	MAX	Maximum V value of the last collected frame
7:0	MIN	Minimum V value of the last collected frame

0x01A072CC MDSS_MDP_VP_0_VIG_1_HIST_FRAME_COLLECTED**Type:** R**Reset State:** 0x00000000

Histogram Frame Number since the last rising START

double buffered: NO

MDSS_MDP_VP_0_VIG_1_HIST_FRAME_COLLECTED

Bits	Name	Description
31:0	FRAME_NUM	The frame number that the current histogram accessible by SW was collected from

0x01A072D0 MDSS_MDP_VP_0_VIG_1_HIST_SEL**Type:** R**Reset State:** 0x00000000

PA LUTV and Histogram Table Selection

double buffered: NO

MDSS_MDP_VP_0_VIG_1_HIST_SEL

Bits	Name	Description
4	HIST_SEL	0x0: Table 0 is available for SW and Table 1 is available for HW 0x1: Table 1 is available for SW and Table 0 is available for HW
0	PA_LUTV_SEL	0x0: LUT0 is available for SW and LUT1 is available for HW 0x1: LUT1 is available for SW and LUT0 is available for HW

0x01A072D4 MDSS_MDP_VP_0_VIG_1_HIST_SUM**Type:** R**Reset State:** 0x00000000

Accumulated V Value of the frame

double buffered: NO

MDSS_MDP_VP_0_VIG_1_HIST_SUM

Bits	Name	Description
31:0	HIST_SUM	This sum matches the histogram currently accessible by SW

0x01A072E0 MDSS_MDP_VP_0_VIG_1_HIST_V_DATAN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_1_HIST_V_DATAN**

Bits	Name	Type	Description
31:24	INDEX	RW	
23:0	VALUE	R	

0x01A072F0 MDSS_MDP_VP_0_VIG_1_PA_LUTV**Type:** RW**Reset State:** 0x00000000

PA LUTV data

Auto-incremented by hardware or by software

256 entries are available for reading

double buffered: NO. Hardware maintains 2 copies

MDSS_MDP_VP_0_VIG_1_PA_LUTV

Bits	Name	Description
17	VALUE_UPDATEN	Software issue an write to the LUT 0: VALUE will be written to RAM at INDEX if INDEX_UPDATE=1 or at INDEX+1 if INDEX_UPDATE=0 1: VALUE will not be written to RAM, this setting is appropriate for example when INDEX needs to be updated for read
16	INDEX_UPDATE	Software issue an index update 0: No index update by software 1: Update LUT index to value specified by INDEX
15:8	INDEX	VALUE is stored in this INDEX of the HIST_LUTn, next write will be stored to the next higher INDEX
7:0	VALUE	Value read depends on the LUT select and which one is available for reading by software The read sequence should always begin with WR INDEX_UPDATE=1, INDEX=<rprr start location> subsequent RD will start from the start location and every read will auto-increment the rprr

0x01A07300 MDSS_MDP_VP_0_VIG_1_PA_LUTV_SWAP**Type:** W**Reset State:** 0x00000000

Histogram SWAP signal to indicate that the HIST_LUTn contents should be swapped.

Software accesses one LUT while HW accesses the other LUT

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_PA_LUTV_SWAP

Bits	Name	Description
0	SWAP	SWAP signal to flip buffers accessible by SW and made available to HW Achieves double buffering of the LUT values

0x01A07310 MDSS_MDP_VP_0_VIG_1_SPA_HUE_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture HUE Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SPA_HUE_ADJUST

Bits	Name	Description
11:0	VALUE	Value in S12, recommend to be within exclusive range xA00 to x600 (i.e. -360 to +360 degree) x600 is equivalent to a shift of 360 degree if VALUE > x5FF in either negative or positive direction, it is circularly clipped (i.e. VALUE + x600 or VALUE - x600)

0x01A07314 MDSS_MDP_VP_0_VIG_1_SPA_SAT_ADJUST**Type:** RW**Reset State:** 0x00001A00

Source Picture Saturation Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SPA_SAT_ADJUST

Bits	Name	Description
15:8	THRSHLD	Below this threshold of saturation, no adjustment is applied to saturation. This field is in U8
7:0	VALUE	Value in S8

0x01A07318 MDSS_MDP_VP_0_VIG_1_SPA_VAL_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SPA_VAL_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A0731C MDSS_MDP_VP_0_VIG_1_SPA_CONT_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture Contrast Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SPA_CONT_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A07320 MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_0**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_0

Bits	Name	Description
28:16	COEFF_12	Coefficient value in S4.9 format Row 1 Column 2
12:0	COEFF_11	Coefficient value in S4.9 format Row 1 Column 1

0x01A07324 MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_1**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_1

Bits	Name	Description
28:16	COEFF_21	Coefficient value in S4.9 format Row 2 Column 1
12:0	COEFF_13	Coefficient value in S4.9 format Row 1 Column 3

0x01A07328 MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_2**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_2

Bits	Name	Description
28:16	COEFF_23	Coefficient value in S4.9 format Row 2 Column 3
12:0	COEFF_22	Coefficient value in S4.9 format Row 2 Column 2

0x01A0732C MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_3**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_3

Bits	Name	Description
28:16	COEFF_32	Coefficient value in S4.9 format Row 3 Column 2
12:0	COEFF_31	Coefficient value in S4.9 format Row 3 Column 1

0x01A07330 MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_4**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_MATRIX_COEFF_4

Bits	Name	Description
12:0	COEFF_33	Coefficient value in S4.9 format Row 3 Column 3

0x01A07334 MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_0_PRE_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_0_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value

MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_0_PRE_CLAMP (cont.)

Bits	Name	Description
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A07338 MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_1_PRE_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_1_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A0733C MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_2_PRE_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_1_CSC_1_COMP_2_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

SSPP

SSPP hardware register description

0x01A07000 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the region of interest source image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_SIZE

Bits	Name	Description
31:16	ROI_H	Source Height of the Region Of Interest (ROI)
15:0	ROI_W	Source Width of the Region Of Interest (ROI) The exact supported size depends on the width of line buffers allocated for MDP.

0x01A07004 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_IMG_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the image in which the ROI resides

This value along with SRC_SIZE and SRC_XY will be used by hardware to calculate whether pixel repeat or overfetch is required along the ROI border.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_IMG_SIZE

Bits	Name	Description
31:16	SRC_H	Source Height. Note that this is NOT the ROI height
15:0	SRC_W	Source Width. Note that this is NOT the ROI width

0x01A07008 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_XY

Type: RW

Reset State: 0x00000000

Source Offset from the top-left corner of the source image for each of the region of interest dimensions

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_XY

Bits	Name	Description
31:16	SRC_Y	Y-offset of source ROI in the source image
15:0	SRC_X	X-offset of source ROI in the source image

0x01A0700C MDSS_MDP_VP_0_VIG_1_SSPP_OUT_SIZE

Type: RW

Reset State: 0x00000000

Output Size of the layer.

Should be same as source size if scaling is NOT enabled.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Height of Output ROI
15:0	DST_W	Width of Output ROI

0x01A07010 MDSS_MDP_VP_0_VIG_1_SSPP_OUT_XY**Type:** RW**Reset State:** 0x00000000

Output Offset from the top-left corner of the output image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_OUT_XY

Bits	Name	Description
31:16	DST_Y	Height of Output ROI
15:0	DST_X	Width of Output ROI

0x01A07014 MDSS_MDP_VP_0_VIG_1_SSPP_SRC0_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 0 base address

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_1_SSPP_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A07018 MDSS_MDP_VP_0_VIG_1_SSPP_SRC1_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 1 base address

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_1_SSPP_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A0701C MDSS_MDP_VP_0_VIG_1_SSPP_SRC2_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 2 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_1_SSPP_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A07020 MDSS_MDP_VP_0_VIG_1_SSPP_SRC3_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 3 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_1_SSPP_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A07024 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_YSTRIDE0

Type: RW

Reset State: 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_YSTRIDE0

Bits	Name	Description
31:16	SRCP1_YSTRIDE	Plane 1 Y stride in bytes
15:0	SRCP0_YSTRIDE	Plane 0 Y stride in bytes

0x01A07028 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_YSTRIDE1

Type: RW

Reset State: 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_YSTRIDE1

Bits	Name	Description
31:16	SRCP3_YSTRIDE	Plane 3 Y stride in bytes
15:0	SRCP2_YSTRIDE	Plane 2 Y stride in bytes

0x01A07030 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_FORMAT**Type:** RW**Reset State:** 0x00000000

Source Format Configuration for each virtual pipeline.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_FORMAT

Bits	Name	Description
31:30	FRAME_FORMAT	Frame format In the current revision, there is no support for tiled formats 0x0: Linear, no tile 0x1: Tiled, 4x4
25:23	SRC_CHROMA_SAMP	Source Chroma Sampling 0x0: RGB/YUV 4:4:4 0x1: 4:2:2 - H2V1 0x2: 4:2:2 - H1V2 0x3: 4:2:0 - N2V1 0x4: 4:2:0 - N1V2
22	SOLID_FILL	Fetch feeds the lower pipeline with the CONSTANT_COLOR register as its output value. NOTHING is fetched Note that in order to use this feature then Interleaved FETCH_PLANES must be set as well and no chroma sub-sampling enabled
21	VC1_REDUCE	VC1 range reduction enable for YUV sources The reduce range is set by separate register VC1_RANGE
20:19	FETCH_PLANES	Determines the number of planes to fetch 0x0: Interleaved 0x1: Planar 0x2: Pseudo-planar
18	UNPACK_ALIGN	0x0: TO LSB 0x1: TO MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
13:12	UNPACK_COUNT	Valid unpacking pattern count 0x0 = 1 component 0x1 = 2 components ... 0x3 = 4 components Unpacking applies to interleaved plane (chroma plane in pseudo-planar)
11	ROT90	Source image is to be rotated 90 degrees
10:9	SRC_BPP	Effective source byte per pixel 0x0: 1 byte 0x1: 2 bytes 0x2: 3 bytes 0x3:4 bytes This is used ONLY when unpacking the interleaved plane
8	SRCC3_EN	Alpha Enable 0x0: Source has NO alpha 0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (Alpha) 0x0: 1 bits 0x1: 4 bits 0x2: 6 bits 0x3: 8 bits
5:4	SRCC2	Number of bits for component 2 (R/Cr) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	SRCC1	Number of bits for component 1 (B/Cb) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	SRCC0	Number of bits for component 0 (G/Luma) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A07034 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_UNPACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4).

Default is ARGB or C3-C2-C0-C1.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_UNPACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A07038 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_OP_MODE

Type: RW

Reset State: 0x00000000

Operation Mode for each SSPP pipeline

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_OP_MODE

Bits	Name	Description
31	SW_PIX_EXT_OVERRIDE	SW override for pixel extension values. 0x0: Use HW calculated pixel extensions 0x1: Use SW programmed pixel extensions

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_OP_MODE (cont.)

Bits	Name	Description
16	IGC_LUT_EN	Inverse Gamma Correction LUT Enable 0x0: Disabled - mapped Linearly from 8-bit to 12-bit 0x1: Enabled
14:13	FLIP_MODE	Flip Operation Lower Bit: Left/Right flip Upper Bit: Up/Down flip

0x01A0703C MDSS_MDP_VP_0_VIG_1_SSPP_SRC_CONSTANT_COLOR**Type:** RW**Reset State:** 0x00000000

Constant Color Register during solid fill mode

double buffered: NO

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x01A07048 MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

SSPP Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_CONFIG

Bits	Name	Description
22	PRI_ARB_DIS	
21	PMARK_DIS	

MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_CONFIG (cont.)

Bits	Name	Description
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 Others: ILLEGAL / Not Supported
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A0704C MDSS_MDP_VP_0_VIG_1_SSPP_VC1_RANGE**Type:** RW**Reset State:** 0x00000707

VC1 Range Map for each virtual pipeline

ONLY valid for pipelines that suport YUV formats

double buffered: NO

MDSS_MDP_VP_0_VIG_1_SSPP_VC1_RANGE

Bits	Name	Description
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x01A07050 MDSS_MDP_VP_0_VIG_1_SSPP_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000040

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SSPP_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A07054 MDSS_MDP_VP_0_VIG_1_SSPP_REQPRIORITY_FIFO_WATERMARK_1**Type:** RW**Reset State:** 0x00000080

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the middle FIFO depth and should not be programmed higher than
REQPRIORITY_FIFO_WATERMARK_2 or lower than
REQPRIORITY_FIFO_WATERMARK_0

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A07058 MDSS_MDP_VP_0_VIG_1_SSPP_REQPRIORITY_FIFO_WATERMARK_2**Type:** RW**Reset State:** 0x000000C0

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the highest FIFO depth and should not be programmed lower than REQPRIORITY_FIFO_WATERMARK_0 or REQPRIORITY_FIFO_WATERMARK_1

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SSPP_REQPRIORITY_FIFO_WATERMARK_2

Bits	Name	Description

0x01A07070 MDSS_MDP_VP_0_VIG_1_SSPP_SRC_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_ADDR_SW_STATUS

Bits	Name	Description
3	SRC3_ADDR_CP	This is the secure status bit for source plane 3 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
2	SRC2_ADDR_CP	This is the secure status bit for source plane 2 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
1	SRC1_ADDR_CP	This is the secure status bit for source plane 1 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State

MDSS_MDP_VP_0_VIG_1_SSPP_SRC_ADDR_SW_STATUS (cont.)

Bits	Name	Description
0	SRC0_ADDR_CP	This is the secure status bit for source plane 0 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State

0x01A070A4 MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC0_ADDR**Type:** R**Reset State:** 0x00000000

Current Plane 0 base address that Hardware is using

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A070A8 MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC1_ADDR**Type:** R**Reset State:** 0x00000000

Plane 1 base address that Hardware is using

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A070AC MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC2_ADDR**Type:** R**Reset State:** 0x00000000

Plane 2 base address that Hardware is using

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A070B0 MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC3_ADDR**Type:** R**Reset State:** 0x00000000

Plane 3 base address that Hardware is using

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_CURRENT_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A070B4 MDSS_MDP_VP_0_VIG_1_SSPP_DECIMATION_CONFIG**Type:** RW**Reset State:** 0x00000000

Decimation Configuration

Note that there is no decimation on DMA pipe which means no decimation in line mode on DMA or block mode

double buffered: YES

MDSS_MDP_VP_0_VIG_1_SSPP_DECIMATION_CONFIG

Bits	Name	Description
11:8	HORZ_S	Horizontal Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of pixels skipped. The algorithm is always the following: read 1 pixel skip S pixels The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 pixel drop 1 pixel. Used to decimate by 2 horizontally 0x3: Read 1 pixel drop 3 pixels. Used to decimate by 4 horizontally 0x7: Read 1 pixel drop 7 pixels. Used to decimate by 8 horizontally 0xF: Read 1 pixel drop 15 pixels. Used to decimate by 16 horizontally
3:0	VERT_S	Vertical Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of lines skipped. The algorithm is always the following: read 1 line skip S lines The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 line drop 1 line. Used to decimate by 2 horizontally 0x3: Read 1 line drop 3 lines. Used to decimate by 4 horizontally 0x7: Read 1 line drop 7 lines. Used to decimate by 8 horizontally 0xF: Read 1 line drop 15 lines. Used to decimate by 16 horizontally

0x01A070D0 MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A070D4 MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_SMP_WR_PLANE1**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 1 write counter

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_SMP_WR_PLANE1

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane1 port This port is NOT used for interleaved formats but is used for U (planar) or UV (pseudo-planar) formats This should correlate to value SMP_UNPACK_RD_PLANE1 More useful for debug but can be used for profiling purposes as well.

0x01A070D8 MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_SMP_WR_PLANE2**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 2 write counter

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_FETCH_SMP_WR_PLANE2

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane2 port This port is NOT used for interleaved formats but is used for V (planar) or A (pseudo-planar plus alpha) formats This should correlate to value SMP_UNPACK_RD_PLANE2 More useful for debug but can be used for profiling purposes as well.

0x01A070E0 MDSS_MDP_VP_0_VIG_1_SSPP_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A070E4 MDSS_MDP_VP_0_VIG_1_SSPP_SMP_UNPACK_RD_PLANE1**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 1 read counter

double buffered: N/A

MDSS_MDP_VP_0_VIG_1_SSPP_SMP_UNPACK_RD_PLANE1

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane1 port This port is NOT used for interleaved formats but is used for U (planar) or UV (pseudo-planar) formats This should correlate to FETCH_SMP_WR_PLANE1 value More useful for debug but can be used for profiling purposes as well.

MDSS_MDP_VP_0_VIG_2_QSEED2_EDGE_FILTER_COEFF_START

Bits	Name	Description
0	START	SW trigger to initiate the calculate of edge coefficients in hardware The pipeline should be idle as smooth/normal filter coefficients are required This implies that the QSEED2 is not active during the trigger

0x01A09288 MDSS_MDP_VP_0_VIG_2_SKIN_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKIN_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A0928C MDSS_MDP_VP_0_VIG_2_SKIN_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKIN_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A09290 MDSS_MDP_VP_0_VIG_2_SKIN_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKIN_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x17ff (i.e. 360 degree), the behaviour will be same as MAX = x1800
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for skin tone adjustment on the pixel if MIN > x17ff (i.e. 360 degree), the behaviour will be same as MIN = x1800

0x01A09294 MDSS_MDP_VP_0_VIG_2_SKIN_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKIN_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A09298 MDSS_MDP_VP_0_VIG_2_SKIN_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKIN_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A0929C MDSS_MDP_VP_0_VIG_2_SKY_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKY_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A092A0 MDSS_MDP_VP_0_VIG_2_SKY_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKY_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A092A4 MDSS_MDP_VP_0_VIG_2_SKY_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKY_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x17ff (i.e. 360 degree), the behaviour will be same as MAX = x1800
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX (U13) to qualify for sky tone adjustment on the pixel if MIN > x17ff (i.e. 360 degree), the behaviour will be same as MIN = x1800

0x01A092A8 MDSS_MDP_VP_0_VIG_2_SKY_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKY_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A092AC MDSS_MDP_VP_0_VIG_2_SKY_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_SKY_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A092B0 MDSS_MDP_VP_0_VIG_2_FOLIAGE_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_2_FOLIAGE_ADJUST_PWL0**

Bits	Name	Description
31:16	HUE_GAIN	
10:0	HUE_MID	

0x01A092B4 MDSS_MDP_VP_0_VIG_2_FOLIAGE_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_2_FOLIAGE_ADJUST_PWL1**

Bits	Name	Description
31:16	VAL_GAIN	
15:0	SAT_GAIN	

0x01A092B8 MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Foilage Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x17ff (i.e. 360 degree), the behaviour will be same as MAX = x1800
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for foilage tone adjustment on the pixel if MIN > x17ff (i.e. 360 degree), the behaviour will be same as MIN = x1800

0x01A092BC MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Foilage Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for foilage adjustment on the pixel

MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_SAT (cont.)

Bits	Name	Description
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for foilage adjustment on the pixel

0x01A092C0 MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Foilage Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_VIG_2_FOLIAGE_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for foilage adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for foilage adjustment on the pixel

0x01A092C4 MDSS_MDP_VP_0_VIG_2_HIST_COLLECT_CTL**Type:** W**Reset State:** 0x00000000

Histogram Collection Control

double buffered: YES

except for LOCK

MDSS_MDP_VP_0_VIG_2_HIST_COLLECT_CTL

Bits	Name	Description
0	LOCK	0: SW and HW swap their access on the 2 histogram tables; HW collects on a new table on the new frame, while SW accesses the histogram of the last frame on the table just swapped out by HW 1: current table will be overwritten for new collection on the next frame, the other table remains untouched for SW to continue to access

0x01A092C8 MDSS_MDP_VP_0_VIG_2_HIST_MIN_MAX**Type:** R**Reset State:** 0x00000000

MIN and MAX V value over the entire frame

double buffered: NO

MDSS_MDP_VP_0_VIG_2_HIST_MIN_MAX

Bits	Name	Description
23:16	MAX	Maximum V value of the last collected frame
7:0	MIN	Minimum V value of the last collected frame

0x01A092CC MDSS_MDP_VP_0_VIG_2_HIST_FRAME_COLLECTED**Type:** R**Reset State:** 0x00000000

Histogram Frame Number since the last rising START

double buffered: NO

MDSS_MDP_VP_0_VIG_2_HIST_FRAME_COLLECTED

Bits	Name	Description
31:0	FRAME_NUM	The frame number that the current histogram accessible by SW was collected from

0x01A092D0 MDSS_MDP_VP_0_VIG_2_HIST_SEL**Type:** R**Reset State:** 0x00000000

PA LUTV and Histogram Table Selection

double buffered: NO

MDSS_MDP_VP_0_VIG_2_HIST_SEL

Bits	Name	Description
4	HIST_SEL	0x0: Table 0 is available for SW and Table 1 is available for HW 0x1: Table 1 is available for SW and Table 0 is available for HW

MDSS_MDP_VP_0_VIG_2_HIST_SEL (cont.)

Bits	Name	Description
0	PA_LUTV_SEL	0x0: LUT0 is available for SW and LUT1 is available for HW 0x1: LUT1 is available for SW and LUT0 is available for HW

0x01A092D4 MDSS_MDP_VP_0_VIG_2_HIST_SUM**Type:** R**Reset State:** 0x00000000

Accumulated V Value of the frame

double buffered: NO

MDSS_MDP_VP_0_VIG_2_HIST_SUM

Bits	Name	Description
31:0	HIST_SUM	This sum matches the histogram currently accessible by SW

0x01A092E0 MDSS_MDP_VP_0_VIG_2_HIST_V_DATAN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_VIG_2_HIST_V_DATAN**

Bits	Name	Type	Description
31:24	INDEX	RW	
23:0	VALUE	R	

0x01A092F0 MDSS_MDP_VP_0_VIG_2_PA_LUTV**Type:** RW**Reset State:** 0x00000000

PA LUTV data

Auto-incremented by hardware or by software

256 entries are available for reading

double buffered: NO. Hardware maintains 2 copies

MDSS_MDP_VP_0_VIG_2_PA_LUTV

Bits	Name	Description
17	VALUE_UPDATEN	Software issue an write to the LUT 0: VALUE will be written to RAM at INDEX if INDEX_UPDATE=1 or at INDEX+1 if INDEX_UPDATE=0 1: VALUE will not be written to RAM, this setting is appropriate for example when INDEX needs to be updated for read
16	INDEX_UPDATE	Software issue an index update 0: No index update by software 1: Update LUT index to value specified by INDEX
15:8	INDEX	VALUE is stored in this INDEX of the HIST_LUTn, next write will be stored to the next higher INDEX
7:0	VALUE	Value read depends on the LUT select and which one is available for reading by software The read sequence should always begin with WR INDEX_UPDATE=1, INDEX=<rptr start location> subsequent RD will start from the start location and every read will auto-increment the rptr

0x01A09300 MDSS_MDP_VP_0_VIG_2_PA_LUTV_SWAP**Type:** W**Reset State:** 0x00000000

Histogram SWAP signal to indicate that the HIST_LUTn contents should be swapped.

Software accesses one LUT while HW accesses the other LUT

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_PA_LUTV_SWAP

Bits	Name	Description
0	SWAP	SWAP signal to flip buffers accessible by SW and made available to HW Achieves double buffering of the LUT values

0x01A09310 MDSS_MDP_VP_0_VIG_2_SPA_HUE_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture HUE Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SPA_HUE_ADJUST

Bits	Name	Description
11:0	VALUE	Value in S12, recommend to be within exclusive range xA00 to x600 (i.e. -360 to +360 degree) x600 is equivalent to a shift of 360 degree if VALUE > x5FF in either negative or positive direction, it is circularly clipped (i.e. VALUE + x600 or VALUE - x600)

0x01A09314 MDSS_MDP_VP_0_VIG_2_SPA_SAT_ADJUST

Type: RW

Reset State: 0x00001A00

Source Picture Saturation Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SPA_SAT_ADJUST

Bits	Name	Description
15:8	THRSHLD	Below this threshold of saturation, no adjustment is applied to saturation. This field is in U8
7:0	VALUE	Value in S8

0x01A09318 MDSS_MDP_VP_0_VIG_2_SPA_VAL_ADJUST

Type: RW

Reset State: 0x00000000

Source Picture Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SPA_VAL_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A0931C MDSS_MDP_VP_0_VIG_2_SPA_CONT_ADJUST**Type:** RW**Reset State:** 0x00000000

Source Picture Contrast Adjustment

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SPA_CONT_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A09320 MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_0**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_0

Bits	Name	Description
28:16	COEFF_12	Coefficient value in S4.9 format Row 1 Column 2
12:0	COEFF_11	Coefficient value in S4.9 format Row 1 Column 1

0x01A09324 MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_1**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_1

Bits	Name	Description
28:16	COEFF_21	Coefficient value in S4.9 format Row 2 Column 1

MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_1 (cont.)

Bits	Name	Description
12:0	COEFF_13	Coefficient value in S4.9 format Row 1 Column 3

0x01A09328 MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_2**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_2

Bits	Name	Description
28:16	COEFF_23	Coefficient value in S4.9 format Row 2 Column 3
12:0	COEFF_22	Coefficient value in S4.9 format Row 2 Column 2

0x01A0932C MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_3**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_3

Bits	Name	Description
28:16	COEFF_32	Coefficient value in S4.9 format Row 3 Column 2
12:0	COEFF_31	Coefficient value in S4.9 format Row 3 Column 1

0x01A09330 MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_4**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients for ALL of the Virtual Pipelines

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_MATRIX_COEFF_4

Bits	Name	Description
12:0	COEFF_33	Coefficient value in S4.9 format Row 3 Column 3

0x01A09334 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_0_PRE_CLAMP

Type: RW

Reset State: 0x000000FF

Component 0 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_0_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A09338 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_1_PRE_CLAMP

Type: RW

Reset State: 0x000000FF

Component 1 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_1_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A0933C MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_2_PRE_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 pre-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_2_PRE_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A09340 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_0_POST_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 post-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_0_POST_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A09344 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_1_POST_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 post-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_1_POST_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A09348 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_2_POST_CLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 post-clamp value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_2_POST_CLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A0934C MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_0_PRE_BIAS**Type:** RW**Reset State:** 0x00000000

Component 0 pre-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_0_PRE_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A09350 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_1_PRE_BIAS**Type:** RW**Reset State:** 0x00000000

Component 1 pre-bias value

double buffered: NO

MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_1_PRE_BIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A09354 MDSS_MDP_VP_0_VIG_2_CSC_1_COMP_2_PRE_BIAS**Type:** RW**Reset State:** 0x00000000

SSPP hardware register description

0x01A09000 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_SIZE**Type:** RW**Reset State:** 0x00000000

Source Size for the region of interest source image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_SIZE

Bits	Name	Description
31:16	ROI_H	Source Height of the Region Of Interest (ROI)
15:0	ROI_W	Source Width of the Region Of Interest (ROI) The exact supported size depends on the width of line buffers allocated for MDP.

0x01A09004 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_IMG_SIZE**Type:** RW**Reset State:** 0x00000000

Source Size for the image in which the ROI resides

This value along with SRC_SIZE and SRC_XY will be used by hardware to calculate whether pixel repeat or overfetch is required along the ROI border.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_IMG_SIZE

Bits	Name	Description
31:16	SRC_H	Source Height. Note that this is NOT the ROI height
15:0	SRC_W	Source Width. Note that this is NOT the ROI width

0x01A09008 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_XY**Type:** RW**Reset State:** 0x00000000

Source Offset from the top-left corner of the source image for each of the region of interest dimensions

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_XY

Bits	Name	Description
31:16	SRC_Y	Y-offset of source ROI in the source image
15:0	SRC_X	X-offset of source ROI in the source image

0x01A0900C MDSS_MDP_VP_0_VIG_2_SSPP_OUT_SIZE

Type: RW

Reset State: 0x00000000

Output Size of the layer.

Should be same as source size if scaling is NOT enabled.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Height of Output ROI
15:0	DST_W	Width of Output ROI

0x01A09010 MDSS_MDP_VP_0_VIG_2_SSPP_OUT_XY

Type: RW

Reset State: 0x00000000

Output Offset from the top-left corner of the output image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_OUT_XY

Bits	Name	Description
31:16	DST_Y	Height of Output ROI
15:0	DST_X	Width of Output ROI

0x01A09014 MDSS_MDP_VP_0_VIG_2_SSPP_SRC0_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 0 base address

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_2_SSPP_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A09018 MDSS_MDP_VP_0_VIG_2_SSPP_SRC1_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 1 base address

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_2_SSPP_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A0901C MDSS_MDP_VP_0_VIG_2_SSPP_SRC2_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 2 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_2_SSPP_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A09020 MDSS_MDP_VP_0_VIG_2_SSPP_SRC3_ADDR

Type: RW

Reset State: 0x00000000

Plane 3 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_VIG_2_SSPP_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A09024 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_YSTRIDE0

Type: RW

Reset State: 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_YSTRIDE0

Bits	Name	Description
31:16	SRCP1_YSTRIDE	Plane 1 Y stride in bytes
15:0	SRCP0_YSTRIDE	Plane 0 Y stride in bytes

0x01A09028 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_YSTRIDE1**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_YSTRIDE1

Bits	Name	Description
31:16	SRCP3_YSTRIDE	Plane 3 Y stride in bytes
15:0	SRCP2_YSTRIDE	Plane 2 Y stride in bytes

0x01A09030 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_FORMAT**Type:** RW**Reset State:** 0x00000000

Source Format Configuration for each virtual pipeline.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_FORMAT

Bits	Name	Description
31:30	FRAME_FORMAT	Frame format In the current revision, there is no support for tiled formats 0x0: Linear, no tile 0x1: Tiled, 4x4
25:23	SRC_CHROMA_SAMP	Source Chroma Sampling 0x0: RGB/YUV 4:4:4 0x1: 4:2:2 - H2V1 0x2: 4:2:2 - H1V2 0x3: 4:2:0 - N2V1 0x4: 4:2:0 - N1V2

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
22	SOLID_FILL	Fetch feeds the lower pipeline with the CONSTANT_COLOR register as its output value. NOTHING is fetched Note that in order to use this feature then Interleaved FETCH_PLANES must be set as well and no chroma sub-sampling enabled
21	VC1_REDUCE	VC1 range reduction enable for YUV sources The reduce range is set by separate register VC1_RANGE
20:19	FETCH_PLANES	Determines the number of planes to fetch 0x0: Interleaved 0x1: Planar 0x2: Pseudo-planar
18	UNPACK_ALIGN	0x0: TO LSB 0x1: TO MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
13:12	UNPACK_COUNT	Valid unpacking pattern count 0x0 = 1 component 0x1 = 2 components ... 0x3 = 4 components Unpacking applies to interleaved plane (chroma plane in pseudo-planar)
11	ROT90	Source image is to be rotated 90 degrees
10:9	SRC_BPP	Effective source byte per pixel 0x0: 1 byte 0x1: 2 bytes 0x2: 3 bytes 0x3: 4 bytes This is used ONLY when unpacking the interleaved plane
8	SRCC3_EN	Alpha Enable 0x0: Source has NO alpha 0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (Alpha) 0x0: 1 bits 0x1: 4 bits 0x2: 6 bits 0x3: 8 bits

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
5:4	SRCC2	Number of bits for component 2 (R/Cr) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	SRCC1	Number of bits for component 1 (B/Cb) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	SRCC0	Number of bits for component 0 (G/Luma) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A09034 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_UNPACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4).

Default is ARGB or C3-C2-C0-C1.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_UNPACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_UNPACK_PATTERN (cont.)

Bits	Name	Description
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A09038 MDSS_MDP_VP_0_VIG_2_SSPP_SRC_OP_MODE**Type:** RW**Reset State:** 0x00000000

Operation Mode for each SSPP pipeline

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_OP_MODE

Bits	Name	Description
31	SW_PIX_EXT_OVERRIDE	SW override for pixel extension values. 0x0: Use HW calculated pixel extensions 0x1: Use SW programmed pixel extensions
16	IGC_LUT_EN	Inverse Gamma Correction LUT Enable 0x0: Disabled - mapped Linearly from 8-bit to 12-bit 0x1: Enabled
14:13	FLIP_MODE	Flip Operation Lower Bit: Left/Right flip Upper Bit: Up/Down flip

0x01A0903C MDSS_MDP_VP_0_VIG_2_SSPP_SRC_CONSTANT_COLOR**Type:** RW**Reset State:** 0x00000000

Constant Color Register during solid fill mode

double buffered: NO

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.

MDSS_MDP_VP_0_VIG_2_SSPP_SRC_CONSTANT_COLOR (cont.)

Bits	Name	Description
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x01A09048 MDSS_MDP_VP_0_VIG_2_SSPP_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

SSPP Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_VIG_2_SSPP_FETCH_CONFIG

Bits	Name	Description
22	PRI_ARB_DIS	
21	PMARK_DIS	
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 Others: ILLEGAL / Not Supported
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment

MDSS_MDP_VP_0_VIG_2_SSPP_FETCH_CONFIG (cont.)

Bits	Name	Description
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A0904C MDSS_MDP_VP_0_VIG_2_SSPP_VC1_RANGE**Type:** RW**Reset State:** 0x00000707

VC1 Range Map for each virtual pipeline

ONLY valid for pipelines that suport YUV formats

double buffered: NO

MDSS_MDP_VP_0_VIG_2_SSPP_VC1_RANGE

Bits	Name	Description
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x01A09050 MDSS_MDP_VP_0_VIG_2_SSPP_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000040

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A09054 MDSS_MDP_VP_0_VIG_2_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000080

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the middle FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_2 or lower than REQPRIORITY_FIFO_WATERMARK_0

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A09058 MDSS_MDP_VP_0_VIG_2_SSPP_REQPRIORITY_FIFO_WATERMARK_2

Type: RW

Reset State: 0x000000C0

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the highest FIFO depth and should not be programmed lower than REQPRIORITY_FIFO_WATERMARK_0 or REQPRIORITY_FIFO_WATERMARK_1

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A090AC MDSS_MDP_VP_0_VIG_2_SSPP_CURRENT_SRC2_ADDR**Type:** R**Reset State:** 0x00000000

Plane 2 base address that Hardware is using

double buffered: N/A

MDSS_MDP_VP_0_VIG_2_SSPP_CURRENT_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A090B0 MDSS_MDP_VP_0_VIG_2_SSPP_CURRENT_SRC3_ADDR**Type:** R**Reset State:** 0x00000000

Plane 3 base address that Hardware is using

double buffered: N/A

MDSS_MDP_VP_0_VIG_2_SSPP_CURRENT_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A090B4 MDSS_MDP_VP_0_VIG_2_SSPP_DECIMATION_CONFIG**Type:** RW**Reset State:** 0x00000000

Decimation Configuration

Note that there is no decimation on DMA pipe which means no decimation in line mode on DMA or block mode

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_DECIMATION_CONFIG

Bits	Name	Description
11:8	HORZ_S	Horizontal Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of pixels skipped. The algorithm is always the following: read 1 pixel skip S pixels The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 pixel drop 1 pixel. Used to decimate by 2 horizontally 0x3: Read 1 pixel drop 3 pixels. Used to decimate by 4 horizontally 0x7: Read 1 pixel drop 7 pixels. Used to decimate by 8 horizontally 0xF: Read 1 pixel drop 15 pixels. Used to decimate by 16 horizontally
3:0	VERT_S	Vertical Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of lines skipped. The algorithm is always the following: read 1 line skip S lines The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 line drop 1 line. Used to decimate by 2 horizontally 0x3: Read 1 line drop 3 lines. Used to decimate by 4 horizontally 0x7: Read 1 line drop 7 lines. Used to decimate by 8 horizontally 0xF: Read 1 line drop 15 lines. Used to decimate by 16 horizontally

0x01A090D0 MDSS_MDP_VP_0_VIG_2_SSPP_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_VIG_2_SSPP_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A090D4 MDSS_MDP_VP_0_VIG_2_SSPP_FETCH_SMP_WR_PLANE1**Type:** R**Reset State:** 0x00000000

MDSS_MDP_VP_0_VIG_2_SSPP_SMP_UNPACK_RD_PLANE2

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane1 port This port is NOT used for interleaved formats but is used for V (planar) or A (pseudo-planar plus alpha) formats This should correlate to FETCH_SMP_WR_PLANE1 value More useful for debug but can be used for profiling purposes as well.

0x01A09100 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C0_LR**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C0_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A09104 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C0_TB**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register
double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C0_TB

Bits	Name	Description
31:24	BOTTOM_OVF	Signed Value for Bottom Overfetch value. +ve value indicates overfetch -ve value indicates line drop
23:16	BOTTOM_RPT	
15:8	TOP_OVF	Signed Value for Top Overfetch value. +ve value indicates overfetch -ve value indicates line drop
7:0	TOP_RPT	Unsigned Value for TOP Line Repeat value.

0x01A09108 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C0_REQ_PIXELS**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for pixel height/width of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C0_REQ_PIXELS

Bits	Name	Description
31:16	TOP_BOTTOM	Unsigned Value for pixel height post pixel extension.
15:0	LEFT_RIGHT	Unsigned Value for pixel width post pixel extension.

0x01A09110 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C1C2_LR

Type: RW

Reset State: 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C1C2_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A09114 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C1C2_TB

Type: RW

Reset State: 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C1C2_TB

Bits	Name	Description
31:24	BOTTOM_OVF	Signed Value for Bottom Overfetch value. +ve value indicates overfetch -ve value indicates line drop
23:16	BOTTOM_RPT	
15:8	TOP_OVF	Signed Value for Top Overfetch value. +ve value indicates overfetch -ve value indicates line drop
7:0	TOP_RPT	Unsigned Value for TOP Line Repeat value.

0x01A09118 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C1C2_REQ_PIXELS**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for pixel height/width of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C1C2_REQ_PIXELS

Bits	Name	Description
31:16	TOP_BOTTOM	Unsigned Value for pixel height post pixel extension.
15:0	LEFT_RIGHT	Unsigned Value for pixel width post pixel extension.

0x01A09120 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C3_LR**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C3_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A09124 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C3_TB**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register
double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C3_TB

Bits	Name	Description
31:24	BOTTOM_OVF	Signed Value for Bottom Overfetch value. +ve value indicates overfetch -ve value indicates line drop
23:16	BOTTOM_RPT	
15:8	TOP_OVF	Signed Value for Top Overfetch value. +ve value indicates overfetch -ve value indicates line drop
7:0	TOP_RPT	Unsigned Value for TOP Line Repeat value.

0x01A09128 MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C3_REQ_PIXELS**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for pixel height/width of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_VIG_2_SSPP_SW_PIX_EXT_C3_REQ_PIXELS

Bits	Name	Description
31:16	TOP_BOTTOM	Unsigned Value for pixel height post pixel extension.
15:0	LEFT_RIGHT	Unsigned Value for pixel width post pixel extension.

SSPP

SSPP hardware register description

0x01A15000 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the region of interest source image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_SIZE

Bits	Name	Description
31:16	ROI_H	Source Height of the Region Of Interest (ROI)
15:0	ROI_W	Source Width of the Region Of Interest (ROI) The exact supported size depends on the width of line buffers allocated for MDP.

0x01A15004 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_IMG_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the image in which the ROI resides

This value along with SRC_SIZE and SRC_XY will be used by hardware to calculate whether pixel repeat or overfetch is required along the ROI border.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_IMG_SIZE

Bits	Name	Description
31:16	SRC_H	Source Height. Note that this is NOT the ROI height

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_IMG_SIZE (cont.)

Bits	Name	Description
15:0	SRC_W	Source Width. Note that this is NOT the ROI width

0x01A15008 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_XY**Type:** RW**Reset State:** 0x00000000

Source Offset from the top-left corner of the source image for each of the region of interest dimensions

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_XY

Bits	Name	Description
31:16	SRC_Y	Y-offset of source ROI in the source image
15:0	SRC_X	X-offset of source ROI in the source image

0x01A1500C MDSS_MDP_VP_0_RGB_0_SSPP_OUT_SIZE**Type:** RW**Reset State:** 0x00000000

Output Size of the layer.

Should be same as source size if scaling is NOT enabled.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Height of Output ROI
15:0	DST_W	Width of Output ROI

0x01A15010 MDSS_MDP_VP_0_RGB_0_SSPP_OUT_XY**Type:** RW**Reset State:** 0x00000000

Output Offset from the top-left corner of the output image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_OUT_XY

Bits	Name	Description
31:16	DST_Y	Height of Output ROI
15:0	DST_X	Width of Output ROI

0x01A15014 MDSS_MDP_VP_0_RGB_0_SSPP_SRC0_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 0 base address

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_0_SSPP_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A15018 MDSS_MDP_VP_0_RGB_0_SSPP_SRC1_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 1 base address

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_0_SSPP_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A1501C MDSS_MDP_VP_0_RGB_0_SSPP_SRC2_ADDR

Type: RW

Reset State: 0x00000000

Plane 2 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_0_SSPP_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A15020 MDSS_MDP_VP_0_RGB_0_SSPP_SRC3_ADDR

Type: RW

Reset State: 0x00000000

Plane 3 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_0_SSPP_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A15024 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_YSTRIDE0**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_YSTRIDE0

Bits	Name	Description
31:16	SRCP1_YSTRIDE	Plane 1 Y stride in bytes
15:0	SRCP0_YSTRIDE	Plane 0 Y stride in bytes

0x01A15028 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_YSTRIDE1**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_YSTRIDE1

Bits	Name	Description
31:16	SRCP3_YSTRIDE	Plane 3 Y stride in bytes
15:0	SRCP2_YSTRIDE	Plane 2 Y stride in bytes

0x01A15030 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_FORMAT**Type:** RW**Reset State:** 0x00000000

Source Format Configuration for each virtual pipeline.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_FORMAT

Bits	Name	Description
31:30	FRAME_FORMAT	Frame format In the current revision, there is no support for tiled formats 0x0: Linear, no tile 0x1: Tiled, 4x4
25:23	SRC_CHROMA_SAMP	Source Chroma Sampling 0x0: RGB/YUV 4:4:4 0x1: 4:2:2 - H2V1 0x2: 4:2:2 - H1V2 0x3: 4:2:0 - N2V1 0x4: 4:2:0 - N1V2
22	SOLID_FILL	Fetch feeds the lower pipeline with the CONSTANT_COLOR register as its output value. NOTHING is fetched Note that in order to use this feature then Interleaved FETCH_PLANES must be set as well and no chroma sub-sampling enabled
21	VC1_REDUCE	VC1 range reduction enable for YUV sources The reduce range is set by separate register VC1_RANGE
20:19	FETCH_PLANES	Determines the number of planes to fetch 0x0: Interleaved 0x1: Planar 0x2: Pseudo-planar
18	UNPACK_ALIGN	0x0: TO LSB 0x1: TO MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
13:12	UNPACK_COUNT	Valid unpacking pattern count 0x0 = 1 component 0x1 = 2 components ... 0x3 = 4 components Unpacking applies to interleaved plane (chroma plane in pseudo-planar)
11	ROT90	Source image is to be rotated 90 degrees
10:9	SRC_BPP	Effective source byte per pixel 0x0: 1 byte 0x1: 2 bytes 0x2: 3 bytes 0x3: 4 bytes This is used ONLY when unpacking the interleaved plane

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
8	SRCC3_EN	Alpha Enable 0x0: Source has NO alpha 0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (Alpha) 0x0: 1 bits 0x1: 4 bits 0x2: 6 bits 0x3: 8 bits
5:4	SRCC2	Number of bits for component 2 (R/Cr) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	SRCC1	Number of bits for component 1 (B/Cb) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	SRCC0	Number of bits for component 0 (G/Luma) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A15034 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_UNPACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4).

Default is ARGB or C3-C2-C0-C1.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_UNPACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_UNPACK_PATTERN (cont.)

Bits	Name	Description
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A15038 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_OP_MODE**Type:** RW**Reset State:** 0x00000000

Operation Mode for each SSPP pipeline

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_OP_MODE

Bits	Name	Description
31	SW_PIX_EXT_OVERRIDE	SW override for pixel extension values. 0x0: Use HW calculated pixel extensions 0x1: Use SW programmed pixel extensions
16	IGC_LUT_EN	Inverse Gamma Correction LUT Enable 0x0: Disabled - mapped Linearly from 8-bit to 12-bit 0x1: Enabled
14:13	FLIP_MODE	Flip Operation Lower Bit: Left/Right flip Upper Bit: Up/Down flip

0x01A1503C MDSS_MDP_VP_0_RGB_0_SSPP_SRC_CONSTANT_COLOR**Type:** RW**Reset State:** 0x00000000

Constant Color Register during solid fill mode

double buffered: NO

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x01A15048 MDSS_MDP_VP_0_RGB_0_SSPP_FETCH_CONFIG

Type: RW

Reset State: 0x00000087

SSPP Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_RGB_0_SSPP_FETCH_CONFIG

Bits	Name	Description
22	PRI_ARB_DIS	
21	PMARK_DIS	
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 Others: ILLEGAL / Not Supported
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line

MDSS_MDP_VP_0_RGB_0_SSPP_FETCH_CONFIG (cont.)

Bits	Name	Description
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A1504C MDSS_MDP_VP_0_RGB_0_SSPP_VC1_RANGE**Type:** RW**Reset State:** 0x00000707

VC1 Range Map for each virtual pipeline

ONLY valid for pipelines that suport YUV formats

double buffered: NO

MDSS_MDP_VP_0_RGB_0_SSPP_VC1_RANGE

Bits	Name	Description
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x01A15050 MDSS_MDP_VP_0_RGB_0_SSPP_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000040

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_0_SSPP_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A15054 MDSS_MDP_VP_0_RGB_0_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000080

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the middle FIFO depth and should not be programmed higher than
REQPRIORITY_FIFO_WATERMARK_2 or lower than
REQPRIORITY_FIFO_WATERMARK_0

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_0_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A15058 MDSS_MDP_VP_0_RGB_0_SSPP_REQPRIORITY_FIFO_WATERMARK_2

Type: RW

Reset State: 0x000000C0

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the highest FIFO depth and should not be programmed lower than
REQPRIORITY_FIFO_WATERMARK_0 or REQPRIORITY_FIFO_WATERMARK_1

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_0_SSPP_REQPRIORITY_FIFO_WATERMARK_2

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_2

0x01A15070 MDSS_MDP_VP_0_RGB_0_SSPP_SRC_ADDR_SW_STATUS

Type: RW

Reset State: 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_RGB_0_SSPP_SRC_ADDR_SW_STATUS

Bits	Name	Description
3	SRC3_ADDR_CP	This is the secure status bit for source plane 3 (if used) If the format doesnt fetch from that plane then this value is ignored Memory transactions will not complete if this status doesnt corespond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
2	SRC2_ADDR_CP	This is the secure status bit for source plane 2 (if used) If the format doesnt fetch from that plane then this value is ignored Memory transactions will not complete if this status doesnt corespond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
1	SRC1_ADDR_CP	This is the secure status bit for source plane 1 (if used) If the format doesnt fetch from that plane then this value is ignored Memory transactions will not complete if this status doesnt corespond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
0	SRC0_ADDR_CP	This is the secure status bit for source plane 0 (if used) If the format doesnt fetch from that plane then this value is ignored Memory transactions will not complete if this status doesnt corespond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State

Bits	Name	Description
31:16	SRCP3_YSTRIDE	Plane 3 Y stride in bytes
15:0	SRCP2_YSTRIDE	Plane 2 Y stride in bytes

0x01A17030 MDSS_MDP_VP_0_RGB_1_SSPP_SRC_FORMAT

Type: RW

Reset State: 0x00000000

Source Format Configuration for each virtual pipeline.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_FORMAT

Bits	Name	Description
31:30	FRAME_FORMAT	Frame format In the current revision, there is no support for tiled formats 0x0: Linear, no tile 0x1: Tiled, 4x4
25:23	SRC_CHROMA_SAMP	Source Chroma Sampling 0x0: RGB/YUV 4:4:4 0x1: 4:2:2 - H2V1 0x2: 4:2:2 - H1V2 0x3: 4:2:0 - N2V1 0x4: 4:2:0 - N1V2
22	SOLID_FILL	Fetch feeds the lower pipeline with the CONSTANT_COLOR register as its output value. NOTHING is fetched Note that in order to use this feature then Interleaved FETCH_PLANES must be set as well and no chroma sub-sampling enabled
21	VC1_REDUCE	VC1 range reduction enable for YUV sources The reduce range is set by separate register VC1_RANGE
20:19	FETCH_PLANES	Determines the number of planes to fetch 0x0: Interleaved 0x1: Planar 0x2: Pseudo-planar

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
18	UNPACK_ALIGN	0x0: TO LSB 0x1: TO MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
13:12	UNPACK_COUNT	Valid unpacking pattern count 0x0 = 1 component 0x1 = 2 components ... 0x3 = 4 components Unpacking applies to interleaved plane (chroma plane in pseudo-planar)
11	ROT90	Source image is to be rotated 90 degrees
10:9	SRC_BPP	Effective source byte per pixel 0x0: 1 byte 0x1: 2 bytes 0x2: 3 bytes 0x3: 4 bytes This is used ONLY when unpacking the interleaved plane
8	SRCC3_EN	Alpha Enable 0x0: Source has NO alpha 0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (Alpha) 0x0: 1 bits 0x1: 4 bits 0x2: 6 bits 0x3: 8 bits
5:4	SRCC2	Number of bits for component 2 (R/Cr) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	SRCC1	Number of bits for component 1 (B/Cb) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	SRCC0	Number of bits for component 0 (G/Luma) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A17034 MDSS_MDP_VP_0_RGB_1_SSPP_SRC_UNPACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4).

Default is ARGB or C3-C2-C0-C1.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_UNPACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A17038 MDSS_MDP_VP_0_RGB_1_SSPP_SRC_OP_MODE**Type:** RW**Reset State:** 0x00000000

Operation Mode for each SSPP pipeline

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_OP_MODE

Bits	Name	Description
31	SW_PIX_EXT_OVERRIDE	SW override for pixel extension values. 0x0: Use HW calculated pixel extensions 0x1: Use SW programmed pixel extensions
16	IGC_LUT_EN	Inverse Gamma Correction LUT Enable 0x0: Disabled - mapped Linearly from 8-bit to 12-bit 0x1: Enabled
14:13	FLIP_MODE	Flip Operation Lower Bit: Left/Right flip Upper Bit: Up/Down flip

0x01A1703C MDSS_MDP_VP_0_RGB_1_SSPP_SRC_CONSTANT_COLOR**Type:** RW**Reset State:** 0x00000000

Constant Color Register during solid fill mode

double buffered: NO

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x01A17048 MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

SSPP Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_CONFIG

Bits	Name	Description
22	PRI_ARB_DIS	

MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_CONFIG (cont.)

Bits	Name	Description
21	PMARK_DIS	
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 Others: ILLEGAL / Not Supported
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A1704C MDSS_MDP_VP_0_RGB_1_SSPP_VC1_RANGE**Type:** RW**Reset State:** 0x00000707

VC1 Range Map for each virtual pipeline

ONLY valid for pipelines that support YUV formats

double buffered: NO

MDSS_MDP_VP_0_RGB_1_SSPP_VC1_RANGE

Bits	Name	Description
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x01A17050 MDSS_MDP_VP_0_RGB_1_SSPP_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000040

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_1_SSPP_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A17054 MDSS_MDP_VP_0_RGB_1_SSPP_REQPRIORITY_FIFO_WATERMARK_1**Type:** RW**Reset State:** 0x00000080

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the middle FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_2 or lower than REQPRIORITY_FIFO_WATERMARK_0

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_1_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A17058 MDSS_MDP_VP_0_RGB_1_SSPP_REQPRIORITY_FIFO_WATERMARK_2**Type:** RW**Reset State:** 0x000000C0

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the highest FIFO depth and should not be programmed lower than REQPRIORITY_FIFO_WATERMARK_0 or REQPRIORITY_FIFO_WATERMARK_1

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_1_SSPP_REQPRIORITY_FIFO_WATERMARK_2

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_2

0x01A17070 MDSS_MDP_VP_0_RGB_1_SSPP_SRC_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_ADDR_SW_STATUS

Bits	Name	Description
3	SRC3_ADDR_CP	This is the secure status bit for source plane 3 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
2	SRC2_ADDR_CP	This is the secure status bit for source plane 2 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State
1	SRC1_ADDR_CP	This is the secure status bit for source plane 1 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State

MDSS_MDP_VP_0_RGB_1_SSPP_SRC_ADDR_SW_STATUS (cont.)

Bits	Name	Description
0	SRC0_ADDR_CP	This is the secure status bit for source plane 0 (if used) If the format doesn't fetch from that plane then this value is ignored Memory transactions will not complete if this status doesn't correspond to system programming in the rest of the path to memory SW should program SRC0_ADDR_CP, SRC1_ADDR_CP, SRC2_ADDR_CP, SRC3_ADDR_CP to the same value 0x0: Non Content Protected Buffer State 0x1: Content Protected Buffer State

0x01A170A4 MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC0_ADDR**Type:** R**Reset State:** 0x00000000

Current Plane 0 base address that Hardware is using

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A170A8 MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC1_ADDR**Type:** R**Reset State:** 0x00000000

Plane 1 base address that Hardware is using

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A170AC MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC2_ADDR**Type:** R**Reset State:** 0x00000000

Plane 2 base address that Hardware is using

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A170B0 MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC3_ADDR**Type:** R**Reset State:** 0x00000000

Plane 3 base address that Hardware is using

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_CURRENT_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A170B4 MDSS_MDP_VP_0_RGB_1_SSPP_DECIMATION_CONFIG**Type:** RW**Reset State:** 0x00000000

Decimation Configuration

Note that there is no decimation on DMA pipe which means no decimation in line mode on DMA or block mode

double buffered: YES

MDSS_MDP_VP_0_RGB_1_SSPP_DECIMATION_CONFIG

Bits	Name	Description
11:8	HORZ_S	Horizontal Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of pixels skipped. The algorithm is always the following: read 1 pixel skip S pixels The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 pixel drop 1 pixel. Used to decimate by 2 horizontally 0x3: Read 1 pixel drop 3 pixels. Used to decimate by 4 horizontally 0x7: Read 1 pixel drop 7 pixels. Used to decimate by 8 horizontally 0xF: Read 1 pixel drop 15 pixels. Used to decimate by 16 horizontally
3:0	VERT_S	Vertical Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of lines skipped. The algorithm is always the following: read 1 line skip S lines The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 line drop 1 line. Used to decimate by 2 horizontally 0x3: Read 1 line drop 3 lines. Used to decimate by 4 horizontally 0x7: Read 1 line drop 7 lines. Used to decimate by 8 horizontally 0xF: Read 1 line drop 15 lines. Used to decimate by 16 horizontally

0x01A170D0 MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A170D4 MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_SMP_WR_PLANE1**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 1 write counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_SMP_WR_PLANE1

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane1 port This port is NOT used for interleaved formats but is used for U (planar) or UV (pseudo-planar) formats This should correlate to value SMP_UNPACK_RD_PLANE1 More useful for debug but can be used for profiling purposes as well.

0x01A170D8 MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_SMP_WR_PLANE2**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 2 write counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_FETCH_SMP_WR_PLANE2

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane2 port This port is NOT used for interleaved formats but is used for V (planar) or A (pseudo-planar plus alpha) formats This should correlate to value SMP_UNPACK_RD_PLANE2 More useful for debug but can be used for profiling purposes as well.

0x01A170E0 MDSS_MDP_VP_0_RGB_1_SSPP_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A170E4 MDSS_MDP_VP_0_RGB_1_SSPP_SMP_UNPACK_RD_PLANE1**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 1 read counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_SMP_UNPACK_RD_PLANE1

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane1 port This port is NOT used for interleaved formats but is used for U (planar) or UV (pseudo-planar) formats This should correlate to FETCH_SMP_WR_PLANE1 value More useful for debug but can be used for profiling purposes as well.

0x01A170E8 MDSS_MDP_VP_0_RGB_1_SSPP_SMP_UNPACK_RD_PLANE2**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 2 read counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_1_SSPP_SMP_UNPACK_RD_PLANE2

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane1 port This port is NOT used for interleaved formats but is used for V (planar) or A (pseudo-planar plus alpha) formats This should correlate to FETCH_SMP_WR_PLANE1 value More useful for debug but can be used for profiling purposes as well.

0x01A17100 MDSS_MDP_VP_0_RGB_1_SSPP_SW_PIX_EXT_C0_LR**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_1_SSPP_SW_PIX_EXT_C0_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A17104 MDSS_MDP_VP_0_RGB_1_SSPP_SW_PIX_EXT_C0_TB**Type:** RW**Reset State:** 0x00000000

SSPP

SSPP hardware register description

0x01A19000 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the region of interest source image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_SIZE

Bits	Name	Description
31:16	ROI_H	Source Height of the Region Of Interest (ROI)
15:0	ROI_W	Source Width of the Region Of Interest (ROI) The exact supported size depends on the width of line buffers allocated for MDP.

0x01A19004 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_IMG_SIZE

Type: RW

Reset State: 0x00000000

Source Size for the image in which the ROI resides

This value along with SRC_SIZE and SRC_XY will be used by hardware to calculate whether pixel repeat or overfetch is required along the ROI border.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_IMG_SIZE

Bits	Name	Description
31:16	SRC_H	Source Height. Note that this is NOT the ROI height

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_IMG_SIZE (cont.)

Bits	Name	Description
15:0	SRC_W	Source Width. Note that this is NOT the ROI width

0x01A19008 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_XY**Type:** RW**Reset State:** 0x00000000

Source Offset from the top-left corner of the source image for each of the region of interest dimensions

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_XY

Bits	Name	Description
31:16	SRC_Y	Y-offset of source ROI in the source image
15:0	SRC_X	X-offset of source ROI in the source image

0x01A1900C MDSS_MDP_VP_0_RGB_2_SSPP_OUT_SIZE**Type:** RW**Reset State:** 0x00000000

Output Size of the layer.

Should be same as source size if scaling is NOT enabled.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Height of Output ROI
15:0	DST_W	Width of Output ROI

0x01A19010 MDSS_MDP_VP_0_RGB_2_SSPP_OUT_XY**Type:** RW**Reset State:** 0x00000000

Output Offset from the top-left corner of the output image

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_OUT_XY

Bits	Name	Description
31:16	DST_Y	Height of Output ROI
15:0	DST_X	Width of Output ROI

0x01A19014 MDSS_MDP_VP_0_RGB_2_SSPP_SRC0_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 0 base address

For fetching BWC data, this plane refers to the compressed RAU data

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_2_SSPP_SRC0_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the image single interleave color plane, Luma plane in pseudo-planar format, or color0 in planar format

0x01A19018 MDSS_MDP_VP_0_RGB_2_SSPP_SRC1_ADDR**Type:** RW**Reset State:** 0x00000000

Plane 1 base address

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_2_SSPP_SRC1_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of the chroma plane in pseudo-planar format, or color1 in planar format

0x01A1901C MDSS_MDP_VP_0_RGB_2_SSPP_SRC2_ADDR

Type: RW

Reset State: 0x00000000

Plane 2 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_2_SSPP_SRC2_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color2 in planar format

0x01A19020 MDSS_MDP_VP_0_RGB_2_SSPP_SRC3_ADDR

Type: RW

Reset State: 0x00000000

Plane 3 base address

double buffered: YES

when: On frame boundaries (vsync or SW trigger) when ADDR_SYNC_MODE is in frame mode and on line boundary if ADDR_SYNC_MODE in in line mode

MDSS_MDP_VP_0_RGB_2_SSPP_SRC3_ADDR

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A19024 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_YSTRIDE0**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_YSTRIDE0

Bits	Name	Description
31:16	SRCP1_YSTRIDE	Plane 1 Y stride in bytes
15:0	SRCP0_YSTRIDE	Plane 0 Y stride in bytes

0x01A19028 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_YSTRIDE1**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_YSTRIDE1

Bits	Name	Description
31:16	SRCP3_YSTRIDE	Plane 3 Y stride in bytes
15:0	SRCP2_YSTRIDE	Plane 2 Y stride in bytes

0x01A19030 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_FORMAT**Type:** RW**Reset State:** 0x00000000

Source Format Configuration for each virtual pipeline.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_FORMAT

Bits	Name	Description
31:30	FRAME_FORMAT	Frame format In the current revision, there is no support for tiled formats 0x0: Linear, no tile 0x1: Tiled, 4x4
25:23	SRC_CHROMA_SAMP	Source Chroma Sampling 0x0: RGB/YUV 4:4:4 0x1: 4:2:2 - H2V1 0x2: 4:2:2 - H1V2 0x3: 4:2:0 - N2V1 0x4: 4:2:0 - N1V2
22	SOLID_FILL	Fetch feeds the lower pipeline with the CONSTANT_COLOR register as its output value. NOTHING is fetched Note that in order to use this feature then Interleaved FETCH_PLANES must be set as well and no chroma sub-sampling enabled
21	VC1_REDUCE	VC1 range reduction enable for YUV sources The reduce range is set by separate register VC1_RANGE
20:19	FETCH_PLANES	Determines the number of planes to fetch 0x0: Interleaved 0x1: Planar 0x2: Pseudo-planar
18	UNPACK_ALIGN	0x0: TO LSB 0x1: TO MSB
17	UNPACK_TIGHT	0x0: Loose 0x1: Tight
13:12	UNPACK_COUNT	Valid unpacking pattern count 0x0 = 1 component 0x1 = 2 components ... 0x3 = 4 components Unpacking applies to interleaved plane (chroma plane in pseudo-planar)
11	ROT90	Source image is to be rotated 90 degrees
10:9	SRC_BPP	Effective source byte per pixel 0x0: 1 byte 0x1: 2 bytes 0x2: 3 bytes 0x3: 4 bytes This is used ONLY when unpacking the interleaved plane

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_FORMAT (cont.)

Bits	Name	Description
8	SRCC3_EN	Alpha Enable 0x0: Source has NO alpha 0x1: Source has alpha
7:6	SRCC3	Number of bits for component 3 (Alpha) 0x0: 1 bits 0x1: 4 bits 0x2: 6 bits 0x3: 8 bits
5:4	SRCC2	Number of bits for component 2 (R/Cr) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	SRCC1	Number of bits for component 1 (B/Cb) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	SRCC0	Number of bits for component 0 (G/Luma) 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A19034 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_UNPACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Unpacking pattern, maximum of 4 pattern elements starting from LSB to MSB (0 to 4).

Default is ARGB or C3-C2-C0-C1.

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_UNPACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_UNPACK_PATTERN (cont.)

Bits	Name	Description
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A19038 MDSS_MDP_VP_0_RGB_2_SSPP_SRC_OP_MODE**Type:** RW**Reset State:** 0x00000000

Operation Mode for each SSPP pipeline

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_OP_MODE

Bits	Name	Description
31	SW_PIX_EXT_OVERRIDE	SW override for pixel extension values. 0x0: Use HW calculated pixel extensions 0x1: Use SW programmed pixel extensions
16	IGC_LUT_EN	Inverse Gamma Correction LUT Enable 0x0: Disabled - mapped Linearly from 8-bit to 12-bit 0x1: Enabled
14:13	FLIP_MODE	Flip Operation Lower Bit: Left/Right flip Upper Bit: Up/Down flip

0x01A1903C MDSS_MDP_VP_0_RGB_2_SSPP_SRC_CONSTANT_COLOR**Type:** RW**Reset State:** 0x00000000

Constant Color Register during solid fill mode

double buffered: NO

MDSS_MDP_VP_0_RGB_2_SSPP_SRC_CONSTANT_COLOR

Bits	Name	Description
31:24	COLOR3	Constant color driven for color3 during solid fill mode.
23:16	COLOR2	Constant color driven for color2 during solid fill mode.
15:8	COLOR1	Constant color driven for color1 during solid fill mode.
7:0	COLOR0	Constant color driven for color0 during solid fill mode.

0x01A19048 MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_CONFIG

Type: RW

Reset State: 0x00000087

SSPP Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_CONFIG

Bits	Name	Description
22	PRI_ARB_DIS	
21	PMARK_DIS	
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 Others: ILLEGAL / Not Supported
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line

MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_CONFIG (cont.)

Bits	Name	Description
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A1904C MDSS_MDP_VP_0_RGB_2_SSPP_VC1_RANGE**Type:** RW**Reset State:** 0x00000707

VC1 Range Map for each virtual pipeline

ONLY valid for pipelines that suport YUV formats

double buffered: NO

MDSS_MDP_VP_0_RGB_2_SSPP_VC1_RANGE

Bits	Name	Description
10:8	RANGE_MAPUV	Chroma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.
2:0	RANGE_MAPY	Luma range map for VC1 range reduction, default of 7 is equivalent to setting it for main profile.

0x01A19050 MDSS_MDP_VP_0_RGB_2_SSPP_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000040

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A19054 MDSS_MDP_VP_0_RGB_2_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000080

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the middle FIFO depth and should not be programmed higher than
REQPRIORITY_FIFO_WATERMARK_2 or lower than
REQPRIORITY_FIFO_WATERMARK_0

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 150 (meaning 150 entries free to be written into SMP - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in SMP)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in SMP so its good)

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A19058 MDSS_MDP_VP_0_RGB_2_SSPP_REQPRIORITY_FIFO_WATERMARK_2

Type: RW

Reset State: 0x000000C0

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the # of 128-entries available in the Shared Memory Pool

The value programmed here should be aware of the amount programmed in the Shared Memory Pool.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the SMP)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the highest FIFO depth and should not be programmed lower than
REQPRIORITY_FIFO_WATERMARK_0 or REQPRIORITY_FIFO_WATERMARK_1

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 50 (meaning 50 entries free to be written into SMP - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 100 (meaning 100 entries free to be written into SMP - middle ground room available)

Bits	Name	Description
31:0	ADDR	Base byte address of color3 in planar format, or pseudo planar + alpha format

0x01A190B4 MDSS_MDP_VP_0_RGB_2_SSPP_DECIMATION_CONFIG

Type: RW

Reset State: 0x00000000

Decimation Configuration

Note that there is no decimation on DMA pipe which means no decimation in line mode on DMA or block mode

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_DECIMATION_CONFIG

Bits	Name	Description
11:8	HORZ_S	Horizontal Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of pixels skipped. The algorithm is always the following: read 1 pixel skip S pixels The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 pixel drop 1 pixel. Used to decimate by 2 horizontally 0x3: Read 1 pixel drop 3 pixels. Used to decimate by 4 horizontally 0x7: Read 1 pixel drop 7 pixels. Used to decimate by 8 horizontally 0xF: Read 1 pixel drop 15 pixels. Used to decimate by 16 horizontally

MDSS_MDP_VP_0_RGB_2_SSPP_DECIMATION_CONFIG (cont.)

Bits	Name	Description
3:0	VERT_S	Vertical Configuration for decimation; required to support downscaling greater than 1/4 S refers to the number of lines skipped. The algorithm is always the following: read 1 line skip S lines The algorithm is applied to ALL components. Decimation only supports the following values. All other values will result in undefined behaviour The decimation block will provide coarse scaling and should be used in conjunction with qseed2 to support all scaling ratios. 0x0: No decimation is performed 0x1: Read 1 line drop 1 line. Used to decimate by 2 horizontally 0x3: Read 1 line drop 3 lines. Used to decimate by 4 horizontally 0x7: Read 1 line drop 7 lines. Used to decimate by 8 horizontally 0xF: Read 1 line drop 15 lines. Used to decimate by 16 horizontally

0x01A190D0 MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A190D4 MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_SMP_WR_PLANE1**Type:** R**Reset State:** 0x00000000

MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_SMP_WR_PLANE1

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane1 port This port is NOT used for interleaved formats but is used for U (planar) or UV (pseudo-planar) formats This should correlate to value SMP_UNPACK_RD_PLANE1 More useful for debug but can be used for profiling purposes as well.

0x01A190D8 MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_SMP_WR_PLANE2**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 2 write counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_2_SSPP_FETCH_SMP_WR_PLANE2

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane2 port This port is NOT used for interleaved formats but is used for V (planar) or A (pseudo-planar plus alpha) formats This should correlate to value SMP_UNPACK_RD_PLANE2 More useful for debug but can be used for profiling purposes as well.

0x01A190E0 MDSS_MDP_VP_0_RGB_2_SSPP_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_2_SSPP_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This port is used for interleaved formats or the Y component for multi-plane source formats This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A190E4 MDSS_MDP_VP_0_RGB_2_SSPP_SMP_UNPACK_RD_PLANE1**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 1 read counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_2_SSPP_SMP_UNPACK_RD_PLANE1

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane1 port This port is NOT used for interleaved formats but is used for U (planar) or UV (pseudo-planar) formats This should correlate to FETCH_SMP_WR_PLANE1 value More useful for debug but can be used for profiling purposes as well.

0x01A190E8 MDSS_MDP_VP_0_RGB_2_SSPP_SMP_UNPACK_RD_PLANE2**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 2 read counter

double buffered: N/A

MDSS_MDP_VP_0_RGB_2_SSPP_SMP_UNPACK_RD_PLANE2

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane1 port This port is NOT used for interleaved formats but is used for V (planar) or A (pseudo-planar plus alpha) formats This should correlate to FETCH_SMP_WR_PLANE1 value More useful for debug but can be used for profiling purposes as well.

0x01A19100 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C0_LR**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C0_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A19104 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C0_TB**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C0_TB

Bits	Name	Description
31:24	BOTTOM_OVF	Signed Value for Bottom Overfetch value. +ve value indicates overfetch -ve value indicates line drop
23:16	BOTTOM_RPT	
15:8	TOP_OVF	Signed Value for Top Overfetch value. +ve value indicates overfetch -ve value indicates line drop
7:0	TOP_RPT	Unsigned Value for TOP Line Repeat value.

0x01A19108 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C0_REQ_PIXELS**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for pixel height/width of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C0_REQ_PIXELS

Bits	Name	Description
31:16	TOP_BOTTOM	Unsigned Value for pixel height post pixel extension.
15:0	LEFT_RIGHT	Unsigned Value for pixel width post pixel extension.

0x01A19110 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C1C2_LR**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C1C2_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A19114 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C1C2_TB**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register
double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C1C2_TB

Bits	Name	Description
31:24	BOTTOM_OVF	Signed Value for Bottom Overfetch value. +ve value indicates overfetch -ve value indicates line drop
23:16	BOTTOM_RPT	
15:8	TOP_OVF	Signed Value for Top Overfetch value. +ve value indicates overfetch -ve value indicates line drop
7:0	TOP_RPT	Unsigned Value for TOP Line Repeat value.

0x01A19118 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C1C2_REQ_PIXELS**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for pixel height/width of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C1C2_REQ_PIXELS

Bits	Name	Description
31:16	TOP_BOTTOM	Unsigned Value for pixel height post pixel extension.
15:0	LEFT_RIGHT	Unsigned Value for pixel width post pixel extension.

0x01A19120 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C3_LR

Type: RW

Reset State: 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C3_LR

Bits	Name	Description
31:24	RIGHT_OVF	Signed Value for Right Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
23:16	RIGHT_RPT	Unsigned Value for Right Pixel Repeat value.
15:8	LEFT_OVF	Signed Value for Left Overfetch value. +ve value indicates overfetch -ve value indicates pixel drop
7:0	LEFT_RPT	Unsigned Value for Left Pixel Repeat value.

0x01A19124 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C3_TB

Type: RW

Reset State: 0x00000000

SW Pixel Extension Override for Left/Right of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C3_TB

Bits	Name	Description
31:24	BOTTOM_OVF	Signed Value for Bottom Overfetch value. +ve value indicates overfetch -ve value indicates line drop
23:16	BOTTOM_RPT	
15:8	TOP_OVF	Signed Value for Top Overfetch value. +ve value indicates overfetch -ve value indicates line drop
7:0	TOP_RPT	Unsigned Value for TOP Line Repeat value.

0x01A19128 MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C3_REQ_PIXELS**Type:** RW**Reset State:** 0x00000000

SW Pixel Extension Override for pixel height/width of Color 0

These value only take effect if SW_PIX_EXT_OVERRIDE is set in SRC_OP_MODE register

double buffered: YES

MDSS_MDP_VP_0_RGB_2_SSPP_SW_PIX_EXT_C3_REQ_PIXELS

Bits	Name	Description
31:16	TOP_BOTTOM	Unsigned Value for pixel height post pixel extension.
15:0	LEFT_RIGHT	Unsigned Value for pixel width post pixel extension.

Layer Mixer hardware register description

0x01A45000 MDSS_MDP_VP_0_LAYER_0_OP_MODE**Type:** RW**Reset State:** 0x00000000

LayerMixer Operation Control

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_OP_MODE

Bits	Name	Description
4	BLEND3_COLOR3_OUT	Selects which source to drive on color3 component output for stage3 blend 0x0: BG Layer Color3 0x1: FG Layer Color3

MDSS_MDP_VP_0_LAYER_0_OP_MODE (cont.)

Bits	Name	Description
3	BLEND2_COLOR3_OUT	Selects which source to drive on color3 component output for stage2 blend 0x0: BG Layer Color3 0x1: FG Layer Color3
2	BLEND1_COLOR3_OUT	Selects which source to drive on color3 component output for stage1 blend 0x0: BG Layer Color3 0x1: FG Layer Color3
1	BLEND0_COLOR3_OUT	Selects which source to drive on color3 component output for stage0 blend 0x0: BG Layer Color3 0x1: FG Layer Color3
0	GC_LUT_EN	0x0: Disabled - mapped linearly from 12-bit to 8-bit 0x1: Enabled

0x01A45004 MDSS_MDP_VP_0_LAYER_0_OUT_SIZE**Type:** RW**Reset State:** 0x00000000

LayerMixer Output Size

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Destination Output Height
15:0	DST_W	Destination Output Width The exact supported size depends on the width of line buffers allocated for MDP.

0x01A45008 MDSS_MDP_VP_0_LAYER_0_BORDER_COLOR_0**Type:** RW**Reset State:** 0x00000000

LayerMixer Border Color Register

double buffered: YES

MDSS_MDP_VP_0_LAYER_0_BORDER_COLOR_0

Bits	Name	Description
27:16	COLOR1	Color1 in 12-bit format
11:0	COLOR0	Color0 in 12-bit format

0x01A45010 MDSS_MDP_VP_0_LAYER_0_BORDER_COLOR_1**Type:** RW**Reset State:** 0x00000000

LayerMixer Border Color Register

double buffered: YES

MDSS_MDP_VP_0_LAYER_0_BORDER_COLOR_1

Bits	Name	Description
27:16	COLOR3	Color3 in 12-bit format, LSB4 are ignored, should be programmed to 0
11:0	COLOR2	Color2 in 12-bit format

0x01A45020 MDSS_MDP_VP_0_LAYER_0_BLEND0_OP**Type:** RW**Reset State:** 0x00000000

LayerMixer Blend0 Operation Control

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_BLEND0_OP

Bits	Name	Description
13	BG_TRANSP_EN	BG transparency enabled
12	BG_INV_MOD_ALPHA	Ability to select between alpha and inverse alpha right after the alpha modulation 0x0: Alpha 0x1: Inverse Alpha
11	BG_MOD_ALPHA	Modulate BG Alpha

MDSS_MDP_VP_0_LAYER_0_BLEND0_OP (cont.)

Bits	Name	Description
10	BG_INV_ALPHA_SEL	Ability to select between alpha and inverse alpha right after the alpha select 0x0: Alpha 0x1: Inverse Alpha
9:8	BG_ALPHA_SEL	Blending Alpha Select 0x0: FG constant alpha 0x1: BG constant alpha 0x2: FG per pixel alpha 0x3: BG per pixel alpha
5	FG TRANSP_EN	FG transparency enabled
4	FG_INV_MOD_ALPHA	Ability to select between alpha and inverse alpha right after the alpha modulation 0x0: Alpha 0x1: Inverse Alpha
3	FG_MOD_ALPHA	Modulate Alpha
2	FG_INV_ALPHA_SEL	Ability to select between alpha and inverse alpha right after the alpha select 0x0: Alpha 0x1: Inverse Alpha
1:0	FG_ALPHA_SEL	Blending Alpha Select 0x0: FG constant alpha 0x1: BG constant alpha 0x2: FG per pixel alpha 0x3: BG per pixel alpha

Bits	Name	Description
7:0	CONSTANT_ALPHA	Constant Alpha

0x01A45088 MDSS_MDP_VP_0_LAYER_0_BLEND2_BG_ALPHA**Type:** RW**Reset State:** 0x00000000

Blend Layer2 BG alpha

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_BLEND2_BG_ALPHA

Bits	Name	Description
7:0	CONSTANT_ALPHA	Constant Alpha

0x01A4508C MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_LOW0**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_LOW0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check lower limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check lower limit for Color0

0x01A45090 MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_LOW1**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_LOW1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check lower limit for Color2

0x01A45094 MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_HIGH0**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_HIGH0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check higher limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check higher limit for Color0

0x01A45098 MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_HIGH1**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_FG TRANSP_HIGH1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check higher limit for Color2

0x01A4509C MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_LOW0**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_LOW0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check lower limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check lower limit for Color0

0x01A450A0 MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_LOW1**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_LOW1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check lower limit for Color2

0x01A450A4 MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_HIGH0**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_HIGH0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check higher limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check higher limit for Color0

0x01A450A8 MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_HIGH1**Type:** RW**Reset State:** 0x00000000

Blend Layer2 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND2_BG TRANSP_HIGH1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check higher limit for Color2

0x01A450B0 MDSS_MDP_VP_0_LAYER_0_BLEND3_OP**Type:** RW**Reset State:** 0x00000000

LayerMixer Blend3 Operation Control

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_BLEND3_OP

Bits	Name	Description
13	BG TRANSP_EN	BG transparency enabled
12	BG_INV_MOD_ALPHA	Ability to select between alpha and inverse alpha right after the alpha modulation 0x0: Alpha 0x1: Inverse Alpha
11	BG_MOD_ALPHA	Modulate BG Alpha
10	BG_INV_ALPHA_SEL	Ability to select between alpha and inverse alpha right after the alpha select 0x0: Alpha 0x1: Inverse Alpha
9:8	BG_ALPHA_SEL	Blending Alpha Select 0x0: FG constant alpha 0x1: BG constant alpha 0x2: FG per pixel alpha 0x3: BG per pixel alpha
5	FG TRANSP_EN	FG transparency enabled
4	FG_INV_MOD_ALPHA	Ability to select between alpha and inverse alpha right after the alpha modulation 0x0: Alpha 0x1: Inverse Alpha
3	FG_MOD_ALPHA	Modulate Alpha
2	FG_INV_ALPHA_SEL	Ability to select between alpha and inverse alpha right after the alpha select 0x0: Alpha 0x1: Inverse Alpha
1:0	FG_ALPHA_SEL	Blending Alpha Select 0x0: FG constant alpha 0x1: BG constant alpha 0x2: FG per pixel alpha 0x3: BG per pixel alpha

0x01A450B4 MDSS_MDP_VP_0_LAYER_0_BLEND3_FG_ALPHA**Type:** RW**Reset State:** 0x00000000

Blend Layer3 FG alpha

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_BLEND3_FG_ALPHA

Bits	Name	Description
7:0	CONSTANT_ALPHA	Constant Alpha

0x01A450B8 MDSS_MDP_VP_0_LAYER_0_BLEND3_BG_ALPHA**Type:** RW**Reset State:** 0x00000000

Blend Layer3 FG alpha

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_BLEND3_BG_ALPHA

Bits	Name	Description
7:0	CONSTANT_ALPHA	Constant Alpha

0x01A450BC MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_LOW0**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_LOW0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check lower limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check lower limit for Color0

0x01A450C0 MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_LOW1**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_LOW1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check lower limit for Color2

0x01A450C4 MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_HIGH0**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_HIGH0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check higher limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check higher limit for Color0

0x01A450C8 MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_HIGH1**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_FG TRANSP_HIGH1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check higher limit for Color2

0x01A450CC MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_LOW0**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_LOW0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check lower limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check lower limit for Color0

0x01A450D0 MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_LOW1**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_LOW1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check lower limit for Color2

0x01A450D4 MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_HIGH0**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_HIGH0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check higher limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check higher limit for Color0

0x01A450D8 MDSS_MDP_VP_0_LAYER_0_BLEND3_BG TRANSP_HIGH1**Type:** RW**Reset State:** 0x00000000

Blend Layer3 Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_BLEND3_BG_TRANSP_HIGH1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check higher limit for Color2

0x01A450DC MDSS_MDP_VP_0_LAYER_0_CURSOR_STRIDE**Type:** RW**Reset State:** 0x00000000

Cursor Stride

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_STRIDE

Bits	Name	Description
15:0	STRIDE	Cursor Stride

0x01A450E0 MDSS_MDP_VP_0_LAYER_0_CURSOR_IMG_SIZE**Type:** RW**Reset State:** 0x00000000

Cursor Image Size

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_IMG_SIZE

Bits	Name	Description
31:16	SRC_H	Total Cursor Source Height
15:0	SRC_W	Total Cursor Source Width

0x01A450E4 MDSS_MDP_VP_0_LAYER_0_CURSOR_SIZE**Type:** RW**Reset State:** 0x00000000

Cursor ROI Image Size

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_SIZE

Bits	Name	Description
31:16	ROI_H	Cursor ROI Source Height
15:0	ROI_W	Cursor ROI Source Width

0x01A450E8 MDSS_MDP_VP_0_LAYER_0_CURSOR_XY

Type: RW

Reset State: 0x00000000

Cursor ROI Offset

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_XY

Bits	Name	Description
31:16	SRC_Y	Y ROI coordinate
15:0	SRC_X	X ROI coordinate

0x01A450EC MDSS_MDP_VP_0_LAYER_0_CURSOR_FORMAT

Type: RW

Reset State: 0x00000000

Cursor Format

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_FORMAT

Bits	Name	Description
2:0	FORMAT	Cursor Format 0x0: ARGB8888 0x2: ARGB1555 0x4: ARGB4444

0x01A450F0 MDSS_MDP_VP_0_LAYER_0_CURSOR_BASE_ADDR**Type:** RW**Reset State:** 0x00000000

Cursor Base Address

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_BASE_ADDR

Bits	Name	Description
31:0	ADDR	Cursor Base-Address (byte-aligned)

0x01A450F4 MDSS_MDP_VP_0_LAYER_0_CURSOR_START_XY**Type:** RW**Reset State:** 0x00000000

Cursor Starting Coordinates

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_START_XY

Bits	Name	Description
31:16	Y_START	Starting Y coordinate
15:0	X_START	Starting X coordinate

0x01A450F8 MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND_CONFIG**Type:** RW**Reset State:** 0x00000000

Cursor Blending Configuration

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND_CONFIG

Bits	Name	Description
3	BLEND_TRANSP_EN	0x0: Disabled 0x1: Color keying is done on the cursor and blended result
2:1	BLEND_ALPHA_SEL	Blending Alpha Select 0x0: Constant Alpha 0x1: reserved 0x2: Cursor per pixel alpha 0x3: reserved
0	BLEND_EN	Cursor Blend Enable

0x01A450FC MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND_PARAM**Type:** RW**Reset State:** 0x00000000

Cursor Blending Parameter

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND_PARAM

Bits	Name	Description
7:0	CONSTANT_ALPHA	Constant Alpha

0x01A45100 MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND_TRANSP_LOW0**Type:** RW**Reset State:** 0x00000000

Cursor Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND_TRANSP_LOW0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check lower limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check lower limit for Color0

0x01A45104 MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND TRANSP_LOW1**Type:** RW**Reset State:** 0x00000000

Cursor Transparency Color Low Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND TRANSP_LOW1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check lower limit for Color2

0x01A45108 MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND TRANSP_HIGH0**Type:** RW**Reset State:** 0x00000000

Cursor Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND TRANSP_HIGH0

Bits	Name	Description
27:16	TRANSPARENCY_C1	Transparency color check higher limit for Color1
11:0	TRANSPARENCY_C0	Transparency color check higher limit for Color0

0x01A4510C MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND TRANSP_HIGH1**Type:** RW**Reset State:** 0x00000000

Cursor Transparency Color High Value

double buffered: NO

MDSS_MDP_VP_0_LAYER_0_CURSOR_BLEND TRANSP_HIGH1

Bits	Name	Description
11:0	TRANSPARENCY_C2	Transparency color check higher limit for Color2

0x01A45110 MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_RED_STARTX_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_RED_STARTX_N**

Bits	Name	Description
21	VALUE_UPDATEN	
20	SEGMENT_UPDATE	
19:16	SEGMENT	
11:0	STARTX	

0x01A45114 MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_RED_SLOPE_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_RED_SLOPE_N**

Bits	Name	Description
21	VALUE_UPDATEN	
20	SEGMENT_UPDATE	
19:16	SEGMENT	
14:0	SLOPE	

0x01A45118 MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_RED_OFFSET_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_RED_OFFSET_N**

Bits	Name	Description
21	VALUE_UPDATEN	
20	SEGMENT_UPDATE	
19:16	SEGMENT	
14:0	OFFSET	

0x01A45120 MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_GREEN_STARTX_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_GREEN_STARTX_N**

Bits	Name	Description
21	VALUE_UPDATEN	
20	SEGMENT_UPDATE	
19:16	SEGMENT	
11:0	STARTX	

0x01A45124 MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_GREEN_SLOPE_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_LAYER_0_GC_ARLUT_GREEN_SLOPE_N**

14:0	OFFSET	

0x01A45200 MDSS_MDP_VP_0_LAYER_0_CURSOR_BASE_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_LAYER_0_CURSOR_BASE_ADDR_SW_STATUS

Bits	Name	Description
0	ADDR_CP	

0x01A45204 MDSS_MDP_VP_0_LAYER_0_CURSOR_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

Cursor Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_LAYER_0_CURSOR_FETCH_CONFIG

Bits	Name	Description
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 0x1: 64x64 0x2: 32x32
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line

MDSS_MDP_VP_0_LAYER_0_CURSOR_FETCH_CONFIG (cont.)

Bits	Name	Description
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A45210 MDSS_MDP_VP_0_LAYER_0_CURSOR_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_0_CURSOR_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A45214 MDSS_MDP_VP_0_LAYER_0_CURSOR_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_0_CURSOR_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A45220 MDSS_MDP_VP_0_LAYER_0_CURSOR_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000008

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than
REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_0_CURSOR_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A45224 MDSS_MDP_VP_0_LAYER_0_CURSOR_REQPRIORITY_FIFO_WATERMARK_1**Type:** RW**Reset State:** 0x00000010

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_0_CURSOR_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A45228 MDSS_MDP_VP_0_LAYER_0_CURSOR_REQPRIORITY_FIFO_WATERMARK_2**Type:** RW**Reset State:** 0x00000020

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

0x01A46200 MDSS_MDP_VP_0_LAYER_1_CURSOR_BASE_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_LAYER_1_CURSOR_BASE_ADDR_SW_STATUS

Bits	Name	Description
0	ADDR_CP	

0x01A46204 MDSS_MDP_VP_0_LAYER_1_CURSOR_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

Cursor Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_LAYER_1_CURSOR_FETCH_CONFIG

Bits	Name	Description
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 0x1: 64x64 0x2: 32x32
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A46210 MDSS_MDP_VP_0_LAYER_1_CURSOR_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_1_CURSOR_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A46214 MDSS_MDP_VP_0_LAYER_1_CURSOR_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_1_CURSOR_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A46220 MDSS_MDP_VP_0_LAYER_1_CURSOR_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000008

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_1_CURSOR_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A46224 MDSS_MDP_VP_0_LAYER_1_CURSOR_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000010

0x01A47200 MDSS_MDP_VP_0_LAYER_2_CURSOR_BASE_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_LAYER_2_CURSOR_BASE_ADDR_SW_STATUS

Bits	Name	Description
0	ADDR_CP	

0x01A47204 MDSS_MDP_VP_0_LAYER_2_CURSOR_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

Cursor Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_LAYER_2_CURSOR_FETCH_CONFIG

Bits	Name	Description
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 0x1: 64x64 0x2: 32x32
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A47210 MDSS_MDP_VP_0_LAYER_2_CURSOR_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_2_CURSOR_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A47214 MDSS_MDP_VP_0_LAYER_2_CURSOR_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_2_CURSOR_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A47220 MDSS_MDP_VP_0_LAYER_2_CURSOR_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000008

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_2_CURSOR_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A47224 MDSS_MDP_VP_0_LAYER_2_CURSOR_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000010

0x01A48200 MDSS_MDP_VP_0_LAYER_3_CURSOR_BASE_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_LAYER_3_CURSOR_BASE_ADDR_SW_STATUS

Bits	Name	Description
0	ADDR_CP	

0x01A48204 MDSS_MDP_VP_0_LAYER_3_CURSOR_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

Cursor Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_LAYER_3_CURSOR_FETCH_CONFIG

Bits	Name	Description
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 0x1: 64x64 0x2: 32x32
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A48210 MDSS_MDP_VP_0_LAYER_3_CURSOR_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_3_CURSOR_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A48214 MDSS_MDP_VP_0_LAYER_3_CURSOR_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_3_CURSOR_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A48220 MDSS_MDP_VP_0_LAYER_3_CURSOR_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000008

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_3_CURSOR_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A48224 MDSS_MDP_VP_0_LAYER_3_CURSOR_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000010

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_3_CURSOR_REQPRIORITY_FIFO_WATERMARK_1

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_1

0x01A48228 MDSS_MDP_VP_0_LAYER_3_CURSOR_REQPRIORITY_FIFO_WATERMARK_2

Type: RW

Reset State: 0x00000020

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

0x01A49200 MDSS_MDP_VP_0_LAYER_4_CURSOR_BASE_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the source buffer plane

This is programmed by SW to indicate if the buffer is NON-SECURE or SECURE

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

double buffered: YES

MDSS_MDP_VP_0_LAYER_4_CURSOR_BASE_ADDR_SW_STATUS

Bits	Name	Description
0	ADDR_CP	

0x01A49204 MDSS_MDP_VP_0_LAYER_4_CURSOR_FETCH_CONFIG**Type:** RW**Reset State:** 0x00000087

Cursor Client Fetch Configuration per Virtual Pipeline double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_VP_0_LAYER_4_CURSOR_FETCH_CONFIG

Bits	Name	Description
17:16	TILE_SIZE	Tile Size for processing of BLOCK formats Note that this only applies to blocks that operate in block mode which is limited to DMA source pipe. This setting has no effect for all other source pipes (ViG/RGB) 0x0: 128x128 0x1: 64x64 0x2: 32x32
12	ADDR_SYNC_MODE	Boundary on which fetch address synchronizes. Setting this field to line forces the address updates on the next line which performs the software requested feature of updating on hsync. Note that updating on line boundaries will likely result in tearing on the panel since hardware is fetching from new memory buffer. 0x0: frame (default) 0x1: line
9:8	MAL	Describes the Minimum Access Length for the source pipeline. This value should align with the DRAM's expected transaction alignment unit. This setting forces the source fetch pipe to be aligned to DRAM and implement re-alignment for maximum efficiency 0x0: 128b alignment (default) 0x1: 256b alignment 0x2: 512b alignment
7:4	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2
3:0	REQ_DEPTH_LIMIT	Pending request limit, default max value of 0x7 means maximum pending requests allowed in the design Anything less limits the bus requests to that number + 1.

0x01A49210 MDSS_MDP_VP_0_LAYER_4_CURSOR_FETCH_SMP_WR_PLANE0**Type:** R**Reset State:** 0x00000000

Fetch to SMP on plane 0 write counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_4_CURSOR_FETCH_SMP_WR_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each write fetch makes to the SMP plane0 port This should correlate to value SMP_UNPACK_RD_PLANE0 More useful for debug but can be used for profiling purposes as well.

0x01A49214 MDSS_MDP_VP_0_LAYER_4_CURSOR_SMP_UNPACK_RD_PLANE0**Type:** R**Reset State:** 0x00000000

SMP to unpack on plane 0 read counter

double buffered: N/A

MDSS_MDP_VP_0_LAYER_4_CURSOR_SMP_UNPACK_RD_PLANE0

Bits	Name	Description
15:0	COUNT	This counter is reset on every frame and is incremented for each line read from SMP plane0 port This should correlate to FETCH_SMP_WR_PLANE0 value More useful for debug but can be used for profiling purposes as well.

0x01A49220 MDSS_MDP_VP_0_LAYER_4_CURSOR_REQPRIORITY_FIFO_WATERMARK_0**Type:** RW**Reset State:** 0x00000008

FIFO watermark to aid in generation of mdpREQPRIORITY

The watermark here refers to the dedicated cursor fetch memory.

The value programmed here should be aware of the amount of dedicated cursor fetch memory.

So a value of 0 indicates completely FULL (i.e. there are no more entries available in the dedicated memory)

A value of 100 indicates 100 entries in the Shared Memory Pool (each entry being 128-bit entries)

This is the lowestmost FIFO depth and should not be programmed higher than REQPRIORITY_FIFO_WATERMARK_1 or REQPRIORITY_FIFO_WATERMARK_2

An example programming would set the following:

REQPRIORITY_FIFO_WATERMARK_0 : 0x08 (meaning 0x08 entries free to be written into dedicated cursor fetch memory - least room available)

REQPRIORITY_FIFO_WATERMARK_1 : 0x10 (meaning 0x10 entries free to be written into dedicated cursor fetch memory - middle ground room available)

REQPRIORITY_FIFO_WATERMARK_2 : 0x20 (meaning 0x20 entries free to be written into dedicated cursor fetch memory - most room available)

mdpREQPRIORITY = 11 (highest priority request) when above all 3 watermark levels (i.e. lots of space available in dedicated cursor fetch memory)

mdpREQPRIORITY = 10 above FIFO_0 and FIFO_1 but below FIFO_2

mdpREQPRIORITY = 01 above FIFO_0 but below FIFO_1 and FIFO_2

mdpREQPRIORITY = 00 (lowest priority request) when below all 3 watermark levels (i.e. not a lot of space available in dedicated cursor fetch memory so its good)

double buffered: YES

MDSS_MDP_VP_0_LAYER_4_CURSOR_REQPRIORITY_FIFO_WATERMARK_0

Bits	Name	Description
15:0	WATERMARK	Watermark Level for FIFO_0

0x01A49224 MDSS_MDP_VP_0_LAYER_4_CURSOR_REQPRIORITY_FIFO_WATERMARK_1

Type: RW

Reset State: 0x00000010

4*c****Type:** RW**Reset State:** 0x00000000

Red Green Coefficient for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RG_COEFF

Bits	Name	Description
27:0	COEFF	RED GREEN Coefficient for RED/GREEN/BLUE plane. Total format is S1.27

**0x01A55090+ MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RB_COEFF, c=[0..2]
4*c****Type:** RW**Reset State:** 0x00000000

Red Blue Coefficient for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RB_COEFF

Bits	Name	Description
27:0	COEFF	RED BLUE Coefficient for RED/GREEN/BLUE plane. Total format is S1.27

**0x01A550A0+MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_GG_COEFF, c=[0..2]
4*c****Type:** RW**Reset State:** 0x00000000

Green Green Coefficient for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_GG_COEFF

Bits	Name	Description
27:0	COEFF	GREEN GREEN Coefficient for RED/GREEN/BLUE plane. Total format is S1.27

**0x01A550B0+MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_BG_COEFF, c=[0..2]
4*c****Type:** RW**Reset State:** 0x00000000

Blue Green Coefficient for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_BG_COEFF

Bits	Name	Description
27:0	COEFF	BLUE GREEN Coefficient for RED/GREEN/BLUE plane. Total format is S1.27

**0x01A550C0+MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_BB_COEFF, c=[0..2]
4*c****Type:** RW**Reset State:** 0x00000000

Blue Blue Coefficient for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_BB_COEFF

Bits	Name	Description
27:0	COEFF	BLUE BLUE Coefficient for RED/GREEN/BLUE plane. Total format is S1.27

**0x01A550D0+MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RGB_COEFF_0, c=[0..2]
4*c**

Type: RW

Reset State: 0x00000000

Red Blue Green Coefficient for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RGB_COEFF_0

Bits	Name	Description
7:0	COEFF	PCC coefficient data (sign + 7 fractional bits - S1.39) for RGB_0 and RGB_1 field

**0x01A550E0+MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RGB_COEFF_1, c=[0..2]
4*c**

Type: RW

Reset State: 0x00000000

Red Blue Green for RED/GREEN/BLUE plane

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PCC_PLANEc_RGB_COEFF_1

Bits	Name	Description
31:0	COEFF	PCC coefficient data (remaining 32 fractional bits - S1.39) for RGB_0 and RGB_1 field

0x01A55150 MDSS_MDP_VP_0_DSPP_0_DITHER_BITDEPTH

Type: RW

Reset State: 0x00000000

Dither Strength

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_DITHER_BITDEPTH

Bits	Name	Description
5:4	C2_BITS	Number of MSB bits on component2 to indicate the dithering boundary 0x0: 4bits 0x1: 5bits 0x2: 6bits 0x3: 8bits
3:2	C1_BITS	Number of MSB bits on component1 to indicate the dithering boundary 0x0: 4bits 0x1: 5bits 0x2: 6bits 0x3: 8bits
1:0	C0_BITS	Number of MSB bits on component0 to indicate the dithering boundary 0x0: 4bits 0x1: 5bits 0x2: 6bits 0x3: 8bits

0x01A55164 MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW0**Type:** RW**Reset State:** 0x00005D7F

Dither Strength Matrix Values Register for first row which covers entries [0-3]

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW0

Bits	Name	Description
15:12	ENTRY_3	Entry 3 for the dither matrix
11:8	ENTRY_2	Entry 2 for the dither matrix
7:4	ENTRY_1	Entry 1 for the dither matrix
3:0	ENTRY_0	Entry 0 for the dither matrix

0x01A55168 MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW1**Type:** RW**Reset State:** 0x000091B3

Dither Strength Matrix Values Register for first row which covers entries [4-7]

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW1

Bits	Name	Description
15:12	ENTRY_7	Entry 7 for the dither matrix
11:8	ENTRY_6	Entry 6 for the dither matrix
7:4	ENTRY_5	Entry 5 for the dither matrix
3:0	ENTRY_4	Entry 4 for the dither matrix

0x01A5516C MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW2

Type: RW

Reset State: 0x00006E4C

Dither Strength Matrix Values Register for first row which covers entries [8-11]

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW2

Bits	Name	Description
15:12	ENTRY_11	Entry 11 for the dither matrix
11:8	ENTRY_10	Entry 10 for the dither matrix
7:4	ENTRY_9	Entry 9 for the dither matrix
3:0	ENTRY_8	Entry 8 for the dither matrix

0x01A55170 MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW3

Type: RW

Reset State: 0x0000A280

Dither Strength Matrix Values Register for first row which covers entries [12-15]

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW3

Bits	Name	Description
15:12	ENTRY_15	Entry 15 for the dither matrix
11:8	ENTRY_14	Entry 14 for the dither matrix

MDSS_MDP_VP_0_DSPP_0_DITHER_MATRIX_ROW3 (cont.)

Bits	Name	Description
7:4	ENTRY_13	Entry 13 for the dither matrix
3:0	ENTRY_12	Entry 12 for the dither matrix

0x01A55210 MDSS_MDP_VP_0_DSPP_0_HIST_COLLECT_CTL**Type:** RW**Reset State:** 0x00000000

Histogram Collection Control

double buffered: YES

except for LOCK

MDSS_MDP_VP_0_DSPP_0_HIST_COLLECT_CTL

Bits	Name	Description
0	LOCK	0: SW and HW swap their access on the 2 histogram tables; HW collects on a new table on the new frame, while SW accesses the histogram of the last frame on the table just swapped out by HW 1: current table will be overwritten for new collection on the next frame, the other table remains untouched for SW to continue to access

0x01A55214 MDSS_MDP_VP_0_DSPP_0_HIST_MIN_MAX**Type:** R**Reset State:** 0x00000000

MIN and MAX V value over the entire frame

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_HIST_MIN_MAX

Bits	Name	Description
23:16	MAX	Maximum V value of the last collected frame
7:0	MIN	Minimum V value of the last collected frame

0x01A55218 MDSS_MDP_VP_0_DSPP_0_HIST_FRAME_COLLECTED**Type:** R**Reset State:** 0x00000000

Histogram Frame Number since the last rising START

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_HIST_FRAME_COLLECTED

Bits	Name	Description
31:0	FRAME_NUM	The frame number that the current histogram accessible by SW was collected from

0x01A5521C MDSS_MDP_VP_0_DSPP_0_HIST_SEL**Type:** R**Reset State:** 0x00000000

PA LUTV and Histogram Table Selection

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_HIST_SEL

Bits	Name	Description
4	HIST_SEL	0x0: Table 0 is available for SW and Table 1 is available for HW 0x1: Table 1 is available for SW and Table 0 is available for HW
0	PA_LUTV_SEL	0x0: LUT0 is available for SW and LUT1 is available for HW 0x1: LUT1 is available for SW and LUT0 is available for HW

0x01A55220 MDSS_MDP_VP_0_DSPP_0_HIST_SUM**Type:** R**Reset State:** 0x00000000

Accumulated V Value of the frame

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_HIST_SUM

Bits	Name	Description
31:0	HIST_SUM	This sum matches the histogram currently accessible by SW

0x01A5522C MDSS_MDP_VP_0_DSPP_0_HIST_V_DATAN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_0_HIST_V_DATAN**

Bits	Name	Type	Description
31:24	INDEX	RW	
23:0	VALUE	R	

0x01A55230 MDSS_MDP_VP_0_DSPP_0_PA_LUTV**Type:** RW**Reset State:** 0x00000000

PA LUTV data

Auto-incremented by hardware

256 entries are available for reading

double buffered: NO

MDSS_MDP_VP_0_DSPP_0_PA_LUTV

Bits	Name	Description
17	VALUE_UPDATEN	Software issue an write to the LUT 0: VALUE will be written to RAM at INDEX if INDEX_UPDATE=1 or at INDEX+1 if INDEX_UPDATE=0 1: VALUE will not be written to RAM, this setting is appropriate for example when INDEX needs to be updated for read
16	INDEX_UPDATE	Software issue an index update 0: No index update by software 1: Update LUT index to value specified by INDEX
15:8	INDEX	VALUE is stored in this INDEX of the PA_LUTV, next write will be stored to the next higher INDEX
7:0	VALUE	Value read depends on the LUT select and which one is available for reading by software The read sequence to the LUT should always begin with WR INDEX_UPDATE=1, INDEX=<rprr start location> subsequent RD will start from the start location and every read will auto-increment the rprr

0x01A55234 MDSS_MDP_VP_0_DSPP_0_PA_LUTV_SWAP**Type:** W**Reset State:** 0x00000000

Histogram SWAP signal to indicate that the PA_LUTV contents should be swapped

Software accesses one LUT while HW accesses the other LUT

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_DSPP_0_PA_LUTV_SWAP

Bits	Name	Description
0	SWAP	SWAP signal to flip buffers accessible by SW and made available to HW. Achieves double buffering of the LUT values

0x01A55238 MDSS_MDP_VP_0_DSPP_0_PA_HUE_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture HUE Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_0_PA_HUE_ADJUST

Bits	Name	Description
11:0	VALUE	Value in S12, recommend to be within exclusive range xA00 to x600 (i.e. -360 to +360 degree) x600 is equivalent to a shift of 360 degree if VALUE > x5FF in either negative or positive direction, it is circularly clipped (i.e. VALUE + x600 or VALUE - x600)

0x01A5523C MDSS_MDP_VP_0_DSPP_0_PA_SAT_ADJUST**Type:** RW**Reset State:** 0x00001A00

Picture Saturation Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_0_PA_SAT_ADJUST

Bits	Name	Description
15:8	THRSHLD	Below this threshold of saturation, no adjustment is applied to saturation. This field is in U8
7:0	VALUE	Value in S8

0x01A55240 MDSS_MDP_VP_0_DSPP_0_PA_VAL_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_0_PA_VAL_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A55244 MDSS_MDP_VP_0_DSPP_0_PA_CONT_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture Contrast Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_0_PA_CONT_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A55248 MDSS_MDP_VP_0_DSPP_0_SIX_ZONE_ADJ_CURVE_P0**Type:** RW**Reset State:** 0x00000000

Six Zone Adjust Curve Part 0

double buffered: No

MDSS_MDP_VP_0_DSPP_0_SIX_ZONE_ADJ_CURVE_P0

Bits	Name	Description
26	INDEX_UPDATE	Set this to 1 to point current LUT location to INDEX. The LUT location is autoincremented on every value write or read when there is no INDEX_UPDATE Before every series of read, there must be an INDEX_UPDATE
25	VALUE_UPDATEN	Set this to 0 to enable VALUE to be written to the current location of the LUT
24:16	INDEX	Index to one of the 384 location of the LUT
11:0	HUE	S12, recommend to be within exclusive range x2800 and x1800 (i.e. -360 to +360 exclusive) circularly clipped otherwise On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX

0x01A5524C MDSS_MDP_VP_0_DSPP_0_SIX_ZONE_ADJ_CURVE_P1**Type:** RW**Reset State:** 0x00000000

Six Zone Adjust Curve Part 1

double buffered: No

MDSS_MDP_VP_0_DSPP_0_SIX_ZONE_ADJ_CURVE_P1

Bits	Name	Description
27:16	SAT	S2.10, On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX
11:0	VALUE	S2.10, On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX

0x01A55250 MDSS_MDP_VP_0_DSPP_0_SIX_ZONE_THRESHOLDS**Type:** RW**Reset State:** 0x00000000

Six Zone Threshold Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SIX_ZONE_THRESHOLDS

Bits	Name	Description
23:16	VAL_MAX	U8, Value has to be within the inclusive range of MIN to MAX to qualify for six zone adjustment on the pixel
15:8	VAL_MIN	
7:0	SAT_MIN	U8, Saturation has to be above or equal to this threshold to qualify for six zone adjustment

0x01A55254 MDSS_MDP_VP_0_DSPP_0_SKIN_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKIN_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A55258 MDSS_MDP_VP_0_DSPP_0_SKIN_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKIN_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A5525C MDSS_MDP_VP_0_DSPP_0_SKIN_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKIN_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x5ff (i.e. 360 degree), the behaviour will be same as MAX = x600
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for skin tone adjustment on the pixel if MIN > x5ff (i.e. 360 degree), the behaviour will be same as MIN = x600

0x01A55260 MDSS_MDP_VP_0_DSPP_0_SKIN_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKIN_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A55264 MDSS_MDP_VP_0_DSPP_0_SKIN_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKIN_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A55268 MDSS_MDP_VP_0_DSPP_0_SKY_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKY_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A5526C MDSS_MDP_VP_0_DSPP_0_SKY_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKY_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A55270 MDSS_MDP_VP_0_DSPP_0_SKY_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKY_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x5ff (i.e. 360 degree), the behaviour will be same as MAX = x600
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for sky tone adjustment on the pixel if MIN > x5ff (i.e. 360 degree), the behaviour will be same as MIN = x600

0x01A55274 MDSS_MDP_VP_0_DSPP_0_SKY_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKY_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A55278 MDSS_MDP_VP_0_DSPP_0_SKY_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_SKY_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A5527C MDSS_MDP_VP_0_DSPP_0_FOLIAGE_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_0_FOLIAGE_ADJUST_PWL0**

Bits	Name	Description
31:16	HUE_GAIN	
10:0	HUE_MID	

0x01A55280 MDSS_MDP_VP_0_DSPP_0_FOLIAGE_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_0_FOLIAGE_ADJUST_PWL1**

Bits	Name	Description
31:16	VAL_GAIN	
15:0	SAT_GAIN	

0x01A55284 MDSS_MDP_VP_0_DSPP_0_FOLIAGE_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Foilage Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_FOLIAGE_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x5ff (i.e. 360 degree), the behaviour will be same as MAX = x600
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for foliage tone adjustment on the pixel if MIN > x5ff (i.e. 360 degree), the behaviour will be same as MIN = x600

0x01A55288 MDSS_MDP_VP_0_DSPP_0_FOLIAGE_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Foliage Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_FOLIAGE_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for foliage adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for foliage adjustment on the pixel

0x01A5528C MDSS_MDP_VP_0_DSPP_0_FOLIAGE_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Foliage Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_0_FOLIAGE_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for foliage adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for foliage adjustment on the pixel

0x01A552B0 MDSS_MDP_VP_0_DSPP_0_GC_ARLUT_RED_STARTX_N**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_0_GC_ARLUT_RED_STARTX_N**

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_DITHER_MATRIX_ROW1

Bits	Name	Description
15:12	ENTRY_7	Entry 7 for the dither matrix
11:8	ENTRY_6	Entry 6 for the dither matrix
7:4	ENTRY_5	Entry 5 for the dither matrix
3:0	ENTRY_4	Entry 4 for the dither matrix

0x01A5716C MDSS_MDP_VP_0_DSPP_1_DITHER_MATRIX_ROW2**Type:** RW**Reset State:** 0x00006E4C

Dither Strength Matrix Values Register for first row which covers entries [8-11]

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_DITHER_MATRIX_ROW2

Bits	Name	Description
15:12	ENTRY_11	Entry 11 for the dither matrix
11:8	ENTRY_10	Entry 10 for the dither matrix
7:4	ENTRY_9	Entry 9 for the dither matrix
3:0	ENTRY_8	Entry 8 for the dither matrix

0x01A57170 MDSS_MDP_VP_0_DSPP_1_DITHER_MATRIX_ROW3**Type:** RW**Reset State:** 0x0000A280

Dither Strength Matrix Values Register for first row which covers entries [12-15]

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_DITHER_MATRIX_ROW3

Bits	Name	Description
15:12	ENTRY_15	Entry 15 for the dither matrix
11:8	ENTRY_14	Entry 14 for the dither matrix
7:4	ENTRY_13	Entry 13 for the dither matrix
3:0	ENTRY_12	Entry 12 for the dither matrix

0x01A57210 MDSS_MDP_VP_0_DSPP_1_HIST_COLLECT_CTL**Type:** RW**Reset State:** 0x00000000

Histogram Collection Control

double buffered: YES

except for LOCK

MDSS_MDP_VP_0_DSPP_1_HIST_COLLECT_CTL

Bits	Name	Description
0	LOCK	0: SW and HW swap their access on the 2 histogram tables; HW collects on a new table on the new frame, while SW accesses the histogram of the last frame on the table just swapped out by HW 1: current table will be overwritten for new collection on the next frame, the other table remains untouched for SW to continue to access

0x01A57214 MDSS_MDP_VP_0_DSPP_1_HIST_MIN_MAX**Type:** R**Reset State:** 0x00000000

MIN and MAX V value over the entire frame

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_HIST_MIN_MAX

Bits	Name	Description
23:16	MAX	Maximum V value of the last collected frame
7:0	MIN	Minimum V value of the last collected frame

0x01A57218 MDSS_MDP_VP_0_DSPP_1_HIST_FRAME_COLLECTED**Type:** R**Reset State:** 0x00000000

Histogram Frame Number since the last rising START

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_HIST_FRAME_COLLECTED

Bits	Name	Description
31:0	FRAME_NUM	The frame number that the current histogram accessible by SW was collected from

0x01A5721C MDSS_MDP_VP_0_DSPP_1_HIST_SEL**Type:** R**Reset State:** 0x00000000

PA LUTV and Histogram Table Selection

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_HIST_SEL

Bits	Name	Description
4	HIST_SEL	0x0: Table 0 is available for SW and Table 1 is available for HW 0x1: Table 1 is available for SW and Table 0 is available for HW
0	PA_LUTV_SEL	0x0: LUT0 is available for SW and LUT1 is available for HW 0x1: LUT1 is available for SW and LUT0 is available for HW

0x01A57220 MDSS_MDP_VP_0_DSPP_1_HIST_SUM**Type:** R**Reset State:** 0x00000000

Accumulated V Value of the frame

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_HIST_SUM

Bits	Name	Description
31:0	HIST_SUM	This sum matches the histogram currently accessible by SW

0x01A5722C MDSS_MDP_VP_0_DSPP_1_HIST_V_DATAN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_1_HIST_V_DATAN**

Bits	Name	Type	Description
31:24	INDEX	RW	
23:0	VALUE	R	

0x01A57230 MDSS_MDP_VP_0_DSPP_1_PA_LUTV**Type:** RW**Reset State:** 0x00000000

PA LUTV data

Auto-incremented by hardware

256 entries are available for reading

double buffered: NO

MDSS_MDP_VP_0_DSPP_1_PA_LUTV

Bits	Name	Description
17	VALUE_UPDATEN	Software issue an write to the LUT 0: VALUE will be written to RAM at INDEX if INDEX_UPDATE=1 or at INDEX+1 if INDEX_UPDATE=0 1: VALUE will not be written to RAM, this setting is appropriate for example when INDEX needs to be updated for read
16	INDEX_UPDATE	Software issue an index update 0: No index update by software 1: Update LUT index to value specified by INDEX
15:8	INDEX	VALUE is stored in this INDEX of the PA_LUTV, next write will be stored to the next higher INDEX
7:0	VALUE	Value read depends on the LUT select and which one is available for reading by software The read sequence to the LUT should always begin with WR INDEX_UPDATE=1, INDEX=<rptr start location> subsequent RD will start from the start location and every read will auto-increment the rptr

0x01A57234 MDSS_MDP_VP_0_DSPP_1_PA_LUTV_SWAP**Type:** W**Reset State:** 0x00000000

Histogram SWAP signal to indicate that the PA_LUTV contents should be swapped

Software accesses one LUT while HW accesses the other LUT

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_DSPP_1_PA_LUTV_SWAP

Bits	Name	Description
0	SWAP	SWAP signal to flip buffers accessible by SW and made available to HW. Achieves double buffering of the LUT values

0x01A57238 MDSS_MDP_VP_0_DSPP_1_PA_HUE_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture HUE Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_1_PA_HUE_ADJUST

Bits	Name	Description
11:0	VALUE	Value in S12, recommend to be within exclusive range xA00 to x600 (i.e. -360 to +360 degree) x600 is equivalent to a shift of 360 degree if VALUE > x5FF in either negative or positive direction, it is circularly clipped (i.e. VALUE + x600 or VALUE - x600)

0x01A5723C MDSS_MDP_VP_0_DSPP_1_PA_SAT_ADJUST**Type:** RW**Reset State:** 0x00001A00

Picture Saturation Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_1_PA_SAT_ADJUST

Bits	Name	Description
15:8	THRSHLD	Below this threshold of saturation, no adjustment is applied to saturation. This field is in U8
7:0	VALUE	Value in S8

0x01A57240 MDSS_MDP_VP_0_DSPP_1_PA_VAL_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_1_PA_VAL_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A57244 MDSS_MDP_VP_0_DSPP_1_PA_CONT_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture Contrast Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_1_PA_CONT_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A57248 MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_ADJ_CURVE_P0**Type:** RW**Reset State:** 0x00000000

Six Zone Adjust Curve Part 0

double buffered: No

MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_ADJ_CURVE_P0

Bits	Name	Description
26	INDEX_UPDATE	Set this to 1 to point current LUT location to INDEX. The LUT location is autoincremented on every value write or read when there is no INDEX_UPDATE Before every series of read, there must be an INDEX_UPDATE
25	VALUE_UPDATEN	Set this to 0 to enable VALUE to be written to the current location of the LUT

MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_ADJ_CURVE_P0 (cont.)

Bits	Name	Description
24:16	INDEX	Index to one of the 384 location of the LUT
11:0	HUE	S12, recommend to be within exclusive range x2800 and x1800 (i.e. -360 to +360 exclusive) circularly clipped otherwise On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX

0x01A5724C MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_ADJ_CURVE_P1**Type:** RW**Reset State:** 0x00000000

Six Zone Adjust Curve Part 1

double buffered: No

MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_ADJ_CURVE_P1

Bits	Name	Description
27:16	SAT	S2.10, On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX
11:0	VALUE	S2.10, On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX

0x01A57250 MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_THRESHOLDS**Type:** RW**Reset State:** 0x00000000

Six Zone Threshold Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SIX_ZONE_THRESHOLDS

Bits	Name	Description
23:16	VAL_MAX	U8, Value has to be within the inclusive range of MIN to MAX to qualify for six zone adjustment on the pixel
15:8	VAL_MIN	
7:0	SAT_MIN	U8, Saturation has to be above or equal to this threshold to qualify for six zone adjustment

0x01A57254 MDSS_MDP_VP_0_DSPP_1_SKIN_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKIN_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A57258 MDSS_MDP_VP_0_DSPP_1_SKIN_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Skin Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKIN_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A5725C MDSS_MDP_VP_0_DSPP_1_SKIN_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKIN_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x5ff (i.e. 360 degree), the behaviour will be same as MAX = x600
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for skin tone adjustment on the pixel if MIN > x5ff (i.e. 360 degree), the behaviour will be same as MIN = x600

0x01A57260 MDSS_MDP_VP_0_DSPP_1_SKIN_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKIN_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A57264 MDSS_MDP_VP_0_DSPP_1_SKIN_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Skin Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKIN_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for skin tone adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for skin tone adjustment on the pixel

0x01A57268 MDSS_MDP_VP_0_DSPP_1_SKY_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKY_ADJUST_PWL0

Bits	Name	Description
31:16	HUE_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
10:0	HUE_MID	U11, this is the offset from the min and max hue of skin region which marks the top 2 corners of the trapezoid

0x01A5726C MDSS_MDP_VP_0_DSPP_1_SKY_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000

Sky Piece-wise Linear Adjustment Curve

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKY_ADJUST_PWL1

Bits	Name	Description
31:16	VAL_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides
15:0	SAT_GAIN	S16, is a symmetrical trapezoidal curve, this is the slope of the 2 sides

0x01A57270 MDSS_MDP_VP_0_DSPP_1_SKY_REGION_HUE**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Hue Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKY_REGION_HUE

Bits	Name	Description
26:16	MAX	if MAX > x5ff (i.e. 360 degree), the behaviour will be same as MAX = x600
10:0	MIN	U11, Hue has to be within the inclusive range of MIN to MAX to qualify for sky tone adjustment on the pixel if MIN > x5ff (i.e. 360 degree), the behaviour will be same as MIN = x600

0x01A57274 MDSS_MDP_VP_0_DSPP_1_SKY_REGION_SAT**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Saturation Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKY_REGION_SAT

Bits	Name	Description
15:8	MAX	Saturation has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Saturation has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A57278 MDSS_MDP_VP_0_DSPP_1_SKY_REGION_VAL**Type:** RW**Reset State:** 0x00000000

Sky Adjustment Value Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_1_SKY_REGION_VAL

Bits	Name	Description
15:8	MAX	Value has to be below or equal to this to qualify for sky adjustment on the pixel
7:0	MIN	U8, Value has to be above or equal to this to qualify for sky adjustment on the pixel

0x01A5727C MDSS_MDP_VP_0_DSPP_1_FOLIAGE_ADJUST_PWL0**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_1_FOLIAGE_ADJUST_PWL0**

Bits	Name	Description
31:16	HUE_GAIN	
10:0	HUE_MID	

0x01A57280 MDSS_MDP_VP_0_DSPP_1_FOLIAGE_ADJUST_PWL1**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_1_FOLIAGE_ADJUST_PWL1**

Dither Strength Matrix Values Register for first row which covers entries [12-15]

double buffered: NO

MDSS_MDP_VP_0_DSPP_2_DITHER_MATRIX_ROW3

Bits	Name	Description
15:12	ENTRY_15	Entry 15 for the dither matrix
11:8	ENTRY_14	Entry 14 for the dither matrix
7:4	ENTRY_13	Entry 13 for the dither matrix
3:0	ENTRY_12	Entry 12 for the dither matrix

0x01A59210 MDSS_MDP_VP_0_DSPP_2_HIST_COLLECT_CTL**Type:** RW**Reset State:** 0x00000000

Histogram Collection Control

double buffered: YES

except for LOCK

MDSS_MDP_VP_0_DSPP_2_HIST_COLLECT_CTL

Bits	Name	Description
0	LOCK	0: SW and HW swap their access on the 2 histogram tables; HW collects on a new table on the new frame, while SW accesses the histogram of the last frame on the table just swapped out by HW 1: current table will be overwritten for new collection on the next frame, the other table remains untouched for SW to continue to access

0x01A59214 MDSS_MDP_VP_0_DSPP_2_HIST_MIN_MAX**Type:** R**Reset State:** 0x00000000

MIN and MAX V value over the entire frame

double buffered: NO

MDSS_MDP_VP_0_DSPP_2_HIST_MIN_MAX

Bits	Name	Description
23:16	MAX	Maximum V value of the last collected frame
7:0	MIN	Minimum V value of the last collected frame

0x01A59218 MDSS_MDP_VP_0_DSPP_2_HIST_FRAME_COLLECTED

Type: R

Reset State: 0x00000000

Histogram Frame Number since the last rising START

double buffered: NO

MDSS_MDP_VP_0_DSPP_2_HIST_FRAME_COLLECTED

Bits	Name	Description
31:0	FRAME_NUM	The frame number that the current histogram accessible by SW was collected from

0x01A5921C MDSS_MDP_VP_0_DSPP_2_HIST_SEL

Type: R

Reset State: 0x00000000

PA LUTV and Histogram Table Selection

double buffered: NO

MDSS_MDP_VP_0_DSPP_2_HIST_SEL

Bits	Name	Description
4	HIST_SEL	0x0: Table 0 is available for SW and Table 1 is available for HW 0x1: Table 1 is available for SW and Table 0 is available for HW
0	PA_LUTV_SEL	0x0: LUT0 is available for SW and LUT1 is available for HW 0x1: LUT1 is available for SW and LUT0 is available for HW

0x01A59220 MDSS_MDP_VP_0_DSPP_2_HIST_SUM**Type:** R**Reset State:** 0x00000000

Accumulated V Value of the frame

double buffered: NO

MDSS_MDP_VP_0_DSPP_2_HIST_SUM

Bits	Name	Description
31:0	HIST_SUM	This sum matches the histogram currently accessible by SW

0x01A5922C MDSS_MDP_VP_0_DSPP_2_HIST_V_DATAN**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_VP_0_DSPP_2_HIST_V_DATAN**

Bits	Name	Type	Description
31:24	INDEX	RW	
23:0	VALUE	R	

0x01A59230 MDSS_MDP_VP_0_DSPP_2_PA_LUTV**Type:** RW**Reset State:** 0x00000000

PA LUTV data

Auto-incremented by hardware

256 entries are available for reading

double buffered: NO

MDSS_MDP_VP_0_DSPP_2_PA_LUTV

Bits	Name	Description
17	VALUE_UPDATEN	Software issue an write to the LUT 0: VALUE will be written to RAM at INDEX if INDEX_UPDATE=1 or at INDEX+1 if INDEX_UPDATE=0 1: VALUE will not be written to RAM, this setting is appropriate for example when INDEX needs to be updated for read

MDSS_MDP_VP_0_DSPP_2_PA_LUTV (cont.)

Bits	Name	Description
16	INDEX_UPDATE	Software issue an index update 0: No index update by software 1: Update LUT index to value specified by INDEX
15:8	INDEX	VALUE is stored in this INDEX of the PA_LUTV, next write will be stored to the next higher INDEX
7:0	VALUE	Value read depends on the LUT select and which one is available for reading by software The read sequence to the LUT should always begin with WR INDEX_UPDATE=1, INDEX=<rptr start location> subsequent RD will start from the start location and every read will auto-increment the rptr

0x01A59234 MDSS_MDP_VP_0_DSPP_2_PA_LUTV_SWAP**Type:** W**Reset State:** 0x00000000

Histogram SWAP signal to indicate that the PA_LUTV contents should be swapped

Software accesses one LUT while HW accesses the other LUT

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_VP_0_DSPP_2_PA_LUTV_SWAP

Bits	Name	Description
0	SWAP	SWAP signal to flip buffers accessible by SW and made available to HW. Achieves double buffering of the LUT values

0x01A59238 MDSS_MDP_VP_0_DSPP_2_PA_HUE_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture HUE Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_2_PA_HUE_ADJUST

Bits	Name	Description
11:0	VALUE	Value in S12, recommend to be within exclusive range xA00 to x600 (i.e. -360 to +360 degree) x600 is equivalent to a shift of 360 degree if VALUE > x5FF in either negative or positive direction, it is circularly clipped (i.e. VALUE + x600 or VALUE - x600)

0x01A5923C MDSS_MDP_VP_0_DSPP_2_PA_SAT_ADJUST**Type:** RW**Reset State:** 0x00001A00

Picture Saturation Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_2_PA_SAT_ADJUST

Bits	Name	Description
15:8	THRSHLD	Below this threshold of saturation, no adjustment is applied to saturation. This field is in U8
7:0	VALUE	Value in S8

0x01A59240 MDSS_MDP_VP_0_DSPP_2_PA_VAL_ADJUST**Type:** RW**Reset State:** 0x00000000

Picture Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_2_PA_VAL_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

Picture Contrast Adjustment

double buffered: YES

MDSS_MDP_VP_0_DSPP_2_PA_CONT_ADJUST

Bits	Name	Description
7:0	VALUE	Value in S8

0x01A59248 MDSS_MDP_VP_0_DSPP_2_SIX_ZONE_ADJ_CURVE_P0

Type: RW

Reset State: 0x00000000

Six Zone Adjust Curve Part 0

double buffered: No

MDSS_MDP_VP_0_DSPP_2_SIX_ZONE_ADJ_CURVE_P0

Bits	Name	Description
26	INDEX_UPDATE	Set this to 1 to point current LUT location to INDEX. The LUT location is autoincremented on every value write or read when there is no INDEX_UPDATE Before every series of read, there must be an INDEX_UPDATE
25	VALUE_UPDATEN	Set this to 0 to enable VALUE to be written to the current location of the LUT
24:16	INDEX	Index to one of the 384 location of the LUT
11:0	HUE	S12, recommend to be within exclusive range x2800 and x1800 (i.e. -360 to +360 exclusive) circularly clipped otherwise On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX

0x01A5924C MDSS_MDP_VP_0_DSPP_2_SIX_ZONE_ADJ_CURVE_P1

Type: RW

Reset State: 0x00000000

Six Zone Adjust Curve Part 1

double buffered: No

MDSS_MDP_VP_0_DSPP_2_SIX_ZONE_ADJ_CURVE_P1

Bits	Name	Description
27:16	SAT	S2.10, On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX
11:0	VALUE	S2.10, On write: Value to be updated to one of the 384 entry LUT On read : Value read out from LUT location pointed by INDEX

0x01A59250 MDSS_MDP_VP_0_DSPP_2_SIX_ZONE_THRESHOLDS**Type:** RW**Reset State:** 0x00000000

Six Zone Threshold Qualifier

double buffered: Yes

MDSS_MDP_VP_0_DSPP_2_SIX_ZONE_THRESHOLDS

Bits	Name	Description
23:16	VAL_MAX	U8, Value has to be within the inclusive range of MIN to MAX to qualify for six zone adjustment on the pixel
15:8	VAL_MIN	
7:0	SAT_MIN	U8, Saturation has to be above or equal to this threshold to qualify for six zone adjustment

0x01A65038 MDSS_MDP_WB_0_DITHER_MATRIX_ROW2

Type: RW

Reset State: 0x00006E4C

Dither Strength Matrix Values Register for first row which covers entries [8-11]

double buffered: NO

MDSS_MDP_WB_0_DITHER_MATRIX_ROW2

Bits	Name	Description
15:12	ENTRY_11	Entry 11 for the dither matrix
11:8	ENTRY_10	Entry 10 for the dither matrix
7:4	ENTRY_9	Entry 9 for the dither matrix

MDSS_MDP_WB_0_DITHER_MATRIX_ROW2 (cont.)

Bits	Name	Description
3:0	ENTRY_8	Entry 8 for the dither matrix

0x01A6503C MDSS_MDP_WB_0_DITHER_MATRIX_ROW3**Type:** RW**Reset State:** 0x0000A280

Dither Strength Matrix Values Register for first row which covers entries [12-15]

double buffered: NO

MDSS_MDP_WB_0_DITHER_MATRIX_ROW3

Bits	Name	Description
15:12	ENTRY_15	Entry 15 for the dither matrix
11:8	ENTRY_14	Entry 14 for the dither matrix
7:4	ENTRY_13	Entry 13 for the dither matrix
3:0	ENTRY_12	Entry 12 for the dither matrix

0x01A65048 MDSS_MDP_WB_0_DST_WRITE_CONFIG**Type:** RW**Reset State:** 0x00000008

Write-back Configuration double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_WB_0_DST_WRITE_CONFIG

Bits	Name	Description
10	ADDR_GEN_MODE	
9:8	HIGHEST_BANK_BIT	
7:6	PRIORITY_LEVEL	Priority Level. Side-band priority reflecting the status of VBIF client. 0x3 - max priority 0x0 - min priority
5:4	REQ_PRIORITY	Request Priority. In-band priority level assigned when VBIF transaction is created. 0x3 - max priority 0x0 - min priority

MDSS_MDP_WB_0_DST_WRITE_CONFIG (cont.)

Bits	Name	Description
3:0	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2 0x1: burst of 1

0x01A65054 MDSS_MDP_WB_0_ROTATOR_PIPE_DOWNSCALER**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_WB_0_ROTATOR_PIPE_DOWNSCALER**

Bits	Name	Description
28:16	COEFF_32	Coefficient value in S4.9 format Row 3 Column 2
12:0	COEFF_31	Coefficient value in S4.9 format Row 3 Column 1

0x01A65270 MDSS_MDP_WB_0_CSC_MATRIX_COEFF_4**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients

double buffered: NO

MDSS_MDP_WB_0_CSC_MATRIX_COEFF_4

Bits	Name	Description
12:0	COEFF_33	Coefficient value in S4.9 format Row 3 Column 3

0x01A65274 MDSS_MDP_WB_0_CSC_COMP0_PRECLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 pre-clamp value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP0_PRECLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A65278 MDSS_MDP_WB_0_CSC_COMP1_PRECLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 pre-clamp value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP1_PRECLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A6527C MDSS_MDP_WB_0_CSC_COMP2_PRECLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 pre-clamp value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP2_PRECLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A65280 MDSS_MDP_WB_0_CSC_COMP0_POSTCLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 post-clamp value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP0_POSTCLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A65284 MDSS_MDP_WB_0_CSC_COMP1_POSTCLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 post-clamp value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP1_POSTCLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A65288 MDSS_MDP_WB_0_CSC_COMP2_POSTCLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 post-clamp value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP2_POSTCLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A6528C MDSS_MDP_WB_0_CSC_COMP0_PREBIAS**Type:** RW**Reset State:** 0x00000000

Component 0 pre-bias value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP0_PREBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A65290 MDSS_MDP_WB_0_CSC_COMP1_PREBIAS**Type:** RW**Reset State:** 0x00000000

Component 1 pre-bias value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP1_PREBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A65294 MDSS_MDP_WB_0_CSC_COMP2_PREBIAS**Type:** RW**Reset State:** 0x00000000

Component 2 pre-bias value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP2_PREBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A65298 MDSS_MDP_WB_0_CSC_COMP0_POSTBIAS**Type:** RW**Reset State:** 0x00000000

Component 0 post-bias value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP0_POSTBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A6529C MDSS_MDP_WB_0_CSC_COMP1_POSTBIAS**Type:** RW**Reset State:** 0x00000000

Component 1 post-bias value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP1_POSTBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A652A0 MDSS_MDP_WB_0_CSC_COMP2_POSTBIAS**Type:** RW**Reset State:** 0x00000000

Component 2 post-bias value

double buffered: NO

MDSS_MDP_WB_0_CSC_COMP2_POSTBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A652B0 MDSS_MDP_WB_0_DST_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the destination buffer plane

This provides a SW override to the hardware calculated content protection sent to VBIF

This value is logically or ed with the source content protection produced by hardware

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

Note that the VBIF context banks need to be properly programmed for the output to be successful

double buffered: NO

MDSS_MDP_WB_0_DST_ADDR_SW_STATUS

Bits	Name	Description
0	DST_ADDR_CP	This is the secure status bit for destination plane 0 (if used) Memory transactions will not complete if this status doesnt correspond to system programming in the rest of the path to memory 0x0: Content Protected Buffer State 0x1: Non Content Protected Buffer State

0x01A65AB0 MDSS_MDP_WB_1_DST_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the destination buffer plane

This provides a SW override to the hardware calculated content protection sent to VBIF

This value is logically or ed with the source content protection produced by hardware

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

Note that the VBIF context banks need to be properly programmed for the output to be successful

double buffered: NO

MDSS_MDP_WB_1_DST_ADDR_SW_STATUS

Bits	Name	Description
0	DST_ADDR_CP	This is the secure status bit for destination plane 0 (if used) Memory transactions will not complete if this status doesnt correspond to system programming in the rest of the path to memory 0x0: Content Protected Buffer State 0x1: Non Content Protected Buffer State

MDSS_MDP_WB_4_DST_OP_MODE (cont.)

Bits	Name	Description
11	CHROMA_DWN_SAMPLE_EN	Chroma Down Sample enable for YUV444 NOTE: This is not valid for WB0. 0x0: Disabled 0x1: Enabled
10	CSC_DST_DATA_FORMAT	Destination Data Format 0x0: RGB 0x1: YCbCr
9	CSC_SRC_DATA_FORMAT	Source Data Format 0x0: RGB 0x1: YCbCr
8	CSC_EN	Enables the color matrix conversion NOTE: This is not valid for WB0. 0x0: Bypass 0x1: Enabled
6	ROT_EN	0x0: Rotate Disabled 0x1: Rotate Enabled
5	ROT_MODE	0x0: Rotate 0 0x1: Rotate 90
4	BLOCK_SIZE	0x0: 64x64 Block Size 0x1: 128x128 Block Size

0x01A67008 MDSS_MDP_WB_4_DST_PACK_PATTERN**Type:** RW**Reset State:** 0x00000000

Write Back Pack Pattern

double buffered: NO

MDSS_MDP_WB_4_DST_PACK_PATTERN

Bits	Name	Description
25:24	ELEMENT3	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
17:16	ELEMENT2	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

MDSS_MDP_WB_4_DST_PACK_PATTERN (cont.)

Bits	Name	Description
9:8	ELEMENT1	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3
1:0	ELEMENT0	0x0: Color0 0x1: Color1 0x2: Color2 0x3: Color3

0x01A6700C MDSS_MDP_WB_4_DST0_ADDR**Type:** RW**Reset State:** 0x00000000

Write Back Destination Address

For fetching BWC data, this plane refers to the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_WB_4_DST0_ADDR

Bits	Name	Description
31:0	ADDR	Destination Address (byte-aligned)

0x01A67010 MDSS_MDP_WB_4_DST1_ADDR**Type:** RW**Reset State:** 0x00000000

Write Back Destination Address

For fetching BWC data, this plane refers to the META data to fetch the lengths of the compressed RAU data stream

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_WB_4_DST1_ADDR

Bits	Name	Description
31:0	ADDR	Destination Address (byte-aligned)

0x01A67014 MDSS_MDP_WB_4_DST2_ADDR**Type:** RW**Reset State:** 0x00000000

Write Back Destination Address

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_WB_4_DST2_ADDR

Bits	Name	Description
31:0	ADDR	Destination Address (byte-aligned)

0x01A67018 MDSS_MDP_WB_4_DST3_ADDR**Type:** RW**Reset State:** 0x00000000

Write Back Destination Address

double buffered: YES

when: On frame boundaries (vsync or SW trigger)

MDSS_MDP_WB_4_DST3_ADDR

Bits	Name	Description
31:0	ADDR	Destination Address (byte-aligned)

0x01A6701C MDSS_MDP_WB_4_DST_YSTRIDE0**Type:** RW**Reset State:** 0x00000000

Stride Values

Double-buffered

double buffered: NO

MDSS_MDP_WB_4_DST_YSTRIDE0

Bits	Name	Description
31:16	DST1_YSTRIDE	Plane 1 Y stride in bytes
15:0	DST0_YSTRIDE	Plane 0 Y stride in bytes

0x01A67020 MDSS_MDP_WB_4_DST_YSTRIDE1

Type: RW

Reset State: 0x00000000

Stride Values

Double-buffered

double buffered: NO

MDSS_MDP_WB_4_DST_YSTRIDE1

Bits	Name	Description
31:16	DST3_YSTRIDE	Plane 3 Y stride in bytes
15:0	DST2_YSTRIDE	Plane 2 Y stride in bytes

0x01A67024 MDSS_MDP_WB_4_DST_DITHER_BITDEPTH

Type: RW

Reset State: 0x00000000

Write Dither Strength

double buffered: NO

MDSS_MDP_WB_4_DST_DITHER_BITDEPTH

Bits	Name	Description
5:4	C2_BITS	Number of MSB bits on component2 to indicate the output depth 0x0: 4bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

MDSS_MDP_WB_4_DST_DITHER_BITDEPTH (cont.)

Bits	Name	Description
3:2	C1_BITS	Number of MSB bits on component1 to indicate the output depth 0x0: 4bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	C0_BITS	Number of MSB bits on component0 to indicate the output depth 0x0: 4bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A67030 MDSS_MDP_WB_4_DITHER_MATRIX_ROW0**Type:** RW**Reset State:** 0x00005D7F

Dither Strength Matrix Values Register for first row which covers entries [0-3]

double buffered: NO

MDSS_MDP_WB_4_DITHER_MATRIX_ROW0

Bits	Name	Description
15:12	ENTRY_3	Entry 3 for the dither matrix
11:8	ENTRY_2	Entry 2 for the dither matrix
7:4	ENTRY_1	Entry 1 for the dither matrix
3:0	ENTRY_0	Entry 0 for the dither matrix

0x01A67034 MDSS_MDP_WB_4_DITHER_MATRIX_ROW1**Type:** RW**Reset State:** 0x000091B3

Dither Strength Matrix Values Register for first row which covers entries [4-7]

double buffered: NO

MDSS_MDP_WB_4_DITHER_MATRIX_ROW1

Bits	Name	Description
15:12	ENTRY_7	Entry 7 for the dither matrix

MDSS_MDP_WB_4_DITHER_MATRIX_ROW1 (cont.)

Bits	Name	Description
11:8	ENTRY_6	Entry 6 for the dither matrix
7:4	ENTRY_5	Entry 5 for the dither matrix
3:0	ENTRY_4	Entry 4 for the dither matrix

0x01A67038 MDSS_MDP_WB_4_DITHER_MATRIX_ROW2**Type:** RW**Reset State:** 0x00006E4C

Dither Strength Matrix Values Register for first row which covers entries [8-11]

double buffered: NO

MDSS_MDP_WB_4_DITHER_MATRIX_ROW2

Bits	Name	Description
15:12	ENTRY_11	Entry 11 for the dither matrix
11:8	ENTRY_10	Entry 10 for the dither matrix
7:4	ENTRY_9	Entry 9 for the dither matrix
3:0	ENTRY_8	Entry 8 for the dither matrix

0x01A6703C MDSS_MDP_WB_4_DITHER_MATRIX_ROW3**Type:** RW**Reset State:** 0x0000A280

Dither Strength Matrix Values Register for first row which covers entries [12-15]

double buffered: NO

MDSS_MDP_WB_4_DITHER_MATRIX_ROW3

Bits	Name	Description
15:12	ENTRY_15	Entry 15 for the dither matrix
11:8	ENTRY_14	Entry 14 for the dither matrix
7:4	ENTRY_13	Entry 13 for the dither matrix
3:0	ENTRY_12	Entry 12 for the dither matrix

0x01A67048 MDSS_MDP_WB_4_DST_WRITE_CONFIG**Type:** RW**Reset State:** 0x00000008

Write-back Configuration double buffered: NO

This register must NOT be altered during operation and MDP must be idle when changing values

MDSS_MDP_WB_4_DST_WRITE_CONFIG

Bits	Name	Description
10	ADDR_GEN_MODE	
9:8	HIGHEST_BANK_BIT	
7:6	PRIORITY_LEVEL	Priority Level. Side-band priority reflecting the status of VBIF client. 0x3 - max priority 0x0 - min priority
5:4	REQ_PRIORITY	Request Priority. In-band priority level assigned when VBIF transaction is created. 0x3 - max priority 0x0 - min priority
3:0	MAX_BURST_SIZE	Maximum burst beat size. Hardware fetch engines operate on 128-bit bus Possible values: 0x8: burst of 8 0x4: burst of 4 0x2: burst of 2 0x1: burst of 1

0x01A67054 MDSS_MDP_WB_4_ROTATOR_PIPE_DOWNSCALER**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_WB_4_ROTATOR_PIPE_DOWNSCALER**

Bits	Name	Description
23:16	DNOSC_FACTOR_V	0x0: V_BYPASS 0x2: V_DNOSC_X2 0x4: V_DNOSC_X4 0x8: V_DNOSC_X8 0x10: V_DNOSC_X16 0x20: V_DNOSC_X32 0x40: V_DNOSC_X64

MDSS_MDP_WB_4_ROTATOR_PIPE_DOWNSCALER (cont.)

Bits	Name	Description
7:0	DNOSC_FACTOR_H	0x0: H_BYPASS 0x2: H_DNOSC_X2 0x4: H_DNOSC_X4 0x8: H_DNOSC_X8 0x10: H_DNOSC_X16 0x20: H_DNOSC_X32 0x40: H_DNOSC_X64

0x01A67074 MDSS_MDP_WB_4_OUT_SIZE**Type:** RW**Reset State:** 0x00000000

Output Size

Should be same as source is scaling is NOT enabled

double buffered: NO

MDSS_MDP_WB_4_OUT_SIZE

Bits	Name	Description
31:16	DST_H	Height of Output ROI
15:0	DST_W	Width of Output ROI

0x01A67078 MDSS_MDP_WB_4_DST_ALPHA_X_VALUE**Type:** RW**Reset State:** 0x00000000

Alpha value used for XRGB formats

double buffered: NO

MDSS_MDP_WB_4_DST_ALPHA_X_VALUE

Bits	Name	Description
7:0	VALUE	Alpha value used for XRGB formats

0x01A67260 MDSS_MDP_WB_4_CSC_MATRIX_COEFF_0**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients

double buffered: NO

MDSS_MDP_WB_4_CSC_MATRIX_COEFF_0

Bits	Name	Description
28:16	COEFF_12	Coefficient value in S4.9 format Row 1 Column 2
12:0	COEFF_11	Coefficient value in S4.9 format Row 1 Column 1

0x01A67264 MDSS_MDP_WB_4_CSC_MATRIX_COEFF_1**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients

double buffered: NO

MDSS_MDP_WB_4_CSC_MATRIX_COEFF_1

Bits	Name	Description
28:16	COEFF_21	Coefficient value in S4.9 format Row 2 Column 1
12:0	COEFF_13	Coefficient value in S4.9 format Row 1 Column 3

0x01A67268 MDSS_MDP_WB_4_CSC_MATRIX_COEFF_2**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients

double buffered: NO

MDSS_MDP_WB_4_CSC_MATRIX_COEFF_2

Bits	Name	Description
28:16	COEFF_23	Coefficient value in S4.9 format Row 2 Column 3
12:0	COEFF_22	Coefficient value in S4.9 format Row 2 Column 2

0x01A6726C MDSS_MDP_WB_4_CSC_MATRIX_COEFF_3**Type:** RW**Reset State:** 0x00000000

Color Space conversion coefficients

double buffered: NO

MDSS_MDP_WB_4_CSC_MATRIX_COEFF_3

Bits	Name	Description
28:16	COEFF_32	Coefficient value in S4.9 format Row 3 Column 2
12:0	COEFF_31	Coefficient value in S4.9 format Row 3 Column 1

0x01A67270 MDSS_MDP_WB_4_CSC_MATRIX_COEFF_4**Type:** RW**Reset State:** 0x00000200

Color Space conversion coefficients

double buffered: NO

MDSS_MDP_WB_4_CSC_MATRIX_COEFF_4

Bits	Name	Description
12:0	COEFF_33	Coefficient value in S4.9 format Row 3 Column 3

0x01A67274 MDSS_MDP_WB_4_CSC_COMP0_PRECLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 pre-clamp value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP0_PRECLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A67278 MDSS_MDP_WB_4_CSC_COMP1_PRECLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 pre-clamp value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP1_PRECLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A6727C MDSS_MDP_WB_4_CSC_COMP2_PRECLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 pre-clamp value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP2_PRECLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A67280 MDSS_MDP_WB_4_CSC_COMP0_POSTCLAMP**Type:** RW**Reset State:** 0x000000FF

Component 0 post-clamp value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP0_POSTCLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A67284 MDSS_MDP_WB_4_CSC_COMP1_POSTCLAMP**Type:** RW**Reset State:** 0x000000FF

Component 1 post-clamp value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP1_POSTCLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A67288 MDSS_MDP_WB_4_CSC_COMP2_POSTCLAMP**Type:** RW**Reset State:** 0x000000FF

Component 2 post-clamp value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP2_POSTCLAMP

Bits	Name	Description
15:8	LOW	Unsigned 8 bit pre-clamp value
7:0	HIGH	Unsigned 8 bit pre-clamp value

0x01A6728C MDSS_MDP_WB_4_CSC_COMP0_PREBIAS**Type:** RW**Reset State:** 0x00000000

Component 0 pre-bias value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP0_PREBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A67290 MDSS_MDP_WB_4_CSC_COMP1_PREBIAS**Type:** RW**Reset State:** 0x00000000

Component 1 pre-bias value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP1_PREBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A67294 MDSS_MDP_WB_4_CSC_COMP2_PREBIAS**Type:** RW**Reset State:** 0x00000000

Component 2 pre-bias value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP2_PREBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A67298 MDSS_MDP_WB_4_CSC_COMP0_POSTBIAS**Type:** RW**Reset State:** 0x00000000

Component 0 post-bias value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP0_POSTBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A6729C MDSS_MDP_WB_4_CSC_COMP1_POSTBIAS**Type:** RW**Reset State:** 0x00000000

Component 1 post-bias value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP1_POSTBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A672A0 MDSS_MDP_WB_4_CSC_COMP2_POSTBIAS**Type:** RW**Reset State:** 0x00000000

Component 2 post-bias value

double buffered: NO

MDSS_MDP_WB_4_CSC_COMP2_POSTBIAS

Bits	Name	Description
8:0	VALUE	Signed 9 bit pre-bias value

0x01A672B0 MDSS_MDP_WB_4_DST_ADDR_SW_STATUS**Type:** RW**Reset State:** 0x00000000

Security Status of the destination buffer plane

This provides a SW override to the hardware calculated content protection sent to VBIF

This value is logically or ed with the source content protection produced by hardware

This information will be presented to VBIF per transaction and reflected as part of the memory transaction

Note that the VBIF context banks need to be properly programmed for the output to be successful
double buffered: NO**MDSS_MDP_WB_4_DST_ADDR_SW_STATUS**

Bits	Name	Description
0	DST_ADDR_CP	This is the secure status bit for destination plane 0 (if used) Memory transactions will not complete if this status doesnt corespond to system programming in the rest of the path to memory 0x0: Content Protected Buffer State 0x1: Non Content Protected Buffer State

17.17.13 MDSS_MDP_INTF_0

Display Interface hardware register description

17.17.13.1 MDSS_MDP_INTF_0_INTF

INTF

Display Interface hardware register description

0x01A6B000 MDSS_MDP_INTF_0_TIMING_ENGINE_EN**Type:** RW**Reset State:** 0x00000000

Display Interface Timing Engine Enable register

double buffered: YES

when: On frame boundaries

MDSS_MDP_INTF_0_TIMING_ENGINE_EN

Bits	Name	Description
1	OSYNC_LOCK	
0	EN	Display Interface enable Should be the LAST register programmed for the interface Be sure to program ALL timing registers and setting up of the display pipeline BEFORE enabling this register Upon disabling of this bit, hardware will stop driving the interface at the NEXT vsync boundary A VSYNC interrupt WILL be generated but a VSYNC will NOT be generated on the interface

0x01A6B004 MDSS_MDP_INTF_0_INTF_CONFIG**Type:** RW**Reset State:** 0x00040000

Display Interface Configuration register.

Note that the configuration register ONLY applies to INTF_4 which transmits to MHL

MDSS_MDP_INTF_0_INTF_CONFIG

Bits	Name	Description
31	PROG_FETCH_START_EN	Programmable Fetch feature enable bit 0: programmable line counter disabled - default value to be backward compatible 1: programmable line counter enabled
30	ACTIVE_V_EN	Active V Enable
29	ACTIVE_H_EN	Active H Enable
28	VSYNC_INTERRUPT_MODE	vsync interrupt generation mode 0 = generate an interrupt every vsync 1 = generate an interrupt every 2 fields (applicable to interlace mode)
27:24	REPEAT_PIXEL_MODE	Pixel repeat mode 0x1 = repeat each pixel 2 times 0x2 = repeat each pixel 3 times ... 15 = repeat pixel 16 times

MDSS_MDP_INTF_0_INTF_CONFIG (cont.)

Bits	Name	Description
23	DSI_VIDEO_STOP_MODE	This bit controls how video mode stream is stopped when DSI dynamic refresh is triggered. It is not applicable for non-DSI interface. 0x0: disable timing engine when DSI sets the video stop signal; 0x1: halt timing engine counters when DSI sets the video stop signal
21	CHROMA_DWN_SAMPLE_H_MTHD	Horizontal Chroma Down Sample method 0x0: non-pixel dropping 0x1: pixel dropping
20	CHROMA_DWN_SAMPLE_EN	Chroma Down Sample enable for YUV444 0x0: Disabled 0x1: Enabled
18	CSC_DST_DATA_FORMAT	Destination Data Format 0x0: RGB 0x1: YCbCr
17	CSC_SRC_DATA_FORMAT	Source Data Format 0x0: RGB 0x1: YCbCr
16	CSC_EN	Enables the color matrix conversion 0x0: Bypass 0x1: Enabled
13:11	NIBBLE_SWAP_EN	Enable nibble swapping within each pixel byte NIBBLE_SWAP_EN[0]: 0 = no swapping for pixel_data [7:0]; 1 = enable swapping of pixel_data[3:0] with pixel_data[7:4] NIBBLE_SWAP_EN[1] = 0 = no swapping for pixel_data [15:8]; 1 = enable swapping of pixel_data[11:8] with pixel_data[15:12] NIBBLE_SWAP_EN[2] = 0 = no swapping for pixel_data [23:16]; 1 = enable swapping of pixel_data[19:16] with pixel_data[23:20]
10	PACK_ALIGN	0x0: LSB 0x1:MSB
9:8	PACK_422	0x0: Y2Cr1Y1Cb1 0x1: Cr1Y2Cb1Y1 0x2: Y2Cb1Y1Cr1 0x3: Cb1Y2Cr1Y1
6:4	OUT_MODE	0x0: YCbCr or RGB4444 seperate syncs 24-bit interface 0x1: RSVD 0x2: YCbCr 422 seperate syncs 16-bit interface
2	INTERLACE_INIT_SEL	0x0: start with even field 0x1: start with odd field
1	REPEAT_PIXEL	0x0: Do NOT repeat 0x1: Repeat

MDSS_MDP_INTF_0_INTF_CONFIG (cont.)

Bits	Name	Description
0	INTERLACE_MODE	double buffered: YES 0x0: Progressive Out 0x1: Interlace out

0x01A6B008 MDSS_MDP_INTF_0_HSYNC_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control

double buffered: YES

MDSS_MDP_INTF_0_HSYNC_CTL

Bits	Name	Description
31:16	HSYNC_PERIOD	HSYNC Period in pixel clocks. This is the start between start of HSYNC pulse and the start of the next HSYNC pulse. Note: hsync_period=width + h_porch where width=output image width h_porch=(h_back_porch+h_front_porch) h_back_porch starts at the beginning of hsync pulse
15:0	PULSE_WIDTH	HSYNC pulse width in pixel clocks

0x01A6B00C MDSS_MDP_INTF_0_VSYNC_PERIOD_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_0_VSYNC_PERIOD_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. This is the time between start of vsync pulse and the start of the next vsync pulse. Note vsync_period=height+v_porch where height=output_image_height v_porch=(v_back_porch+v_front_porch) v_back_porch starts at the beginning of vsync pulse.

0x01A6B010 MDSS_MDP_INTF_0_VSYNC_PERIOD_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_0_VSYNC_PERIOD_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. In progressive mode, this is the time between start of vsync pulse and the start of next vsync pulse Interlace mode this is the time between start of Field1 vsync pulse and the start of Field2 vsync pulse. Note: vsync_period = Height + v_porch where, Height = Output image height v_porch = (v_back_porch + v_front_porch) v_back_porch starts at the beginning of vsync pulse

0x01A6B014 MDSS_MDP_INTF_0_VSYNC_PULSE_WIDTH_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_0_VSYNC_PULSE_WIDTH_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period width in pixel clocks

0x01A6B018 MDSS_MDP_INTF_0_VSYNC_PULSE_WIDTH_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_0_VSYNC_PULSE_WIDTH_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks for the 2nd field. NOT valid for progressive mode

0x01A6B01C MDSS_MDP_INTF_0_DISPLAY_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_0_DISPLAY_V_START_F0

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field0 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6B020 MDSS_MDP_INTF_0_DISPLAY_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_0_DISPLAY_V_START_F1

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field1 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6B024 MDSS_MDP_INTF_0_DISPLAY_V_END_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_0_DISPLAY_V_END_F0

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where hcycle = horizontal_back_porch + horizontal_active + horizontal_front_porch For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6B028 MDSS_MDP_INTF_0_DISPLAY_V_END_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_0_DISPLAY_V_END_F1

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where hcycle = horizontal_back_porch + horizontal_active + horizontal_front_porch For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6B02C MDSS_MDP_INTF_0_ACTIVE_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_0_ACTIVE_V_START_F0

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6B030 MDSS_MDP_INTF_0_ACTIVE_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_0_ACTIVE_V_START_F1

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6B034 MDSS_MDP_INTF_0_ACTIVE_V_END_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_0_ACTIVE_V_END_F0

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6B038 MDSS_MDP_INTF_0_ACTIVE_V_END_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_0_ACTIVE_V_END_F1

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6B03C MDSS_MDP_INTF_0_DISPLAY_HCTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_0_DISPLAY_HCTL

Bits	Name	Description
31:16	DISPLAY_END_X	Display End X
15:0	DISPLAY_START_X	Display Start X

0x01A6B040 MDSS_MDP_INTF_0_ACTIVE_HCTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_0_ACTIVE_HCTL

Bits	Name	Description
31:16	ACTIVE_END_X	Active End X
15:0	ACTIVE_START_X	Active Start X

0x01A6B044 MDSS_MDP_INTF_0_BORDER_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Border Color

double buffered: NO

MDSS_MDP_INTF_0_BORDER_COLOR

Bits	Name	Description
23:0	BORDER_COLOR	Defines 24-bit Border Color of the inactive region of display

0x01A6B048 MDSS_MDP_INTF_0_UNDERFLOW_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Underflow Color

double buffered: NO

MDSS_MDP_INTF_0_UNDERFLOW_COLOR

Bits	Name	Description
23:0	UNDERFLOW_COLOR	Defines 24-bit Underflow Color

0x01A6B04C MDSS_MDP_INTF_0_HSYNC_SKEW**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Skew Control

double buffered: YES

MDSS_MDP_INTF_0_HSYNC_SKEW

Bits	Name	Description
15:0	HSYNC_SKEW	HSYNC Skew Defines the number of pixel clocks HSYNC active edge is delayed from VSYNC active edge

0x01A6B050 MDSS_MDP_INTF_0_POLARITY_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface Polarity Control

double buffered: NO

MDSS_MDP_INTF_0_POLARITY_CTL

Bits	Name	Description
2	DEN	DEN Polarity 0x0: Active HIGH 0x1: Active LOW
1	VSYNC	VSYNC Polarity 0x0: Active HIGH 0x1: Active LOW
0	HSYNC	HSYNC Polarity 0x0: Active HIGH 0x1: Active LOW

0x01A6B058 MDSS_MDP_INTF_0_TP_COLOR0**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_0_TP_COLOR0

Bits	Name	Description
23:0	COLOR0	Test Pattern Color

0x01A6B05C MDSS_MDP_INTF_0_TP_COLOR1**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_0_TP_COLOR1

Bits	Name	Description
23:0	COLOR1	Test Pattern Color

0x01A6B084 MDSS_MDP_INTF_0_DSI_CMD_MODE_TRIGGER_EN**Type:** RW**Reset State:** 0x00000000

Enable for DSI trigger processing on DSI Command Mode interface

double buffered: NO

MDSS_MDP_INTF_0_DSI_CMD_MODE_TRIGGER_EN

Bits	Name	Description
5:4	DSI_CMD_TG_INTF_SEL	Select the stream to be triggered by DSI controller. Takes effect only if DSI_CMD_TG_EN is set to 1
0	DSI_CMD_TG_EN	DSI Command Trigger Enable. Set it to 1 to enable trigger processing 0: Disable trigger processing 1: Enable trigger processing

0x01A6B090 MDSS_MDP_INTF_0_PANEL_FORMAT**Type:** RW**Reset State:** 0x00002100

Panel Packer Configuration

double buffered: NO

MDSS_MDP_INTF_0_PANEL_FORMAT

Bits	Name	Description
16	COMP2_BIT_FLIP_EN	0x1: All bits of component 2 are flipped
15	COMP1_BIT_FLIP_EN	0x1: All bits of component 1 are flipped
14	COMP0_BIT_FLIP_EN	0x1: All bits of component 0 are flipped

MDSS_MDP_INTF_0_PANEL_FORMAT (cont.)

Bits	Name	Description
13:8	PACK_PATTERN	Packing Pattern used by the packer 0x21: RGB 0x24: RBG 0x12: BGR 0x18: BRG 0x06: GBR 0x09: GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each colour component 0x0: LSB 0x1: MSB
5:4	COMP2_OUT	Number of bits for component 2 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	COMP1_OUT	Number of bits for component 1 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	COMP0_OUT	Number of bits for component 0 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A6B0A8 MDSS_MDP_INTF_0_FRAME_LINE_COUNT_EN**Type:** RW**Reset State:** 0x00000000

Frame and Line Count Enable

double buffered: NO

MDSS_MDP_INTF_0_FRAME_LINE_COUNT_EN

Bits	Name	Description
1	FRAME_COUNT_EN	Current Frame Count Enable This will provide SW information on the current frame being sent out on an active panel It will reset upon disabling of the timing engine and increment for every frame Note that there is possibility for rollover if enabled for long time. NO status is provided that rollover occurred
0	LINE_COUNT_EN	Current Line Count Enable This will provide SW information on the current line being sent out on an active panel This will include all blanking lines as well It will reset upon vsync and increment until the end of the frame.

0x01A6B0AC MDSS_MDP_INTF_0_FRAME_COUNT**Type:** R**Reset State:** 0x00000000

Current Frame Count since Timing Engine Enabled

double buffered: N/A

MDSS_MDP_INTF_0_FRAME_COUNT

Bits	Name	Description
31:0	VALUE	Current Frame Count - Base 1

0x01A6B0B0 MDSS_MDP_INTF_0_LINE_COUNT**Type:** R**Reset State:** 0x00000000

Current Line Count Including blanking

double buffered: N/A

MDSS_MDP_INTF_0_LINE_COUNT

Bits	Name	Description
15:0	VALUE	Current Line Count - Base 1

0x01A6B170 MDSS_MDP_INTF_0_PROG_FETCH_START**Type:** RW**Reset State:** 0x00000000

Programmable Fetch Start

double buffered: YES

MDSS_MDP_INTF_0_PROG_FETCH_START

Bits	Name	Description
31:0	VALUE	Programmable line value for the feature Note: The valid register setting shall be vsync counter value for the first pixel of VFP lines

0x01A6B180 MDSS_MDP_INTF_0_INTF_INTR_EN**Type:** RW**Reset State:** 0x00000000

Display Interface Interrupt Enable

MDSS_MDP_INTF_0_INTF_INTR_EN

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt 0x0: Interrupt Disabled 0x1: Interrupt Enabled

0x01A6B184 MDSS_MDP_INTF_0_INTF_INTR_STATUS**Type:** R**Reset State:** 0x00000000

Display Interface Interrupt Status

MDSS_MDP_INTF_0_INTF_INTR_STATUS

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6B188 MDSS_MDP_INTF_0_INTF_INTR_CLEAR**Type:** W**Reset State:** 0x00000000

Display Interface Interrupt Clear

MDSS_MDP_INTF_0_INTF_INTR_CLEAR

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6B18C MDSS_MDP_INTF_0_PROG_LINE_INTR_CONF**Type:** RW**Reset State:** 0xFFFFFFFF

Programmable Line Interrupt Config

double buffered: YES

MDSS_MDP_INTF_0_PROG_LINE_INTR_CONF

Bits	Name	Description
31:0	INTR_CORD	Pixel location in the panel video timing in terms of video raster structure including V/H blanks where the programmable line interrupt be generated When SW programe this register, it will be applied for the next frame after vsync

0x01A6B190 MDSS_MDP_INTF_0_VIDEO_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

Video MISR Control

MDSS_MDP_INTF_0_VIDEO_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6B194 MDSS_MDP_INTF_0_VIDEO_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

Video MISR signature

MDSS_MDP_INTF_0_VIDEO_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

0x01A6B198 MDSS_MDP_INTF_0_CMD_0_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

DSI CMD0 MISR Control

MDSS_MDP_INTF_0_CMD_0_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6B19C MDSS_MDP_INTF_0_CMD_0_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

DSI CMD0 MISR signature

MDSS_MDP_INTF_0_CMD_0_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

17.17.14 MDSS_MDP_INTF_1

Display Interface hardware register description

17.17.14.1 MDSS_MDP_INTF_1_INTF

INTF

Display Interface hardware register description

0x01A6B800 MDSS_MDP_INTF_1_TIMING_ENGINE_EN

Type: RW

Reset State: 0x00000000

Display Interface Timing Engine Enable register

double buffered: YES

when: On frame boundaries

MDSS_MDP_INTF_1_TIMING_ENGINE_EN

Bits	Name	Description
1	OSYNC_LOCK	
0	EN	Display Interface enable Should be the LAST register programmed for the interface Be sure to program ALL timing registers and setting up of the display pipeline BEFORE enabling this register Upon disabling of this bit, hardware will stop driving the interface at the NEXT vsync boundary A VSYNC interrupt WILL be generated but a VSYNC will NOT be generated on the interface

0x01A6B804 MDSS_MDP_INTF_1_INTF_CONFIG

Type: RW

Reset State: 0x00040000

Display Interface Configuration register.

Note that the configuration register ONLY applies to INTF_4 which transmits to MHL

MDSS_MDP_INTF_1_INTF_CONFIG

Bits	Name	Description
31	PROG_FETCH_START_EN	Programmable Fetch feature enable bit 0: programmable line counter disabled - default value to be backward compatible 1: programmable line counter enabled
30	ACTIVE_V_EN	Active V Enable
29	ACTIVE_H_EN	Active H Enable
28	VSYNC_INTERRUPT_MODE	vsync interrupt generation mode 0 = generate an interrupt every vsync 1 = generate an interrupt every 2 fields (applicable to interlace mode)
27:24	REPEAT_PIXEL_MODE	Pixel repeat mode 0x1 = repeat each pixel 2 times 0x2 = repeat each pixel 3 times ... 15 = repeat pixel 16 times
23	DSI_VIDEO_STOP_MODE	This bit controls how video mode stream is stopped when DSI dynamic refresh is triggered. It is not applicable for non-DSI interface. 0x0: disable timing engine when DSI sets the video stop signal; 0x1: halt timing engine counters when DSI sets the video stop signal
21	CHROMA_DWN_SAMPLE_H_MTHD	Horizontal Chroma Down Sample method 0x0: non-pixel dropping 0x1: pixel dropping
20	CHROMA_DWN_SAMPLE_EN	Chroma Down Sample enable for YUV444 0x0: Disabled 0x1: Enabled
18	CSC_DST_DATA_FORMAT	Destination Data Format 0x0: RGB 0x1: YCbCr
17	CSC_SRC_DATA_FORMAT	Source Data Format 0x0: RGB 0x1: YCbCr
16	CSC_EN	Enables the color matrix conversion 0x0: Bypass 0x1: Enabled

MDSS_MDP_INTF_1_INTF_CONFIG (cont.)

Bits	Name	Description
13:11	NIBBLE_SWAP_EN	Enable nibble swapping within each pixel byte NIBBLE_SWAP_EN[0]: 0 = no swapping for pixel_data [7:0]; 1 = enable swapping of pixel_data[3:0] with pixel_data[7:4] NIBBLE_SWAP_EN[1] = 0 = no swapping for pixel_data [15:8]; 1 = enable swapping of pixel_data[11:8] with pixel_data[15:12] NIBBLE_SWAP_EN[2] = 0 = no swapping for pixel_data [23:16]; 1 = enable swapping of pixel_data[19:16] with pixel_data[23:20]
10	PACK_ALIGN	0x0: LSB 0x1:MSB
9:8	PACK_422	0x0: Y2Cr1Y1Cb1 0x1: Cr1Y2Cb1Y1 0x2: Y2Cb1Y1Cr1 0x3: Cb1Y2Cr1Y1
6:4	OUT_MODE	0x0: YCbCr or RGB4444 seperate syncs 24-bit interface 0x1: RSVD 0x2: YCbCr 422 seperate syncs 16-bit interface
2	INTERLACE_INIT_SEL	0x0: start with even field 0x1: start with odd field
1	REPEAT_PIXEL	0x0: Do NOT repeat 0x1: Repeat
0	INTERLACE_MODE	double buffered: YES 0x0: Progressive Out 0x1: Interlace out

0x01A6B808 MDSS_MDP_INTF_1_HSYNC_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control

double buffered: YES

MDSS_MDP_INTF_1_HSYNC_CTL

Bits	Name	Description
31:16	HSYNC_PERIOD	HSYNC Period in pixel clocks. This is the start between start of HSYNC pulse and the start of the next HSYNC pulse. Note: hsync_period=width + h_porch where width=output image width h_porch=(h_back_porch+h_front_porch) h_back_porch starts at the beginning of hsync pulse
15:0	PULSE_WIDTH	HSYNC pulse width in pixel clocks

0x01A6B80C MDSS_MDP_INTF_1_VSYNC_PERIOD_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_1_VSYNC_PERIOD_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. This is the time between start of vsync pulse and the start of the next vsync pulse. Note vsync_period=height+v_porch where height=output_image_height v_porch=(v_back_porch+v_front_porch) v_back_porch starts at the beginning of vsync pulse.

0x01A6B810 MDSS_MDP_INTF_1_VSYNC_PERIOD_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_1_VSYNC_PERIOD_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. In progressive mode, this is the time between start of vsync pulse and the start of next vsync pulse Interlace mode this is the time between start of Field1 vsync pulse and the start of Field2 vsync pulse. Note: $\text{vsync_period} = \text{Height} + \text{v_porch}$ where, Height = Output image height $\text{v_porch} = (\text{v_back_porch} + \text{v_front_porch})$ v_back_porch starts at the beginning of vsync pulse

0x01A6B814 MDSS_MDP_INTF_1_VSYNC_PULSE_WIDTH_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_1_VSYNC_PULSE_WIDTH_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period width in pixel clocks

0x01A6B818 MDSS_MDP_INTF_1_VSYNC_PULSE_WIDTH_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_1_VSYNC_PULSE_WIDTH_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks for the 2nd field. NOT valid for progressive mode

0x01A6B81C MDSS_MDP_INTF_1_DISPLAY_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_1_DISPLAY_V_START_F0

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field0 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6B820 MDSS_MDP_INTF_1_DISPLAY_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_1_DISPLAY_V_START_F1

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field1 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6B824 MDSS_MDP_INTF_1_DISPLAY_V_END_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_1_DISPLAY_V_END_F0

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6B828 MDSS_MDP_INTF_1_DISPLAY_V_END_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_1_DISPLAY_V_END_F1

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where hcycle = horizontal_back_porch + horizontal_active + horizontal_front_porch For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6B82C MDSS_MDP_INTF_1_ACTIVE_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_1_ACTIVE_V_START_F0

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6B830 MDSS_MDP_INTF_1_ACTIVE_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 1

MDSS_MDP_INTF_1_ACTIVE_V_START_F1

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6B834 MDSS_MDP_INTF_1_ACTIVE_V_END_F0

Type: RW

Reset State: 0x00000000

Display Interface Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_1_ACTIVE_V_END_F0

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6B838 MDSS_MDP_INTF_1_ACTIVE_V_END_F1

Type: RW

Reset State: 0x00000000

Display Interface Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_1_ACTIVE_V_END_F1

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6B83C MDSS_MDP_INTF_1_DISPLAY_HCTL

Type: RW

Reset State: 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_1_DISPLAY_HCTL

Bits	Name	Description
31:16	DISPLAY_END_X	Display End X
15:0	DISPLAY_START_X	Display Start X

0x01A6B840 MDSS_MDP_INTF_1_ACTIVE_HCTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_1_ACTIVE_HCTL

Bits	Name	Description
31:16	ACTIVE_END_X	Active End X
15:0	ACTIVE_START_X	Active Start X

0x01A6B844 MDSS_MDP_INTF_1_BORDER_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Border Color

double buffered: NO

MDSS_MDP_INTF_1_BORDER_COLOR

Bits	Name	Description
23:0	BORDER_COLOR	Defines 24-bit Border Color of the inactive region of display

0x01A6B848 MDSS_MDP_INTF_1_UNDERFLOW_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Underflow Color

double buffered: NO

MDSS_MDP_INTF_1_UNDERFLOW_COLOR

Bits	Name	Description
23:0	UNDERFLOW_COLOR	Defines 24-bit Underflow Color

0x01A6B84C MDSS_MDP_INTF_1_HSYNC_SKEW**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Skew Control

double buffered: YES

MDSS_MDP_INTF_1_HSYNC_SKEW

Bits	Name	Description
15:0	HSYNC_SKEW	HSYNC Skew Defines the number of pixel clocks HSYNC active edge is delayed from VSYNC active edge

0x01A6B850 MDSS_MDP_INTF_1_POLARITY_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface Polarity Control

double buffered: NO

MDSS_MDP_INTF_1_POLARITY_CTL

Bits	Name	Description
2	DEN	DEN Polarity 0x0: Active HIGH 0x1: Active LOW
1	VSYNC	VSYNC Polarity 0x0: Active HIGH 0x1: Active LOW
0	HSYNC	HSYNC Polarity 0x0: Active HIGH 0x1: Active LOW

0x01A6B858 MDSS_MDP_INTF_1_TP_COLOR0**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_1_TP_COLOR0

Bits	Name	Description
23:0	COLOR0	Test Pattern Color

0x01A6B85C MDSS_MDP_INTF_1_TP_COLOR1**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_1_TP_COLOR1

Bits	Name	Description
23:0	COLOR1	Test Pattern Color

0x01A6B884 MDSS_MDP_INTF_1_DSI_CMD_MODE_TRIGGER_EN**Type:** RW**Reset State:** 0x00000000

Enable for DSI trigger processing on DSI Command Mode interface

double buffered: NO

MDSS_MDP_INTF_1_DSI_CMD_MODE_TRIGGER_EN

Bits	Name	Description
5:4	DSI_CMD_TG_INTF_SEL	Select the stream to be triggered by DSI controller. Takes effect only if DSI_CMD_TG_EN is set to 1
0	DSI_CMD_TG_EN	DSI Command Trigger Enable. Set it to 1 to enable trigger processing 0: Disable trigger processing 1: Enable trigger processing

0x01A6B890 MDSS_MDP_INTF_1_PANEL_FORMAT**Type:** RW**Reset State:** 0x00002100

Panel Packer Configuration

double buffered: NO

MDSS_MDP_INTF_1_PANEL_FORMAT

Bits	Name	Description
16	COMP2_BIT_FLIP_EN	0x1: All bits of component 2 are flipped
15	COMP1_BIT_FLIP_EN	0x1: All bits of component 1 are flipped
14	COMP0_BIT_FLIP_EN	0x1: All bits of component 0 are flipped
13:8	PACK_PATTERN	Packing Pattern used by the packer 0x21: RGB 0x24: RBG 0x12: BGR 0x18: BRG 0x06: GBR 0x09: GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each colour component 0x0: LSB 0x1: MSB
5:4	COMP2_OUT	Number of bits for component 2 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	COMP1_OUT	Number of bits for component 1 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	COMP0_OUT	Number of bits for component 0 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A6B8A8 MDSS_MDP_INTF_1_FRAME_LINE_COUNT_EN**Type:** RW**Reset State:** 0x00000000

Frame and Line Count Enable

double buffered: NO

MDSS_MDP_INTF_1_FRAME_LINE_COUNT_EN

Bits	Name	Description
1	FRAME_COUNT_EN	Current Frame Count Enable This will provide SW information on the current frame being sent out on an active panel It will reset upon disabling of the timing engine and increment for every frame Note that there is possibility for rollover if enabled for long time. NO status is provided that rollover occurred
0	LINE_COUNT_EN	Current Line Count Enable This will provide SW information on the current line being sent out on an active panel This will include all blanking lines as well It will reset upon vsync and increment until the end of the frame.

0x01A6B8AC MDSS_MDP_INTF_1_FRAME_COUNT**Type:** R**Reset State:** 0x00000000

Current Frame Count since Timing Engine Enabled

double buffered: N/A

MDSS_MDP_INTF_1_FRAME_COUNT

Bits	Name	Description
31:0	VALUE	Current Frame Count - Base 1

0x01A6B8B0 MDSS_MDP_INTF_1_LINE_COUNT**Type:** R**Reset State:** 0x00000000

Current Line Count Including blanking

double buffered: N/A

MDSS_MDP_INTF_1_LINE_COUNT

Bits	Name	Description
15:0	VALUE	Current Line Count - Base 1

0x01A6B970 MDSS_MDP_INTF_1_PROG_FETCH_START**Type:** RW**Reset State:** 0x00000000

Programmable Fetch Start

double buffered: YES

MDSS_MDP_INTF_1_PROG_FETCH_START

Bits	Name	Description
31:0	VALUE	Programmable line value for the feature Note: The valid register setting shall be vsync counter value for the first pixel of VFP lines

0x01A6B980 MDSS_MDP_INTF_1_INTF_INTR_EN**Type:** RW**Reset State:** 0x00000000

Display Interface Interrupt Enable

MDSS_MDP_INTF_1_INTF_INTR_EN

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt 0x0: Interrupt Disabled 0x1: Interrupt Enabled

0x01A6B984 MDSS_MDP_INTF_1_INTF_INTR_STATUS**Type:** R**Reset State:** 0x00000000

Display Interface Interrupt Status

MDSS_MDP_INTF_1_INTF_INTR_STATUS

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6B988 MDSS_MDP_INTF_1_INTF_INTR_CLEAR**Type:** W**Reset State:** 0x00000000

Display Interface Interrupt Clear

MDSS_MDP_INTF_1_INTF_INTR_CLEAR

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6B98C MDSS_MDP_INTF_1_PROG_LINE_INTR_CONF**Type:** RW**Reset State:** 0xFFFFFFFF

Programmable Line Interrupt Config

double buffered: YES

MDSS_MDP_INTF_1_PROG_LINE_INTR_CONF

Bits	Name	Description
31:0	INTR_CORD	Pixel location in the panel video timing in terms of video raster structure including V/H blanks where the programmable line interrupt be generated When SW programe this register, it will be applied for the next frame after vsync

0x01A6B990 MDSS_MDP_INTF_1_VIDEO_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

Video MISR Control

MDSS_MDP_INTF_1_VIDEO_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6B994 MDSS_MDP_INTF_1_VIDEO_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

Video MISR signature

MDSS_MDP_INTF_1_VIDEO_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

0x01A6B998 MDSS_MDP_INTF_1_CMD_0_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

DSI CMD0 MISR Control

MDSS_MDP_INTF_1_CMD_0_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6B99C MDSS_MDP_INTF_1_CMD_0_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

DSI CMD0 MISR signature

MDSS_MDP_INTF_1_CMD_0_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

17.17.15 MDSS_MDP_INTF_2

Display Interface hardware register description

17.17.15.1 MDSS_MDP_INTF_2_INTF

INTF

Display Interface hardware register description

0x01A6C000 MDSS_MDP_INTF_2_TIMING_ENGINE_EN

Type: RW

Reset State: 0x00000000

Display Interface Timing Engine Enable register

double buffered: YES

when: On frame boundaries

MDSS_MDP_INTF_2_TIMING_ENGINE_EN

Bits	Name	Description
1	OSYNC_LOCK	
0	EN	Display Interface enable Should be the LAST register programmed for the interface Be sure to program ALL timing registers and setting up of the display pipeline BEFORE enabling this register Upon disabling of this bit, hardware will stop driving the interface at the NEXT vsync boundary A VSYNC interrupt WILL be generated but a VSYNC will NOT be generated on the interface

0x01A6C004 MDSS_MDP_INTF_2_INTF_CONFIG

Type: RW

Reset State: 0x00040000

Display Interface Configuration register.

Note that the configuration register ONLY applies to INTF_4 which transmits to MHL

MDSS_MDP_INTF_2_INTF_CONFIG

Bits	Name	Description
31	PROG_FETCH_START_EN	Programmable Fetch feature enable bit 0: programmable line counter disabled - default value to be backward compatible 1: programmable line counter enabled
30	ACTIVE_V_EN	Active V Enable
29	ACTIVE_H_EN	Active H Enable
28	VSYNC_INTERRUPT_MODE	vsync interrupt generation mode 0 = generate an interrupt every vsync 1 = generate an interrupt every 2 fields (applicable to interlace mode)
27:24	REPEAT_PIXEL_MODE	Pixel repeat mode 0x1 = repeat each pixel 2 times 0x2 = repeat each pixel 3 times ... 15 = repeat pixel 16 times
23	DSI_VIDEO_STOP_MODE	This bit controls how video mode stream is stopped when DSI dynamic refresh is triggered. It is not applicable for non-DSI interface. 0x0: disable timing engine when DSI sets the video stop signal; 0x1: halt timing engine counters when DSI sets the video stop signal
21	CHROMA_DWN_SAMPLE_H_MTHD	Horizontal Chroma Down Sample method 0x0: non-pixel dropping 0x1: pixel dropping
20	CHROMA_DWN_SAMPLE_EN	Chroma Down Sample enable for YUV444 0x0: Disabled 0x1: Enabled
18	CSC_DST_DATA_FORMAT	Destination Data Format 0x0: RGB 0x1: YCbCr
17	CSC_SRC_DATA_FORMAT	Source Data Format 0x0: RGB 0x1: YCbCr
16	CSC_EN	Enables the color matrix conversion 0x0: Bypass 0x1: Enabled

MDSS_MDP_INTF_2_INTF_CONFIG (cont.)

Bits	Name	Description
13:11	NIBBLE_SWAP_EN	Enable nibble swapping within each pixel byte NIBBLE_SWAP_EN[0]: 0 = no swapping for pixel_data [7:0]; 1 = enable swapping of pixel_data[3:0] with pixel_data[7:4] NIBBLE_SWAP_EN[1] = 0 = no swapping for pixel_data [15:8]; 1 = enable swapping of pixel_data[11:8] with pixel_data[15:12] NIBBLE_SWAP_EN[2] = 0 = no swapping for pixel_data [23:16]; 1 = enable swapping of pixel_data[19:16] with pixel_data[23:20]
10	PACK_ALIGN	0x0: LSB 0x1:MSB
9:8	PACK_422	0x0: Y2Cr1Y1Cb1 0x1: Cr1Y2Cb1Y1 0x2: Y2Cb1Y1Cr1 0x3: Cb1Y2Cr1Y1
6:4	OUT_MODE	0x0: YCbCr or RGB4444 seperate syncs 24-bit interface 0x1: RSVD 0x2: YCbCr 422 seperate syncs 16-bit interface
2	INTERLACE_INIT_SEL	0x0: start with even field 0x1: start with odd field
1	REPEAT_PIXEL	0x0: Do NOT repeat 0x1: Repeat
0	INTERLACE_MODE	double buffered: YES 0x0: Progressive Out 0x1: Interlace out

0x01A6C008 MDSS_MDP_INTF_2_HSYNC_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control

double buffered: YES

MDSS_MDP_INTF_2_HSYNC_CTL

Bits	Name	Description
31:16	HSYNC_PERIOD	HSYNC Period in pixel clocks. This is the start between start of HSYNC pulse and the start of the next HSYNC pulse. Note: hsync_period=width + h_porch where width=output image width h_porch=(h_back_porch+h_front_porch) h_back_porch starts at the beginning of hsync pulse
15:0	PULSE_WIDTH	HSYNC pulse width in pixel clocks

0x01A6C00C MDSS_MDP_INTF_2_VSYNC_PERIOD_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_2_VSYNC_PERIOD_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. This is the time between start of vsync pulse and the start of the next vsync pulse. Note vsync_period=height+v_porch where height=output_image_height v_porch=(v_back_porch+v_front_porch) v_back_porch starts at the beginning of vsync pulse.

0x01A6C010 MDSS_MDP_INTF_2_VSYNC_PERIOD_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_2_VSYNC_PERIOD_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. In progressive mode, this is the time between start of vsync pulse and the start of next vsync pulse Interlace mode this is the time between start of Field1 vsync pulse and the start of Field2 vsync pulse. Note: $\text{vsync_period} = \text{Height} + \text{v_porch}$ where, Height = Output image height $\text{v_porch} = (\text{v_back_porch} + \text{v_front_porch})$ v_back_porch starts at the beginning of vsync pulse

0x01A6C014 MDSS_MDP_INTF_2_VSYNC_PULSE_WIDTH_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_2_VSYNC_PULSE_WIDTH_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period width in pixel clocks

0x01A6C018 MDSS_MDP_INTF_2_VSYNC_PULSE_WIDTH_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_2_VSYNC_PULSE_WIDTH_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks for the 2nd field. NOT valid for progressive mode

0x01A6C01C MDSS_MDP_INTF_2_DISPLAY_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_2_DISPLAY_V_START_F0

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field0 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6C020 MDSS_MDP_INTF_2_DISPLAY_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_2_DISPLAY_V_START_F1

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field1 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6C024 MDSS_MDP_INTF_2_DISPLAY_V_END_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_2_DISPLAY_V_END_F0

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6C028 MDSS_MDP_INTF_2_DISPLAY_V_END_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_2_DISPLAY_V_END_F1

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6C02C MDSS_MDP_INTF_2_ACTIVE_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_2_ACTIVE_V_START_F0

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6C030 MDSS_MDP_INTF_2_ACTIVE_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_2_ACTIVE_V_START_F1

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6C034 MDSS_MDP_INTF_2_ACTIVE_V_END_F0

Type: RW

Reset State: 0x00000000

Display Interface Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_2_ACTIVE_V_END_F0

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6C038 MDSS_MDP_INTF_2_ACTIVE_V_END_F1

Type: RW

Reset State: 0x00000000

Display Interface Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_2_ACTIVE_V_END_F1

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6C03C MDSS_MDP_INTF_2_DISPLAY_HCTL

Type: RW

Reset State: 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_2_DISPLAY_HCTL

Bits	Name	Description
31:16	DISPLAY_END_X	Display End X
15:0	DISPLAY_START_X	Display Start X

0x01A6C040 MDSS_MDP_INTF_2_ACTIVE_HCTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_2_ACTIVE_HCTL

Bits	Name	Description
31:16	ACTIVE_END_X	Active End X
15:0	ACTIVE_START_X	Active Start X

0x01A6C044 MDSS_MDP_INTF_2_BORDER_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Border Color

double buffered: NO

MDSS_MDP_INTF_2_BORDER_COLOR

Bits	Name	Description
23:0	BORDER_COLOR	Defines 24-bit Border Color of the inactive region of display

0x01A6C048 MDSS_MDP_INTF_2_UNDERFLOW_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Underflow Color

double buffered: NO

MDSS_MDP_INTF_2_UNDERFLOW_COLOR

Bits	Name	Description
23:0	UNDERFLOW_COLOR	Defines 24-bit Underflow Color

0x01A6C04C MDSS_MDP_INTF_2_HSYNC_SKEW**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Skew Control

double buffered: YES

MDSS_MDP_INTF_2_HSYNC_SKEW

Bits	Name	Description
15:0	HSYNC_SKEW	HSYNC Skew Defines the number of pixel clocks HSYNC active edge is delayed from VSYNC active edge

0x01A6C050 MDSS_MDP_INTF_2_POLARITY_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface Polarity Control

double buffered: NO

MDSS_MDP_INTF_2_POLARITY_CTL

Bits	Name	Description
2	DEN	DEN Polarity 0x0: Active HIGH 0x1: Active LOW
1	VSYNC	VSYNC Polarity 0x0: Active HIGH 0x1: Active LOW
0	HSYNC	HSYNC Polarity 0x0: Active HIGH 0x1: Active LOW

0x01A6C058 MDSS_MDP_INTF_2_TP_COLOR0**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_2_TP_COLOR0

Bits	Name	Description
23:0	COLOR0	Test Pattern Color

0x01A6C05C MDSS_MDP_INTF_2_TP_COLOR1**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_2_TP_COLOR1

Bits	Name	Description
23:0	COLOR1	Test Pattern Color

0x01A6C084 MDSS_MDP_INTF_2_DSI_CMD_MODE_TRIGGER_EN**Type:** RW**Reset State:** 0x00000000

Enable for DSI trigger processing on DSI Command Mode interface

double buffered: NO

MDSS_MDP_INTF_2_DSI_CMD_MODE_TRIGGER_EN

Bits	Name	Description
5:4	DSI_CMD_TG_INTF_SEL	Select the stream to be triggered by DSI controller. Takes effect only if DSI_CMD_TG_EN is set to 1
0	DSI_CMD_TG_EN	DSI Command Trigger Enable. Set it to 1 to enable trigger processing 0: Disable trigger processing 1: Enable trigger processing

0x01A6C090 MDSS_MDP_INTF_2_PANEL_FORMAT**Type:** RW**Reset State:** 0x00002100

Panel Packer Configuration

double buffered: NO

MDSS_MDP_INTF_2_PANEL_FORMAT

Bits	Name	Description
16	COMP2_BIT_FLIP_EN	0x1: All bits of component 2 are flipped
15	COMP1_BIT_FLIP_EN	0x1: All bits of component 1 are flipped
14	COMP0_BIT_FLIP_EN	0x1: All bits of component 0 are flipped
13:8	PACK_PATTERN	Packing Pattern used by the packer 0x21: RGB 0x24: RBG 0x12: BGR 0x18: BRG 0x06: GBR 0x09: GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each colour component 0x0: LSB 0x1: MSB
5:4	COMP2_OUT	Number of bits for component 2 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	COMP1_OUT	Number of bits for component 1 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
1:0	COMP0_OUT	Number of bits for component 0 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A6C0A8 MDSS_MDP_INTF_2_FRAME_LINE_COUNT_EN**Type:** RW**Reset State:** 0x00000000

Frame and Line Count Enable

double buffered: NO

MDSS_MDP_INTF_2_FRAME_LINE_COUNT_EN

Bits	Name	Description
1	FRAME_COUNT_EN	Current Frame Count Enable This will provide SW information on the current frame being sent out on an active panel It will reset upon disabling of the timing engine and increment for every frame Note that there is possibility for rollover if enabled for long time. NO status is provided that rollover occurred
0	LINE_COUNT_EN	Current Line Count Enable This will provide SW information on the current line being sent out on an active panel This will include all blanking lines as well It will reset upon vsync and increment until the end of the frame.

0x01A6C0AC MDSS_MDP_INTF_2_FRAME_COUNT**Type:** R**Reset State:** 0x00000000

Current Frame Count since Timing Engine Enabled

double buffered: N/A

MDSS_MDP_INTF_2_FRAME_COUNT

Bits	Name	Description
31:0	VALUE	Current Frame Count - Base 1

0x01A6C0B0 MDSS_MDP_INTF_2_LINE_COUNT**Type:** R**Reset State:** 0x00000000

Current Line Count Including blanking

double buffered: N/A

MDSS_MDP_INTF_2_LINE_COUNT

Bits	Name	Description
15:0	VALUE	Current Line Count - Base 1

0x01A6C170 MDSS_MDP_INTF_2_PROG_FETCH_START**Type:** RW**Reset State:** 0x00000000

Programmable Fetch Start

double buffered: YES

MDSS_MDP_INTF_2_PROG_FETCH_START

Bits	Name	Description
31:0	VALUE	Programmable line value for the feature Note: The valid register setting shall be vsync counter value for the first pixel of VFP lines

0x01A6C180 MDSS_MDP_INTF_2_INTF_INTR_EN**Type:** RW**Reset State:** 0x00000000

Display Interface Interrupt Enable

MDSS_MDP_INTF_2_INTF_INTR_EN

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt 0x0: Interrupt Disabled 0x1: Interrupt Enabled

0x01A6C184 MDSS_MDP_INTF_2_INTF_INTR_STATUS**Type:** R**Reset State:** 0x00000000

Display Interface Interrupt Status

MDSS_MDP_INTF_2_INTF_INTR_STATUS

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6C188 MDSS_MDP_INTF_2_INTF_INTR_CLEAR**Type:** W**Reset State:** 0x00000000

Display Interface Interrupt Clear

MDSS_MDP_INTF_2_INTF_INTR_CLEAR

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6C18C MDSS_MDP_INTF_2_PROG_LINE_INTR_CONF**Type:** RW**Reset State:** 0xFFFFFFFF

Programmable Line Interrupt Config

double buffered: YES

MDSS_MDP_INTF_2_PROG_LINE_INTR_CONF

Bits	Name	Description
31:0	INTR_CORD	Pixel location in the panel video timing in terms of video raster structure including V/H blanks where the programmable line interrupt be generated When SW programe this register, it will be applied for the next frame after vsync

0x01A6C190 MDSS_MDP_INTF_2_VIDEO_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

Video MISR Control

MDSS_MDP_INTF_2_VIDEO_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6C194 MDSS_MDP_INTF_2_VIDEO_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

Video MISR signature

MDSS_MDP_INTF_2_VIDEO_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

0x01A6C198 MDSS_MDP_INTF_2_CMD_0_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

DSI CMD0 MISR Control

MDSS_MDP_INTF_2_CMD_0_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6C19C MDSS_MDP_INTF_2_CMD_0_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

DSI CMD0 MISR signature

MDSS_MDP_INTF_2_CMD_0_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

17.17.16 MDSS_MDP_INTF_3

Display Interface hardware register description

17.17.16.1 MDSS_MDP_INTF_3_INTF

INTF

Display Interface hardware register description

0x01A6C800 MDSS_MDP_INTF_3_TIMING_ENGINE_EN

Type: RW

Reset State: 0x00000000

Display Interface Timing Engine Enable register

double buffered: YES

when: On frame boundaries

MDSS_MDP_INTF_3_TIMING_ENGINE_EN

Bits	Name	Description
1	OSYNC_LOCK	
0	EN	Display Interface enable Should be the LAST register programmed for the interface Be sure to program ALL timing registers and setting up of the display pipeline BEFORE enabling this register Upon disabling of this bit, hardware will stop driving the interface at the NEXT vsync boundary A VSYNC interrupt WILL be generated but a VSYNC will NOT be generated on the interface

0x01A6C804 MDSS_MDP_INTF_3_INTF_CONFIG

Type: RW

Reset State: 0x00040000

Display Interface Configuration register.

Note that the configuration register ONLY applies to INTF_4 which transmits to MHL

MDSS_MDP_INTF_3_INTF_CONFIG

Bits	Name	Description
31	PROG_FETCH_START_EN	Programmable Fetch feature enable bit 0: programmable line counter disabled - default value to be backward compatible 1: programmable line counter enabled
30	ACTIVE_V_EN	Active V Enable
29	ACTIVE_H_EN	Active H Enable
28	VSYNC_INTERRUPT_MODE	vsync interrupt generation mode 0 = generate an interrupt every vsync 1 = generate an interrupt every 2 fields (applicable to interlace mode)
27:24	REPEAT_PIXEL_MODE	Pixel repeat mode 0x1 = repeat each pixel 2 times 0x2 = repeat each pixel 3 times ... 15 = repeat pixel 16 times
23	DSI_VIDEO_STOP_MODE	This bit controls how video mode stream is stopped when DSI dynamic refresh is triggered. It is not applicable for non-DSI interface. 0x0: disable timing engine when DSI sets the video stop signal; 0x1: halt timing engine counters when DSI sets the video stop signal
21	CHROMA_DWN_SAMPLE_H_MTHD	Horizontal Chroma Down Sample method 0x0: non-pixel dropping 0x1: pixel dropping
20	CHROMA_DWN_SAMPLE_EN	Chroma Down Sample enable for YUV444 0x0: Disabled 0x1: Enabled
18	CSC_DST_DATA_FORMAT	Destination Data Format 0x0: RGB 0x1: YCbCr
17	CSC_SRC_DATA_FORMAT	Source Data Format 0x0: RGB 0x1: YCbCr
16	CSC_EN	Enables the color matrix conversion 0x0: Bypass 0x1: Enabled

MDSS_MDP_INTF_3_INTF_CONFIG (cont.)

Bits	Name	Description
13:11	NIBBLE_SWAP_EN	Enable nibble swapping within each pixel byte NIBBLE_SWAP_EN[0]: 0 = no swapping for pixel_data [7:0]; 1 = enable swapping of pixel_data[3:0] with pixel_data[7:4] NIBBLE_SWAP_EN[1] = 0 = no swapping for pixel_data [15:8]; 1 = enable swapping of pixel_data[11:8] with pixel_data[15:12] NIBBLE_SWAP_EN[2] = 0 = no swapping for pixel_data [23:16]; 1 = enable swapping of pixel_data[19:16] with pixel_data[23:20]
10	PACK_ALIGN	0x0: LSB 0x1:MSB
9:8	PACK_422	0x0: Y2Cr1Y1Cb1 0x1: Cr1Y2Cb1Y1 0x2: Y2Cb1Y1Cr1 0x3: Cb1Y2Cr1Y1
6:4	OUT_MODE	0x0: YCbCr or RGB4444 seperate syncs 24-bit interface 0x1: RSVD 0x2: YCbCr 422 seperate syncs 16-bit interface
2	INTERLACE_INIT_SEL	0x0: start with even field 0x1: start with odd field
1	REPEAT_PIXEL	0x0: Do NOT repeat 0x1: Repeat
0	INTERLACE_MODE	double buffered: YES 0x0: Progressive Out 0x1: Interlace out

0x01A6C808 MDSS_MDP_INTF_3_HSYNC_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control

double buffered: YES

MDSS_MDP_INTF_3_HSYNC_CTL

Bits	Name	Description
31:16	HSYNC_PERIOD	HSYNC Period in pixel clocks. This is the start between start of HSYNC pulse and the start of the next HSYNC pulse. Note: $hsync_period = width + h_porch$ where $width = \text{output image width}$ $h_porch = (h_back_porch + h_front_porch)$ h_back_porch starts at the beginning of hsync pulse
15:0	PULSE_WIDTH	HSYNC pulse width in pixel clocks

0x01A6C80C MDSS_MDP_INTF_3_VSYNC_PERIOD_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_3_VSYNC_PERIOD_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. This is the time between start of vsync pulse and the start of the next vsync pulse. Note $vsync_period = height + v_porch$ where $height = \text{output_image_height}$ $v_porch = (v_back_porch + v_front_porch)$ v_back_porch starts at the beginning of vsync pulse.

0x01A6C810 MDSS_MDP_INTF_3_VSYNC_PERIOD_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_3_VSYNC_PERIOD_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks. In progressive mode, this is the time between start of vsync pulse and the start of next vsync pulse Interlace mode this is the time between start of Field1 vsync pulse and the start of Field2 vsync pulse. Note: $\text{vsync_period} = \text{Height} + \text{v_porch}$ where, Height = Output image height $\text{v_porch} = (\text{v_back_porch} + \text{v_front_porch})$ v_back_porch starts at the beginning of vsync pulse

0x01A6C814 MDSS_MDP_INTF_3_VSYNC_PULSE_WIDTH_F0**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 0

double buffered: YES

MDSS_MDP_INTF_3_VSYNC_PULSE_WIDTH_F0

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period width in pixel clocks

0x01A6C818 MDSS_MDP_INTF_3_VSYNC_PULSE_WIDTH_F1**Type:** RW**Reset State:** 0x00000000

Display Interface VSYNC Control for field 1

double buffered: NO

MDSS_MDP_INTF_3_VSYNC_PULSE_WIDTH_F1

Bits	Name	Description
31:0	VSYNC_PERIOD	VSYNC Period in pixel clocks for the 2nd field. NOT valid for progressive mode

0x01A6C81C MDSS_MDP_INTF_3_DISPLAY_V_START_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 0

double buffered: YES

MDSS_MDP_INTF_3_DISPLAY_V_START_F0

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field0 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6C820 MDSS_MDP_INTF_3_DISPLAY_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_3_DISPLAY_V_START_F1

Bits	Name	Description
31:0	DISPLAY_START_Y	Display Y Start Defines the time period between the field1 start of vsync pulse and the first displayed line position in pixel clocks $\text{display_start_y} = \text{v_back_porch} * \text{hcycle}$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the first active pixel and not the first pixel on that line! In particular, the programming for eDP should be: $\text{display_start_y} = (\text{v_back_porch} * \text{hcycle}) + \text{horizontal_back_porch}$

0x01A6C824 MDSS_MDP_INTF_3_DISPLAY_V_END_F0**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_3_DISPLAY_V_END_F0

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where $\text{hcycle} = \text{horizontal_back_porch} + \text{horizontal_active} + \text{horizontal_front_porch}$ For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

0x01A6C828 MDSS_MDP_INTF_3_DISPLAY_V_END_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Vertical Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_3_DISPLAY_V_END_F1

Bits	Name	Description
31:0	DISPLAY_END_Y	Display Y End Defines the time period between the field0 start of vsync pulse and the last displayed line position in pixel clocks $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1$ where hcycle = horizontal_back_porch + horizontal_active + horizontal_front_porch For eDP control the value programmed into this register differs slightly and should be programmed to the last active pixel and not the last pixel on that line! In particular, the programming for eDP should be: $\text{display_end_y} = (\text{vertical_back_porch} + \text{vertical_active}) * \text{hcycle} - 1 - \text{horizontal_front_porch}$

double buffered: YES

MDSS_MDP_INTF_3_ACTIVE_V_START_F0

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6C830 MDSS_MDP_INTF_3_ACTIVE_V_START_F1**Type:** RW**Reset State:** 0x00000000

Display Interface Active Start Control for field 1

double buffered: NO

MDSS_MDP_INTF_3_ACTIVE_V_START_F1

Bits	Name	Description
31:0	ACTIVE_START_Y	Active Y Start

0x01A6C834 MDSS_MDP_INTF_3_ACTIVE_V_END_F0

Type: RW

Reset State: 0x00000000

Display Interface Active End Control for field 0

double buffered: YES

MDSS_MDP_INTF_3_ACTIVE_V_END_F0

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6C838 MDSS_MDP_INTF_3_ACTIVE_V_END_F1

Type: RW

Reset State: 0x00000000

Display Interface Active End Control for field 1

double buffered: NO

MDSS_MDP_INTF_3_ACTIVE_V_END_F1

Bits	Name	Description
31:0	ACTIVE_END_Y	Active Y End

0x01A6C83C MDSS_MDP_INTF_3_DISPLAY_HCTL

Type: RW

Reset State: 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_3_DISPLAY_HCTL

Bits	Name	Description
31:16	DISPLAY_END_X	Display End X
15:0	DISPLAY_START_X	Display Start X

0x01A6C840 MDSS_MDP_INTF_3_ACTIVE_HCTL**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Control for field 1

double buffered: YES

MDSS_MDP_INTF_3_ACTIVE_HCTL

Bits	Name	Description
31:16	ACTIVE_END_X	Active End X
15:0	ACTIVE_START_X	Active Start X

0x01A6C844 MDSS_MDP_INTF_3_BORDER_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Border Color

double buffered: NO

MDSS_MDP_INTF_3_BORDER_COLOR

Bits	Name	Description
23:0	BORDER_COLOR	Defines 24-bit Border Color of the inactive region of display

0x01A6C848 MDSS_MDP_INTF_3_UNDERFLOW_COLOR**Type:** RW**Reset State:** 0x00000000

Display Interface Underflow Color

double buffered: NO

MDSS_MDP_INTF_3_UNDERFLOW_COLOR

Bits	Name	Description
23:0	UNDERFLOW_COLOR	Defines 24-bit Underflow Color

0x01A6C84C MDSS_MDP_INTF_3_HSYNC_SKEW**Type:** RW**Reset State:** 0x00000000

Display Interface HSYNC Skew Control

double buffered: YES

MDSS_MDP_INTF_3_HSYNC_SKEW

Bits	Name	Description
15:0	HSYNC_SKEW	HSYNC Skew Defines the number of pixel clocks HSYNC active edge is delayed from VSYNC active edge

0x01A6C850 MDSS_MDP_INTF_3_POLARITY_CTL**Type:** RW**Reset State:** 0x00000000

Display Interface Polarity Control

double buffered: NO

MDSS_MDP_INTF_3_POLARITY_CTL

Bits	Name	Description
2	DEN	DEN Polarity 0x0: Active HIGH 0x1: Active LOW
1	VSYNC	VSYNC Polarity 0x0: Active HIGH 0x1: Active LOW
0	HSYNC	HSYNC Polarity 0x0: Active HIGH 0x1: Active LOW

0x01A6C858 MDSS_MDP_INTF_3_TP_COLOR0**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_3_TP_COLOR0

Bits	Name	Description
23:0	COLOR0	Test Pattern Color

0x01A6C85C MDSS_MDP_INTF_3_TP_COLOR1**Type:** RW**Reset State:** 0x00000000

Display Interface Test Pattern Color

double buffered: NO

MDSS_MDP_INTF_3_TP_COLOR1

Bits	Name	Description
23:0	COLOR1	Test Pattern Color

0x01A6C884 MDSS_MDP_INTF_3_DSI_CMD_MODE_TRIGGER_EN**Type:** RW**Reset State:** 0x00000000

Enable for DSI trigger processing on DSI Command Mode interface

double buffered: NO

MDSS_MDP_INTF_3_DSI_CMD_MODE_TRIGGER_EN

Bits	Name	Description
5:4	DSI_CMD_TG_INTF_SEL	Select the stream to be triggered by DSI controller. Takes effect only if DSI_CMD_TG_EN is set to 1
0	DSI_CMD_TG_EN	DSI Command Trigger Enable. Set it to 1 to enable trigger processing 0: Disable trigger processing 1: Enable trigger processing

0x01A6C890 MDSS_MDP_INTF_3_PANEL_FORMAT**Type:** RW**Reset State:** 0x00002100

Panel Packer Configuration

double buffered: NO

MDSS_MDP_INTF_3_PANEL_FORMAT

Bits	Name	Description
16	COMP2_BIT_FLIP_EN	0x1: All bits of component 2 are flipped
15	COMP1_BIT_FLIP_EN	0x1: All bits of component 1 are flipped
14	COMP0_BIT_FLIP_EN	0x1: All bits of component 0 are flipped
13:8	PACK_PATTERN	Packing Pattern used by the packer 0x21: RGB 0x24: RBG 0x12: BGR 0x18: BRG 0x06: GBR 0x09: GRB
7	PACK_ALIGN	Packing alignment (within a byte) for each colour component 0x0: LSB 0x1: MSB
5:4	COMP2_OUT	Number of bits for component 2 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits
3:2	COMP1_OUT	Number of bits for component 1 output 0x0: 4 bits 0x1: 5 bits 0x2: 6 bits 0x3: 8 bits

0x01A6C8A8 MDSS_MDP_INTF_3_FRAME_LINE_COUNT_EN**Type:** RW**Reset State:** 0x00000000

Frame and Line Count Enable

double buffered: NO

MDSS_MDP_INTF_3_FRAME_LINE_COUNT_EN

Bits	Name	Description
1	FRAME_COUNT_EN	Current Frame Count Enable This will provide SW information on the current frame being sent out on an active panel It will reset upon disabling of the timing engine and increment for every frame Note that there is possibility for rollover if enabled for long time. NO status is provided that rollover occurred
0	LINE_COUNT_EN	Current Line Count Enable This will provide SW information on the current line being sent out on an active panel This will include all blanking lines as well It will reset upon vsync and increment until the end of the frame.

0x01A6C8AC MDSS_MDP_INTF_3_FRAME_COUNT**Type:** R**Reset State:** 0x00000000

Current Frame Count since Timing Engine Enabled

double buffered: N/A

MDSS_MDP_INTF_3_FRAME_COUNT

Bits	Name	Description
31:0	VALUE	Current Frame Count - Base 1

0x01A6C8B0 MDSS_MDP_INTF_3_LINE_COUNT**Type:** R**Reset State:** 0x00000000

Current Line Count Including blanking

double buffered: N/A

MDSS_MDP_INTF_3_LINE_COUNT

Bits	Name	Description
15:0	VALUE	Current Line Count - Base 1

0x01A6C970 MDSS_MDP_INTF_3_PROG_FETCH_START**Type:** RW**Reset State:** 0x00000000

Programmable Fetch Start

double buffered: YES

MDSS_MDP_INTF_3_PROG_FETCH_START

Bits	Name	Description
31:0	VALUE	Programmable line value for the feature Note: The valid register setting shall be vsync counter value for the first pixel of VFP lines

0x01A6C980 MDSS_MDP_INTF_3_INTF_INTR_EN**Type:** RW**Reset State:** 0x00000000

Display Interface Interrupt Enable

MDSS_MDP_INTF_3_INTF_INTR_EN

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt 0x0: Interrupt Disabled 0x1: Interrupt Enabled

0x01A6C984 MDSS_MDP_INTF_3_INTF_INTR_STATUS**Type:** R**Reset State:** 0x00000000

Display Interface Interrupt Status

MDSS_MDP_INTF_3_INTF_INTR_STATUS

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6C988 MDSS_MDP_INTF_3_INTF_INTR_CLEAR**Type:** W**Reset State:** 0x00000000

Display Interface Interrupt Clear

MDSS_MDP_INTF_3_INTF_INTR_CLEAR

Bits	Name	Description
0	PROG_LINE	Programmeble Line Interrupt

0x01A6C98C MDSS_MDP_INTF_3_PROG_LINE_INTR_CONF**Type:** RW**Reset State:** 0xFFFFFFFF

Programmable Line Interrupt Config

double buffered: YES

MDSS_MDP_INTF_3_PROG_LINE_INTR_CONF

Bits	Name	Description
31:0	INTR_CORD	Pixel location in the panel video timing in terms of video raster structure including V/H blanks where the programmable line interrupt be generated When SW programe this register, it will be applied for the next frame after vsync

0x01A6C990 MDSS_MDP_INTF_3_VIDEO_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

Video MISR Control

MDSS_MDP_INTF_3_VIDEO_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6C994 MDSS_MDP_INTF_3_VIDEO_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

Video MISR signature

MDSS_MDP_INTF_3_VIDEO_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

0x01A6C998 MDSS_MDP_INTF_3_CMD_0_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

DSI CMD0 MISR Control

MDSS_MDP_INTF_3_CMD_0_MISR_CTRL

Bits	Name	Type	Description
31	RUN_MODE	RW	This register defines the operation mode for the MISR 0x0: Single run mode meaning it stops after the programmable number of frames. (i.e. legacy mode prior to MDP5 1.5.0) 0x1: Free running mode meaning it updates the misr signature every programmable number of frames and continues to run while MISR_ENABLE is set to 0x1
27:24	INPUT_SEL	RW	This field allows the selected input to propagate to the MISR in the event that multiple inputs want to share the same physical MISR For example, the video interface might want to MISR on active pixel data only or active+timing information as well This field would select which input is sent to the MISR
10	STATUS_CLEAR	W	This is a write only register that doesn't have any effect prior to MDP5 1.5.0 since there was no logic associated with it Write 0x1: Clears the MISR_STATUS register Write 0x0: Has no effect on the the MISR_STATUS register
9	STATUS	R	Read only register Set to 0x1 when misr signature has been updated
8	ENABLE	RW	MISR enable which starts/ends calculation of MISR on the next vsync/trigger event This essentially double buffers the enable so that the misr doesn't start/end immediately but rather at a defined time The MISR calculation would run until the end of programmed number of frames
7:0	FRAME_COUNT	RW	Number of frames to run before capturing

0x01A6C99C MDSS_MDP_INTF_3_CMD_0_MISR_SIGNATURE**Type:** R**Reset State:** 0x00000000

DSI CMD0 MISR signature

MDSS_MDP_INTF_3_CMD_0_MISR_SIGNATURE

Bits	Name	Description
31:0	CAPTURED	This register is the MISR value captured

17.17.17 MDSS_MDP_PP_0

Ping Pong hardware register description

17.17.17.1 MDSS_MDP_PP_0_PP

PP

Ping Pong hardware register description

0x01A71000 MDSS_MDP_PP_0_TEAR_CHECK_EN

Type: RW

Reset State: 0x00000000

Register is used to enable tearing check on different displays.

double buffered: NO

MDSS_MDP_PP_0_TEAR_CHECK_EN

Bits	Name	Description
0	EN	Enable tear check 0x0: disabled 0x1: enabled

0x01A71004 MDSS_MDP_PP_0_SYNC_CONFIG_VSYNC

Type: RW

Reset State: 0x00000000

The SYNC_CONFIG_VSYNC register is a synchronization configuration register.

double buffered: NO

MDSS_MDP_PP_0_SYNC_CONFIG_VSYNC

Bits	Name	Description
20	VSYNC_IN_EN	Setting this bit will sync with the external frame sync input

MDSS_MDP_PP_0_SYNC_CONFIG_VSYNC (cont.)

Bits	Name	Description
19	VSYNC_COUNTER_EN	Setting this bit to enable the internal counter
18:0	VSYNC_COUNT	This scale value to be programmed is the ratio of the MDP VSYNC clock frequency to LCD panel frequency divided by the no. of rows (lines) in the LCD panel. For example, if the VSYNC clock is 133 MHz and the LCD is 176 lines (rows) and 220 pixels (columns) at 60 Hz, then the value to be programmed is:\n $133 * 10^6 / (60 * 176) = 12594$ That is, it takes 12594 MDP clocks to complete writing one line in the LCD panel.

0x01A71008 MDSS_MDP_PP_0_SYNC_CONFIG_HEIGHT**Type:** RW**Reset State:** 0x00000000

The SYNC_CONFIG_VSYNC register is a synchronization configuration register.

double buffered: NO

MDSS_MDP_PP_0_SYNC_CONFIG_HEIGHT

Bits	Name	Description
15:0	HEIGHT	Display height - 1. It is the vertical total number of lines

0x01A7100C MDSS_MDP_PP_0_SYNC_WRCOUNT**Type:** RW**Reset State:** 0x00000000

The MDP_SYNC_STATUS_P register is a primary synchronization status register. Writing to this register loads the line counter and is equivalent to providing a software Vsync.

double buffered: NO

MDSS_MDP_PP_0_SYNC_WRCOUNT

Bits	Name	Description
31:16	FRAME_COUNT	Writing to this register will load the counter according to the written value
15:0	LINE_COUNT	Writing to this register will load the counter according to the written value

0x01A71010 MDSS_MDP_PP_0_VSYNC_INIT_VAL**Type:** RW**Reset State:** 0x00000000

VSYNC_INIT_VAL defines the value with which the read pointer gets loaded at primary vsync edge.

double buffered: NO

MDSS_MDP_PP_0_VSYNC_INIT_VAL

Bits	Name	Description
15:0	INIT_VAL	Specify the init value to which the read pointer gets loaded at vsync edge

0x01A71014 MDSS_MDP_PP_0_INT_COUNT_VAL**Type:** R**Reset State:** 0x00000000

The INT_CNT_VAL register shows the internal line and frame counter for primary vsync.

double buffered: NO

MDSS_MDP_PP_0_INT_COUNT_VAL

Bits	Name	Description
31:16	FRAME_COUNT	Indication of the number of frames elapsed since enabling the Interface The counter increments once MDP has send the frame to the display peripheral The counter will reset upon enabling of the interface
15:0	LINE_COUNT	Indication of the current line count for the current frame This counter is applicable for both command and active panels. For active panels, the line count WILL include blanking information For command mode panels, there is no blanking information so it reflects the actual line count being displayed The counter increments at the end of each line The counter will reset at the start of the first line

0x01A71018 MDSS_MDP_PP_0_SYNC_THRESH**Type:** RW**Reset State:** 0x00000000

SYNC_THRESH register is a primary synchronization threshold register.

double buffered: NO

MDSS_MDP_PP_0_SYNC_THRESH

Bits	Name	Description
31:16	CONTINUE_THRESHOLD	The minimum number of lines the write pointer needs to be above the read pointer so that it is safe to write to the panel. (This check is not done for the first ROI line write of an update)
15:0	START_THRESHOLD	Allows the first ROI line write to an panel when read pointer is between the range of ROI start line and ROI start line plus this setting

0x01A7101C MDSS_MDP_PP_0_START_POS

Type: RW

Reset State: 0x00000000

START_POS defines the starting y position value for the vsync line counter at every frame

double buffered: NO

MDSS_MDP_PP_0_START_POS

Bits	Name	Description
15:0	POS	Specify the y position from which the start_threshold value is added and write is kicked off if the read pointer falls within that region

0x01A71020 MDSS_MDP_PP_0_RD_PTR_IRQ

Type: RW

Reset State: 0x00000000

RD_PTR_IRQ defines the read pointer of the display at which an interrupt has to be generated.

double buffered: NO

MDSS_MDP_PP_0_RD_PTR_IRQ

Bits	Name	Description
15:0	IRQ_LINE	Specify the read pointer value at which an interrupt has to be generated

0x01A71024 MDSS_MDP_PP_0_WR_PTR_IRQ**Type:** RW**Reset State:** 0x00000000

WR_PTR_IRQ defines the read pointer of the display at which an interrupt has to be generated.

double buffered: NO

MDSS_MDP_PP_0_WR_PTR_IRQ

Bits	Name	Description
15:0	IRQ_LINE	Specify the write pointer value at which an interrupt has to be generated

0x01A71028 MDSS_MDP_PP_0_OUT_LINE_COUNT**Type:** RW**Reset State:** 0x00000000

Output line counter as to when the update will occur

This is equivalent to the Y value of the panel update .

double buffered: NO

MDSS_MDP_PP_0_OUT_LINE_COUNT

Bits	Name	Description
15:0	OUT_Y	Starting Y value as to when the update will occur

0x01A7102C MDSS_MDP_PP_0_PP_LINE_COUNT**Type:** R**Reset State:** 0x00000000

Current write pointer line counter

double buffered: NO

MDSS_MDP_PP_0_PP_LINE_COUNT

Bits	Name	Description
15:0	COUNT	Contains the current line counter within the ping pong FIFO as used by tear check logic

0x01A71030 MDSS_MDP_PP_0_AUTOREFRESH_CONFIG**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_PP_0_AUTOREFRESH_CONFIG**

Bits	Name	Description
31	ENABLE	
15:0	FRAME_COUNT	

17.17.18 MDSS_MDP_PP_1

MDSS_MDP_PP_2_PP_LINE_COUNT

Bits	Name	Description
15:0	COUNT	Contains the current line counter within the ping pong FIFO as used by tear check logic

0x01A72030 MDSS_MDP_PP_2_AUTOREFRESH_CONFIG**Type:** RW**Reset State:** 0x00000000**MDSS_MDP_PP_2_AUTOREFRESH_CONFIG**

Bits	Name	Description
31	ENABLE	
15:0	FRAME_COUNT	

17.17.20 MDSS_MDP_ENCR_NS_0_ENCR_NS**0x01A77004 MDSS_MDP_ENCR_NS_0_CRYPT0_SEG_SIZE****Type:** RW**Clock:** Core Clock**Reset State:** 0x00000000

This register specifies the total size of the segment. It must be set to the total number of bytes in line.

MDSS_MDP_ENCR_NS_0_CRYPT0_SEG_SIZE

Bits	Name	Description
31:0	SEG_SIZE	The number of bytes to process in total. Normally this register would be set to a value representing the end of encryption segment.

17.17.21 MDSS_MDP_ENCR_S_0_ENCR_S

0x01A77400 MDSS_MDP_ENCR_S_0_CRYPTO_CONFIG

Type: RW

Clock: Core Clock

Reset State: 0x00000000

This register enables/disables the crypto core operation. The register is double buffered and protected by the permissions logic.

MDSS_MDP_ENCR_S_0_CRYPTO_CONFIG

Bits	Name	Description
0	FRAME_ENCR_EN	Enables video frame encryption. The value is qualified at the start of each video frame.

0x01A77404+ MDSS_MDP_ENCR_S_0_CRYPTO_ENCR_KEYn, n=[0..3] 0x4*n

Type: W

Clock: Core Clock

Reset State: 0x00000000

These registers specify the keys for AES encryption algorithms. The registers are write only and can be accessed by Trustzonesoftware only.

MDSS_MDP_ENCR_S_0_CRYPTO_ENCR_KEYn

Bits	Name	Description
31:0	CRYPTO_ENCR_KEY	Specifies the key for AES encryption algorithms.

0x01A77414+ MDSS_MDP_ENCR_S_0_CRYPTO_ENCR_RIVn, n=[0..1] 0x4*n

Type: W

Clock: Core Clock

Reset State: 0x00000000

This register holds the Riv value used for Counter Initialization Vector computation according to HDCP2.1.

MDSS_MDP_ENCR_S_0_CRYPTO_ENCR_RIVn

Bits	Name	Description
31:0	CRYPTO_ENCR_RIV	Specifies the Riv value for AES encryption algorithms.

0x01A7741C MDSS_MDP_ENCR_S_0_CRYPTO_ENCR_STRCTR**Type:** W**Clock:** Core Clock**Reset State:** 0x00000000

This register holds the StreamCtr value used for Counter Initialization Vector computation according to HDCP2.1.

MDSS_MDP_ENCR_S_0_CRYPTO_ENCR_STRCTR

Bits	Name	Description
31:0	CRYPTO_ENCR_STRCTR	Specifies the StreamCtr value for AES encryption algorithms.

17.17.22 MDSS_MDP_AADC_0

Apical Assertive Dispay Core hardware register description

17.17.22.1 MDSS_MDP_AADC_0_AADC

AADC

Apical Assertive Dispay Core hardware register description

0x01A79000 MDSS_MDP_AADC_0_APICAL_CORE_BYPASS**Type:** RW**Reset State:** 0x00000101

Apical bypass and SW reset control

MDSS_MDP_AADC_0_APICAL_CORE_BYPASS

Bits	Name	Description
23:16	APICAL_CORE_RESERVED_23_16	RESERVED for future use.
8	APICAL_CORE_SW_RESET_EN	Enable SW reset control capability for Apical Iridix core - SHOULD always be set to 1'b1; (active high, default 0). This ensures that when ares and apical_core_sw_reset are ORed together, the in/out conversion blocks reset first to block propagation of any potential hazards out of the apical wrapper,, also clocks to the apical core are stopped preventing internal hazards.

MDSS_MDP_AADC_0_APICAL_CORE_BYPASS (cont.)

Bits	Name	Description
0	APICAL_CORE_BYPASS	0x0 : Pass pixel data through Apical core - Apical processing is enabled via APICAL_IRIDIX_CONTROL_0.IRIDIX_ENABLE 0x1 : Bypass Apical core entirely - this will also clock gate the core (default) Double-buffered: Yes

0x01A79004 MDSS_MDP_AADC_0_APICAL_CONTROL_REG0**Type:** RW**Reset State:** 0x00000003

The Data format port specifies the input data format so that the iridix core can process the different input data formats.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_CONTROL_REG0

Bits	Name	Description
7:2	CONTROL_REG0_RESERVED_7_2	Reserved - Should be zero, except for bit 3 which is hardcoded as 1b.
1:0	DATA_FORMAT	Data Format Select 0x0: YCbCr Color space 4:2:2 format, interleaved (Cb-Y-Cr-Y) 0x1: YCbCr Color space 4:2:2 format, parallel 0x2: YCbCr Color 4:4:4 format 0x3: RGB Color space

0x01A79008 MDSS_MDP_AADC_0_APICAL_CONTROL_REG1**Type:** RW**Reset State:** 0x00000000

Synchronization Format Register.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_CONTROL_REG1

Bits	Name	Description
7	AUTO_SIZE	Auto Size Register 0x0: Auto_Size off. The Iridix core will use Frame_Width, Frame_Height ports values 0x1: Auto_Size on. The Iridix core will calculate the frame geometry based on the active line and field signals. The size of current frame will be used for the estimation of the next frame. The Frame size will be updated when the Field signal toggles.
6:0	CONTROL_REG1_RESERVED_6_0	Reserved, should be set to 0x00.

0x01A7900C MDSS_MDP_AADC_0_APICAL_FRAME_SIZE**Type:** RW**Reset State:** 0x01000100

Frame Size Register.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_FRAME_SIZE

Bits	Name	Description
31:16	FRAME_WIDTH	Frame width in number of pixels in an active line. This port is used only in non-automatic mode(default)
15:0	FRAME_HEIGHT	Frame height in number of line in an active frame. This port is used only in non-automatic mode(default)

0x01A79010 MDSS_MDP_AADC_0_APICAL_IRIDIX_CONTROL_0**Type:** RW**Reset State:** 0x00000006

Iridix Control Register 0

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_IRIDIX_CONTROL_0

Bits	Name	Description
7:5	IRIDIX_CONTROL_0_RESERVED_7_5	Reserved - Should be zero.

MDSS_MDP_AADC_0_APICAL_IRIDIX_CONTROL_0 (cont.)

Bits	Name	Description
4	IRIDIX_COLOR_CORRECTION	Color Correction/Control - Enabling this processing will result in more accurate colors processing. The color correction algorithm is required on gamma corrected sources. It reduces the saturation in dark areas when they are being amplified, and saturates bright parts when they get darker. 0x0: Disable color correction 0x1: Enable color correction
3	IRIDIX_LOCAL_CONTRAST_2D	Local contrast (2D) 0x0: Memory interfaces for 2D processing used 0x1: Memory interfaces for 2D processing bypassed, 2D processing disabled. This selection overrides LC0, LC1 settings. Note: If 2D Local contrast is not implemented then the bit[3] should be one.
2:1	IRIDIX_LOCAL_CONTRAST	Local Contrast Control - This is a supplementary module preserving local contrast in small areas. Depending on custom implementation LC module can be implemented differently and may have different settings. 1D Case : 0x0: disabled; 0x1: LC enabled, kernel 1x3 used 0x2: LC enabled, kernel 1x3 used 0x3: LC enabled, kernel 1x5 used 2D Case : 0x0: disabled; 0x1: LC enabled, kernel 1x3 used 0x2: LC enabled, kernel 3x3 used 0x3: LC enabled, kernel 3x5 used
0	IRIDIX_ENABLE	iridix Enable - This bit turns iridix processing ON and OFF. When iridix is OFF, the video data passes to the output without any changes. Disabling iridix® using this bit is equivalent to setting the Strength parameter to 0. Many internal modules run in idle mode when this bit is 0. The Latency Delays between the input and the output signals are the same in both ON and OFF modes. 0x0: Disable iridix processing 0x1: Enable iridix processing

0x01A79014 MDSS_MDP_AADC_0_APICAL_IRIDIX_CONTROL_1**Type:** RW**Reset State:** 0x00004600

This Port is reserved for debugging purposes by Apical. Do not modify.

MDSS_MDP_AADC_0_APICAL_IRIDIX_CONTROL_1

Bits	Name	Description
15:8	IRIDIX_CONTROL_1	Reserved for debugging purposes by Apical

0x01A79018 MDSS_MDP_AADC_0_APICAL_STRENGTH_MANUAL**Type:** RW**Reset State:** 0x00000000

Strength of iridix -Manual override value of iridix module's strength input (strength_ir) when option_select = 7 (dec).

MDSS_MDP_AADC_0_APICAL_STRENGTH_MANUAL

Bits	Name	Description
7:0	STRENGTH_MANUAL	Strength of iridix - This Port sets processing Strength. Minimum value is 0, maximum is 255. 0x00: Video data will not be processed at all, and will go to the output unchanged. 0xFF: Maximum strengthSTRENGTH_MANUAL

0x01A7901C MDSS_MDP_AADC_0_APICAL_VARIANCE**Type:** RW**Reset State:** 0x00000041

Affects the sensitivity of the transform to different areas of the image, and can be increased in order to emphasize small regions (e.g. faces).

If this parameter is set to zero, the sensitivity to the small areas is maximal. The transform becomes more local.

When the parameter is set to 0xFF the transform deemphasizes small local details, and transform becomes more global

e.g. the sky at the top of the frame can affect flowers at the bottom of the frame.

Default value is 36h but it depends on custom implementation.

Setting variance to zero will progressively increase the spatial sensitivity of the algorithm but it can lead to artificial-looking images in some cases.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_VARIANCE

Bits	Name	Description
7:4	VARIANCE_INTENSITY	Sets the degree of sensitivity in the luminance domain. Maximum Variance is 0xF, and minimum Variance is 0x0.
3:0	VARIANCE_SPACE	Sets the degree of spatial sensitivity of the algorithm. As this parameter is made smaller, the algorithm focuses on smaller regions within the image. Maximum Variance is 0xF, and minimum Variance is 0x0

0x01A79020 MDSS_MDP_AADC_0_APICAL_IRIDIX_DITHER**Type:** RW**Reset State:** 0x00000000

Iridix Dither Register: When the number of color gradations of a display device is small (for example 6 bit per color) pixel dithering can make gradients look smother.

There can be a situation when iridix output signal is 12 bits but the signal needs to be compressed into 8 bits.

The best way for this is to use dithering of least significant bits and then truncate these bits. The dithering can be performed by iridix Processor.

However, the truncation needs to be done by a hardware designer outside iridix.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_IRIDIX_DITHER

Bits	Name	Description
7:3	IRIDIX_DITHER_RESERVE_D_7_3	Reserved - Not used for now.
2:0	DITHER	Strength of Dithering. 0x0: No dithering 0x1: One least significant bit of the output signal is dithered 0x2: Two bits are dithered 0x3: Three bits are dithered 0x4: Four bits are dithered Others: Four bits are dithered

0x01A79024 MDSS_MDP_AADC_0_APICAL_DITEHR_CONTROL**Type:** RW**Reset State:** 0x00000000

Spatial Preceptual Model Dither

This module provides a 4-bit dither via a spatial perceptual model.

There is no temporal dependence of the dither pattern, therefore eliminating the possibility of flicker

note that temporal dither is available via the port iridix_dither.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_DITEHR_CONTROL

Bits	Name	Description
7:4	DITHER_CONTROL_RESE RVED_7_4	Reserved - Should be Zero.
3:2	DITHER_AMOUNT	Strength of Dithering. 0x0: Dither 1 bit 0x1: Dither 2 bit 0x2: Dither 3 bit 0x3: Dither 4 bit
1	DITHER_SHIFT_MODE	Shift Mode: 0x0: Output is MSB aligned 0x1: Output is LSB aligned
0	DITHER_ENABLE_DITHER	Enable Dither: Enables the dither module. 0: Disable dither module 1: Enable dither module

0x01A79028 MDSS_MDP_AADC_0_APICAL_LIMIT_AMPL

Type: RW

Reset State: 0x000000F0

Two parameters used to restrict the luminance space in which Iridix can adaptively generate tone curves for each pixel

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_LIMIT_AMPL

Bits	Name	Description
7:4	BRIGHT_AMP_LIMIT	Bright amplification limit - The resultant tone curve cannot be lower than bright amplification limit line controlled by the bright amplification limit parameter. See Apical TRM Chapter 4 for more explanation. Maximum limit is 0xF, when the value is 0x0 there is no limit.

MDSS_MDP_AADC_0_APICAL_LIMIT_AMPL (cont.)

Bits	Name	Description
3:0	DARK_AMP_LIMIT	Dark amplification limit - The resultant tone curve cannot be higher than dark amplification limit line controlled by the dark amplification limit parameter. See Apical TRM Chapter 4 for more explanation. Maximum limit is 0xF, when the value is 0x0 there is no limit.

0x01A7902C MDSS_MDP_AADC_0_APICAL_SLOPE**Type:** RW**Reset State:** 0x00003C80

Slope Min and Max Limit used to restrict the slope of the tone-curve generated by Iridix.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_SLOPE

Bits	Name	Description
15:8	SLOPE_MAX	Slope Max Limit - Slope Max Limit is used to restrict the slope of the tone-curve generated by iridix. When Slope Max Limit parameter is set to 0xFF, the tone curve slope, generated by iridix is not limited (maximum slope 15). When this value is set to 00 iridix will not generate the tone-curve with slope greater than 16/15 (48°). Intermediate values of Slope Limit are linear interpolation between minimum and maximum values. Recommended Slope Max Limit range is 20h-60h. For noisy images less value should be used. See Chapter 4 for more explanation.
7:0	SLOPE_MIN	Slope Min Limit - Slope Min Limit is used to restrict the slope of the tone-curve generated by iridix. When Slope Min Limit parameter is set to 0x00, the tone curve slope, generated by iridix is not limited. When this value is set to FF iridix will not generate the tone-curve with slope less than 3/4. Intermediate values of Slope Limit are linear interpolation between minimum and maximum values. Recommended Slope Min Limit range is 00h-C0h. See Chapter 4 for more explanation.

0x01A79030 MDSS_MDP_AADC_0_APICAL_BW_LEVEL**Type:** RW**Reset State:** 0x03FF0000

Black and White Level of the Iridix IP.

The least significant bits [dw-1:0] are used; higher bits [15:dw] are unused. dw is the component data width. dw=8 for MDSS \n double buffered: Yes

MDSS_MDP_AADC_0_APICAL_BW_LEVEL

Bits	Name	Description
25:16	WHITE_LEVEL	White Level - The value stored in White Level Port will be used as white level for iridix processing in all unsigned data channels. Data above White level will not be processed and stay unchanged. Note: 1. For 12 bit variant minimum White Level is constrained as: White Level - Black Level > 1024. 2. For 10 bit variant minimum White Level is constrained as: White Level - Black Level > 256.
9:0	BLACK_LEVEL	Black Level - The value stored in Black Level Port will be used as zero level for iridix processing in all unsigned data channels. Data below Black level will not be processed and stay unchanged. Note: 1. For 12 bit variant maximum Black Level is constrained as: White Level - Black Level > 1024. 2. For 10 bit variant maximum Black Level is constrained as: White Level - Black Level > 256

0x01A79034 MDSS_MDP_AADC_0_APICAL_LOGO_POS

Type: RW

Reset State: 0x00000000

Apical Logo Position

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_LOGO_POS

Bits	Name	Description
15:8	LOGO_LEFT	horizontal position of logo.
7:0	LOGO_TOP	vertical position of logo.

0x01A79038 MDSS_MDP_AADC_0_APICAL_LUT_FI1_0

Type: RW

Reset State: 0x00C70000

Asymmetry Function Lookup Table Entry 1-0

The Asymmetry Function Lookup Table port geometry is 33 words, each of which is 16 bits.

The Asymmetry function is used to balance the iridix effect between the dark and bright regions of the image.

double buffered: Yes

MDSS_MDP_AADC_0_APICAL_LUT_FI1_0

Bits	Name	Description
31:16	LUT_FI1	Asymmetry Function Lookup Table Entry 1.
15:0	LUT_FI0	Asymmetry Function Lookup Table Entry 0.

0x01A7903C MDSS_MDP_AADC_0_APICAL_LUT_FI3_2

27:16	LUT_CC32	Color Correction Lookup Table Entry 32.

0x01A790C8 MDSS_MDP_AADC_0_APICAL_STRENGTH_LIMIT**Type:** RW**Reset State:** 0x00000080

Imposes a cap on maximum dynamic range compression strength.

double buffered: No

MDSS_MDP_AADC_0_APICAL_STRENGTH_LIMIT

Bits	Name	Description
7:0	STRENGTH_LIMIT	Used to restrict the maximum value taken by strength_out: in all cases, strength_out <= strength_limit.

0x01A790CC MDSS_MDP_AADC_0_APICAL_CALIBRATION_AB**Type:** RW**Reset State:** 0x005F006E

Screen calibration parameter

four calibration parameters control the overall adaptation of displayed content to ambient light and backlight level.

They represent a combination of physical and perceptual factors which influence the apparent contrast of imagery as the user's eyes adapt to changing viewing conditions.

double buffered: No

MDSS_MDP_AADC_0_APICAL_CALIBRATION_AB

Bits	Name	Description
31:16	CALIBRATION_B	This parameter controls the adaptation of content to the screen brightness. As backlight is reduced in the presence of ambient light, shadow detail is progressively lost below the minimum grey level of the display. When calibrated correctly, this parameter ensures that image content remains viewable at all backlight levels.
15:0	CALIBRATION_A	This parameter is related to the reflectivity of the screen. The more reflective the screen, the greater is the loss of shadow detail as ambient light level increases. It is the objective of the Assertive Display core to maintain the same level of shadow detail which pertains in very low light, up to ambient light levels typical of outdoor viewing. When calibrated correctly, this parameter ensures that image content is neither lost nor over-enhanced leading to preservation of the viewing experience.

0x01A790D0 MDSS_MDP_AADC_0_APICAL_CALIBRATION_CD**Type:** RW**Reset State:** 0x00000013

Screen calibration parameter

four calibration parameters control the overall adaptation of displayed content to ambient light and backlight level.

They represent a combination of physical and perceptual factors which influence the apparent contrast of imagery as the user's eyes adapt to changing viewing conditions.

double buffered: No

MDSS_MDP_AADC_0_APICAL_CALIBRATION_CD

Bits	Name	Description
31:16	CALIBRATION_D	Typical movie, image and gaming content is 8-bit and encoded with a gamma curve which results in a dynamic range of around 1000:1. Most large displays have an effective contrast ratio larger than this under ideal viewing conditions (full backlight, low ambient light). However, many portable displays cannot reproduce such contrast ratios even under ideal conditions. When calibrated correctly, this parameter increases the effective contrast ratio of low contrast displays to match that of typical content.

MDSS_MDP_AADC_0_APICAL_CALIBRATION_CD (cont.)

Bits	Name	Description
15:0	CALIBRATION_C	This parameter controls the adaptation of content to overcome the limitations of the human eye sensitivity at very low light. Decreasing screen brightness in total darkness causes loss of image detail in shadow regions, especially on small displays, as the eyes are unable to adapt sufficiently. When calibrated correctly, this parameter enables restoration of such details.

0x01A790D4 MDSS_MDP_AADC_0_APICAL_OPTION_SELECT**Type:** RW**Reset State:** 0x00000000

Selects the overall operating mode of the core.- refer to Apical TRM Option_select Section for details

double buffered: ??

MDSS_MDP_AADC_0_APICAL_OPTION_SELECT

Bits	Name	Description
7:0	OPTION_SELECT	Selects the overall operating mode of the core. 0x0: Automatic BC, Automatic ACM 0x1: Manual BC, Automatic ACM 0x3/0x7: Manual BC, Manual ACM Others: Reserved - do not use

0x01A790D8 MDSS_MDP_AADC_0_APICAL_T_FILTER_CONTROL**Type:** RW**Reset State:** 0x00000001

Recursion depth of temporal filter

double buffered: No

MDSS_MDP_AADC_0_APICAL_T_FILTER_CONTROL

Bits	Name	Description
7:0	T_FILTER_CONTROL	The port t_filter_control sets the recursion depth of temporal filtering of photosensor measurements and is used to smooth changes in the strength of DRC in response to rapid changes in photosensor data. A larger value increases the recursion depth in the averaging of time-historic photosensor measurements and results in a slower response to changes in ambient light.

0x01A790DC MDSS_MDP_AADC_0_APICAL_BACKLIGHT_MINMAX**Type:** RW**Reset State:** 0xFFFF2800

Apical Backlight Min/Max Value

double buffered: No

MDSS_MDP_AADC_0_APICAL_BACKLIGHT_MINMAX

Bits	Name	Description
31:16	BACKLIGHT_MAX	Maximum output backlight value permitted.
15:0	BACKLIGHT_MIN	Minimum output backlight value permitted.

0x01A790E0 MDSS_MDP_AADC_0_APICAL_BACKLIGHT**Type:** RW**Reset State:** 0x00008000

Apical Screen brightness Value.

MDSS_MDP_AADC_0_APICAL_BACKLIGHT

Bits	Name	Description
15:0	BACKLIGHT	Screen brightness on a scale of 0 to backlight_scale.

0x01A790E8 MDSS_MDP_AADC_0_APICAL_BACKLIGHT_SCALE**Type:** RW**Reset State:** 0x0000FFFF

Apical Screen brightness Value.

double buffered: No

MDSS_MDP_AADC_0_APICAL_BACKLIGHT_SCALE

Bits	Name	Description
15:0	BACKLIGHT_SCALE	Digital value corresponding to the maximum possible backlight input value. The port backlight_scale should be set equal to the digital value corresponding to the maximum possible backlight brightness that the display can produce. For example, if the backlight level is 16-bit, then backlight_scale should be set to 0xFFFF, if it is an 8-bit range, then backlight_scale should be set to 0x00FF.

0x01A790EC MDSS_MDP_AADC_0_APICAL_AMBIENT_LIGHT

Type: RW

Reset State: 0x00000000

Ambient light level from photosensor

MDSS_MDP_AADC_0_APICAL_AMBIENT_LIGHT

Bits	Name	Description
15:0	AMBIENT_LIGHT	Real time control input from photosensor The core takes the input of the ambient light level in lux via the parameter ambient_light. If the value is available in linear lux units, then it should be entered directly via this parameter. For light sensors which provide a non-linear measure of ambient light, the LUT al_calib_lut should be programmed to convert this value into linear lux units.

0x01A790F0 MDSS_MDP_AADC_0_APICAL_AMBIENT_LIGHT_MIN

Type: RW

Reset State: 0x0000000E

Minimum Ambient light Register

double buffered: No

MDSS_MDP_AADC_0_APICAL_AMBIENT_LIGHT_MIN

Bits	Name	Description
15:0	AMBIENT_LIGHT_MIN	This value represents the incoming ambient light level which backlight_out is set to backlight_min.

0x01A790F4 MDSS_MDP_AADC_0_APICAL_FILTER**Type:** RW**Reset State:** 0x000606CA

Filter values for the input ambient_light

double buffered: No

MDSS_MDP_AADC_0_APICAL_FILTER

Bits	Name	Description
23:16	FILTER_B	This value sets the ambient light-independent component of the stability threshold, below which deviations in photosensor measurements do not lead to a response by the backlight. Larger values result in greater stability to changes in photosensor measurements. This component of the threshold becomes increasingly influential as average ambient light decreases.
15:0	FILTER_A	FilterA Settings [11:9]: Sets the recursion depth of the temporal filter used to smooth out rapid changes in detected ambient light. The larger this parameter, the greater the recursion depth, and the more slowly the backlight responds to changes in ambient light. [8:6] : Sets the ambient light-dependent component of the stability threshold, below which deviations in photosensor measurements do not lead to a response by the backlight. Larger values result in greater stability to changes in photosensor measurements. This component of the threshold becomes increasingly influential as average ambient light increases. [5:3] : Sets the rate at which backlight responds to changes in photosensor measurements, within the stability range established by the values in bits [8:6] and filter_b. [2:0] : Sets the asymmetry between the rate of decrease of backlight compared to the rate of increase of backlight. A value of 0 implies symmetric response, while increasing this value leads to a faster increase in backlight compared to decrease

0x01A790F8 MDSS_MDP_AADC_0_APICAL_CONFIG_BUFFER**Type:** RW**Reset State:** 0x00000003

Double buffering control for Video Pipeline Configuration Parameters

Together with config_buffer_global real time input for iridix core, which is driven by vp_db_update, these control the double buffering of the video pipeline configuration parameters inside Iridix core

double buffered: No

MDSS_MDP_AADC_0_APICAL_CONFIG_BUFFER

Bits	Name	Description
1:0	CONFIG_BUFFER_MODE	config_buffer_mode = 0 (dec) (Pass through): Allows the input configuration ports to pass through to the registers within the core. The internal configuration registers are updated as soon as the ports are changed. config_buffer_mode = 1 (dec) (Block Access): Stops the internal configuration registers from being updated even when the input port values change. The previous register values are held till the next update is allowed. config_buffer_mode = 2 (dec) (Update on VBI): Allows the internal configuration registers only to be updated during the vertical blanking interval (VBI). This ensures that the configuration is never updated during an active frame. config_buffer_mode = 3 (dec) (External): This method is based on the config_buffer_global signal and updates the internal configuration registers when the config_buffer_global signal is asserted. This signal can be generated externally by user logic.

0x01A79100 MDSS_MDP_AADC_0_APICAL_LUT_AL_CALIB1_0**Type:** RW**Reset State:** 0x08000000

Reset State: 0xFFFF0000

Calibration Lookup Table Entry 32

The Calibration Lookup Table port geometry is 33 words, each of which is 16 bits.

This LUT is used to linearize the ambient light data

double buffered: No

MDSS_MDP_AADC_0_APICAL_LUT_AL_CALIB32

Bits	Name	Description
31:16	LUT_AL_CALIB32	Calibration Lookup Table Entry 32.

0x01A79144 MDSS_MDP_AADC_0_APICAL_DRC_IN

Type: RW

Reset State: 0x00000000

Target strength of dynamic range compression.

MDSS_MDP_AADC_0_APICAL_DRC_IN

Bits	Name	Description
15:0	DRC_IN	Target strength of dynamic range compression.

0x01A79148 MDSS_MDP_AADC_0_APICAL_START_CALC

Type: RW

Reset State: 0x00000000

Start calculator pulse.

double buffered: NO

MDSS_MDP_AADC_0_APICAL_START_CALC

Bits	Name	Description
0	START_CALC	Start calculation register Start-Done Protocol of non-Video Pipeline Parameters: Double buffering is not required for the Assertive Display core parameters. Instead a simple start-done protocol is used. The external host will update the parameters and then transition the start_calc input from 0 to 1. After a rising edge is detected on this input, the Assertive Display core's calculator will use the input parameters to calculate the backlight and iridix module strength and the optimum backlight. When the results are available the calc_done status flag is asserted about 500 clock cycles after this edge. In a typical use case this calc_done flag can be used as an interrupt to start the next parameter update cycle. The calc_done flag is held high until the next start_calc rising edge arrives.

0x01A7914C MDSS_MDP_AADC_0_APICAL_STRENGTH_OUT

Type: R

Reset State: 0x00000000

Strength of iridix core output

MDSS_MDP_AADC_0_APICAL_STRENGTH_OUT

Bits	Name	Description
7:0	STRENGTH_OUT	The primary output of the calculator, passed to the internal iridix module's strength_ir signal. This is included as an output from the core for debug purposes only.

0x01A79150 MDSS_MDP_AADC_0_APICAL_DRC_OUT

Type: R

Reset State: 0x00000000

Calculated dynamic range compression output.

MDSS_MDP_AADC_0_APICAL_DRC_OUT

Bits	Name	Description
15:0	DRC_OUT	Calculated dynamic range compression output.

0x01A79154 MDSS_MDP_AADC_0_APICAL_BACKLIGHT_OUT**Type:** R**Reset State:** 0x00000000

Calculated backlight setting.

MDSS_MDP_AADC_0_APICAL_BACKLIGHT_OUT

Bits	Name	Description
15:0	BACKLIGHT_OUT	

0x01A79158 MDSS_MDP_AADC_0_APICAL_CALC_DONE**Type:** R**Reset State:** 0x00000000

Calculator operations finished flag.

MDSS_MDP_AADC_0_APICAL_CALC_DONE

Bits	Name	Description
0	CALC_DONE	Start calculation register Start-Done Protocol of non-Video Pipeline Parameters: Double buffering is not required for the Assertive Display core parameters. Instead a simple start-done protocol is used. The external host will update the parameters and then transition the start_calc input from 0 to 1. After a rising edge is detected on this input, the Assertive Display core's calculator will use the input parameters to calculate the backlight and iridix module strength and the optimum backlight. When the results are available the calc_done status flag is asserted about 500 clock cycles after this edge. In a typical use case this calc_done flag can be used as an interrupt to start the next parameter update cycle. The calc_done flag is held high until the next start_calc rising edge arrives.

17.17.23.1 MDSS_MDP_AADC_1_AADC

AADC

Apical Assertive Display Core hardware register description

0x01A79800 MDSS_MDP_AADC_1_APICAL_CORE_BYPASS

Type: RW

Reset State: 0x00000101

Apical bypass and SW reset control

MDSS_MDP_AADC_1_APICAL_CORE_BYPASS

Bits	Name	Description
23:16	APICAL_CORE_RESERVED_23_16	RESERVED for future use.
8	APICAL_CORE_SW_RESET_EN	Enable SW reset control capability for Apical Iridix core - SHOULD always be set to 1'b1; (active high, default 0). This ensures that when ares and apical_core_sw_reset are ORed together, the in/out conversion blocks reset first to block propagation of any potential hazards out of the apical wrapper,, also clocks to the apical core are stopped preventing internal hazards.
0	APICAL_CORE_BYPASS	0x0 : Pass pixel data through Apical core - Apical processing is enabled via APICAL_IRIDIX_CONTROL_0.IRIDIX_ENABLE 0x1 : Bypass Apical core entirely - this will also clock gate the core (default) Double-buffered: Yes

0x01A79804 MDSS_MDP_AADC_1_APICAL_CONTROL_REG0

Type: RW

Reset State: 0x00000003

The Data format port specifies the input data format so that the iridix core can process the different input data formats.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_CONTROL_REG0

Bits	Name	Description
7:2	CONTROL_REG0_RESERVED_7_2	Reserved - Should be zero, except for bit 3 which is hardcoded as 1b.
1:0	DATA_FORMAT	Data Format Select 0x0: YCbCr Color space 4:2:2 format, interleaved (Cb-Y-Cr-Y) 0x1: YCbCr Color space 4:2:2 format, parallel 0x2: YCbCr Color 4:4:4 format 0x3: RGB Color space

0x01A79808 MDSS_MDP_AADC_1_APICAL_CONTROL_REG1**Type:** RW**Reset State:** 0x00000000

Synchronization Format Register.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_CONTROL_REG1

Bits	Name	Description
7	AUTO_SIZE	Auto Size Register 0x0: Auto_Size off. The Iridix core will use Frame_Width, Frame_Height ports values 0x1: Auto_Size on. The Iridix core will calculate the frame geometry based on the active line and field signals. The size of current frame will be used for the estimation of the next frame. The Frame size will be updated when the Field signal toggles.
6:0	CONTROL_REG1_RESERVED_6_0	Reserved, should be set to 0x00.

0x01A7980C MDSS_MDP_AADC_1_APICAL_FRAME_SIZE**Type:** RW**Reset State:** 0x01000100

Frame Size Register.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_FRAME_SIZE

Bits	Name	Description
31:16	FRAME_WIDTH	Frame width in number of pixels in an active line. This port is used only in non-automatic mode(default)
15:0	FRAME_HEIGHT	Frame height in number of line in an active frame. This port is used only in non-automatic mode(default)

0x01A79810 MDSS_MDP_AADC_1_APICAL_IRIDIX_CONTROL_0**Type:** RW**Reset State:** 0x00000006

Iridix Control Register 0

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_IRIDIX_CONTROL_0

Bits	Name	Description
7:5	IRIDIX_CONTROL_0_RESERVED_7_5	Reserved - Should be zero.
4	IRIDIX_COLOR_CORRECTION	Color Correction/Control - Enabling this processing will result in more accurate colors processing. The color correction algorithm is required on gamma corrected sources. It reduces the saturation in dark areas when they are being amplified, and saturates bright parts when they get darker. 0x0: Disable color correction 0x1: Enable color correction
3	IRIDIX_LOCAL_CONTRAST_2D	Local contrast (2D) 0x0: Memory interfaces for 2D processing used 0x1: Memory interfaces for 2D processing bypassed, 2D processing disabled. This selection overrides LC0, LC1 settings. Note: If 2D Local contrast is not implemented then the bit[3] should be one.

MDSS_MDP_AADC_1_APICAL_IRIDIX_CONTROL_0 (cont.)

Bits	Name	Description
2:1	IRIDIX_LOCAL_CONTRAST	Local Contrast Control - This is a supplementary module preserving local contrast in small areas. Depending on custom implementation LC module can be implemented differently and may have different settings. 1D Case : 0x0: disabled; 0x1: LC enabled, kernel 1x3 used 0x2: LC enabled, kernel 1x3 used 0x3: LC enabled, kernel 1x5 used 2D Case : 0x0: disabled; 0x1: LC enabled, kernel 1x3 used 0x2: LC enabled, kernel 3x3 used 0x3: LC enabled, kernel 3x5 used
0	IRIDIX_ENABLE	iridix Enable - This bit turns iridix processing ON and OFF. When iridix is OFF, the video data passes to the output without any changes. Disabling iridix®using this bit is equivalent to setting the Strength parameter to 0. Many internal modules run in idle mode when this bit is 0. The Latency Delays between the input and the output signals are the same in both ON and OFF modes. 0x0: Disable iridix processing 0x1: Enable iridix processing

0x01A79814 MDSS_MDP_AADC_1_APICAL_IRIDIX_CONTROL_1**Type:** RW**Reset State:** 0x00004600

This Port is reserved for debugging purposes by Apical. Do not modify.

MDSS_MDP_AADC_1_APICAL_IRIDIX_CONTROL_1

Bits	Name	Description
15:8	IRIDIX_CONTROL_1	Reserved for debugging purposes by Apical

0x01A79818 MDSS_MDP_AADC_1_APICAL_STRENGTH_MANUAL**Type:** RW**Reset State:** 0x00000000

Strength of iridix -Manual override value of iridix module's strength input (strength_ir) when option_select = 7 (dec).

MDSS_MDP_AADC_1_APICAL_STRENGTH_MANUAL

Bits	Name	Description
7:0	STRENGTH_MANUAL	Strength of iridix - This Port sets processing Strength. Minimum value is 0, maximum is 255. 0x00: Video data will not be processed at all, and will go to the output unchanged. 0xFF: Maximum strengthSTRENGTH_MANUAL

0x01A7981C MDSS_MDP_AADC_1_APICAL_VARIANCE

Type: RW

Reset State: 0x00000041

Affects the sensitivity of the transform to different areas of the image, and can be increased in order to emphasize small regions (e.g. faces).

If this parameter is set to zero, the sensitivity to the small areas is maximal. The transform becomes more local.

When the parameter is set to 0xFF the transform deemphasizes small local details, and transform becomes more global

e.g. the sky at the top of the frame can affect flowers at the bottom of the frame.

Default value is 36h but it depends on custom implementation.

Setting variance to zero will progressively increase the spatial sensitivity of the algorithm but it can lead to artificial-looking images in some cases.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_VARIANCE

Bits	Name	Description
7:4	VARIANCE_INTENSITY	Sets the degree of sensitivity in the luminance domain. Maximum Variance is 0xF, and minimum Variance is 0x0.
3:0	VARIANCE_SPACE	Sets the degree of spatial sensitivity of the algorithm. As this parameter is made smaller, the algorithm focuses on smaller regions within the image. Maximum Variance is 0xF, and minimum Variance is 0x0

0x01A79820 MDSS_MDP_AADC_1_APICAL_IRIDIX_DITHER**Type:** RW**Reset State:** 0x00000000

Iridix Dither Register: When the number of color gradations of a display device is small (for example 6 bit per color) pixel dithering can make gradients look smother.

There can be a situation when iridix output signal is 12 bits but the signal needs to be compressed into 8 bits.

The best way for this is to use dithering of least significant bits and then truncate these bits. The dithering can be performed by iridix Processor.

However, the truncation needs to be done by a hardware designer outside iridix.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_IRIDIX_DITHER

Bits	Name	Description
7:3	IRIDIX_DITHER_RESERVE D_7_3	Reserved - Not used for now.
2:0	DITHER	Strength of Dithering. 0x0: No dithering 0x1: One least significant bit of the output signal is dithered 0x2: Two bits are dithered 0x3: Three bits are dithered 0x4: Four bits are dithered Others: Four bits are dithered

0x01A79824 MDSS_MDP_AADC_1_APICAL_DITEHR_CONTROL**Type:** RW**Reset State:** 0x00000000

Spatial Preceptual Model Dither

This module provides a 4-bit dither via a spatial perceptual model.

There is no temporal dependence of the dither pattern, therefore eliminating the possibility of flicker

note that temporal dither is available via the port iridix_dither.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_DITEHR_CONTROL

Bits	Name	Description
7:4	DITHER_CONTROL_RESE RVED_7_4	Reserved - Should be Zero.
3:2	DITHER_AMOUNT	Strength of Dithering. 0x0: Dither 1 bit 0x1: Dither 2 bit 0x2: Dither 3 bit 0x3: Dither 4 bit
1	DITHER_SHIFT_MODE	Shift Mode: 0x0: Output is MSB aligned 0x1: Output is LSB aligned
0	DITHER_ENABLE_DITHER	Enable Dither: Enables the dither module. 0: Disable dither module 1: Enable dither module

0x01A79828 MDSS_MDP_AADC_1_APICAL_LIMIT_AMPL**Type:** RW**Reset State:** 0x000000F0

Two parameters used to restrict the luminance space in which Iridix can adaptively generate tone curves for each pixel

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_LIMIT_AMPL

Bits	Name	Description
7:4	BRIGHT_AMP_LIMIT	Bright amplification limit - The resultant tone curve cannot be lower than bright amplification limit line controlled by the bright amplification limit parameter. See Apical TRM Chapter 4 for more explanation. Maximum limit is 0xF, when the value is 0x0 there is no limit.
3:0	DARK_AMP_LIMIT	Dark amplification limit - The resultant tone curve cannot be higher than dark amplification limit line controlled by the dark amplification limit parameter. See Apical TRM Chapter 4 for more explanation. Maximum limit is 0xF, when the value is 0x0 there is no limit.

0x01A7982C MDSS_MDP_AADC_1_APICAL_SLOPE**Type:** RW**Reset State:** 0x00003C80

Slope Min and Max Limit used to restrict the slope of the tone-curve generated by Iridix.

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_SLOPE

Bits	Name	Description
15:8	SLOPE_MAX	Slope Max Limit - Slope Max Limit is used to restrict the slope of the tone-curve generated by iridix. When Slope Max Limit parameter is set to 0xFF, the tone curve slope, generated by iridix is not limited (maximum slope 15). When this value is set to 00 iridix will not generate the tone-curve with slope greater than 16/15 (48°). Intermediate values of Slope Limit are linear interpolation between minimum and maximum values. Recommended Slope Max Limit range is 20h-60h. For noisy images less value should be used. See Chapter 4 for more explanation.
7:0	SLOPE_MIN	Slope Min Limit - Slope Min Limit is used to restrict the slope of the tone-curve generated by iridix. When Slope Min Limit parameter is set to 0x00, the tone curve slope, generated by iridix is not limited. When this value is set to FF iridix will not generate the tone-curve with slope less than 3/4. Intermediate values of Slope Limit are linear interpolation between minimum and maximum values. Recommended Slope Min Limit range is 00h-C0h. See Chapter 4 for more explanation.

0x01A79830 MDSS_MDP_AADC_1_APICAL_BW_LEVEL**Type:** RW**Reset State:** 0x03FF0000

Black and White Level of the Iridix IP.

The least significant bits [dw-1:0] are used; higher bits [15:dw] are unused. dw is the component data width. dw=8 for MDSS \n double buffered: Yes

MDSS_MDP_AADC_1_APICAL_BW_LEVEL

Bits	Name	Description
25:16	WHITE_LEVEL	White Level - The value stored in White Level Port will be used as white level for iridix processing in all unsigned data channels. Data above White level will not be processed and stay unchanged. Note: 1. For 12 bit variant minimum White Level is constrained as: White Level - Black Level > 1024. 2. For 10 bit variant minimum White Level is constrained as: White Level - Black Level > 256.
9:0	BLACK_LEVEL	Black Level - The value stored in Black Level Port will be used as zero level for iridix processing in all unsigned data channels. Data below Black level will not be processed and stay unchanged. Note: 1. For 12 bit variant maximum Black Level is constrained as: White Level - Black Level > 1024. 2. For 10 bit variant maximum Black Level is constrained as: White Level - Black Level > 256

0x01A79834 MDSS_MDP_AADC_1_APICAL_LOGO_POS**Type:** RW**Reset State:** 0x00000000

Apical Logo Position

double buffered: Yes

MDSS_MDP_AADC_1_APICAL_LOGO_POS

Bits	Name	Description
15:8	LOGO_LEFT	horizontal position of logo.
7:0	LOGO_TOP	vertical position of logo.

Imposes a cap on maximum dynamic range compression strength.

double buffered: No

MDSS_MDP_AADC_1_APICAL_STRENGTH_LIMIT

Bits	Name	Description
7:0	STRENGTH_LIMIT	Used to restrict the maximum value taken by strength_out: in all cases, strength_out <= strength_limit.

0x01A798CC MDSS_MDP_AADC_1_APICAL_CALIBRATION_AB

Type: RW

Reset State: 0x005F006E

Screen calibration parameter

four calibration parameters control the overall adaptation of displayed content to ambient light and backlight level.

They represent a combination of physical and perceptual factors which influence the apparent contrast of imagery as the user's eyes adapt to changing viewing conditions.

double buffered: No

MDSS_MDP_AADC_1_APICAL_CALIBRATION_AB

Bits	Name	Description
31:16	CALIBRATION_B	This parameter controls the adaptation of content to the screen brightness. As backlight is reduced in the presence of ambient light, shadow detail is progressively lost below the minimum grey level of the display. When calibrated correctly, this parameter ensures that image content remains viewable at all backlight levels.
15:0	CALIBRATION_A	This parameter is related to the reflectivity of the screen. The more reflective the screen, the greater is the loss of shadow detail as ambient light level increases. It is the objective of the Assertive Display core to maintain the same level of shadow detail which pertains in very low light, up to ambient light levels typical of outdoor viewing. When calibrated correctly, this parameter ensures that image content is neither lost nor over-enhanced leading to preservation of the viewing experience.

0x01A798D0 MDSS_MDP_AADC_1_APICAL_CALIBRATION_CD**Type:** RW**Reset State:** 0x00000013

Screen calibration parameter

four calibration parameters control the overall adaptation of displayed content to ambient light and backlight level.

They represent a combination of physical and perceptual factors which influence the apparent contrast of imagery as the user's eyes adapt to changing viewing conditions.

double buffered: No

MDSS_MDP_AADC_1_APICAL_CALIBRATION_CD

Bits	Name	Description
31:16	CALIBRATION_D	Typical movie, image and gaming content is 8-bit and encoded with a gamma curve which results in a dynamic range of around 1000:1. Most large displays have an effective contrast ratio larger than this under ideal viewing conditions (full backlight, low ambient light). However, many portable displays cannot reproduce such contrast ratios even under ideal conditions. When calibrated correctly, this parameter increases the effective contrast ratio of low contrast displays to match that of typical content.

MDSS_MDP_AADC_1_APICAL_CALIBRATION_CD (cont.)

Bits	Name	Description
15:0	CALIBRATION_C	This parameter controls the adaptation of content to overcome the limitations of the human eye sensitivity at very low light. Decreasing screen brightness in total darkness causes loss of image detail in shadow regions, especially on small displays, as the eyes are unable to adapt sufficiently. When calibrated correctly, this parameter enables restoration of such details.

0x01A798D4 MDSS_MDP_AADC_1_APICAL_OPTION_SELECT**Type:** RW**Reset State:** 0x00000000

Selects the overall operating mode of the core.- refer to Apical TRM Option_select Section for details

MDSS_MDP_AADC_1_APICAL_OPTION_SELECT

Bits	Name	Description
7:0	OPTION_SELECT	Selects the overall operating mode of the core. 0x0: Automatic BC, Automatic ACM 0x1: Manual BC, Automatic ACM 0x3/0x7: Manual BC, Manual ACM Others: Reserved - do not use

0x01A798D8 MDSS_MDP_AADC_1_APICAL_T_FILTER_CONTROL**Type:** RW**Reset State:** 0x00000001

Recursion depth of temporal filter

double buffered: No

MDSS_MDP_AADC_1_APICAL_T_FILTER_CONTROL

Bits	Name	Description
7:0	T_FILTER_CONTROL	The port t_filter_control sets the recursion depth of temporal filtering of photosensor measurements and is used to smooth changes in the strength of DRC in response to rapid changes in photosensor data. A larger value increases the recursion depth in the averaging of time-historic photosensor measurements and results in a slower response to changes in ambient light.

0x01A798DC MDSS_MDP_AADC_1_APICAL_BACKLIGHT_MINMAX**Type:** RW**Reset State:** 0xFFFF2800

Apical Backlight Min/Max Value

double buffered: No

MDSS_MDP_AADC_1_APICAL_BACKLIGHT_MINMAX

Bits	Name	Description
31:16	BACKLIGHT_MAX	Maximum output backlight value permitted.
15:0	BACKLIGHT_MIN	Minimum output backlight value permitted.

0x01A798E0 MDSS_MDP_AADC_1_APICAL_BACKLIGHT**Type:** RW**Reset State:** 0x00008000

Apical Screen brightness Value.

MDSS_MDP_AADC_1_APICAL_BACKLIGHT

Bits	Name	Description
15:0	BACKLIGHT	Screen brightness on a scale of 0 to backlight_scale.

0x01A798E8 MDSS_MDP_AADC_1_APICAL_BACKLIGHT_SCALE**Type:** RW**Reset State:** 0x0000FFFF

Apical Screen brightness Value.

double buffered: No

MDSS_MDP_AADC_1_APICAL_BACKLIGHT_SCALE

Bits	Name	Description
15:0	BACKLIGHT_SCALE	Digital value corresponding to the maximum possible backlight input value. The port backlight_scale should be set equal to the digital value corresponding to the maximum possible backlight brightness that the display can produce. For example, if the backlight level is 16-bit, then backlight_scale should be set to 0xFFFF, if it is an 8-bit range, then backlight_scale should be set to 0x00FF.

0x01A798EC MDSS_MDP_AADC_1_APICAL_AMBIENT_LIGHT

Type: RW

Reset State: 0x00000000

Ambient light level from photosensor

MDSS_MDP_AADC_1_APICAL_AMBIENT_LIGHT

Bits	Name	Description
15:0	AMBIENT_LIGHT	Real time control input from photosensor The core takes the input of the ambient light level in lux via the parameter ambient_light. If the value is available in linear lux units, then it should be entered directly via this parameter. For light sensors which provide a non-linear measure of ambient light, the LUT al_calib_lut should be programmed to convert this value into linear lux units.

0x01A798F0 MDSS_MDP_AADC_1_APICAL_AMBIENT_LIGHT_MIN

Type: RW

Reset State: 0x0000000E

Minimum Ambient light Register

double buffered: No

MDSS_MDP_AADC_1_APICAL_AMBIENT_LIGHT_MIN

Bits	Name	Description
15:0	AMBIENT_LIGHT_MIN	This value represents the incoming ambient light level which backlight_out is set to backlight_min.

0x01A798F4 MDSS_MDP_AADC_1_APICAL_FILTER**Type:** RW**Reset State:** 0x000606CA

Filter values for the input ambient_light

double buffered: No

MDSS_MDP_AADC_1_APICAL_FILTER

Bits	Name	Description
23:16	FILTER_B	This value sets the ambient light-independent component of the stability threshold, below which deviations in photosensor measurements do not lead to a response by the backlight. Larger values result in greater stability to changes in photosensor measurements. This component of the threshold becomes increasingly influential as average ambient light decreases.
15:0	FILTER_A	FilterA Settings [11:9]: Sets the recursion depth of the temporal filter used to smooth out rapid changes in detected ambient light. The larger this parameter, the greater the recursion depth, and the more slowly the backlight responds to changes in ambient light. [8:6] : Sets the ambient light-dependent component of the stability threshold, below which deviations in photosensor measurements do not lead to a response by the backlight. Larger values result in greater stability to changes in photosensor measurements. This component of the threshold becomes increasingly influential as average ambient light increases. [5:3] : Sets the rate at which backlight responds to changes in photosensor measurements, within the stability range established by the values in bits [8:6] and filter_b. [2:0] : Sets the asymmetry between the rate of decrease of backlight compared to the rate of increase of backlight. A value of 0 implies symmetric response, while increasing this value leads to a faster increase in backlight compared to decrease

0x01A798F8 MDSS_MDP_AADC_1_APICAL_CONFIG_BUFFER**Type:** RW**Reset State:** 0x00000003

Double buffering control for Video Pipeline Configuration Parameters

Together with config_buffer_global real time input for iridix core, which is driven by vp_db_update, these control the double buffering of the video pipeline configuration parameters inside Iridix core

double buffered: No

MDSS_MDP_AADC_1_APICAL_CONFIG_BUFFER

Bits	Name	Description
1:0	CONFIG_BUFFER_MODE	config_buffer_mode = 0 (dec) (Pass through): Allows the input configuration ports to pass through to the registers within the core. The internal configuration registers are updated as soon as the ports are changed. config_buffer_mode = 1 (dec) (Block Access): Stops the internal configuration registers from being updated even when the input port values change. The previous register values are held till the next update is allowed. config_buffer_mode = 2 (dec) (Update on VBI): Allows the internal configuration registers only to be updated during the vertical blanking interval (VBI). This ensures that the configuration is never updated during an active frame. config_buffer_mode = 3 (dec) (External): This method is based on the config_buffer_global signal and updates the internal configuration registers when the config_buffer_global signal is asserted. This signal can be generated externally by user logic.

Type: RW

Reset State: 0xFFFF0000

Calibration Lookup Table Entry 32

The Calibration Lookup Table port geometry is 33 words, each of which is 16 bits.

This LUT is used to linearize the ambient light data

double buffered: No

MDSS_MDP_AADC_1_APICAL_LUT_AL_CALIB32

Bits	Name	Description
31:16	LUT_AL_CALIB32	Calibration Lookup Table Entry 32.

0x01A79944 MDSS_MDP_AADC_1_APICAL_DRC_IN

Type: RW

Reset State: 0x00000000

Target strength of dynamic range compression.

MDSS_MDP_AADC_1_APICAL_DRC_IN

Bits	Name	Description
15:0	DRC_IN	Target strength of dynamic range compression.

0x01A79948 MDSS_MDP_AADC_1_APICAL_START_CALC

Type: RW

Reset State: 0x00000000

Start calculator pulse.

double buffered: NO

MDSS_MDP_AADC_1_APICAL_START_CALC

Bits	Name	Description
0	START_CALC	Start calculation register Start-Done Protocol of non-Video Pipeline Parameters: Double buffering is not required for the Assertive Display core parameters. Instead a simple start-done protocol is used. The external host will update the parameters and then transition the start_calc input from 0 to 1. After a rising edge is detected on this input, the Assertive Display core's calculator will use the input parameters to calculate the backlight and iridix module strength and the optimum backlight. When the results are available the calc_done status flag is asserted about 500 clock cycles after this edge. In a typical use case this calc_done flag can be used as an interrupt to start the next parameter update cycle. The calc_done flag is held high until the next start_calc rising edge arrives.

0x01A7994C MDSS_MDP_AADC_1_APICAL_STRENGTH_OUT

Type: R

Reset State: 0x00000000

Strength of iridix core output

MDSS_MDP_AADC_1_APICAL_STRENGTH_OUT

Bits	Name	Description
7:0	STRENGTH_OUT	The primary output of the calculator, passed to the internal iridix module's strength_ir signal. This is included as an output from the core for debug purposes only.

0x01A79950 MDSS_MDP_AADC_1_APICAL_DRC_OUT

Type: R

Reset State: 0x00000000

Calculated dynamic range compression output.

MDSS_MDP_AADC_1_APICAL_DRC_OUT

Bits	Name	Description
15:0	DRC_OUT	Calculated dynamic range compression output.

0x01A79954 MDSS_MDP_AADC_1_APICAL_BACKLIGHT_OUT**Type:** R**Reset State:** 0x00000000

Calculated backlight setting.

MDSS_MDP_AADC_1_APICAL_BACKLIGHT_OUT

Bits	Name	Description
15:0	BACKLIGHT_OUT	

0x01A79958 MDSS_MDP_AADC_1_APICAL_CALC_DONE**Type:** R**Reset State:** 0x00000000

Calculator operations finished flag.

MDSS_MDP_AADC_1_APICAL_CALC_DONE

Bits	Name	Description
0	CALC_DONE	Start calculation register Start-Done Protocol of non-Video Pipeline Parameters: Double buffering is not required for the Assertive Display core parameters. Instead a simple start-done protocol is used. The external host will update the parameters and then transition the start_calc input from 0 to 1. After a rising edge is detected on this input, the Assertive Display core's calculator will use the input parameters to calculate the backlight and iridix module strength and the optimum backlight. When the results are available the calc_done status flag is asserted about 500 clock cycles after this edge. In a typical use case this calc_done flag can be used as an interrupt to start the next parameter update cycle. The calc_done flag is held high until the next start_calc rising edge arrives.

17.18 MDSS_DSI_0

Basic description of the dsi controller block

17.18.1 MDSS_DSI_0_DSI

DSI

0x01A98004 MDSS_DSI_0_CTRL

Type: RW

Reset State: 0x00000000

DSI Control Register provides general control to the protocol, lane management and PHY layers

MDSS_DSI_0_CTRL

Bits	Name	Description
30	NEW_INTERLEAVE_MODE_EN	unused (Enable new interleave mode with H/W arbitration between long commands and BLLP periods.)
29:28	PACKET_BYTE_MSB_LSB_FLIP	Swap the bit ordering of each byte of a packet 0: no swap (bit 0 is lsb, bit 7 is msb) 1: swap each byte of payload (bit 0 is msb, bit 7 is lsb) 2: swap each byte of packet (bit 0 is msb, bit 7 is lsb)
26	RESERVED	Reserved
24	CRC_CHK_EN	Enable CRC verification of the received packets
20	ECC_CHK_EN	Enable ECC verification of the received packets
8	CLKLN_EN	Enable clock lane of the PHY
7	DLN3_EN	Enable data lane 3 of the PHY
6	DLN2_EN	Enable data lane 2 of the PHY
5	DLN1_EN	Enable data lane 1 of the PHY
4	DLN0_EN	Enable data lane 0 of the PHY
2	CMD_MODE_EN	Enable the Command Mode Engine.
1	VIDEO_MODE_EN	Enable the Video Mode Engine.
0	DSI_EN	Enable the DSI controller.

0x01A98008 MDSS_DSI_0_STATUS**Type:** RW**Reset State:** 0x00000000

DSI Status Register provides status of the DSI controller

MDSS_DSI_0_STATUS

Bits	Name	Type	Description
31	INTERLEAVE_OP_CONTENTION_CLR	W	writing a 1 to this field will clear this bit
31	INTERLEAVE_OP_CONTENTION	R	The controller generates command mode packets and video mode packets at the same time (i.e.: the command mode packets are longer than one BLLP period)
6	PHY_RESET_BUSY	R	DSI interface is busy sending the panel reset through the link
5	GENERIC_TRIGGER_BUSY	R	DSI interface is busy sending the generic trigger through the link
4	BTA_BUSY	R	DSI interface is busy waiting for read response, acknowledge or tearing effect signal from the peripheral
3	VIDEO_MODE_ENGINE_BUSY	R	Video Mode Engine is busy sending data from display engine
2	CMD_MODE_MDP_BUSY	R	Command Mode Engine is busy sending data from display engine
1	CMD_MODE_DMA_BUSY	R	Command Mode Engine is busy sending data from memory or reading data from the display panel
0	CMD_MODE_ENGINE_BUSY	R	Command Mode Engine Busy

0x01A9800C MDSS_DSI_0_FIFO_STATUS**Type:** RW**Reset State:** 0x11111000

Status of FIFOs in the DSI controller

MDSS_DSI_0_FIFO_STATUS

Bits	Name	Type	Description
31	DLN3_HS_FIFO_UNDERFLOW_CLR	W	writing a 1 to this field will clear this bit
31	DLN3_HS_FIFO_UNDERFLOW	R	The FIFO for HS data on Lane 3 underflows

MDSS_DSI_0_FIFO_STATUS (cont.)

Bits	Name	Type	Description
30	DLN3_HS_FIFO_OVERFLOW	R	The FIFO of Lane 3 overflows
30	DLN3_HS_FIFO_OVERFLOW_CLR	W	writing a 1 to this field will clear this bit
29	DLN3_HS_FIFO_FULL	R	The FIFO of Lane 3 is full
28	DLN3_HS_FIFO_EMPTY	R	The FIFO of Lane 3 is empty
27	DLN2_HS_FIFO_UNDERFLOW_CLR	W	writing a 1 to this field will clear this bit
27	DLN2_HS_FIFO_UNDERFLOW	R	The FIFO for HS data on Lane 2 underflows
26	DLN2_HS_FIFO_OVERFLOW_CLR	W	writing a 1 to this field will clear this bit
26	DLN2_HS_FIFO_OVERFLOW	R	The FIFO for HS data on Lane 2 overflows
25	DLN2_HS_FIFO_FULL	R	The FIFO for HS data on Lane 2 is full
24	DLN2_HS_FIFO_EMPTY	R	The FIFO for HS data on Lane 2 is empty
23	DLN1_HS_FIFO_UNDERFLOW	R	The FIFO for HS data on Lane 1 underflows
23	DLN1_HS_FIFO_UNDERFLOW_CLR	W	writing a 1 to this field will clear this bit
22	DLN1_HS_FIFO_OVERFLOW	R	The FIFO of Lane 1 overflows
22	DLN1_HS_FIFO_OVERFLOW_CLR	W	writing a 1 to this field will clear this bit
21	DLN1_HS_FIFO_FULL	R	The FIFO of Lane 1 is full
20	DLN1_HS_FIFO_EMPTY	R	The FIFO of Lane 1 is empty
19	DLN0_HS_FIFO_UNDERFLOW	R	The FIFO for HS data on Lane 0 underflows
19	DLN0_HS_FIFO_UNDERFLOW_CLR	W	writing a 1 to this field will clear this bit
18	DLN0_HS_FIFO_OVERFLOW_CLR	W	writing a 1 to this field will clear this bit
18	DLN0_HS_FIFO_OVERFLOW	R	The FIFO for HS data on Lane 0 overflows
17	DLN0_HS_FIFO_FULL	R	The FIFO for HS data on Lane 0 is full
16	DLN0_HS_FIFO_EMPTY	R	The FIFO for HS data on Lane 0 is empty
14	DLN0_LP_FIFO_OVERFLOW_CLR	W	unused

MDSS_DSI_0_FIFO_STATUS (cont.)

Bits	Name	Type	Description
14	DLN0_LP_FIFO_OVERFLOW	R	unused
13	DLN0_LP_FIFO_FULL	R	The FIFO for LP data on Lane 0 is full
12	DLN0_LP_FIFO_EMPTY	R	The FIFO for LP data on Lane 0 is empty
10	CMD_DMA_FIFO_UNDERFLOW	R	The Command mode engine dmafifo underflows
10	CMD_DMA_FIFO_UNDERFLOW_CLR	W	writing a 1 to this field will clear this bit
9	CMD_DMA_FIFO_WR_WATERMARK_REACH	R	The Command mode engine dmafifo write watermark is reached
9	CMD_DMA_FIFO_WR_WATERMARK_REACH_CLR	W	writing a 1 to this field will clear this bit
8	CMD_DMA_FIFO_RD_WATERMARK_REACH_CLR	W	writing a 1 to this field will clear this bit
8	CMD_DMA_FIFO_RD_WATERMARK_REACH	R	The Command mode engine dmafifo read watermark is reached
7	CMD_MDP_FIFO_UNDERFLOW_CLR	W	writing a 1 to this field will clear this bit
7	CMD_MDP_FIFO_UNDERFLOW	R	command mode pixel stream from MDP underflows
3	VIDEO_MDP_FIFO_UNDERFLOW	R	Unused
3	VIDEO_MDP_FIFO_UNDERFLOW_CLR	W	Unused
0	VIDEO_MDP_FIFO_OVERFLOW_CLR	W	Unused
0	VIDEO_MDP_FIFO_OVERFLOW	R	Unused

0x01A98010 MDSS_DSI_0_VIDEO_MODE_CTRL**Type:** RW**Reset State:** 0x00008000

DSI Video Mode Engine Control Register

MDSS_DSI_0_VIDEO_MODE_CTRL

Bits	Name	Description
31	LAST_LINE_INTERLEAVE_EN	Allow command mode operation interleaved on last line of video stream 0: disable 1: enable
28	PULSE_MODE_OPT	Select pulse mode option 0: no HSA and HE following VS/VE packet 1: send HSA and HE following VS/VE packet
24	HFP_PWR_MODE	Select power mode during the HFP period 0: send blanking packets in High Speed mode 1: low power stop mode (LP-11)
20	HBP_PWR_MODE	Select power mode during the HBP period 0: send blanking packets in High Speed mode 1: low power stop mode (LP-11)
16	HSA_PWR_MODE	Select power mode during the HSA period 0: send blanking packets in High Speed mode 1: low power stop mode (LP-11)
15	EOF_BLLP_PWR_MODE	Select power mode for the BLLP of the last line of a frame 0: send blanking packets during BLLP in high speed mode and block Command Mode packets 1: low power stop mode (LP-11) or let Command Mode Engine send packets in HS or LP mode
12	BLLP_PWR_MODE	DSI Power Mode for packets sent during BLLP period 0: send blanking packets during BLLP in high speed mode and block Command Mode packets 1: low power stop mode (LP-11) or let Command Mode Engine send packets in HS or LP mode
9:8	TRAFFIC_MODE	DSI video mode traffic sequence 0: non-burst mode with sync pulses 1: non-burst mode with sync start events 2: burst mode
5:4	DST_FORMAT	Pixel format. If there is interleaved Command Mode pixel packets (generated from MDP), the pixel depth of the Command Mode pixel packet should be greater or equal to the pixel depth of the Video mode pixel packet. 0: RGB565 1: RGB666 (packed) 2: RGB666 (loosely packed) 3: RGB888
1:0	VC	Virtual channel identifier

0x01A98014 MDSS_DSI_0_VIDEO_MODE_SYNC_DATATYPE**Type:** RW**Reset State:** 0x31211101

DSI Video Mode Sync Datatype Register

MDSS_DSI_0_VIDEO_MODE_SYNC_DATATYPE

Bits	Name	Description
29:24	HE	Specify the datatype of a hsync end packet
21:16	HS	Specify the datatype of a hsync start packet
13:8	VE	Specify the datatype of a vsync end packet
5:0	VS	Specify the datatype of a vsync start packet

0x01A98018 MDSS_DSI_0_VIDEO_MODE_PIXEL_DATATYPE**Type:** RW**Reset State:** 0x3E2E1E0E

DSI Video Mode Pixel Datatype Register

MDSS_DSI_0_VIDEO_MODE_PIXEL_DATATYPE

Bits	Name	Description
29:24	RGB888	Specify the datatype of an RGB888 pixel stream packet
21:16	RGB666	Specify the datatype of a loosely-packed RGB666 pixel stream packet
13:8	RGB666_PACKED	Specify the datatype of a packed RGB666 pixel stream packet
5:0	RGB565	Specify the datatype of an RGB565 pixel stream packet

0x01A9801C MDSS_DSI_0_VIDEO_MODE_BLANKING_DATATYPE**Type:** RW**Reset State:** 0x00001900

DSI Video Mode Blanking Packet Datatype Register

MDSS_DSI_0_VIDEO_MODE_BLANKING_DATATYPE

Bits	Name	Description
13:8	BLANK_PKT_DATATYPE	Specify the datatype of a blanking packet

MDSS_DSI_0_VIDEO_MODE_BLANKING_DATATYPE (cont.)

Bits	Name	Description
7:0	BLANK_PKT_DATA	This byte will be repeated in the payload portion of the blanking packet

0x01A98020 MDSS_DSI_0_VIDEO_MODE_DATA_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Video Mode Data Control Register

MDSS_DSI_0_VIDEO_MODE_DATA_CTRL

Bits	Name	Description
14:12	RGB_SWAP	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556.
8	B_SEL	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
4	G_SEL	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
0	R_SEL	Bit Swaps the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.

0x01A98024 MDSS_DSI_0_VIDEO_MODE_ACTIVE_H**Type:** RW**Reset State:** 0x00000000

Active Horizontal Display Region register.

The Active_H_Disp register defines the horizontal characteristics of the active window. (NOTE: video mode parameters are 0-based.)

double buffered: YES when DSI double-buffer is enabled by set DSI_TIMING_DB_MODE to 1.

MDSS_DSI_0_VIDEO_MODE_ACTIVE_H

Bits	Name	Description
31:16	ACTIVE_H_END	ACTIVE_H_END field tells the video mode engine where the horizontal viewing area ends (minus one) in pixel clock cycle relative to the horizontal sync signal.
15:0	ACTIVE_H_START	ACTIVE_H_START field tells the video mode engine where the horizontal viewing area starts (minus one) in pixel clock cycle relative to the horizontal sync signal.

0x01A98028 MDSS_DSI_0_VIDEO_MODE_ACTIVE_V**Type:** RW**Reset State:** 0x00000000

CRTC Active Vertical Display Region register.

The Active_V_Disp register defines the vertical characteristics of the active window. (NOTE: video mode parameters are 0-based.)

double buffered: YES when DSI double-buffer is enabled by set DSI_TIMING_DB_MODE to 1.

MDSS_DSI_0_VIDEO_MODE_ACTIVE_V

Bits	Name	Description
31:16	ACTIVE_V_END	ACTIVE_V_END field tells the video mode engine where the horizontal viewing area ends (minus one) in lines relative to the vertical sync signal
15:0	ACTIVE_V_START	ACTIVE_V_START field tells the video mode engine where the vertical viewing area starts (minus one) in lines relative to the vertical sync signal

0x01A9802C MDSS_DSI_0_VIDEO_MODE_TOTAL**Type:** RW**Reset State:** 0x00000000

Total Scan Area register.

TOTAL register defines the size of the total possible scanning area (NOTE: video mode parameters are 0-based.)

double buffered: YES when DSI double-buffer is enabled by set DSI_TIMING_DB_MODE to 1.

MDSS_DSI_0_VIDEO_MODE_TOTAL

Bits	Name	Description
31:16	VIDEO_V_TOTAL	Number of lines in one frame minus one. This value is equivalent to the period of the vertical sync
15:0	VIDEO_H_TOTAL	Number of pixels in one scan line (horizontal line) of the LCD controller minus one. This value is equivalent to the period of the horizontal sync signal (in pixel clock cycles).

0x01A98030 MDSS_DSI_0_VIDEO_MODE_HSYNC**Type:** RW**Reset State:** 0x00000000

HSync Control register which controls the horizontal screen position at which a horizontal sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

double buffered: YES when DSI double-buffer is enabled by set DSI_TIMING_DB_MODE to 1.

MDSS_DSI_0_VIDEO_MODE_HSYNC

Bits	Name	Description
31:16	HS_END	The position (minus one) where the horizontal sync ends in one line.
15:0	HS_START	The position (minus one) where the horizontal sync starts in one line.

0x01A98034 MDSS_DSI_0_VIDEO_MODE_VSYNC**Type:** RW**Reset State:** 0x00000000

VSynC Control register which controls the horizontal screen position at which a vertical sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

double buffered: YES when DSI double-buffer is enabled by set DSI_TIMING_DB_MODE to 1.

MDSS_DSI_0_VIDEO_MODE_VSYNC

Bits	Name	Description
31:16	VS_END	The position (minus one) where the vertical sync ends in one line.
15:0	VS_START	The position (minus one) where the vertical sync starts in one line.

0x01A98038 MDSS_DSI_0_VIDEO_MODE_VSYNC_VPOS**Type:** RW**Reset State:** 0x00000000

VSync Control register which controls the vertical screen position at which a vertical sync packet is sent by the DSI controller to the panel. (NOTE: video mode parameters are 0-based.)

double buffered: YES when DSI double-buffer is enabled by set DSI_TIMING_DB_MODE to 1.

MDSS_DSI_0_VIDEO_MODE_VSYNC_VPOS

Bits	Name	Description
31:16	VS_VPOS_END	The line (minus one) where the vertical sync ends in one frame.
15:0	VS_VPOS_START	The line (minus one) where the vertical sync starts in one frame.

0x01A9803C MDSS_DSI_0_COMMAND_MODE_DMA_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Command Mode Control Register for DMA data control

MDSS_DSI_0_COMMAND_MODE_DMA_CTRL

Bits	Name	Description
31	BROADCAST_EN	Enable the DSI core to send packets from DMA at the same time with the other core (this bit has to be set for the other DSI core as well). If broadcast is enable, the core needs to wait until both cores have fetched entire command buffer before start sending dma packets. When this bit is set, the command buffer size (DSI_DMA_CMD_LENGTH) must be less than 0x200 bytes.
30	BROADCAST_MASTER	Indicate whether this core is the master or slave 0: this core is the slave 1: this core is the master
28	EMBEDDED_MODE	Select packet_type, BTA settings and packet header information 0: from the register 1: from the frame buffer
26	POWER_MODE	Select power mode for data transmission of both embedded and non-embedded commands
24	PACKET_TYPE	Select packet type for non-embedded commands
23:22	VC	Virtual channel identifier for pixel data or non-embedded commands
21:16	DT	Data type for pixel data or non-embedded commands

MDSS_DSI_0_COMMAND_MODE_DMA_CTRL (cont.)

Bits	Name	Description
15:0	WC	Exact number of bytes in one packet for pixel data or non-embedded commands

0x01A98040 MDSS_DSI_0_COMMAND_MODE_MDP_CTRL**Type:** RW**Reset State:** 0x06100006

DSI Command Mode Control Register for MDP data control

MDSS_DSI_0_COMMAND_MODE_MDP_CTRL

Bits	Name	Description
31	LINE_SPLIT	Break a line into small packets
30:28	RGB_SWAP1	Swaps the R, G, and B channels of the dst pixels for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise rgb swap for stream1 is defined by RGB_SWAP). This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556.
27:24	DST_FORMAT1	Pixel format for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise pixel format for stream1 is defined by DST_FORMAT) 0 = RGB111 1 = reserved 2 = reserved 3 = RGB332 (data_src_width must be in multiple of 2 pixels) 4 = RGB444 (data_src_width must be in multiple of 2 pixels) 5 = reserved 6 = RGB565 7 = RGB666 8 = RGB888 others = reserved
23:20	INTERLEAVE_MAX	Maximum number of Command Mode RGB packets to send within one horizontal blanking period of the Video Mode frame (sw must ensure that they can fit in one BLLP period)
18:16	RGB_SWAP	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556.

MDSS_DSI_0_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
15	STREAM1_DST_FORMAT_SEL	Pixel format selection for stream 1. If MDP sends two streams to DSI and these streams have different output formats, then the pixel clock must be set according to the smallest pixel depth between the two. Otherwise, underflow may occur. Ex.: If stream0 is in RGB888 and stream1 is in RGB565, then pixel clock must be greater than dsiclk/2. 0: DST_FORMAT (same as stream0) 1: DST_FORMAT1
13	B_SEL1	Bit Swaps the B Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by B_SEL). This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
12	B_SEL	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
9	G_SEL1	Bit Swaps the G Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by G_SEL). This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
8	G_SEL	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
7	BYTE_MSB_LSB_FLIP1	Swap the bit ordering of each byte of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise the byte endian is defined by BYTE_MSB_LSB_FLIP). 0: bit 0 is lsb, bit 7 is msb 1: bit 0 is msb, bit 0 is lsb
6	BYTE_MSB_LSB_FLIP	Swap the bit ordering of each byte of the dst pixel (this is done after the RGB swap and R/G/B_SEL). 0: bit 0 is lsb, bit 7 is msb 1: bit 0 is msb, bit 0 is lsb
5	R_SEL1	Bit Swaps the R Channel of the dst pixel for stream 1 (if STREAM1_DST_FORMAT_SEL = 1, otherwise bit swap for stream1 is defined by R_SEL). This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
4	R_SEL	Bit Swaps the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.

MDSS_DSI_0_COMMAND_MODE_MDP_CTRL (cont.)

Bits	Name	Description
3:0	DST_FORMAT	Destination pixel format. For video mode operation interleave with MDP pixel packets, this is required: command mode pixel depth >= video mode pixel depth (check video mode pixel format in DSI_VIDEO_MODE_PIXEL_DATATYPE) 0 = RGB111 1 = reserved 2 = reserved 3 = RGB332 (data_src_width must be in multiple of 2 pixels) 4 = RGB444 (data_src_width must be in multiple of 2 pixels) 5 = reserved 6 = RGB565 7 = RGB666 8 = RGB888 others = reserved

0x01A98044 MDSS_DSI_0_COMMAND_MODE_MDP_DCS_CMD_CTRL**Type:** RW**Reset State:** 0x00003C2C

This register controls DCS command insertion to MDP data

MDSS_DSI_0_COMMAND_MODE_MDP_DCS_CMD_CTRL

Bits	Name	Description
18	STREAM2_INSERT_DCS_COMMAND	Indicate whether a DCS command has to be inserted as the first byte of the payload of the pixel data packet of the stream 2 0: no command is inserted 1: value in the DCS_COMMAND field will be inserted
17	INSERT_DCS_COMMAND2	Indicate whether a DCS command has to be inserted as the first byte of the payload of the pixel data packet of the stream 1 if COMMAND_MODE_DMA_STREAM_SEL is set to 1 or 2, otherwise it is for stream 0 0: no command is inserted 1: value in the DCS_COMMAND field will be inserted
16	INSERT_DCS_COMMAND	Indicate whether a DCS command has to be inserted as the first byte of payload of the pixel data packet for stream 0 if COMMAND_MODE_DMA_STREAM_SEL is set to 0 or 2, otherwise it is for stream 1 0: no command is inserted 1: value in the DCS_COMMAND field will be inserted
15:8	WR_MEM_CONTINUE	DCS command for write_memory_continue

MDSS_DSI_0_COMMAND_MODE_MDP_DCS_CMD_CTRL (cont.)

Bits	Name	Description
7:0	WR_MEM_START	DCS command for write_memory_start

0x01A98048 MDSS_DSI_0_DMA_CMD_OFFSET**Type:** RW**Reset State:** 0x00000000

SECURE

DSI Command Offset Register

MDSS_DSI_0_DMA_CMD_OFFSET

Bits	Name	Description
31:0	CMD_OFFSET	ZERO 2 : 0 Memory offset (in bytes) for DSI command, qword aligned, i.e.: bit 2:0 are tied to 0. This value has to be multiple of 8.

0x01A9804C MDSS_DSI_0_DMA_CMD_LENGTH**Type:** RW**Reset State:** 0x00000000

SECURE

DSI Command Length Register

MDSS_DSI_0_DMA_CMD_LENGTH

Bits	Name	Description
23:0	CMD_LENGTH	Number of commands (in bytes). This value has to be multiple of 4.

0x01A98050 MDSS_DSI_0_DMA_FIFO_CTRL**Type:** RW**Reset State:** 0x00000000

DSI DMA FIFO Control Register

MDSS_DSI_0_DMA_FIFO_CTRL

Bits	Name	Description
5:4	READ_WATERMARK	Allow fifo reads for a packet when the number of unread entries is above this watermark or larger than the packet size (read_watermark has to be smaller than or equal to write_watermark) 0: FIFO is 1/2 full 1: FIFO is 3/4 full 2: FIFO is 7/8 full 3: FIFO is 15/16 full
1:0	WRITE_WATERMARK	Fills FIFO under the following conditions 0: FIFO is 1/2 empty 1: FIFO is 1/4 empty 2: FIFO is 1/8 empty 3: FIFO is 1/16 empty

0x01A98054 MDSS_DSI_0_DMA_NULL_PACKET_DATA**Type:** RW**Reset State:** 0x00000900

DSI DMA Null Packet Data Register

MDSS_DSI_0_DMA_NULL_PACKET_DATA

Bits	Name	Description
13:8	NULL_DATATYPE	Datatype of null packet
7:0	NULL_DATA	This byte will be repeated in the payload portion of the embedded null packet

0x01A98058 MDSS_DSI_0_COMMAND_MODE_MDP_STREAM0_CTRL**Type:** RW**Reset State:** 0x00000000

DSI MDP stream 0 control register

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM0_CTRL

Bits	Name	Description
31:16	MDP0_WC	Exact number of Word (byte) count for one packet
9:8	MDP0_VC	Virtual channel

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM0_CTRL (cont.)

Bits	Name	Description
5:0	MDP0_DT	Packet data type

0x01A9805C MDSS_DSI_0_COMMAND_MODE_MDP_STREAM0_TOTAL**Type:** RW**Reset State:** 0x00000000

DSI MDP stream 0 frame dimension (NOTE: unlike video mode parameters which are 0-based, these parameters in command mode are 1-based, i.e.: the actual number of pixels are set.)

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM0_TOTAL

Bits	Name	Description
31:16	MDP0_V_TOTAL	Number of lines in 1 frame
15:0	MDP0_H_TOTAL	Number of pixels in 1 line

0x01A98060 MDSS_DSI_0_COMMAND_MODE_MDP_STREAM1_CTRL**Type:** RW**Reset State:** 0x00000000

DSI MDP stream 1 control register

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM1_CTRL

Bits	Name	Description
31:16	MDP1_WC	Exact number of word (byte) count for one packet
9:8	MDP1_VC	Virtual channel
5:0	MDP1_DT	Packet data type

0x01A98064 MDSS_DSI_0_COMMAND_MODE_MDP_STREAM1_TOTAL**Type:** RW**Reset State:** 0x00000000

DSI MDP stream 1 frame dimension (NOTE: unlike video mode parameters which are 0-based, these parameters in command mode are 1-based, i.e.: the actual number of pixels are set.)

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM1_TOTAL

Bits	Name	Description
31:16	MDP1_V_TOTAL	Exact number of lines in 1 frame
15:0	MDP1_H_TOTAL	Exact number of pixels in 1 line

0x01A98068 MDSS_DSI_0_ACK_ERR_STATUS**Type:** RW**Reset State:** 0x00000000

DSI Error Report Register stores errors and acknowledge from the DSI display module.

This register stores errors from the error report packet and error in the ECC and CRC of the returned packet

MDSS_DSI_0_ACK_ERR_STATUS

Bits	Name	Type	Description
28	ACK_CLR	W	clear ACK by writing a '1' and then a '0' to this bit
28	ACK	R	Transmission acknowledged by the DSI display module
24	ERROR	R	There is an error report returned from the DSI display module (or-ed error bits 0 - 15)
24	ERROR_CLR	W	clear ERROR by writing a '1' and then a '0' to this bit
23	RDBK_INCOMPLETE_PACKET_ERR	R	Received incomplete read packet
23	RDBK_INCOMPLETE_PACKET_ERR_CLR	W	clear RDBK_INCOMPLETE_PACKET_ERR by writing a '1' and then a '0' to this bit
20	RDBK_DATA_CRC_ERR_CLR	W	clear RDBK_DATA_CRC_ERR by writing a '1' and then a '0' to this bit
20	RDBK_DATA_CRC_ERR	R	Incorrect CRC detected in read packet
17	RDBK_DATA_MULTI_ECC_ERR	R	Multi-bit ECC detected in read packet and not corrected
17	RDBK_DATA_MULTI_ECC_ERR_CLR	W	clear RDBK_DATA_MULTI_ECC_ERR by writing a '1' and then a '0' to this bit
16	RDBK_DATA_ECC_ERR	R	Single bit ECC error detected in read packet and corrected by DSI controller
16	RDBK_DATA_ECC_ERR_CLR	W	clear RDBK_DATA_ECC_ERR by writing a '1' and then a '0' to this bit
15	PANEL_SPECIFIC_ERR_CLR	W	Clear PANEL_SPECIFIC_ERR by writing a '1' and then a '0' to this bit

MDSS_DSI_0_ACK_ERR_STATUS (cont.)

Bits	Name	Type	Description
15	PANEL_SPECIFIC_ERR	R	This bit correspond to bit 15 (DSI protocol violation) of the error report. Refer to the meaning by this description rather than by the name of the register field
13	PROTOCOL_VIOLATION_CLR	W	Clear Protocol violation by writing a '1' and then a '0' to this bit
13	PROTOCOL_VIOLATION	R	This bit correspond to bit 13 (invalid transmission length) of the error report. Refer to the meaning by this description rather than by the name of the register field.
12	VC_ERR	R	Invalid virtual channel ID detected by the DSI display module
12	VC_ERR_CLR	W	clear VC_ERR by writing a '1' and then a '0' to this bit
11	DT_ERR_CLR	W	clear DT_ERR by writing a '1' and then a '0' to this bit
11	DT_ERR	R	DSI data type not recognized by the DSI display module
10	CRC_ERR_CLR	W	clear CRC_ERR by writing a '1' and then a '0' to this bit
10	CRC_ERR	R	Checksum error for long packet detected by the DSI display module
9	MULTI_ECC_ERR_CLR	W	clear MULTI_ECC_ERR by writing a '1' and then a '0' to this bit
9	MULTI_ECC_ERR	R	Multi-bit ECC detected and not corrected by the DSI display module
8	ECC_ERR	R	Single bit ECC detected and corrected by the DSI display module
8	ECC_ERR_CLR	W	clear ECC_ERR by writing a '1' and then a '0' to this bit
7	CONTENTION	R	Contention Detected by Peripheral
7	CONTENTION_CLR	W	clear CONTENTION by writing a '1' and then a '0' to this bit
6	FALSE_CTRL_ERR_CLR	W	clear FALSE_CTRL_ERR by writing a '1' and then a '0' to this bit
6	FALSE_CTRL_ERR	R	False Control Error detected by the DSI display module
5	TIMEOUT	R	timeout error (Low Power forward transmission, bus turn around, High Speed reverse transmission) detected by the DSI display module
5	TIMEOUT_CLR	W	clear TIMEOUT by writing a '1' and then a '0' to this bit
4	LP_ERR	R	Low-power transmit sync error detected by the DSI display module
4	LP_ERR_CLR	W	clear LP_ERR by writing a '1' and then a '0' to this bit
3	ESC_ERR_CLR	W	clear ESC_ERR by writing a '1' and then a '0' to this bit
3	ESC_ERR	R	Escape Mode Entry Command Error detected by the DSI display module

MDSS_DSI_0_ACK_ERR_STATUS (cont.)

Bits	Name	Type	Description
2	EOT_ERR_CLR	W	clear EOT_ERR by writing a '1' and then a '0' to this bit
2	EOT_ERR	R	EoT Sync Error detected by the DSI display module
1	SOT_SYNC_ERR	R	SoT Sync Error detected by the DSI display module
1	SOT_SYNC_ERR_CLR	W	clear SOT_SYNC_ERR by writing a '1' and then a '0' to this bit
0	SOT_ERR_CLR	W	clear SOT_ERR by writing a '1' and then a '0' to this bit
0	SOT_ERR	R	SoT Error detected by the DSI display module

0x01A9806C MDSS_DSI_0_RDBK_DATA0**Type:** R**Reset State:** 0x00000000

DSI Read Data 0 Register

MDSS_DSI_0_RDBK_DATA0

Bits	Name	Description
31:0	RD_DATA0	Data returned from the DSI display module

0x01A98070 MDSS_DSI_0_RDBK_DATA1**Type:** R**Reset State:** 0x00000000

DSI Read Data 1 Register

MDSS_DSI_0_RDBK_DATA1

Bits	Name	Description
31:0	RD_DATA1	Data returned from the DSI display module

0x01A98074 MDSS_DSI_0_RDBK_DATA2**Type:** R**Reset State:** 0x00000000

DSI Read Data 2 Register

MDSS_DSI_0_RDBK_DATA2

Bits	Name	Description
31:0	RD_DATA2	Data returned from the DSI display module

0x01A98078 MDSS_DSI_0_RDBK_DATA3**Type:** R**Reset State:** 0x00000000

DSI Read Data 3 Register

MDSS_DSI_0_RDBK_DATA3

Bits	Name	Description
31:0	RD_DATA3	Data returned from the DSI display module

0x01A9807C MDSS_DSI_0_RDBK_DATATYPE0**Type:** RW**Reset State:** 0x22211211

DSI Read Response Datatype Register 0

MDSS_DSI_0_RDBK_DATATYPE0

Bits	Name	Description
29:24	DCS_SHORT_RD_2_BYTE	Specify the datatype of a DCS short read response with 2 byte returned
21:16	DCS_SHORT_RD_1_BYTE	Specify the datatype of a DCS short read response with 1 byte returned
13:8	GENERIC_SHORT_RD_2_BYTE	Specify the datatype of a generic short read response with 2 byte returned
5:0	GENERIC_SHORT_RD_1_BYTE	Specify the datatype of a generic short read response with 1 byte returned

0x01A98080 MDSS_DSI_0_RDBK_DATATYPE1**Type:** RW**Reset State:** 0x001C1A02

DSI Read Response Datatype Register 1

MDSS_DSI_0_RDBK_DATATYPE1

Bits	Name	Description
21:16	DCS_LONG_RD	Specify the datatype of a DCS long read response
13:8	GENERIC_LONG_RD	Specify the datatype of a generic long read response
5:0	ERROR_REPORT	Specify the datatype of an acknowledge with error report

0x01A98084 MDSS_DSI_0_TRIG_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Trigger Control Register

When DSI is enabled and CRTC1 or 2 is used for other non-DSI panels, the display engine path trigger must be set to manual internal, otherwise the CRTC will be stalled

MDSS_DSI_0_TRIG_CTRL

Bits	Name	Description
31	TE_SEL	Select TE path 0: Tearing effect (external trigger) returns from data link 1: Tearing effect (external trigger) returns from a dedicated pin
28	COMMAND_MODE_DMA_MDP_ORDER	This bit field indicates whether DMA or MDP path will win the arbitration if both requests the link at the same time 0: DMA has higher priority than display processor 1: Display processor has higher priority than DMA
24	COMMAND_MODE_MDP_REQ_ORDER	If PHY TE is required for one of the MDP stream while the other stream is ready to transmit, this field determines which will win the arbitration 0: Command Mode MDP PHY TE request has higher priority than Command Mode MDP data transmission request 1: Command Mode MDP Data transmission request has higher priority than Command Mode MDP PHY TE request
12	BLOCK_DMA_WITHIN_FRAME	If Command Mode DMA operation is triggered in the middle of a frame of the stream selected by COMMAND_MODE_DMA_STREAM_SEL, delay the operation until end of frame, otherwise service the dma operation right away

MDSS_DSI_0_TRIG_CTRL (cont.)

Bits	Name	Description
9:8	COMMAND_MODE_DMA_STREAM_SEL	If COMMAND_MODE_DMA_TRIGGER_SEL = SOF/EOF or both COMMAND_MODE_DMA_TRIGGER_SEL and COMMAND_MODE_MDP_TRIGGER_SEL = TE or sw+TE, the Command Mode DMA path is triggered at frame boundary of the MDP stream selected by this field. 0 = command dma triggered by stream 0 1 = command dma triggered by stream 1 2 = command dma triggered by stream2 0: stream 0 1: stream 1 2: stream 2 3: reserved
6:4	COMMAND_MODE_MDP_TRIGGER_SEL	TRIGGER_SEL field is used to select which trigger is used for Command Mode display processor path. (The stream to be triggered is selected by COMMAND_MODE_DMA_STREAM_SEL) 0: none 1: reserved0 2: TE 3: reserved1 4: sw trigger 5: reserved2 6: sw trigger and TE 7: reserved3
2:0	COMMAND_MODE_DMA_TRIGGER_SEL	DMA_TRIGGER_SEL field is used to select which trigger is used for Command Mode DMA path. 0: none 1: Start/end of frame (determined by COMMAND_MODE_DMA_MDP_ORDER) 2: TE 3: reserved0 4: sw trigger 5: sw trigger and start/end of frame (COMMAND_MODE_DMA_MDP_ORDER) 6: sw trigger and TE 7: reserved1

0x01A98088 MDSS_DSI_0_EXT_MUX**Type:** RW**Reset State:** 0x00000000

DSI External Pin Mux Register - select IO pin for tearing effect and panel reset

MDSS_DSI_0_EXT_MUX

Bits	Name	Description
31:20	EXT_TE_HSYNC_TOTAL	Defines the total number of hsync per frame
19:8	EXT_TE_HSYNC_TRIG_CN T	Defines the number of hsync needed to trigger the engine if TE_MODE is set to 1
7	EXT_TE_POL	Polarity of external tearing effect signal 0: TE occurs at the rising edge 1: TE occurs at the falling edge
5:4	EXT_TE_MODE	Select TE mode 0: vsync (edge detection) 1: vsync (pulse width detection) 2: vsync and hsync combined in 1 signal (edge detection) 3: vsync and hsync combined in 1 signal (pulse width detection)
3:0	EXT_TE_MUX	Input port for external tearing effect (external trigger). Valid range: 0 to 1

0x01A9808C MDSS_DSI_0_EXT_TE_PULSE_DETECT_CTRL**Type:** RW**Reset State:** 0x00000000

DSI External Tearing Effect Pulse Width Detection Control Register

MDSS_DSI_0_EXT_TE_PULSE_DETECT_CTRL

Bits	Name	Description
31:16	TE_VSYNC_MIN_WIDTH	Defines the minimum width (in escclk) of the vsync pulse in the TE signal
15:0	TE_HSYNC_MAX_WIDTH	Defines the maximum width (in escclk) of the hsync pulse in the TE signal

0x01A98090 MDSS_DSI_0_CMD_MODE_DMA_SW_TRIGGER**Type:** RW**Reset State:** 0x00000000

DSI Command Mode DMA Software Trigger Register

MDSS_DSI_0_CMD_MODE_DMA_SW_TRIGGER

Bits	Name	Description
0	SW_TRIGGER	Software can start a DMA trigger for the Command Mode engine by writing a 1 to this bit

0x01A98094 MDSS_DSI_0_CMD_MODE_MDP_SW_TRIGGER**Type:** RW**Reset State:** 0x00000000

DSI Command Mode Display Processor Path Software Trigger Register

MDSS_DSI_0_CMD_MODE_MDP_SW_TRIGGER

Bits	Name	Description
0	SW_TRIGGER	Software can start an MPD trigger for the Command Mode engine by writing a 1 to this bit

0x01A98098 MDSS_DSI_0_CMD_MODE_BTA_SW_TRIGGER**Type:** RW**Reset State:** 0x00000000

DSI Command Mode Bus-Turn-Around Software Trigger Register

MDSS_DSI_0_CMD_MODE_BTA_SW_TRIGGER

Bits	Name	Description
0	SW_TRIGGER	Software can start a BTA trigger for the Command Mode engine by writing a 1 to this bit

0x01A9809C MDSS_DSI_0_RESET_SW_TRIGGER**Type:** RW**Reset State:** 0x00000000

DSI Reset Software Trigger Register

MDSS_DSI_0_RESET_SW_TRIGGER

Bits	Name	Description
0	SW_TRIGGER	Software can trigger reset through the data link by writing a 1 to this bit

0x01A980A0 MDSS_DSI_0_MISR_CMD_CTRL**Type:** RW**Reset State:** 0x00000000

DSI misr control for command mode operation - misr is collected for packets output from packetizer

MDSS_DSI_0_MISR_CMD_CTRL

Bits	Name	Type	Description
28	EN		enable Command Mode misr accumulation (all the misr's are reset to 0 when it is disable)
24	WIDTH_SEL		misr width of packets generated from dma, mdp stream 0 and mdp stream1 data 0: generate misr in 8 bits 1: generate misr in 16 bits
23:16	MDP_STREAM1_MISR	R	8-bit misr for packets generated from MDP stream 1
15:8	MDP_STREAM0_MISR	R	8-bit misr for packets generated from MDP stream 0
7:0	DMA_MISR	R	8-bit misr for packets generated from memory

0x01A980A4 MDSS_DSI_0_MISR_VIDEO_CTRL**Type:** RW**Reset State:** 0x00000000

DSI misr control for video mode operation - misr is collected for packets output from packetizer

MDSS_DSI_0_MISR_VIDEO_CTRL

Bits	Name	Type	Description
28	STOP_EN		select misr accumulation restart or stop after N frame (specified in MAX_FRAME_COUNT) 0: auto reset every N frame 1: stop after N frames

MDSS_DSI_0_MISR_VIDEO_CTRL (cont.)

Bits	Name	Type	Description
24	WIDTH_SEL		misr width of packets generated from dma, mdp stream 0 and mdp stream1 data 0: generate misr in 8 bits 1: generate misr in 16 bits
16	EN		enable Video Mode misr accumulation (the misr is reset to 0 when it is disable)
15:8	MAX_FRAME_COUNT		internal misr is reset when the number of frames generated by the video mode engine reaches this number and the MISR field in this register is updated before the reset
7:0	MISR	R	misr for video mode packets

0x01A980A8 MDSS_DSI_0_LANE_STATUS**Type:** R**Reset State:** 0x00000000

DSI Lane Status Register

MDSS_DSI_0_LANE_STATUS

Bits	Name	Description
16	DLN0_DIRECTION	Indicate transmission direction of Data Lane 0
12	CLKLN_ULPS_ACTIVE_NOT	Indicate whether Clock Lane is in Ultra-Low power state
11	DLN3_ULPS_ACTIVE_NOT	Indicate whether Data Lane 3 is in Ultra-Low power state
10	DLN2_ULPS_ACTIVE_NOT	Indicate whether Data Lane 2 is in Ultra-Low power state
9	DLN1_ULPS_ACTIVE_NOT	Indicate whether Data Lane 1 is in Ultra-Low power state
8	DLN0_ULPS_ACTIVE_NOT	Indicate whether Data Lane 0 is in Ultra-Low power state
4	CLKLN_STOPSTATE	Indicate whether Clock Lane is in Stop state
3	DLN3_STOPSTATE	Indicate whether Data Lane 3 is in Stop state
2	DLN2_STOPSTATE	Indicate whether Data Lane 2 is in Stop state
1	DLN1_STOPSTATE	Indicate whether Data Lane 1 is in Stop state
0	DLN0_STOPSTATE	Indicate whether Data Lane 0 is in Stop state

0x01A980AC MDSS_DSI_0_LANE_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Lane Control Register

MDSS_DSI_0_LANE_CTRL

Bits	Name	Description
28	CLKLN_HS_FORCE_REQU EST	Force Clock Lane to enter HS mode always
20	CLKLN_FORCE_TX_STOP	Force Clock Lane to go into transmit mode and the lane module state machine is forced into the Stop state
19	DLN3_FORCE_TX_STOP	Force Data Lane 3 to go into transmit mode and the lane module state machine is forced into the Stop state
18	DLN2_FORCE_TX_STOP	Force Data Lane 2 to go into transmit mode and the lane module state machine is forced into the Stop state
17	DLN1_FORCE_TX_STOP	Force Data Lane 1 to go into transmit mode and the lane module state machine is forced into the Stop state
16	DLN0_FORCE_TX_STOP	Force Data Lane 0 to go into transmit mode and the lane module state machine is forced into the Stop state
12	CLKLN_ULPS_EXIT	Request Clock Lane to exit Ultra-Low power state
11	DLN3_ULPS_EXIT	Request Data Lane 3 to exit Ultra-Low power state
10	DLN2_ULPS_EXIT	Request Data Lane 2 to exit Ultra-Low power state
9	DLN1_ULPS_EXIT	Request Data Lane 1 to exit Ultra-Low power state
8	DLN0_ULPS_EXIT	Request Data Lane 0 to exit Ultra-Low power state
4	CLKLN_ULPS_REQUEST	Request Clock Lane to enter Ultra-Low power state
3	DLN3_ULPS_REQUEST	Request Data Lane 3 to enter Ultra-Low power state
2	DLN2_ULPS_REQUEST	Request Data Lane 2 to enter Ultra-Low power state
1	DLN1_ULPS_REQUEST	Request Data Lane 1 to enter Ultra-Low power state
0	DLN0_ULPS_REQUEST	Request Data Lane 0 to enter Ultra-Low power state

0x01A980B0 MDSS_DSI_0_LANE_SWAP_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Lane Swapping Control Register

MDSS_DSI_0_LANE_SWAP_CTRL

Bits	Name	Description
2:0	DLN_SWAP_SEL	PHY lane mapping for data lane 0, 1, 2, 3 output from the DSI controller 000 = 0, 1, 2, 3 001 = 3, 0, 1, 2 010 = 2, 3, 0, 1 011 = 1, 2, 3, 0 100 = 0, 3, 2, 1 101 = 1, 0, 3, 2 110 = 2, 1, 0, 3 111 = 3, 2, 1, 0

0x01A980B4 MDSS_DSI_0_DLN0_PHY_ERR**Type:** RW**Reset State:** 0x00088888

DSI PHY Error Register - reports errors returned from the PHY. If the mask bit for a specific error is set to 1, turn request will be deasserted if the corresponding error occurs and controller will wait for the link to return to forward stopstate.

NOTE: turn request abort/interrupt will be generated if the mask field(s) in DSI_DLN0_PHY_ERR is set to 1. (Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0)

MDSS_DSI_0_DLN0_PHY_ERR

Bits	Name	Type	Description
19	DLN0_ERR_CONTENTION_LP1_MASK		Option for controller to ignore this error 0: no action 1: abort turn request if error occurs
16	DLN0_ERR_CONTENTION_LP1_CLR	W	Clear DLN0_ERR_CONTENTION_LP1 by writing a '1' to this field
16	DLN0_ERR_CONTENTION_LP1	R	Contention detected while lane 0 is driven high
15	DLN0_ERR_CONTENTION_LP0_MASK		Option for controller to ignore this error 0: no action 1: abort turn request if error occurs
12	DLN0_ERR_CONTENTION_LP0_CLR	W	Clear DLN0_ERR_CONTENTION_LP0 by writing a '1' to this field

MDSS_DSI_0_DLN0_PHY_ERR (cont.)

Bits	Name	Type	Description
12	DLN0_ERR_CONTENTION_LP0	R	Contention detected while lane 0 is driven low
11	DLN0_ERR_CONTROL_MASK		Option for controller to ignore this error 0: no action 1: abort turn request if error occurs
8	DLN0_ERR_CONTROL_CLR	W	Clear DLN0_ERR_CONTROL by writing a '1' to this field
8	DLN0_ERR_CONTROL	R	An incorrect line state sequence is detected
7	DLN0_ERR_SYNC_ESC_MASK		Option for controller to ignore this error 0: no action 1: abort turn request if error occurs
4	DLN0_ERR_SYNC_ESC	R	Number of bits received during a low power data transmission is not a multiple of eight when the transmission ends
4	DLN0_ERR_SYNC_ESC_CLR	W	Clear DLN0_ERR_SYNC_ESC by writing a '1' to this field
3	DLN0_ERR_ESC_MASK		Option for controller to ignore this error 0: no action 1: abort turn request if error occurs
0	DLN0_ERR_ESC_CLR	W	Clear DLN0_ERR_ESC by writing a '1' to this field
0	DLN0_ERR_ESC	R	Unrecognized escape entry command received

0x01A980B8 MDSS_DSI_0_LP_TIMER_CTRL**Type:** RW**Reset State:** 0xFFFFFFFF

DSI Timeout Control Register for Low Power Mode Transmission

MDSS_DSI_0_LP_TIMER_CTRL

Bits	Name	Description
31:16	BTA_TO	Bus turn around timeout (in escclk)
15:0	LP_RX_TO	Low power transmission reverse timeout (in Escclk)

0x01A980BC MDSS_DSI_0_HS_TIMER_CTRL**Type:** RW**Reset State:** 0x0000FFFF

DSI Timeout Control Register for High Speed Mode Transmission

MDSS_DSI_0_HS_TIMER_CTRL

Bits	Name	Description
28	HS_TX_TO_STOP_EN	Stop High Speed Transmission immediately at timeout
19:16	TIMER_RESOLUTION	Control all 3 timeout counter increment steps by power of 2 of this field. Ex.: 0 = increment every escclk; 1 = increment every 2 escclk; 3 = increment every 8 escclk;
15:0	HS_TX_TO	High speed transmission timeout (in escclk)

0x01A980C0 MDSS_DSI_0_TIMEOUT_STATUS**Type:** RW**Reset State:** 0x00000000

DSI Timeout Status Register

MDSS_DSI_0_TIMEOUT_STATUS

Bits	Name	Type	Description
8	BTA_TIMEOUT_CLR	W	writing a 1 will clear this bit
8	BTA_TIMEOUT	R	Indicates Bus Turnaround timeout
4	LP_RX_TIMEOUT_CLR	W	writing a 1 will clear this bit
4	LP_RX_TIMEOUT	R	Indicates Low Power reverse transmission timeout
0	HS_TX_TIMEOUT_CLR	W	writing a 1 will clear this bit
0	HS_TX_TIMEOUT	R	Indicates High Speed forward transmission timeout

0x01A980C4 MDSS_DSI_0_CLKOUT_TIMING_CTRL**Type:** RW**Reset State:** 0x00000000

DSI PHY Clock Lane Timing Control Register

MDSS_DSI_0_CLKOUT_TIMING_CTRL

Bits	Name	Description
13:8	T_CLK_POST	Number of byteclk cycles (minus one) that the transmitter shall continue sending HS clock after the last associated Data Lane has transitioned to Low Power mode
5:0	T_CLK_PRE	Number of byteclk cycles (minus one) that the high speed clock shall be driven prior to any associated Data Lane beginning the transition from Low Power to High Speed mode

0x01A980C8 MDSS_DSI_0_EOT_PACKET**Type:** RW**Reset State:** 0x010F0F08

DSI EOT Packet Register - packet to append at the end of a High Speed Data Burst

MDSS_DSI_0_EOT_PACKET

Bits	Name	Description
31:24	ECC	ECC of the EOT packet
23:8	WC	Word count of the EOT packet
7:0	DI	Data identifier (virtual channel and datatype) of the EOT packet

0x01A980CC MDSS_DSI_0_EOT_PACKET_CTRL**Type:** RW**Reset State:** 0x00000000

DSI EOT Packet Control Register

MDSS_DSI_0_EOT_PACKET_CTRL

Bits	Name	Description
4	RX_EOT_IGNORE	Specify whether the controller should ignore the EOT packet if it is received from reverse transmission
0	TX_EOT_APPEND	Specify whether the EOT packet has to be appended at the end of each forward High Speed data burst

0x01A980D0 MDSS_DSI_0_GENERIC_ESC_TX_TRIGGER**Type:** RW**Reset State:** 0x00000000

DSI Generic Escape Mode Trigger Register

MDSS_DSI_0_GENERIC_ESC_TX_TRIGGER

Bits	Name	Description
0	SW_TRIGGER	Software can trigger a generic escape mode command through DISP_DSI_PHY_DLN0_TX_TRIGGER_ESC[3] by writing a 1 to this bit

0x01A9810C MDSS_DSI_0_ERR_INT_MASK0**Type:** RW**Reset State:** 0x7FFF3BFF

DSI Error Interrupt Enable Register - enable any event to drive the error status (DSI_INT_CTRL.DSI_ERROR_STAT). If the DSI_INT_CTRL.DSI_ERROR_MASK is set to 1, interrupt will be generated.

NOTE: Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0.

MDSS_DSI_0_ERR_INT_MASK0

Bits	Name	Description
30	DLN3_HS_FIFO_UNDERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 3 interrupt (DSI_STATUS reg, bit 31) 0: allow generation of error status 1: no error status generated
29	DLN2_HS_FIFO_UNDERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 2 interrupt (DSI_STATUS reg, bit 27) 0: allow generation of error status 1: no error status generated
28	DPHY_DSIPLL_UNLOCK_MASK	Mask dsipll unlock (to avoid sending out unnecessary interrupts, set this bit to 1 before dsipll locks) 0: allow generation of error status 1: no error status generated
27	DLN1_HS_FIFO_UNDERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 1 interrupt (DSI_FIFO_STATUS reg, bit 23) 0: allow generation of error status 1: no error status generated

MDSS_DSI_0_ERR_INT_MASK0 (cont.)

Bits	Name	Description
26	DLN0_HS_FIFO_UNDERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 19) 0: allow generation of error status 1: no error status generated
25	DLN0_ERR_CONTENTION_LP1_MASK	Mask contention while data lane 0 is driven high interrupt (DSI_DLNO_PHY_ERR reg, bit 16) 0: allow generation of error status (this should be set when dsipll is ready or when dsipll bypass is set to 1) 1: no error status generated
24	DLN0_ERR_CONTENTION_LP0_MASK	Mask contention while data lane 0 is driven low interrupt (DSI_DLNO_PHY_ERR reg, bit 12) 0: allow generation of error status 1: no error status generated
23	DLN0_ERR_CONTROL_MASK	Mask incorrect LP RX state sequence interrupt (DSI_DLNO_PHY_ERR reg, bit 8) 0: allow generation of error status 1: no error status generated
22	DLN0_ERR_SYNC_ESCAPE_MASK	Mask LP RX data that is not byte-aligned interrupt (DSI_DLNO_PHY_ERR reg, bit 4) 0: allow generation of error status 1: no error status generated
21	DLN0_ERR_ESCAPE_MASK	Mask incorrect LP RX escape entry interrupt (DSI_DLNO_PHY_ERR reg, bit 0) 0: allow generation of error status 1: no error status generated
20	DLN0_LP_FIFO_OVERFLOW_MASK	unused (Mask Lane Layer Low Power FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 14)) 0: allow generation of error status 1: no error status generated
19	DLN3_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 3 interrupt (DSI_STATUS reg, bit 30) 0: allow generation of error status 1: no error status generated
18	DLN2_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 2 interrupt (DSI_STATUS reg, bit 26) 0: allow generation of error status 1: no error status generated
17	DLN1_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 1 interrupt (DSI_FIFO_STATUS reg, bit 22) 0: allow generation of error status 1: no error status generated

MDSS_DSI_0_ERR_INT_MASK0 (cont.)

Bits	Name	Description
16	DLN0_HS_FIFO_OVERFLOW_MASK	Mask Lane Layer High Speed FIFO for data lane 0 interrupt (DSI_FIFO_STATUS reg, bit 18) 0: allow generation of error status 1: no error status generated
13	VID_MDP_FIFO_UNDERFLOW_MASK	Unused
12	VID_MDP_FIFO_OVERFLOW_MASK	Unused
11	CMD_MDP_FIFO_UNDERFLOW_MASK	Mask Display Engine FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 7) 0: allow generation of error status 1: no error status generated
9	CMD_DMA_FIFO_UNDERFLOW_MASK	Mask Command mode dma FIFO underflow interrupt (DSI_FIFO_STATUS reg, bit 10) 0: allow generation of error status 1: no error status generated
8	INTERLEAVE_OP_CONTENTION_MASK	Mask interleave operation contention interrupt (DSI_STATUS reg, bit 31) 0: allow generation of error status 1: no error status generated
7	BTA_TO_MASK	Mask bus turnaround timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 8) 0: allow generation of error status 1: no error status generated
6	HS_TX_TO_MASK	Mask High Speed forward transmission timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 0) 0: allow generation of error status 1: no error status generated
5	LP_RX_TO_MASK	Mask Low Power reverse transmission timeout interrupt (DSI_TIMEOUT_STATUS reg, bit 4) 0: allow generation of error status 1: no error status generated
4	ERROR_PACKET_MASK	Mask error packet returned from peripheral interrupt (DSI_ACK_ERR_STATUS reg, bit 24) 0: allow generation of error status 1: no error status generated
3	RDBK_INCOMPLETE_PACKET_ERR_MASK	Mask incomplete read packet error interrupt (DSI_ACK_ERR_STATUS reg, bit 23) 0: allow generation of error status 1: no error status generated

MDSS_DSI_0_ERR_INT_MASK0 (cont.)

Bits	Name	Description
2	RDBK_DATA_CRC_ERR_MASK	Mask crc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 20) 0: allow generation of error status 1: no error status generated
1	RDBK_DATA_MULTI_ECC_ERR_MASK	Mask multi bit ecc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 17) 0: allow generation of error status 1: no error status generated
0	RDBK_DATA_ECC_ERR_MASK	Mask single bit ecc error in the read packet interrupt (DSI_ACK_ERR_STATUS reg, bit 16) 0: allow generation of error status 1: no error status generated

0x01A98110 MDSS_DSI_0_INT_CTRL**Type:** RW**Reset State:** 0x2220AA02

DSI Interrupt Control Register.

NOTE: Interrupt will be generated if the mask field(s) in DSI_INT_CTRL is set to 1; error status will be generated if the mask field(s) in DSI_ERR_INT_MASK0 is set to 0.

MDSS_DSI_0_INT_CTRL

Bits	Name	Type	Description
29	DSI_DYNAMIC_REFRESH_DONE_MASK		DSI Dynamic Refresh Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
28	DSI_DYNAMIC_REFRESH_DONE_STAT	R	DSI Dynamic Refresh status. Set when the Dynamic Refresh has completed.
28	DSI_DYNAMIC_REFRESH_DONE_AK	W	DSI Dynamic Refresh Acknowledge. If set to 1, status and interrupt is cleared.
25	DSI_ERROR_MASK		DSI Error Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
24	DSI_ERROR_AK	W	DSI Error Acknowledge. If set to 1, status and interrupt is cleared.
24	DSI_ERROR_STAT	R	DSI Error status. Set when the DSI Error has happened.

MDSS_DSI_0_INT_CTRL (cont.)

Bits	Name	Type	Description
21	DSI_BTA_DONE_MASK		DSI BTA Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
20	DSI_BTA_DONE_AK	W	DSI BTA Done Acknowledge. If set to 1, status and interrupt is cleared.
20	DSI_BTA_DONE_STAT	R	DSI BTA Done Status (sw triggered BTA, embededd BTA or BTA generated for TE). Set when a bus turnaround has completed.
17	DSI_VIDEO_MODE_DONE_MASK		DSI Video Mode Engine path Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
16	DSI_VIDEO_MODE_DONE_AK	W	DSI Video Mode Engine path Done Acknowledge. If set to 1, status and interrupt is cleared.
16	DSI_VIDEO_MODE_DONE_STAT	R	DSI Video Mode Engine status. Set when the DSI Video Mode Engine has finished transferring data to the panel.
15	DSI_CMD_MDP_STREAM2_DONE_MASK		DSI Command Mode Engine MDP stream 2 Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
14	DSI_CMD_MDP_STREAM2_DONE_AK	W	DSI Command Mode Engine MDP stream 2 Done Acknowledge. If set to 1, status and interrupt is cleared.
14	DSI_CMD_MDP_STREAM2_DONE_STAT	R	DSI Command Mode Engine MDP stream 2 status. Set when the DSI Command Mode Engine has finished transferring stream 2 data to the panel.
13	DSI_CMD_MDP_STREAM1_DONE_MASK		DSI Command Mode Engine MDP stream 1 Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
12	DSI_CMD_MDP_STREAM1_DONE_AK	W	DSI Command Mode Engine MDP stream 1 Done Acknowledge. If set to 1, status and interrupt is cleared.
12	DSI_CMD_MDP_STREAM1_DONE_STAT	R	DSI Command Mode Engine MDP stream 1 status. Set when the DSI Command Mode Engine has finished transferring stream 1 data to the panel.
11	DSI_CMD_MDP_STREAM0_DONE_MASK		DSI Command Mode Engine MDP stream 0 Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
10	DSI_CMD_MDP_STREAM0_DONE_STAT	R	DSI Command Mode Engine MDP stream 0 status. Set when the DSI Command Mode Engine has finished transferring stream 0 data to the panel.

MDSS_DSI_0_INT_CTRL (cont.)

Bits	Name	Type	Description
10	DSI_CMD_MDP_STREAM0_DONE_AK	W	DSI Command Mode Engine MDP stream 0 Done Acknowledge. If set to 1, status and interrupt is cleared.
9	DSI_CMD_MODE_MDP_DONE_MASK		DSI Command Mode Engine MDP path Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
8	DSI_CMD_MODE_MDP_DONE_STAT	R	DSI Command Mode Engine MDP path status. Set when the DSI Command Mode Engine has finished transferring MDP stream data selected by COMMAND_MODE_DMA_STREAM_SEL to the panel.
8	DSI_CMD_MODE_MDP_DONE_AK	W	DSI Command Mode Engine MDP path Done Acknowledge. If set to 1, status and interrupt is cleared.
1	DSI_CMD_MODE_DMA_DONE_MASK		DSI Command Mode Engine DMA path Done Mask. If set to 1, interrupt generation is enabled. 0: no interrupt generated 1: allow generation of interrupt
0	DSI_CMD_MODE_DMA_DONE_AK	W	DSI Command Mode Engine DMA path Done Acknowledge. If set to 1, status and interrupt is cleared.
0	DSI_CMD_MODE_DMA_DONE_STAT	R	DSI Command Mode Engine DMA status. Set when the DSI Command Mode Engine has finished transferring dma data to the panel.

0x01A98114 MDSS_DSI_0_IOBIST_CTRL**Type:** RW**Reset State:** 0x00000000

DSI IOBIST Control Register

MDSS_DSI_0_IOBIST_CTRL

Bits	Name	Description
31:0	DSI_IOBIST_CTRL	This register has 2 modes of operation: command and timing mode. All configuration fields should be written first, then enable (bit 0) should be set to 1 next and start (bit 5) is set to 1 last. COMMAND MODE bit 0 = DSI IOBIST ENABLE. Active high; bit 5 = IOBIST start. Active high; bit 6 = Select power mode for data transfer. 0 = high speed (HS), 1 = low power (LP) bit 7 = Data pattern mode. 0 = Use data pattern word, 1 = PRBS pattern. bit 10:8 = multiple of finite random run (N): if bit 12 is finite, the finite run is 256 x (N+1) runs for HS PRBS and user data, or 16 x (N+1) for LP PRBS bit 12 = Infinite run 0 for infinite; 1 for 256 x (N+1) runs of HS PRBS, 16 x (N+1) runs of LP PRBS, 256 x (N+1) runs of HS user data, or 8 runs of LP user data. bit 14:13 = DSIBIST_DSIPHY_LANE_SWAP, select which lane is used as lane0 for LPDT: 0 = DLN0 1 = DLN1 2 = DLN2 3 = DLN3 bit 15 = Select instruction type 0 = command mode, 1 = DSI timing control mode. bit 23:16 = data pattern byte (used when bit 7 is set to 0) other bits = reserved TIMING MODE bit 0 = DSI IOBIST ENABLE. Active high; bit 5 = IOBIST start. Active high; bit 15 = Select instruction type 0 = command mode, 1 = DSI timing control mode. (If you write one DSI timing data with the select instruction type == 1, you have to change the select instruction type from 1 to 0 for timing data latch control.) bit 23:16 = DSI timing data; bit 28:24 = DSI timing register selection: 0x10 = DSI_T_CLK_PRE (data width[5:0]) 0x11 = DSI_T_CLK_POST (data width[5:0])

0x01A98118 MDSS_DSI_0_SOFT_RESET**Type:** RW**Reset State:** 0x00000000

DSI soft reset Register

MDSS_DSI_0_SOFT_RESET

Bits	Name	Description
0	DSI_SOFT_RESET	Resets all internal logic in dsiclk, pclk, byteclk, escclk, ahbm_hclk domain. All enable bits in DSI_CTRL should be already set to 0 when exiting soft reset (DSI_SOFT_RESET changing from 1 to 0). The dynamic clocks should be forced on when DSI_SOFT_RESET is set to 1. (This reset does not apply to DSI registers which are in ahbs_hclk domain.)

0x01A9811C MDSS_DSI_0_CLK_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Clock Control Register. The dynamic clocks should be forced on when DSI_SOFT_RESET is set to 1 or when DSI_EN is changed from 1 to 0

MDSS_DSI_0_CLK_CTRL

Bits	Name	Description
20	DSI_FORCE_ON_DYN_PCLK	DSI PCLK clock Branch Force On. Set to one to always force on all PCLK clock branches.
17:16	DSI_DSICLK_HYSTERISIS1_CTRL	DSI DSICLK Hysterisis Control
15:14	DSI_AHBM_HCLK_HYSTERISIS1_CTRL	DSI AHBM_HCLK Hysterisis Control
13:12	DSI_AHBS_HCLK_HYSTERISIS1_CTRL	unused
11	DSI_FORCE_ON_DYN_BYTECLK	DSI Dynamic BYTECLK Clock Branch Force On. Set to one to always force on this clock branch.
10	DSI_FORCE_ON_DYN_DSICLK	Unused.
9	DSI_FORCE_ON_DYN_AHBM_HCLK	DSI Dynamic AHBM_HCLK (MCLK) Clock Branch Force On. Set to one to always force on this clock branch.
8	DSI_FORCE_ON_DYN_AHBS_HCLK	DSI Dynamic AHBS_HCLK (REGCLK) Clock Branch Force On. Set to one to always force on this clock branch.
5	DSI_ESCCLK_ON	Turns on/off ESCCLK for the DSI. If set to 1, clock is ON.

MDSS_DSI_0_CLK_CTRL (cont.)

Bits	Name	Description
4	DSI_BYTECLK_ON	Turns on/off BYTECLK for the DSI. If set to 1, clock is ON.
3	DSI_DSICLK_ON	Unused.
2	DSI_PCLK_ON	Turns on/off PCLK for the DSI. If set to 1, clock is ON.
1	DSI_AHBM_SCLK_ON	Turns on/off AHBM_HCLK for the DSI. If set to 1, clock is ON.
0	DSI_AHBS_HCLK_ON	Turns on/off AHBS_HCLK for the DSI. If set to 1, clock is ON.

0x01A98120 MDSS_DSI_0_CLK_STATUS**Type:** RW**Reset State:** 0x00000000

DSI Clock Status Register

MDSS_DSI_0_CLK_STATUS

Bits	Name	Type	Description
16	DSIPLL_UNLOCKED_CLR	W	Write only. Clear dsipll_unlocked status by writing to this register field
16	DSIPLL_UNLOCKED	R	Read only. Dsi pll unlock status 0: dsipll not unlocked 1: dsipll unlocked
15	DSI_CAM_BIST_PCLK_ACTIVE	R	Active Status of PCLK branch of Camera (CSI) BIST block of Application Layer. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
14	DSI_VID_PCLK_ACTIVE	R	Active Status of PCLK branch of Video Mode engine of Application Layer. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
13	DSI_CMD_PCLK_ACTIVE	R	Active Status of PCLK branch of Command Mode engine of Application Layer. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
12	DSI_DYN_CMD_PCLK_ACTIVE	R	Active Status of the Dynamic PCLK branch of Command Mode engine of Application Layer. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
10	DSI_DYN_PCLK_ACTIVE	R	DSI Dynamic PCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.

MDSS_DSI_0_CLK_STATUS (cont.)

Bits	Name	Type	Description
9	DSI_AON_PCLK_ACTIVE	R	DSI Always ON PCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
8	DSI_AON_ESCCLK_ACTIVE	R	DSI Always ON ESCCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
7	DSI_DYN_BYTECLK_ACTIVE	R	DSI Dynamic BYTECLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
6	DSI_AON_BYTECLK_ACTIVE	R	DSI Always ON BYTECLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
5	DSI_DYN_DSICLK_ACTIVE	R	Unused.
4	DSI_AON_DSICLK_ACTIVE	R	Unused.
3	DSI_DYN_AHBS_HCLK_ACTIVE	R	DSI Dynamic AHBS_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
2	DSI_AON_AHBS_HCLK_ACTIVE	R	DSI Always ON AHBS_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
1	DSI_DYN_AHBM_HCLK_ACTIVE	R	DSI Dynamic AHBM_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.
0	DSI_AON_AHBM_HCLK_ACTIVE	R	DSI Always ON AHBM_HCLK Active Status. Read-only field that shows the status of this clock branch. If set to one, clock is on. If set to zero, clock is off.

0x01A9812C MDSS_DSI_0_PHY_SW_RESET**Type:** RW**Reset State:** 0x00000000

DSI PHY SW Reset Register

MDSS_DSI_0_PHY_SW_RESET

Bits	Name	Description
24	PHY_REGULATOR_HW_RESET	THIS BIT IS ONLY USED IN DSI CORE 1. PHY software reset for the regulator. A reset pulse is issued by writing 1 followed by a 0 to this bit.
16	PHY_LN_HW_RESET	PHY software reset for the LANES. A reset pulse is issued by writing 1 followed by a 0 to this bit.

MDSS_DSI_0_PHY_SW_RESET (cont.)

Bits	Name	Description
8	PHY_PLL_HW_RESET	PHY software reset for the PLL. A reset pulse is issued by writing 1 followed by a 0 to this bit.
4	PHY_SW_RESET_POL	polarity of all reset signals for PHY PLL, LANES and regulator. 0 = active high; 1 = active low
0	PHY_SW_RESET	PHY hardware reset for all PHY PLL, LANES and REGULATOR (for DSI CORE 1 only). A reset pulse is issued by writing 1 followed by a 0 to this bit.

0x01A98130 MDSS_DSI_0_AXI2AHB_CTRL**Type:** RW**Reset State:** 0x00000000

DSI AXI to AHB bridge control Register

MDSS_DSI_0_AXI2AHB_CTRL

Bits	Name	Description
0	MSM_ACCUMULATE_EN	Read data accumulate enable 1 = allows for all read data to be returned prior to feeding it out 0 = returns read data immediately

0x01A98134 MDSS_DSI_0_MISR_CMD_MDP0_32BIT**Type:** R**Reset State:** 0xFFFFFFFF

DSI Command MDP stream 0 32-bit misr

MDSS_DSI_0_MISR_CMD_MDP0_32BIT

Bits	Name	Description
31:0	MISR	32-bit misr for packets generated from MDP stream 0

0x01A98138 MDSS_DSI_0_MISR_CMD_MDP1_32BIT**Type:** R**Reset State:** 0xFFFFFFFF

DSI Command MDP stream 0 32-bit misr

MDSS_DSI_0_MISR_CMD_MDP1_32BIT

Bits	Name	Description
31:0	MISR	32-bit misr for packets generated from MDP stream 0

0x01A9813C MDSS_DSI_0_MISR_CMD_DMA_32BIT**Type:** R**Reset State:** 0xFFFFFFFF

DSI Command dma 32-bit misr

MDSS_DSI_0_MISR_CMD_DMA_32BIT

Bits	Name	Description
31:0	MISR	32-bit misr for packets generated from memory

0x01A98140 MDSS_DSI_0_MISR_VIDEO_32BIT**Type:** R**Reset State:** 0xFFFFFFFF

DSI Video Mode 32-bit misr

MDSS_DSI_0_MISR_VIDEO_32BIT

Bits	Name	Description
31:0	MISR	32-bit misr for packets generated from MDP's DSI Video Mode stream

0x01A98144 MDSS_DSI_0_LANE_MISR_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Lane MISR control

MDSS_DSI_0_LANE_MISR_CTRL

Bits	Name	Description
0	EN	Enable MISR calculation of the lane data at the output of the lane distribution layer

0x01A98148 MDSS_DSI_0_LANE0_MISR**Type:** R**Reset State:** 0x0000FFFF

DSI Lane 0 MISR value

MDSS_DSI_0_LANE0_MISR

Bits	Name	Description
15:0	MISR	MISR value of the lane data at the output of the lane distribution layer

0x01A9814C MDSS_DSI_0_LANE1_MISR**Type:** R**Reset State:** 0x0000FFFF

DSI Lane 1 MISR value

MDSS_DSI_0_LANE1_MISR

Bits	Name	Description
15:0	MISR	MISR value of the lane data at the output of the lane distribution layer

0x01A98150 MDSS_DSI_0_LANE2_MISR**Type:** R**Reset State:** 0x0000FFFF

DSI Lane 2 MISR value

MDSS_DSI_0_LANE2_MISR

Bits	Name	Description
15:0	MISR	MISR value of the lane data at the output of the lane distribution layer

0x01A98154 MDSS_DSI_0_LANE3_MISR**Type:** R**Reset State:** 0x0000FFFF

DSI Lane 3 MISR value

MDSS_DSI_0_LANE3_MISR

Bits	Name	Description
15:0	MISR	MISR value of the lane data at the output of the lane distribution layer

0x01A98194 MDSS_DSI_0_COMMAND_MODE_MDP_IDLE_CTRL

Type: RW

Reset State: 0x00000000

Idle insertion between Command MDP packets

MDSS_DSI_0_COMMAND_MODE_MDP_IDLE_CTRL

Bits	Name	Description
14:12	EN	enable idle insertion between Command Mode MDP packets
9:0	LENGTH	Number of dsiclk cycles of idle time to insert between Command Mode MDP packets. This idle counter is added in the application layer. To ensure the DSI link will go into stopstate between Command Mode MDP packets, the LENGTH must be long enough to cover the time the link takes to switch between High Speed mode to Low Power mode (LP11). 0: disable 1: insert idle for stream0 2: insert idle for stream1 3: insertion idle for both streams

0x01A981B8 MDSS_DSI_0_COMMAND_MODE_MDP_CTRL2

Type: RW

Reset State: 0x00000006

Command Mode MDP Control2

MDSS_DSI_0_COMMAND_MODE_MDP_CTRL2

Bits	Name	Description
16	BURST_MODE	Enable frame transfer in one burst 0: a frame can be transferred in multiple High Speed data bursts 1: enable frame transfer in one High Speed data burst if there is no gaps between lines from MDP

MDSS_DSI_0_COMMAND_MODE_MDP_CTRL2 (cont.)

Bits	Name	Description
14:12	INPUT_RGB_SWAP	Swaps the R, G, and B channels of the input command mode pixels from MDP. This field should be used when different R,G, and B orderings are required.
10:8	RGB_SWAP2	Swaps the R, G, and B channels of the dst pixels. This field should be used when different R,G, and B orderings are required. For example, if RGB_SWAP = 1 , RGB565 will become RBG556.
7	BYTE_MSB_LSB_FLIP2	Swap the bit ordering of each byte of the dst pixel (this is done after the RGB swap and R/G/B_SEL). 0: bit 0 is lsb, bit 7 is msb 1: bit 0 is msb, bit 7 is lsb
6	B_SEL2	Bit Swaps the B Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
5	G_SEL2	Bit Swaps the G Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
4	R_SEL2	Bit Swaps the R Channel of the dst pixel. This field is used to reverse the ordering of the bits that is outputted for the color red. For example, for RGB888 color format, if the red component is 10000000 then if this field is enabled, 00000001 is output.
3:0	DST_FORMAT2	Pixel format for stream 2 0 = RGB111 1 = reserved 2 = reserved 3 = RGB332 (data_src_width must be in multiple of 2 pixels) 4 = RGB444 (data_src_width must be in multiple of 2 pixels) 5 = reserved 6 = RGB565 7 = RGB666 8 = RGB888 others = reserved

0x01A981BC MDSS_DSI_0_COMMAND_MODE_MDP_STREAM2_CTRL**Type:** RW**Reset State:** 0x00000000

Command Mode MDP Stream2 control

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM2_CTRL

Bits	Name	Description
31:16	MDP2_WC	Stream 2 packet word count (number of bytes of the packet payload)
9:8	MDP2_VC	Stream 2 packet virtual channel
5:0	MDP2_DT	Stream 2 packet datatype

0x01A981C0 MDSS_DSI_0_COMMAND_MODE_MDP_STREAM2_TOTAL**Type:** RW**Reset State:** 0x00000000

Command Mode MDP Stream2 resolution

MDSS_DSI_0_COMMAND_MODE_MDP_STREAM2_TOTAL

Bits	Name	Description
31:16	MDP2_V_TOTAL	Stream 2 height (in lines)
15:0	MDP2_H_TOTAL	Stream 2 width (in pixels)

0x01A981C4 MDSS_DSI_0_MISR_CMD_MDP2_8BIT**Type:** R**Reset State:** 0x00000000

Command Mode MDP Stream2 8-bit MISR value

MDSS_DSI_0_MISR_CMD_MDP2_8BIT

Bits	Name	Description
7:0	MISR	The 8-bit MISR value

0x01A981C8 MDSS_DSI_0_MISR_CMD_MDP2_32BIT**Type:** R**Reset State:** 0xFFFFFFFF

Command Mode MDP Stream2 32-bit MISR value

MDSS_DSI_0_MISR_CMD_MDP2_32BIT

Bits	Name	Description
31:0	MISR	The 32-bit MISR value

0x01A981CC MDSS_DSI_0_VBIF_CTRL**Type:** RW**Reset State:** 0x00000000

VBIF interface control register

MDSS_DSI_0_VBIF_CTRL

Bits	Name	Description
1:0	PRIORITY	Value of VBIF request priority and priority level

0x01A981D0 MDSS_DSI_0_AES_CTRL**Type:** RW**Reset State:** 0x00290000

AES counter interface control register

MDSS_DSI_0_AES_CTRL

Bits	Name	Description
21:16	AES_DATATYPE	Data type of the AES counter packet
9:8	AES_VC	Virtual channel of the AES counter packet
4	AES_SEL	Send counter packet at 0 = video mode vsync 1 = command mode sof
0	AES_EN	Enable AES counter packet generation

0x01A981D4 MDSS_DSI_0_RDBK_DATA_CTRL**Type:** RW**Reset State:** 0x00000000

Read Data Control register

MDSS_DSI_0_RDBK_DATA_CTRL

Bits	Name	Type	Description
23:16	RDBK_DATA_COUNT	R	Number of bytes read
0	RDBK_DATA_CLR		Clear read back data and counter by writing a 1 followed by a 0 to this bit

0x01A981E4 MDSS_DSI_0_DSI_TIMING_FLUSH**Type:** RW**Reset State:** 0x00000000

DSI Timing Flush registers

MDSS_DSI_0_DSI_TIMING_FLUSH

Bits	Name	Description
0	DSI_TIMING_FLUSH	DSI Timing Flush register, SW set this bit and post-write trigger will flush the dsi timing register to pclk domain. This flush bit would also returned a 0 once the back copies are updated. Before the back copies are updated, this bit would returned a 1 if it has been previously written a 1.

0x01A981E8 MDSS_DSI_0_DSI_TIMING_DB_MODE**Type:** RW**Reset State:** 0x00000000

DSI Timing Double-buffer Mode

MDSS_DSI_0_DSI_TIMING_DB_MODE

Bits	Name	Description
0	DSI_TIMING_DB_MODE	Register bit to enable DSI timing DB 0: Disable DSI timing register double-buffering - fall back to legacy mode 1: Enable DSI timing register double-buffering

0x01A981F0 MDSS_DSI_0_SCRATCH_REGISTER_0**Type:** RW**Reset State:** 0x00000000

DSI Scratch register

MDSS_DSI_0_SCRATCH_REGISTER_0

Bits	Name	Description
31:0	DSI_SCRATCH_0	32 bit scratch register

0x01A981F8 MDSS_DSI_0_SCRATCH_REGISTER_1**Type:** RW**Reset State:** 0x00000000

DSI Scratch register

MDSS_DSI_0_SCRATCH_REGISTER_1

Bits	Name	Description
31:0	DSI_SCRATCH_1	32 bit scratch register

0x01A981FC MDSS_DSI_0_SCRATCH_REGISTER_2**Type:** RW**Reset State:** 0x00000000

DSI Scratch register

MDSS_DSI_0_SCRATCH_REGISTER_2

Bits	Name	Description
31:0	DSI_SCRATCH_2	32 bit scratch register

0x01A98200 MDSS_DSI_0_DYNAMIC_REFRESH_CTRL**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh Control Register

MDSS_DSI_0_DYNAMIC_REFRESH_CTRL

Bits	Name	Type	Description
31	READY	R	This register is ready for write when the read value of this bit is 1
12	HW_PLL_SWI_MODE		HW access mode 0 = write PLL_DATA0-31 before PLL delay and PLL_DATA32-35 after PLL delay; 1 = only write PLL_DATA0-31 before PLL delay
8	SW_TRIGGER		Trigger dynamic refresh operation by writing '1' once to this field
4	RESET		Reset dynamic refresh operation by writing a '1' followed by a '0' to this field
0	PLL_SWI_CTRL		Select PLL Register access control. This field should not be changed when dynamic refresh operation is busy. 0: SW control 1: HW control

0x01A98204 MDSS_DSI_0_DYNAMIC_REFRESH_PIPE_DELAY**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh Pipe Delay Control Register

MDSS_DSI_0_DYNAMIC_REFRESH_PIPE_DELAY

Bits	Name	Description
31:0	PIPE_DELAY	Delay (in escclk cycles) between the last video Hsync and the PLL register flush. The delay should be long enough for the High Speed data transmission for the Hsync to be completed.

0x01A98208 MDSS_DSI_0_DYNAMIC_REFRESH_PIPE_DELAY2**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh Pipe Delay Control Register 2

MDSS_DSI_0_DYNAMIC_REFRESH_PIPE_DELAY2

Bits	Name	Description
31:0	PIPE_DELAY2	Second delay (in escclk cycles) between the PLL register flush and the end of dynamic refresh operation. The delay should be used when LANE_CTRL.CLKLN_HS_FORCE_REQUEST register is set to 1.

0x01A9820C MDSS_DSI_0_DYNAMIC_REFRESH_PLL_DELAY**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Delay Control Register

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_DELAY

Bits	Name	Description
31:0	PLL_DELAY	Delay (in escclk cycles) between the PLL register flush and the end of dynamic refresh operation. The delay should be long enough for PLL to lock.

0x01A98210 MDSS_DSI_0_DYNAMIC_REFRESH_STATUS**Type:** R**Reset State:** 0x00000000

DSI Dynamic Refresh Status Register

MDSS_DSI_0_DYNAMIC_REFRESH_STATUS

Bits	Name	Description
13	PLL_DELAY_DONE	DSI Dynamic Refresh pll delay completion status
12	PLL_DELAY_BUSY	DSI Dynamic Refresh pll delay status
9	PIPE_DELAY2_DONE	
8	PIPE_DELAY2_BUSY	
5	PIPE_DELAY_DONE	DSI Dynamic Refresh pipe delay completion status
4	PIPE_DELAY_BUSY	DSI Dynamic Refresh pipe delay busy status
0	BUSY	DSI Dynamic Refresh operation busy status

0x01A98214 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL0**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL0

Bits	Name	Description
31:24	PLL_DATA1	data of PLL register access 1
23:16	PLL_ADDR1	address of PLL register access 1
15:8	PLL_DATA0	data of PLL register access 0
7:0	PLL_ADDR0	address of PLL register access 0.

0x01A98218 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL1**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL1

Bits	Name	Description
31:24	PLL_DATA3	data of PLL register access 3
23:16	PLL_ADDR3	address of PLL register access 3
15:8	PLL_DATA2	data of PLL register access 2
7:0	PLL_ADDR2	address of PLL register access 2.

0x01A9821C MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL2**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL2

Bits	Name	Description
31:24	PLL_DATA5	data of PLL register access 5
23:16	PLL_ADDR5	address of PLL register access 5

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL2 (cont.)

Bits	Name	Description
15:8	PLL_DATA4	data of PLL register access 4
7:0	PLL_ADDR4	address of PLL register access 4.

0x01A98220 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL3**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL3

Bits	Name	Description
31:24	PLL_DATA7	data of PLL register access 7
23:16	PLL_ADDR7	address of PLL register access 7
15:8	PLL_DATA6	data of PLL register access 6
7:0	PLL_ADDR6	address of PLL register access 6.

0x01A98224 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL4**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL4

Bits	Name	Description
31:24	PLL_DATA9	data of PLL register access 9
23:16	PLL_ADDR9	address of PLL register access 9
15:8	PLL_DATA8	data of PLL register access 8
7:0	PLL_ADDR8	address of PLL register access 8.

0x01A98228 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL5**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL5

Bits	Name	Description
31:24	PLL_DATA11	data of PLL register access 11
23:16	PLL_ADDR11	address of PLL register access 11
15:8	PLL_DATA10	data of PLL register access 10
7:0	PLL_ADDR10	address of PLL register access 10.

0x01A9822C MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL6**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL6

Bits	Name	Description
31:24	PLL_DATA13	data of PLL register access 13
23:16	PLL_ADDR13	address of PLL register access 13
15:8	PLL_DATA12	data of PLL register access 12
7:0	PLL_ADDR12	address of PLL register access 12.

0x01A98230 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL7**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL7

Bits	Name	Description
31:24	PLL_DATA15	data of PLL register access 15
23:16	PLL_ADDR15	address of PLL register access 15
15:8	PLL_DATA14	data of PLL register access 14
7:0	PLL_ADDR14	address of PLL register access 14.

0x01A98234 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL8**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL8

Bits	Name	Description
31:24	PLL_DATA17	data of PLL register access 17
23:16	PLL_ADDR17	address of PLL register access 17
15:8	PLL_DATA16	data of PLL register access 16
7:0	PLL_ADDR16	address of PLL register access 16.

0x01A98238 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL9**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL9

Bits	Name	Description
31:24	PLL_DATA19	data of PLL register access 19
23:16	PLL_ADDR19	address of PLL register access 19
15:8	PLL_DATA18	data of PLL register access 18
7:0	PLL_ADDR18	address of PLL register access 18.

0x01A9823C MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL10**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL10

Bits	Name	Description
31:24	PLL_DATA21	data of PLL register access 21
23:16	PLL_ADDR21	address of PLL register access 21

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL10 (cont.)

Bits	Name	Description
15:8	PLL_DATA20	data of PLL register access 20
7:0	PLL_ADDR20	address of PLL register access 20.

0x01A98240 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL11**Type:** RW**Reset State:** 0x00000000

Bits	Name	Description
31:24	PLL_DATA33	data of PLL register access 33
23:16	PLL_ADDR33	address of PLL register access 33
15:8	PLL_DATA32	data of PLL register access 32
7:0	PLL_ADDR32	address of PLL register access 32.

0x01A98258 MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL17**Type:** RW**Reset State:** 0x00000000

DSI Dynamic Refresh PLL Register Control

MDSS_DSI_0_DYNAMIC_REFRESH_PLL_CTRL17

Bits	Name	Description
31:24	PLL_DATA35	data of PLL register access 35
23:16	PLL_ADDR35	address of PLL register access 35
15:8	PLL_DATA34	data of PLL register access 34
7:0	PLL_ADDR34	address of PLL register access 34.

17.18.2 MDSS_DSI_0_PHY_PLL_QSERDES_PLL**0x01A98300 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_REFCLK_CFG****Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Reference clock divider and feedback pre-dividers

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_REFCLK_CFG

Bits	Name	Description
7	RSVD_7	
6	PLL_CLOCK_BYPASS_ANA	Bypass PLL and use reference clock as the PLL output clock Default value is 0
5:4	PLL_FBCLK_PREDIV	FB pre-divider x0: divide FB clock by 1 x1: divide FB clock by 2 Normal operational value : Refer to PLL Frequency programming table in Integration guideline Default value is 00
3:2	PLL_REFCLK_DIV	Reference clock divider ratio. 00 : div by 1 01 : div by 2 10 : div by 3 11 : div by 4 Normal operational value : Refer to PLL Frequency programming table in Integration guideline Default value is 0000
1	RSVD_1	
0	PLL_REFCLK_DBLR	Reference clock doubler ratio. 0: div by 1 1: div by 2 Normal operational value : Refer to PLL Frequency programming table in Integration guideline Default value is 0

0x01A98304 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV1_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000009

Divide ratio for post-divider 1 and SVS mode selection

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV1_CFG

Bits	Name	Description
7:5	RSVD_7_5	

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV1_CFG (cont.)

Bits	Name	Description
4	PLL_SVS_MODE	SVS Mode Enable 0: Normal operation mode 1: SVS operation mode In SVS mode, all clocks will be half the frequency of normal operation mode. Normal operational mode setting is 0. Default value is 0
3:0	PLL_POSTDIV1	Output Divider setting for oCLK1. 0000: div by1 0001: div by2 ... 1111: div by16 Normal operational value : Refer to PLL Frequency programming table in Integration guideline Default up value is 0000

0x01A98308 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CHGPUMP_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000002

Charge pump Control

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CHGPUMP_CFG

Bits	Name	Description
7	PLL_IDAC_FILTER_CAP_SEL	select filter cap of IDAC
6:5	RSVD_6_5	
4	PLL_IDAC_PTAT_STR_EN	Enable PTAT strength Normal operational mode setting is 0 Default value is 0
3:0	PLL_CP_IDAC	Charge charge pump current Normal operational mode setting is 0010 Default value is 0010

0x01A9830C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_VCOLPF_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000030

Loop filter and VCO control

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_VCOLPF_CFG

Bits	Name	Description
7:6	RSVD_7_6	
5	PD_HP_VCO	Power down high-performance VCO Default value is 1 Normal value: refer to frequency plan
4	PD_LP_VCO	Power down low-power VCO Default value is 1 Normal value: refer to frequency plan
3	PLL_VCO_SEL	Select VCO (LP or HP) Normal operational mode setting is 0 Default value is 0
2:1	PLL_C3_SEL	Select C3 in LPF Normal operational mode setting is 00 Default value is 00
0	PLL_BYPASS_P3	Bypass P3 in LPF Normal operational mode setting is 0 Default value is 0

0x01A98310 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_VREG_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Regulator control

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_VREG_CFG

Bits	Name	Description
7:3	RSVD_7_3	
2	RESERVED	Reserved

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_VREG_CFG (cont.)

Bits	Name	Description
1	PLL_POSTDIV1_BYPASS_B	Bypass post-divider 1 0 : post-divider is bypassed (output of postdiv 1 is same as vco_clk) 1: post-divider is functional (output of postdiv 1 is a divided clock) Normal operational mode setting is 0 Default value is 0
0	PLL_BAND_SEL	Select PLL operating band Normal operational mode setting: refer to programming guideline Default value is 0

0x01A98314 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_PWRGEN_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Powergen control

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_PWRGEN_CFG

Bits	Name	Description
7:4	RSVD_7_4	
3	PLL_IBIAS_CAL_EN	Bias calibration enable
2:0	PLL_PWRGEN_CTRL	PWRGEN block control (reserved) Normal operational mode setting is 000 Default value is 000

0x01A98318 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_DMUX_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Digital mux control setting

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_DMUX_CFG

Bits	Name	Description
7:5	RSVD_7_5	
4:1	PLL_DMUX_SEL	PLL digital test mux select Default value is 0000

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_DMUX_CFG (cont.)

Bits	Name	Description
0	PLL_DMUX_EN	PLL digital test mux enable Default value is 0

0x01A9831C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_AMUX_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Analog mux control setting

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_AMUX_CFG

Bits	Name	Description
7:5	RSVD_7_5	
4:1	PLL_AMUX_SEL	PLL analog test mux select Default value is 00000
0	PLL_AMUX_EN	PLL analog test mux enable Default value is 0

0x01A98320 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_GLB_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Global configuration for PLL

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_GLB_CFG

Bits	Name	Description
7:4	PLL_GLB_CFG	Reserved Normal operational mode setting is 000000 Default value is 000000
3	PLL_ENABLE	Enable PLL, e.g., enable analg side of the PLL and start calibration process Normal operational mode setting is 1 Default value is 0
2	PLL_PWRGEN_PWRDN_B	power down the powergen block Normal operational mode setting is 1 Default value is 0

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_GLB_CFG (cont.)

Bits	Name	Description
1	PLL_LDO_PWRDN_B	LDO Power Down. 1---Normal operation 0---Digital block power down mode Normal operational mode setting is 1 Default value is 0
0	PLL_PWRDN_B	Global power-down signal for PLL; this is an active low signal, i.e., when PLL_PWRDN_B = 0, PLL is in power-down mode. CSR is still accessible Normal operational mode setting is 1 Default value is 0

0x01A98324 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV2_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000007

Divide ratio for post divider number 2

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV2_CFG

Bits	Name	Description
7:0	PLL_POSTDIV2	Output Divider setting for oCLK2 00000000: div by1 00000001: div by2 ... 11111111: div by256 Normal operational value : Refer to PLL Frequency programming table in Integration guideline Default value is 0000_0111

0x01A98328 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV3_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000007

Divide ratio for post divider number 3

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_POSTDIV3_CFG

Bits	Name	Description
7:0	PLL_POSTDIV3	Output Divider setting for oCLK3 00000000: div by1 00000001: div by2 ... 11111111: div by256 Normal operational value : Refer to PLL Frequency programming table in Integration guideline Defalut value is 0000_0111

0x01A9832C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LPFR_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Resistance setting of loop filter

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LPFR_CFG

Bits	Name	Description
7:0	PLL_LPF_R	Loop filter resistance selection Normal operational mode setting is 00000000 Default value is 00000000

0x01A98330 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LPFC1_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000003

Capacitance C1 setting of loop filter

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LPFC1_CFG

Bits	Name	Description
7:0	PLL_LPF_C1	Loop filter C1 selection Normal operational mode setting is 00000011 Default value is 00000011

0x01A98334 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LPFC2_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000003

Capacitance C2 setting of loop filter

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LPFC2_CFG

Bits	Name	Description
7:0	PLL_LPF_C2	Loop filter C2 selection Normal operational mode setting is 00000011 Default value is 00000011

0x01A98338 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG0**Type:** RW**Clock:** WCLK**Reset State:** 0x00000076

Sigma-delta modulator setting- cfg0

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG0

Bits	Name	Description
7	RSVD_7	
6	PLL_SDM_BYP	Bypass sigma-delta modulator and run PLL in integer N mode Normal operational mode setting is 1 Default value is 1
5:0	PLL_SDM_BYP_DIV	Integer N mode feedback clock divider value Normal operational mode setting is 110110 Default value is 110110

0x01A9833C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG1**Type:** RW**Clock:** WCLK**Reset State:** 0x0000004C

Sigma-delta modulator setting- cfg1

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG1

Bits	Name	Description
7	RSVD_7	
6	PLL_SDM_DITHER_EN	Enable dithering Normal operational mode setting is 1 Default value is 1
5:0	PLL_SDM_DC_OFFSET	Integer portion of fractional N mode divider Normal operational mode setting is 001100 Default value is 001100

0x01A98340 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG2**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Sigma-delta modulator setting- cfg2

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG2

Bits	Name	Description
7:0	PLL_SDM_FREQ_SEED_7_0	Fractional N mode divider fractional portion, bits 7:0 sdm_freq_seed[17:16] are always 00. fddiv value= (sdm_dc_+1)+(sdm_freq_seed<15:0>/2^16) ex:(6+1)+2^15/2^16=7+0.5=7.5 Normal operational mode setting is 00000000 Default value is 00000000

0x01A98344 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG3**Type:** RW**Clock:** WCLK**Reset State:** 0x000000C0

Sigma-delta modulator setting- cfg3

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG3

Bits	Name	Description
7:0	PLL_SDM_FREQ_SEED_15_8	Fractional N mode divider fractional portion, bits 15:8 Normal operational mode setting is 11000000 Default value is 11000000

0x01A98348 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG4**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Sigma-delta modulator setting- cfg4

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SDM_CFG4

Bits	Name	Description
7:2	RSVD_7_2	
1:0	PLL_SDM_FREQ_SEED_17_16	Fractional N mode divider fractional portion, bits 17:16 Normal operational mode setting is 00 Default value is 00

0x01A9834C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG0**Type:** RW**Clock:** WCLK**Reset State:** 0x0000009A

Spread-spectrum clocking setting- cfg0

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG0

Bits	Name	Description
7	PLL_SSC_BYP	Bypass SSC circuit Normal operational mode setting is 1 Default value is 1
6:0	PLL_SSC_KDIV	Divider to generate 2MHz clock from refclk. This clock is used by the Spread spectrum portion of the sigma-delta block. It is mainly changing the fractional portion of feedback divider value, e.g. if refclk=100MHz, kdiv = 00110001 Normal operational mode setting is 0011010 Default value is 0011010

0x01A98350 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG1**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Spread-spectrum clocking setting- cfg1

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG1

Bits	Name	Description
7:0	PLL_SSC_TRIANG_INC_7_0	SSC triangle incr, bits 7:0 Normal operational mode setting is 00000000 Default value is 00000000

0x01A98354 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG2**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Spread-spectrum clocking setting- cfg2

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG2

Bits	Name	Description
7:0	PLL_SSC_TRIANG_INC_15_8	SSC triangle incr, bits 9:8 Normal operational mode setting is 00 Default value is 00

0x01A98358 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG3**Type:** RW**Clock:** WCLK**Reset State:** 0x00000020

Spread-spectrum clocking setting- cfg2

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_SSC_CFG3

Bits	Name	Description
7:0	PLL_SSC_TRIANG_STEPS	SSC triangle steps Normal operational mode setting is 100000 Default value is 100000

0x01A9835C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG0**Type:** RW**Clock:** WCLK**Reset State:** 0x00000010

Lock detect setting - cfg0

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG0

Bits	Name	Description
7:0	PLL_LCKDET_MCNT	mpll lock detect maximum count value for the fref and fddiv counters Normal operational mode setting is 00010000 Default value is 00010000

0x01A98360 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG1**Type:** RW**Clock:** WCLK**Reset State:** 0x0000001A

Lock detect setting - cfg1

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG1

Bits	Name	Description
7:0	PLL_LOCKDET_WAIT	Number of cycles to wait (2 cycles incremental) Normal operational mode setting is 00011010 Default value is 00011010

0x01A98364 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG2**Type:** RW**Clock:** WCLK**Reset State:** 0x0000000D

Lock detect setting - cfg2

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG2

Bits	Name	Description
7	RSVD_7	
6	FORCE_PLL_LOCK	0: PLL_RDY and pll_lockdet from PLL Lock detect will be used 1: PLL_RDY and pll_lockdet from PLL Lock detect will be bypassed. In other words, it will force the PLL_RDY to go high and pll_unlockdet to go low. This bit is only used as a back up in case the PLL Lock Detect circuit does not operate correctly. Normal operational mode setting is 0 Default value is 0

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_LKDET_CFG2 (cont.)

Bits	Name	Description
5:2	PLL_LOCKDET_PPM	PPM setting for PLL lock detect circuitry Normal operational mode setting is 0011 Default value is 0011
1	PLL_LOCKDET_CTRL	control phy_tx_lockdet Normal operational mode setting is 0 Default value is 0
0	PLL_LOCKDET_EN	Enable lockdet Normal operational mode setting is 1 Default value is 1

0x01A9836C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG0**Type:** RW**Clock:** WCLK**Reset State:** 0x0000000A

PLL calibration setting - cfg0

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG0

Bits	Name	Description
7	RSVD_7	
6	PLL_LOAD_CAL_STR	Load saved PLL calibration string for offset, vco, and kvdd calibration Normal operational mode setting is 0 Default value is 0
5	PLL_OPEN_LOOP	Configure PLL in open loop mode Normal operational mode setting is 0 Default value is 0
4:3	PLL_CAL_WAITTIME	Idle time for VCO frequency adjustment during Calibration Normal operational mode setting is 01 Default value is 01
2:0	PLL_CAL_MODE	Calibration Mode 000: skip calibration 001: offset only 010: offset --> kvco --> offset 011: offset --> kvdd --> offset 100: offset --> kvdd --> offset --> kvco --> offset 101: offset --> kvco --> offset --> kvdd --> offset Normal operational mode setting is 010 Default value is 010

0x01A98370 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG1**Type:** RW**Clock:** WCLK**Reset State:** 0x00000004

PLL calibration setting - cfg1

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG1

Bits	Name	Description
7	PLL_POS_KVSLP	Slope polarity of KVCO Normal operational mode setting is 0 Default value is 0
6	RSVD_6	
5:4	PLL_STARTUP_TIME	Control PLL startup pulse time 00: pll_start pulse width is 5 cycles of refclk 01: pll_start pulse width is 10 cycles of refclk 10: pll_start pulse width is 15 cycles of refclk 11: pll_start pulse width is 20 cycles of refclk
3:0	PLL_VREF_CONF	KVCO Calibration Reference voltage setting Normal operational mode setting is 0100 Default value is 0100

0x01A98374 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG2**Type:** RW**Clock:** WCLK**Reset State:** 0x00000004

PLL calibration setting - cfg2

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG2

Bits	Name	Description
7:0	PLL_VREG_CONF	KVDD Calibration Reference voltage setting Normal operational mode setting is 11110000 Default value is 11110000

0x01A98378 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG3**Type:** RW**Clock:** WCLK**Reset State:** 0x0000002B

PLL calibration setting - cfg3

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG3

Bits	Name	Description
7:0	PLL_VCO_MAN_OFFSET	Manual selection of VCO frequency sub-banding (offset) Normal operational mode setting is 0101011 Default value is 0101011

0x01A9837C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG4

Type: RW

Clock: WCLK

Reset State: 0x00000006

PLL calibration setting - cfg4

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG4

Bits	Name	Description
7:5	RSVD_7_5	
4:0	PLL_VCO_MAN_SLOPE	Manual selection of Kvco slope Normal operational mode setting is 00110 Default value is 00110

0x01A98380 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG5

Type: RW

Clock: WCLK

Reset State: 0x00000006

PLL calibration setting - cfg5

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG5

Bits	Name	Description
7	RSVD_7	
6:0	PLL_VCO_MAN_KVDD	Manual selction of KVDD parameters Normal operational mode setting is 00110 Default value is 00110

0x01A98384 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG6**Type:** RW**Clock:** WCLK**Reset State:** 0x0000002B

PLL calibration setting - cfg6

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG6

Bits	Name	Description
7:0	PLL_CAL_KVCO_COUNT_7_0	Target Calibration KVCO Use This equation: KV_COUNT = kvco *vdd/6, bits 7:0 Normal operational mode setting is 00101011 Default value is 00101011

0x01A98388 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG7**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

PLL calibration setting - cfg7

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG7

Bits	Name	Description
7:2	RSVD_7_2	
1:0	PLL_CAL_KVCO_COUNT_9_8	Target Calibration KVCO Use This equation: KV_COUNT = kvco *vdd/6, bits 9:8 Normal operational mode setting is 00 Default value is 00

0x01A9838C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG8**Type:** RW**Clock:** WCLK**Reset State:** 0x00000086

PLL calibration setting - cfg8

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG8

Bits	Name	Description
7:0	PLL_CAL_REFCLK_DIV_7_0	Reference divider number to get to 5us measurement period, bits 7:0 Normal operational mode setting is 10000110 Default value is 10000110

0x01A98390 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG9**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

PLL calibration setting - cfg9

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG9

Bits	Name	Description
7:2	RSVD_7_2	
1:0	PLL_CAL_REFCLK_DIV_9_8	Reference divider number to get to 5us measurement period, bits 9:8 Normal operational mode setting is 00 Default value is 00

0x01A98394 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG10**Type:** RW**Clock:** WCLK**Reset State:** 0x000000E6

PLL calibration setting - cfg10

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG10

Bits	Name	Description
7:0	PLL_VCO_FREQ_7_0	Target Calibration VCO frequency, bits 7:0 Normal operational mode setting is 11100110 Default value is 11100110

0x01A98398 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG11**Type:** RW**Clock:** WCLK**Reset State:** 0x00000002

PLL calibration setting - cfg11

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CAL_CFG11

Bits	Name	Description
7:3	RSVD_7_3	
2:0	PLL_VCO_FREQ_10_8	Target Calibration VCO frequency, bits 10:8 Normal operational mode setting is 010 Default value is 010

0x01A9839C MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_EFUSE_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

PLL efuse setting

MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_EFUSE_CFG

Bits	Name	Description
7:6	RSVD_7_6	
5	PLL_EFUSE_OVRRISE_SEL	0: Use EFUSE value selected by PLLPHY_DRVSTR_EFUSE_SEL 1: Override with PLLPHY_EFUSE value. Default value is 0
4	PLL_DRVSTR_EFUSE_SEL	1: Select the efuse used for datalane impedance calibration 0: Select dedicated PLL calibration efuse Default value is 0
3:0	PLL_EFUSE	efuse override value Default value is 0000

0x01A983A4 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CTRL_42**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CTRL_42**

Bits	Name	Description
7:0	RSVD_7_0	

0x01A983A8 MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CTRL_43**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_PLL_UNIPHY_PLL_CTRL_43**

Bits	Name	Description
7:0	RSVD_7_0

tHS_CLK_ZERO Timing Parameter Per UI based 9-bit Counter bit8.

MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_3

Bits	Name	Description
7:1	RSVD_7_1	
0	DSIPHY_T_CLK_ZERO_8	DSIPHY tCLK-ZERO Timing Parameter bit8. UI Calculation: {(DSIPHY_T_CLK_ZERO_8, DSIPHY_T_CLK_ZERO[7:0]) >> 1} * 2 + 2 DSIPHY_T_CLK_ZERO_8 only possibly need to be used for 1.5Gbps lane rate. Normal operational mode setting is 0b0_0000_0111. Power up value is 0b0_0000_0111

0x01A98650 MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_4**Type:** RW**Clock:** WCLK**Reset State:** 0x00000008

tHS_EXIT Timing Parameter Per UI based 8-bit Counter.

MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_4

Bits	Name	Description
7:0	DSIPHY_T_HS_EXIT	DSIPHY tHS-EXIT Timing Parameter UI Calculation: (DSIPHY_T_HS_EXIT>>1) * 2 + 2 Normal operational mode setting is 0b0000_1000. Power up value is 0b0000_1000

0x01A98654 MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_5**Type:** RW**Clock:** WCLK**Reset State:** 0x00000018

tHS_ZERO Timing Parameter Per UI based 8-bit Counter.

MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_5

Bits	Name	Description
7:0	DSIPHY_T_HS_ZERO	DSIPHY tHS-ZERO Timing Parameter. Due to design implementation limitation, tHS-ZERO has to be set greater than 8 (>8). Set to 24 for typical operation and above 24 when HS settle time need to be expended. Any value set between 0 and 24 will cause un-expected high speed data transfer behavior such as data loss or miss sync pattern. UI Calculation: (DSIPHY_T_HS_ZERO>>1) * 2 + 2 Normal operational mode setting is 0b0001_1000. Power up value is 0b0001_1000

0x01A98658 MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_6**Type:** RW**Clock:** WCLK**Reset State:** 0x00000009

tHS_PREPARE Timing Parameter Per UI based 8-bit Counter.

MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_6

Bits	Name	Description
7:0	DSIPHY_T_HS_PREPARE	DSIPHY tHS-PREPARE Timing Parameter UI Calculation: $(\text{DSIPHY_T_HS_PREPARE} \gg 1) * 2 + 2$ Normal operational mode setting is 0b0000_1001. Power up value is 0b0000_1001

0x01A9865C MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_7**Type:** RW**Clock:** WCLK**Reset State:** 0x00000008

tHS_TRAIL Timing Parameter Per UI based 8-bit Counter.

MDSS_DSI_0_PHY_DSIPHY_TIMING_CTRL_7

Bits	Name	Description
7:0	DSIPHY_T_HS_TRAIL	DSIPHY tHS-TRAIL Timing Parameter UI Calculation: $(\text{DSIPHY_T_HS_TRAIL} \gg 1) * 2 + 2$ Normal operational mode setting is 0b0000_1000. Power up value is 0b0000_1000

6:0	DCC_SEL_N_PGM	Duty Cycle Correction NMOS programe setting. Power up value is 000_1000

0x01A98684 MDSS_DSI_0_PHY_DSIPHY_STRENGTH_CTRL_0**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

MDSS_DSI_0_PHY_DSIPHY_STRENGTH_CTRL_0

Bits	Name	Description
7:4	DSIPHY_STR_LP_N	0000: 2-9.5 pF load. 0010: 9.5-18 pF load 0100: 18-25 pF load. 0110: 25-35 pF load. 1100: 35-65 pF load. 1111: 65-70 pF load. Operational mode value is 1111 Power up value is 0000
3:0	DSIPHY_STR_LP_P	0000: 2-9.5 pF load. 0010: 9.5-18 pF load 0100: 18-25 pF load. 0110: 25-35 pF load. 1100: 35-65 pF load. 1111: 65-70 pF load. Operational mode value is 1111 Power up value is 0000

0x01A98688 MDSS_DSI_0_PHY_DSIPHY_STRENGTH_CTRL_1**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

Note: The preferred name of this register is DSIPHY_GLBL_LPRX_CFG

MDSS_DSI_0_PHY_DSIPHY_STRENGTH_CTRL_1

Bits	Name	Description
7:4	RSVD_7_4	
3	DSIPHY_LN_CTRL_3	HS Contention Disable. 1 : Disable HS Mode Contention Detection Power up value is 0
2	DSIPHY_LN_CTRL_2	Enable for Low Power Receiver. 1 : LP RX is enabled 0 : LP RX is disabled Note; The preferred name for this register bit should be DSIPHY_LPRX_EN Power up value is 0

MDSS_DSI_0_PHY_DSIPHY_STRENGTH_CTRL_1 (cont.)

Bits	Name	Description
1	DSIPHY_LN_CTRL_1	Enable for Contention Detection Receiver. 1 : CD RX is enabled. 0 : CD RX is disabled Note : The preferred name for this register bit should be DSIPHY_CDRX_EN Power up value is 0
0	RSVD_0	

0x01A9868C MDSS_DSI_0_PHY_DSIPHY_CAL_HW_TRIGGER**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_CAL_HW_TRIGGER**

Bits	Name	Description
7:1	RSVD_7_1	
0	TRIGGER	Trigger the hw calibration of the pull-up and pull-down strength for the High-speed transmitters. Normal operational mode setting is 0 Power up value is 0

0x01A98690 MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG0**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG0**

Bits	Name	Description
7:5	RSVD_7_5	
4	SW_CAL_TX_BOT_EN	High speed transmitter pull-down strength calibration enable. Normal operational mode setting is 0 Power up value is 0
3:1	RSVD_3_1	

MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG0 (cont.)

Bits	Name	Description
0	SW_CAL_TX_TOP_EN	High speed transmitter pull-up strength calibration enable. Normal operational mode setting is 0 Power up value is 0

0x01A98694 MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG1**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG1**

Bits	Name	Description
7:4	SW_CAL_TX_BOT_STR	High speed transmitter pull-down strength setting. 1111=Strongest 0000=Weakest strength. Normal operational mode setting is 0000 Power up value is 0000
3:0	SW_CAL_TX_TOP_STR	High speed transmitter pull-up strength setting. 1111=Strongest 0000=Weakest strength. Normal operational mode setting is 0000 Power up value is 0000

0x01A98698 MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG2**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_CAL_SW_CFG2**

Bits	Name	Description
7:1	RSVD_7_1	
0	CALIBRATION_SEL	Select calibration mode 0: hardware control 1: software control Normal operational mode setting is 0 Power up value is 0

0x01A9869C MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG0**Type:** RW**Clock:** WCLK**Reset State:** 0x00000001**MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG0**

Bits	Name	Description
7:5	RSVD_7_5	
4	CAL_POLYR_MODE	DSIPHY Poly Resistor Select. To enable the Poly Resistor to be used for impedance calibration. When asserted, the MIPI_DSI_LDO pin will be connected to the reference poly resistor. Note: DSIPHY_REGULATOR_CTRL_0[DSIPH_REG_EN] must be set to 0 before asserting CAL_POLYR_MODE Normal operational mode setting is 0 Power up value is 0
3:1	RSVD_3_1	
0	HW_CAL_EN	To enable the hardware calibration Normal operational mode setting is 1 Power up value is 1

0x01A986A0 MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG1**Type:** RW**Clock:** WCLK**Reset State:** 0x0000005A**MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG1**

Bits	Name	Description
7:4	LOWER_THRESHOLD	If number of 1s out of samples of CAL_WEAK(Comparator output signal) is below this value, strength will be incremented Normal operational mode setting is 0101 Power up value is 0101
3:0	UPPER_THRESHOLD	If number of 1s out of samples of CAL_WEAK(Comparator output signal) is above this value, strength will be incremented Normal operational mode setting is 1010 Power up value is 1010

0x01A986A4 MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG2**Type:** RW**Clock:** WCLK**Reset State:** 0x00000010**MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG2**

Bits	Name	Description
7:5	RSVD_7_5	
4:0	PC_STR_TOO_WEAK_COUNT	Number of samples of CAL_WEAK(Comparator output signal) to take for each loop. This is used for counting the samples of analog calibrator compactor output str_too_weak signal. The sample counter are based on dsi pll refclk cycle. This register value must be set greater than UPPER_THRESHOLD in order to have correct HW calibration sequence. Normal operational mode setting is 1_0000 Power up value is 1_0000

0x01A986A8 MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG3**Type:** RW**Clock:** WCLK**Reset State:** 0x0000000A**MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG3**

Bits	Name	Description
7:0	COMPARATOR_SETTLE_TIME_7_0	Number of ESCCLK cycles to wait before taking another set of 16 samples of CAL_WEAK(Comparator output signal) Normal operational mode setting is 0000_1010 Power up value is 0000_1010

0x01A986AC MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG4**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG4**

Bits	Name	Description
7:2	RSVD_7_2	

MDSS_DSI_0_PHY_DSIPHY_CAL_HW_CFG4 (cont.)

Bits	Name	Description
1:0	COMPARATOR_SETTLE_TIME_9_8	Number of ESCCLK cycles to wait before taking another set of 16 samples of CAL_WEAK(Comparator output signal) Normal operational mode setting is 00 Power up value is 00

0x01A986CC MDSS_DSI_0_PHY_RSVD_1_PHY_DIGTOP**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_RSVD_1_PHY_DIGTOP**

Bits	Name	Description
7:0	RSVD_7_0	

0x01A986D0 MDSS_DSI_0_PHY_DSIPHY_GLBL_MISR_CTRL**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_GLBL_MISR_CTRL**

Bits	Name	Description
7:4	RSVD_7_4	
3:0	DSIPHY_MISR_EN	DSIPHY_MISR_en<i> is MISR enable for each data lane <i>. Power up value is 0000

0x01A986DC MDSS_DSI_0_PHY_DSIPHY_LDO_CNTRL**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000

MDSS_DSI_0_PHY_DSIPHY_LDO_CNTRL

Bits	Name	Description
7	RSVD_7	
6	LDO_MODE_1P2_EN	LDO Mode. DSIPHY Regulator 1.2V Enable. 1: DSIPHY Regulator is enabled. 0: DSIPHY Regulator is disabled. Normal operational mode setting is 0. DSIPHY_REGULATOR_CTRL_0[DSIPHY_REG_EN] must be set to 0 when LDO_MODE_EN is set to 1 Power up value is 0
5:3	LDO_VREF_SEL	DSIPHY Regulator Reference Select. Selects the value of reference voltage for the DSIPHY LDO Regulator. When LDO_VREF_DIV_EN = 1 000 : 0.400V 001 : 0.415V 010 : 0.385V 011 : 0.370V 100 : 0.430V 101 : 0.445V 110 : 0.460V 111 : 0.475V When LDO_VREF_CGM_EN = 1 000 : 0.400V 001 : 0.415V 010 : 0.385V 011 : 0.370V 100 : 0.430V 101 : 0.430V 110 : 0.430V 111 : 0.430V Note: LDO_VREF_CGM_EN and LDO_VREF_DIV_EN both cannot be 1. Setting both to 1 will disable both CGM_EN and DIV_EN Normal operational mode setting is 000 Power up value is 000
2	LDO_VREF_DIV_EN	To enable resistor divider as reference voltage Power up value is 0
1	LDO_VREF_CGM_EN	To enable Constant Gm as reference voltage Power up value is 0

MDSS_DSI_0_PHY_DSIPHY_LDO_CNTRL (cont.)

Bits	Name	Description
0	LDO_MODE_0P4_EN	LDO Mode. DSIPHY Regulator 0.4V Enable. 1: DSIPHY Regulator is enabled. 0: DSIPHY Regulator is disabled. Normal operational mode setting is 0. DSIPHY_REGULATOR_CTRL_0[DSIPHY_REG_EN] must be set to 0 when LDO_MODE_EN is set to 1 Power up value is 0

0x01A986E0 MDSS_DSI_0_PHY_DSIPHY_REGULATOR_CAL_STATUS0**Type:** R**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_REGULATOR_CAL_STATUS0**

Bits	Name	Description
7:5	RSVD_7_5	
4	HW_CALIBRATOR_BUSY	To monitor hardware calibration status 1 : Calibration in progress 0 : Calibration complete
3:1	RSVD_3_1	
0	PC_STR_TOO_WEAK	To monitor CAL_WEAK(Comparator output signal)

0x01A986E4 MDSS_DSI_0_PHY_DSIPHY_REGULATOR_CAL_STATUS1**Type:** R**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_REGULATOR_CAL_STATUS1**

Bits	Name	Description
7:4	HW_CAL_BOT_STR	Bottom calibrated impedance strength value. Stable after calibration is complete
3:0	HW_CAL_TOP_STR	Top calibrated impedance strength value. Stable after calibration is complete

0x01A986E8 MDSS_DSI_0_PHY_DSIPHY_GLBL_STATUS_DCC_SEL_P**Type:** R**Clock:** WCLK**Reset State:** 0x00000008**MDSS_DSI_0_PHY_DSIPHY_GLBL_STATUS_DCC_SEL_P**

Bits	Name	Description
7	DCC_DONE_SEL_P	Duty Cycle Correction Done SEL_P. Power up value is 0
6:0	DCC_SEL_P_STATUS	Duty Cycle Correction SEL_P status. Power up value is 000_1000

0x01A986EC MDSS_DSI_0_PHY_DSIPHY_GLBL_STATUS_DCC_SEL_N**Type:** R**Clock:** WCLK**Reset State:** 0x00000008**MDSS_DSI_0_PHY_DSIPHY_GLBL_STATUS_DCC_SEL_N**

Bits	Name	Description
7	DCC_DONE_SEL_N	Duty Cycle Correction Done SEL_N. Power up value is 0
6:0	DCC_SEL_N_STATUS	Duty Cycle Correction SEL_N status. Power up value is 000_1000

0x01A98700 MDSS_DSI_0_PHY_DSIPHY_REVISION_ID0**Type:** R**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_DSIPHY_REVISION_ID0**

Bits	Name	Description
7:0	STEP_7_0	Revision ID0

0x01A98704 MDSS_DSI_0_PHY_DSIPHY_REVISION_ID1

Type: R
Clock: WCLK
Reset State: 0x00000000

MDSS_DSI_0_PHY_DSIPHY_REVISION_ID1

Bits	Name	Description
7:0	STEP_15_8	Revision ID1

0x01A98708 MDSS_DSI_0_PHY_DSIPHY_REVISION_ID2

Type: R
Clock: WCLK
Reset State: 0x00000000

MDSS_DSI_0_PHY_DSIPHY_REVISION_ID2

Bits	Name	Description
7:0	MINOR_7_0	Revision ID2

0x01A9870C MDSS_DSI_0_PHY_DSIPHY_REVISION_ID3

Type: R
Clock: WCLK
Reset State: 0x00000010

MDSS_DSI_0_PHY_DSIPHY_REVISION_ID3

Bits	Name	Description
7:4	MAJOR	Revision ID3_major
3:0	MINOR_11_8	Revision ID3_minor

17.18.4 MDSS_DSI_0_PHY_REG_CM_MIPI_DSI_REG**0x01A98780 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_0**

Type: RW
Clock: WCLK
Reset State: 0x00000000

MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_0

Bits	Name	Description
7:4	RSVD_7_4	
3:1	DSIPHY_REG_REF_SEL	DSIPHY Regulator Reference Select. Selects the value of reference voltage for the DSIPHY DCDC Regulator. When DSIPHY_REGULATOR_TEST[DIV_EN] = 1 000 : 0.400V 001 : 0.415V 010 : 0.385V 011 : 0.370V 100 : 0.430V 101 : 0.445V 110 : 0.460V 111 : 0.475V When DSIPHY_REGULATOR_TEST[NP_CGM_EN] = 1 000 : 0.400V 001 : 0.415V 010 : 0.385V 011 : 0.370V 100 : 0.430V 101 : 0.430V 110 : 0.430V 111 : 0.430V Note: NP_CGM_EN and DIV_EN both cannot be 1. Setting both to 1 will disable both CGM_EN and DIV_EN Normal operational mode setting is 000 Power up value is 000
0	DSIPHY_REG_EN	DC DC Mode. DSIPHY Regulator Enable. 1: DSIPHY Regulator is enabled. 0: DSIPHY Regulator is disabled. Normal operational mode setting is 1 and DSIPHY_LDO_CNTRL[LDO_MODE_EN] must be set to 0 Power up value is 0

0x01A98784 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_1**Type:** RW**Clock:** WCLK**Reset State:** 0x00000006

MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_1

Bits	Name	Description
7:0	DSIPHY_REG_CONT_DISCHARGE_CYCLES	DSIPHY Continuous Mode Cycle Control. Used to control the number of cycles of continuous discharge mode. Normal operational mode setting is 0000_0110 Power up value is 0000_0110

0x01A98788 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_2**Type:** RW**Clock:** WCLK**Reset State:** 0x00000004**MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_2**

Bits	Name	Description
7:0	DSIPHY_REG_CONT_CHARGE_CYCLES	DSIPHY Continuous Mode I Cycle Control. Used to control the number of cycles of continuous charge mode. Normal operational mode setting is 0000_0100 Power up value is 0000_0100

0x01A9878C MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_3**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_3**

Bits	Name	Description
7:4	RSVD_7_4	
3:0	DSIPHY_REG_CLK_DIV_RATIO	DSIPHY REFCLK CLOCK DIVIDER Selection Bits. 0000 : div by1 0001 : div by2 0010 : div by3 . . . 1111--- div by16 Power up value is 0000

0x01A98790 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_4**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_4**

Bits	Name	Description
7:6	RSVD_7_6	
5	DIV_EN	To enable resistor divider as reference voltage Power up value is 0
4	NP_CGM_ENABLE	To enable constant Gm as reference voltage Power up value is 0
3:0	RSVD_3_0	

0x01A98794 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_5**Type:** RW**Clock:** WCLK**Reset State:** 0x00000007**MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_5**

Bits	Name	Description
7:5	RSVD_7_5	
4	DSIPHY_REG_SWCTRL_DISCHARGE_EN	SWI switch discharge mode for NP_PSW_CTRL NP_NSW_CTRL NP_EMI_CTRL. Power up value is 0
3	DSIPHY_REG_SWI_FORCE_PWR_SWITCH	SWI control discharge enable for NP_PSW_CTRL NP_NSW_CTRL NP_EMI_CTRL. Power up value is 0
2	DSIPHY_REG_SWI_PSW_CTRL	SWI control bit for NP_PSW_CTRL. Power up value is 1
1	DSIPHY_REG_SWI_NSW_CTRL	SWI control bit for NP_NSW_CTRL. Power up value is 1

MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_5 (cont.)

Bits	Name	Description
0	DSIPHY_REG_SWI_EMI_CTRL	SWI control bit for NP_EMI_CTRL. Power up value is 1

0x01A98798 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CAL_PWR_CFG**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CAL_PWR_CFG**

Bits	Name	Description
7:5	RSVD_7_5	
4	SW_RESET	RESET for Digital blocks except control registers . Active high signal. 1: Assertion 0: Deassertion Normal operational mode setting is 0. Power up value is 0
3:1	RSVD_3_1	
0	DSIPHY_REG_PWRDN_B	DSIPHY Regulator NPL Power Down. 1 : Normal operation.Note: After the Regulator power down bit be set from '1' to '0' (powerup), regulator takes minumum 250uS worst case to charge up the external capacitor for MIPI DC/DC converter. 0 : Regulator NPL Block powerdown Normal operational mode setting is 1 Power up value is 0

0x01A9879C MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_6**Type:** RW**Clock:** WCLK**Reset State:** 0x00000015

MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_CTRL_6

Bits	Name	Description
7:0	INIT_DISCHARGE_CYCLES	DSIPHY INIT_DISCHARGE delay Cycle Control. Used to control the number of cycles of continuous power_up_discharge mode. Normal operational mode setting is 0001_0101 Power up value is 0001_0101

0x01A987A0 MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_RSVD_1**Type:** RW**Clock:** WCLK**Reset State:** 0x00000000**MDSS_DSI_0_PHY_REG_DSIPHY_REGULATOR_RSVD_1**

Bits	Name	Description
7:0	RSVD_7_0	

17.19 MDSS_VBIF

VBIF block

Decode space for top block.

17.19.1 VBIF_MDP

Description of the VBIF core

17.19.1.1 MDSS_VBIF_VBIFCORE

VBIF core Registers

Description of the VBIF core

0x01AC8004 MDSS_VBIF_VBIF_CLKON**Type:** RW**Reset State:** 0x00000000

Clock force ON for both DDR and OCMEM AXI clock.

MDSS_VBIF_VBIF_CLKON

Bits	Name	Description
15:8	HYSTERESIS_VALUE	Hysteresis counter value for all CGCs inside VBIF.
1	RESERVED	Reserved
0	FORCE_ON	0: dynamic clock gating on. 1: force on, always clock is on for all AXI clock domain both DDR and OCMEM domain without test bus logic.

0x01AC8008 MDSS_VBIF_VBIF_CLK_FORCE_CTRL0**Type:** RW**Reset State:** 0x00000000

individual force enables for each clock branch.

MDSS_VBIF_VBIF_CLK_FORCE_CTRL0

Bits	Name	Description
7	FORCE_ON_C7	force on for AXI clock of XIN7.
6	FORCE_ON_C6	force on for AXI clock of XIN6.
5	FORCE_ON_C5	force on for AXI clock of XIN5.
4	FORCE_ON_C4	force on for AXI clock of XIN4.
3	FORCE_ON_C3	force on for AXI clock of XIN3.
2	FORCE_ON_C2	force on for AXI clock of XIN2.
1	FORCE_ON_C1	force on for AXI clock of XIN1.
0	FORCE_ON_C0	0: dynamic clock gating on for AXI clock of XIN0. 1: force on, always clock is on for AXI clock of XIN0.

0x01AC800C MDSS_VBIF_VBIF_CLK_FORCE_CTRL1**Type:** RW**Reset State:** 0x00000000

individual force enables for each clock branch.

MDSS_VBIF_VBIF_CLK_FORCE_CTRL1

Bits	Name	Description
15	FORCE_ON_DCD	force on the DCD output for AXI DDR clock.

MDSS_VBIF_VBIF_CLK_FORCE_CTRL1 (cont.)

Bits	Name	Description
9	FORCE_ON_QOS	force on for all of QOS logics AXI clock.
8	FORCE_ON_PERF	force on for all of performance logics AXI,OCMEM clock.
7	RESERVED	Reserved
5	RESERVED	Reserved
4	RESERVED	Reserved
3	FORCE_ON_MM_MMU	force on for AXI clock of MM_MMU.
2	FORCE_ON_AHB2AHB	force on for AXI clock of ahb2ahb bridge(Master side).
0	FORCE_ON_ARB	0: dynamic clock gating on for all of ARBs(AXI Master block) AXI clock . 1: force on, always clock is on for all of ARBs AXI clock.

0x01AC8010 MDSS_VBIF_VBIF_QOS_OVERRIDE_EN**Type:** RW**Reset State:** 0x00000000

Enable VBIF to override the request priority and priority level signals provided by the client ports.

MDSS_VBIF_VBIF_QOS_OVERRIDE_EN

Bits	Name	Description
23	OVERRIDE_PRILVL_EN_C7	Enable VBIF to override the priority level for client 7.
22	OVERRIDE_PRILVL_EN_C6	Enable VBIF to override the priority level for client 6.
21	OVERRIDE_PRILVL_EN_C5	Enable VBIF to override the priority level for client 5.
20	OVERRIDE_PRILVL_EN_C4	Enable VBIF to override the priority level for client 4.
19	OVERRIDE_PRILVL_EN_C3	Enable VBIF to override the priority level for client 3.
18	OVERRIDE_PRILVL_EN_C2	Enable VBIF to override the priority level for client 2.
17	OVERRIDE_PRILVL_EN_C1	Enable VBIF to override the priority level for client 1.
16	OVERRIDE_PRILVL_EN_C0	Enable VBIF to override the priority level for client 0.
7	OVERRIDE_REQPRI_EN_C7	Enable VBIF to override the request priority for client 7.
6	OVERRIDE_REQPRI_EN_C6	Enable VBIF to override the request priority for client 6.
5	OVERRIDE_REQPRI_EN_C5	Enable VBIF to override the request priority for client 5.
4	OVERRIDE_REQPRI_EN_C4	Enable VBIF to override the request priority for client 4.

MDSS_VBIF_VBIF_QOS_OVERRIDE_EN (cont.)

Bits	Name	Description
3	OVERRIDE_REQPRI_EN_C3	Enable VBIF to override the request priority for client 3.
2	OVERRIDE_REQPRI_EN_C2	Enable VBIF to override the request priority for client 2.
1	OVERRIDE_REQPRI_EN_C1	Enable VBIF to override the request priority for client 1.
0	OVERRIDE_REQPRI_EN_C0	Enable VBIF to override the request priority for client 0.

0x01AC8014 MDSS_VBIF_VBIF_PRILVL_ACT_PROP_EN**Type:** RW**Reset State:** 0x00000000

Enable VBIF to only propagate priority level for active clients.

MDSS_VBIF_VBIF_PRILVL_ACT_PROP_EN

Bits	Name	Description
7	PRILVL_ACT_PROP_EN_C7	Enable VBIF to only propagate priority level for client 7 if it is active.
6	PRILVL_ACT_PROP_EN_C6	Enable VBIF to only propagate priority level for client 6 if it is active.
5	PRILVL_ACT_PROP_EN_C5	Enable VBIF to only propagate priority level for client 5 if it is active.
4	PRILVL_ACT_PROP_EN_C4	Enable VBIF to only propagate priority level for client 4 if it is active.
3	PRILVL_ACT_PROP_EN_C3	Enable VBIF to only propagate priority level for client 3 if it is active.

0x01AC80D0 MDSS_VBIF_VBIF_OUT_RD_LIM_CONF0

Type: RW

Reset State: 0x00000010

The maximum number of pending reads from each AXI is programmable.

MDSS_VBIF_VBIF_OUT_RD_LIM_CONF0

Bits	Name	Description
7:0	OUT_RD_LIM_A0	The maximum number of pending reads from AXI 0. Must be <= the HW parameter that XBAR_OUT_RD_LIM

0x01AC80D4 MDSS_VBIF_VBIF_OUT_WR_LIM_CONF0

Type: RW

Reset State: 0x00000010

The maximum number of pending reads from each AXI is programmable.

MDSS_VBIF_VBIF_OUT_WR_LIM_CONF0

Bits	Name	Description
7:0	OUT_WR_LIM_A0	The maximum number of pending writes from AXI 0. Must be <= the HW parameter that XBAR_OUT_WR_LIM

0x01AC80D8 MDSS_VBIF_VBIF_DDR_OUT_MAX_BURST**Type:** RW**Reset State:** 0x00000707

The maximum burst length from any DDR AXI is programmable.

The client bursts will be broken up according to these limits, although the client will not be aware of it.

MDSS_VBIF_VBIF_DDR_OUT_MAX_BURST

Bits	Name	Description
15:8	DDR_OUT_MAX_WR_BURST	The maximum number of write beats minus 1 allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that XBAR_OUT_WR_BURST
7:0	DDR_OUT_MAX_RD_BURST	The maximum number of read beats minus 1 allowed on the AXI bus (arbiter outputs). Must be < the HW parameter that XBAR_OUT_RD_BURST

0x01AC80E0 MDSS_VBIF_VBIF_ISO_SYNC**Type:** RW**Reset State:** 0x00000000

Enables iso-sync operation between client and arbiter, 1-bit per client. Client & AXI clocks must be iso-sync and have balanced clock trees.

MDSS_VBIF_VBIF_ISO_SYNC

Bits	Name	Description
7	ISO_SYNC_C7	Enables for Client 7
6	ISO_SYNC_C6	Enables for Client 6
5	ISO_SYNC_C5	Enables for Client 5
4	ISO_SYNC_C4	Enables for Client 4
3	ISO_SYNC_C3	Enables for Client 3
2	ISO_SYNC_C2	Enables for Client 2
1	ISO_SYNC_C1	Enables for Client 1
0	ISO_SYNC_C0	Enables for Client 0

0x01AC80F0 MDSS_VBIF_VBIF_ARB_CTL**Type:** RW**Reset State:** 0x00000010

Each arbiter can be programmed to utilize fixed priority, slave-aware or Round-Robin arbitration

MDSS_VBIF_VBIF_ARB_CTL

Bits	Name	Description
4	ROUND_ROBIN_ARB_EN_A0	Enables Round-Robin arbitration for AXI port 0. If enabled, Slave-Aware and Longest-Time-Waiting arbitrations are ignored.
0	FIXED_ARB_EN_A0	Enables fixed priority arbitration for AXI port 0. If enabled, the other arbitrations are ignored

0x01AC80F4 MDSS_VBIF_VBIF_DDR_ARB_CONF0**Type:** RW**Reset State:** 0x00000000

Client limits for DDR AXI, 5 bits per client.

Each client limit is the maximum number of consecutive grants minus 1 to give that client before allowing requests from other clients.

This is used for slave-aware and longest-time-waiting arbitration.

MDSS_VBIF_VBIF_DDR_ARB_CONF0

Bits	Name	Description
29:25	DDR_CLIENT_LIM_C5	Client limits for Client 5
24:20	DDR_CLIENT_LIM_C4	Client limits for Client 4
19:15	DDR_CLIENT_LIM_C3	Client limits for Client 3
14:10	DDR_CLIENT_LIM_C2	Client limits for Client 2
9:5	DDR_CLIENT_LIM_C1	Client limits for Client 1
4:0	DDR_CLIENT_LIM_C0	Client limits for Client 0

0x01AC80F8 MDSS_VBIF_VBIF_DDR_ARB_CONF1**Type:** RW**Reset State:** 0x00000000

Client limits

MDSS_VBIF_VBIF_DDR_ARB_CONF1

Bits	Name	Description
9:5	DDR_CLIENT_LIM_C7	Client limits for Client 7
4:0	DDR_CLIENT_LIM_C6	Client limits for Client 6

0x01AC8100 MDSS_VBIF_VBIF_FIXED_ARB_CONF0**Type:** RW**Reset State:** 0x76543210

A list of Client number for Fixed arbitration

The highest priority client number on highest number of register name.

For example, If total unnumber of client is 12, and client2 has highest priority should be write 2 into FIXED_ARB_LIST_11. and ignore LIST_12 ~ 15.

MDSS_VBIF_VBIF_FIXED_ARB_CONF0

Bits	Name	Description
31:28	FIXED_ARB_LIST_7	A list of Client number for Fixed arbitration
27:24	FIXED_ARB_LIST_6	A list of Client number for Fixed arbitration
23:20	FIXED_ARB_LIST_5	A list of Client number for Fixed arbitration
19:16	FIXED_ARB_LIST_4	A list of Client number for Fixed arbitration
15:12	FIXED_ARB_LIST_3	A list of Client number for Fixed arbitration
11:8	FIXED_ARB_LIST_2	A list of Client number for Fixed arbitration
7:4	FIXED_ARB_LIST_1	A list of Client number for Fixed arbitration
3:0	FIXED_ARB_LIST_0	A list of Client number for Fixed arbitration

0x01AC8124 MDSS_VBIF_VBIF_ROUND_ROBIN_QOS_ARB**Type:** RW**Reset State:** 0x00000003

Round-Robin Arbiter with QoS signal that from MM core to VBIF via input signal.

MDSS_VBIF_VBIF_ROUND_ROBIN_QOS_ARB

Bits	Name	Description
1	MMU_RR_QOS_EN	Enable Round-Robin Arbiter with QoS for MMU Virtual Address Arbiter.
0	RR_QOS_EN	Enable Round-Robin Arbiter with QoS for AXI Master Arbiter. If Round-Robin Arbiter is disabled, ignore this register.

0x01AC8160 MDSS_VBIF_VBIF_OUT_AXI_AMEMTYPE_CONF0**Type:** RW**Reset State:** 0x22222222

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

MDSS_VBIF_VBIF_OUT_AXI_AMEMTYPE_CONF0

Bits	Name	Description
30:28	AXI_AMEMTYPE_C7	A MEMTYPE signal for Client 7
26:24	AXI_AMEMTYPE_C6	A MEMTYPE signal for Client 6
22:20	AXI_AMEMTYPE_C5	A MEMTYPE signal for Client 5
18:16	AXI_AMEMTYPE_C4	A MEMTYPE signal for Client 4
14:12	AXI_AMEMTYPE_C3	A MEMTYPE signal for Client 3
10:8	AXI_AMEMTYPE_C2	A MEMTYPE signal for Client 2
6:4	AXI_AMEMTYPE_C1	A MEMTYPE signal for Client 1
2:0	AXI_AMEMTYPE_C0	A MEMTYPE signal for Client 0

0x01AC8168 MDSS_VBIF_VBIF_OUT_AXI_AINST_OVERRIDE_EN**Type:** RW**Reset State:** 0x00000000

Enable VBIF to override the AINST signals provided by the client ports or MM-MMU.

MDSS_VBIF_VBIF_OUT_AXI_AINST_OVERRIDE_EN

Bits	Name	Description
7	AXI_AINST_OVERRIDE_EN_C7	Enable VBIF to override the AINST signal for Client 7

MDSS_VBIF_VBIF_OUT_AXI_AINST_OVERRIDE_EN (cont.)

Bits	Name	Description
6	AXI_AINST_OVERRIDE_EN_C6	Enable VBIF to override the AINST signal for Client 6
5	AXI_AINST_OVERRIDE_EN_C5	Enable VBIF to override the AINST signal for Client 5
4	AXI_AINST_OVERRIDE_EN_C4	Enable VBIF to override the AINST signal for Client 4

0x01AC8180 MDSS_VBIF_VBIF_OUT_AXI_ANOALLOCATE**Type:** RW**Reset State:** 0x00000000

When a request is finally granted, this AXI signal is controlled on a per-client basis.

This is driven to AXI port but does not directly impact VBIF functionality.

MDSS_VBIF_VBIF_OUT_AXI_ANOALLOCATE

Bits	Name	Description
7	AXI_ANOALLOCATE_C7	ANOALLOCATE signal for Client 7
6	AXI_ANOALLOCATE_C6	ANOALLOCATE signal for Client 6
5	AXI_ANOALLOCATE_C5	ANOALLOCATE signal for Client 5
4	AXI_ANOALLOCATE_C4	ANOALLOCATE signal for Client 4
3	AXI_ANOALLOCATE_C3	ANOALLOCATE signal for Client 3
2	AXI_ANOALLOCATE_C2	ANOALLOCATE signal for Client 2
1	AXI_ANOALLOCATE_C1	ANOALLOCATE signal for Client 1
0	AXI_ANOALLOCATE_C0	ANOALLOCATE signal for Client 0

0x01AC8184 MDSS_VBIF_VBIF_WD_TIMEOUT**Type:** RW**Reset State:** 0x00000000

Write Data Timeout function. enable bit per Client.

Each Client block generate a interrupt when write data timeout with enabled.

MDSS_VBIF_VBIF_WD_TIMEOUT

Bits	Name	Description
19:16	WD_TIMEOUT_LOG2	This field (shared by all Clients) contains log2(write data timeout), i.e. the bit number of the timeout counter which, when 1, will trigger the timeout. For example, 15 here means the timeout is 32768 AXI clock cycles. This field is ignored when AXI_WD_TIMEOUT_EN=0
7	WD_TIMEOUT_EN_C7	Write Data Timeout enable for Client 7
6	WD_TIMEOUT_EN_C6	Write Data Timeout enable for Client 6
5	WD_TIMEOUT_EN_C5	Write Data Timeout enable for Client 5
4	WD_TIMEOUT_EN_C4	Write Data Timeout enable for Client 4
3	WD_TIMEOUT_EN_C3	Write Data Timeout enable for Client 3
2	WD_TIMEOUT_EN_C2	Write Data Timeout enable for Client 2
1	WD_TIMEOUT_EN_C1	Write Data Timeout enable for Client 1
0	WD_TIMEOUT_EN_C0	Write Data Timeout enable for Client 0

0x01AC8190 MDSS_VBIF_VBIF_PND_ERR**Type:** R**Reset State:** 0x00000000

Pending error status. per client

When error is happened and not masked, this register is set to 1.

But masked, not appear in this register.

MDSS_VBIF_VBIF_PND_ERR

Bits	Name	Description
7	CLIENT_PND_ERR_C7	Indicates than an error in Client 7 occured since the last reset or ERR_CLR was set.

MDSS_VBIF_VBIF_PND_ERR (cont.)

Bits	Name	Description
6	CLIENT_PND_ERR_C6	Indicates than an error in Client 6 occured since the last reset or ERR_CLR was set.
5	CLIENT_PND_ERR_C5	Indicates than an error in Client 5 occured since the last reset or ERR_CLR was set.
4	CLIENT_PND_ERR_C4	Indicates than an error in Client 4 occured since the last reset or ERR_CLR was set.
3	CLIENT_PND_ERR_C3	Indicates than an error in Client 3 occured since the last reset or ERR_CLR was set.
2	CLIENT_PND_ERR_C2	Indicates than an error in Client 2 occured since the last reset or ERR_CLR was set.
1	CLIENT_PND_ERR_C1	Indicates than an error in Client 1 occured since the last reset or ERR_CLR was set.
0	CLIENT_PND_ERR_C0	Indicates than an error in Client 0 occured since the last reset or ERR_CLR was set.

0x01AC8194 MDSS_VBIF_VBIF_SRC_ERR**Type:** R**Reset State:** 0x00000000

Source error status. per client

When error is happened, this register is set to 1 evenif masked.

MDSS_VBIF_VBIF_SRC_ERR

Bits	Name	Description
7	CLIENT_SRC_ERR_C7	Indicates than an error in Client 7 occured since the last reset or ERR_CLR was set.
6	CLIENT_SRC_ERR_C6	Indicates than an error in Client 6 occured since the last reset or ERR_CLR was set.
5	CLIENT_SRC_ERR_C5	Indicates than an error in Client 5 occured since the last reset or ERR_CLR was set.
4	CLIENT_SRC_ERR_C4	Indicates than an error in Client 4 occured since the last reset or ERR_CLR was set.
3	CLIENT_SRC_ERR_C3	Indicates than an error in Client 3 occured since the last reset or ERR_CLR was set.
2	CLIENT_SRC_ERR_C2	Indicates than an error in Client 2 occured since the last reset or ERR_CLR was set.
1	CLIENT_SRC_ERR_C1	Indicates than an error in Client 1 occured since the last reset or ERR_CLR was set.

MDSS_VBIF_VBIF_SRC_ERR (cont.)

Bits	Name	Description
0	CLIENT_SRC_ERR_C0	Indicates than an error in Client 0 occurred since the last reset or ERR_CLR was set.

0x01AC8198 MDSS_VBIF_VBIF_ERR_MASK**Type:** RW**Reset State:** 0x00000000

Error Mask. per client.

When this mask register is set to 1, error is not propagated to Interrupt signal port.

But, can check the error within SRC_ERR register and ERR_INFO register.

MDSS_VBIF_VBIF_ERR_MASK

Bits	Name	Description
7	CLIENT_ERR_MASK_C7	Error mask for Client 7
6	CLIENT_ERR_MASK_C6	Error mask for Client 6
5	CLIENT_ERR_MASK_C5	Error mask for Client 5
4	CLIENT_ERR_MASK_C4	Error mask for Client 4
3	CLIENT_ERR_MASK_C3	Error mask for Client 3
2	CLIENT_ERR_MASK_C2	Error mask for Client 2
1	CLIENT_ERR_MASK_C1	Error mask for Client 1
0	CLIENT_ERR_MASK_C0	Error mask for Client 0

0x01AC819C MDSS_VBIF_VBIF_ERR_CLR**Type:** RW**Reset State:** 0x00000000

Error clear(interrupt clear). per client

After Client error has been captured, this field should be written to 1 in order to clear the previous error and enable future errors to be captured.

NOT need to write to 0, This field will be changed to 0 automatically when error is cleared.

MDSS_VBIF_VBIF_ERR_CLR

Bits	Name	Description
7	CLIENT_ERR_CLR_C7	Error Clear for Client 7
6	CLIENT_ERR_CLR_C6	Error Clear for Client 6
5	CLIENT_ERR_CLR_C5	Error Clear for Client 5
4	CLIENT_ERR_CLR_C4	Error Clear for Client 4
3	CLIENT_ERR_CLR_C3	Error Clear for Client 3
2	CLIENT_ERR_CLR_C2	Error Clear for Client 2
1	CLIENT_ERR_CLR_C1	Error Clear for Client 1
0	CLIENT_ERR_CLR_C0	Error Clear for Client 0

0x01AC81A0 MDSS_VBIF_VBIF_ERR_INFO**Type:** RW**Reset State:** 0x00000000

Error informations. only the first error is captured. The error must be cleared to enable future errors to be captured.

MDSS_VBIF_VBIF_ERR_INFO

Bits	Name	Type	Description
15:8	CLIENT_MID	R	The value on Client MID when the last error occurred. Note that value of this CLIENT_MID register will be 0 when write responses are disabled(XBAR_INn_WR_RESP=0)
7:6	AXI_RESP	R	The value of AXI_RRSP or AXI_BRSP when the last error occurred.
5:4	ERR_TYPE	R	The type of the last error. Read only
3:0	CLIENT_SEL		select number of Client to can read follow error info. (type, resp, mid and tid) For example, if this field is 3, can read error information about Client 3 error.

0x01AC8200 MDSS_VBIF_VBIF_XIN_HALT_CTRL0**Type:** RW**Reset State:** 0x00000000

VBIF Client HALT REQ

MDSS_VBIF_VBIF_XIN_HALT_CTRL0

Bits	Name	Description
7	HALT_REQ_C7	HALT request and internal SW-reset for Client I/F 7 .
6	HALT_REQ_C6	HALT request and internal SW-reset for Client I/F 6 .
5	HALT_REQ_C5	HALT request and internal SW-reset for Client I/F 5 .
4	HALT_REQ_C4	HALT request and internal SW-reset for Client I/F 4 .
3	HALT_REQ_C3	HALT request and internal SW-reset for Client I/F 3 .
2	HALT_REQ_C2	HALT request and internal SW-reset for Client I/F 2 .
1	HALT_REQ_C1	HALT request and internal SW-reset for Client I/F 1 .
0	HALT_REQ_C0	HALT request and internal SW-reset for Client I/F 0. When asserted, that Client I/F block(XIN) does not accept new requests/write data from all XINs(Client I/F block) and does not return the RESP/read data to MM core client. And also does not send the request to AXI. And waiting until return all outstanding RESP/read data from AXI Slave(NoC). When all RESPs are returned, ACK/IDLE/writes/reads_done are asserted. Finally, when that XIN block is IDLE, assert the internal sw-reset automatically for that XIN. MUST set to '0' to this field again after ACK/IDLE goes to High.

0x01AC8204 MDSS_VBIF_VBIF_XIN_HALT_CTRL1**Type:** R**Reset State:** 0x00FF0000

VBIF Client HALT ACK/IDLE

MDSS_VBIF_VBIF_XIN_HALT_CTRL1

Bits	Name	Description
23	HALT_IDLE_C7	IDLE for Client 7 .
22	HALT_IDLE_C6	IDLE for Client 6 .
21	HALT_IDLE_C5	IDLE for Client 5 .
20	HALT_IDLE_C4	IDLE for Client 4 .
19	HALT_IDLE_C3	IDLE for Client 3 .
18	HALT_IDLE_C2	IDLE for Client 2 .
17	HALT_IDLE_C1	IDLE for Client 1 .

MDSS_VBIF_VBIF_XIN_HALT_CTRL1 (cont.)

Bits	Name	Description
16	HALT_IDLE_C0	IDLE for Client 0 .
7	HALT_ACK_C7	Acknowledge about the Halt Request of the Client 7 .
6	HALT_ACK_C6	Acknowledge about the Halt Request of the Client 6 .
5	HALT_ACK_C5	Acknowledge about the Halt Request of the Client 5 .
4	HALT_ACK_C4	Acknowledge about the Halt Request of the Client 4 .
3	HALT_ACK_C3	Acknowledge about the Halt Request of the Client 3 .
2	HALT_ACK_C2	Acknowledge about the Halt Request of the Client 2 .
1	HALT_ACK_C1	Acknowledge about the Halt Request of the Client 1 .
0	HALT_ACK_C0	Acknowledge about the Halt Request of the Client 0. Reset value is '0'. After Halt requests, this acknowledge field is set to '1' when Client is IDLE.

0x01AC8208 MDSS_VBIF_VBIF_AXI_HALT_CTRL0**Type:** RW**Reset State:** 0x00000000

VBIF AXI HALT REQ

MDSS_VBIF_VBIF_AXI_HALT_CTRL0

Bits	Name	Description
0	HALT_REQ	HALT request for all VBIF AXI I/F(both DDR and OCMEM) . When asserted, AXI Master block(ARB) does not accept new requests from all XINs(Client I/F block) and MM-MMU(for HTW). And waiting until return all outstanding RESP/read data from AXI Slave(NoC). When all RESPs are returned, ACK/IDLE is asserted. This HATL request requires HW reset for VBIF.

0x01AC820C MDSS_VBIF_VBIF_AXI_HALT_CTRL1**Type:** R**Reset State:** 0x00000010

VBIF AXI HALT ACK/IDLE

MDSS_VBIF_VBIF_AXI_HALT_CTRL1

Bits	Name	Description
4	HALT_IDLE_A0	IDLE for AXI I/F 0 .
0	HALT_ACK	Acknowledge about the Halt Request of the AXI I/F. Reset value is '0'. After Halt requests, this acknowledge field is set to '1' when all AXI I/F are IDLE.

0x01AC8260 MDSS_VBIF_VBIF_STM_CONF**Type:** RW**Reset State:** 0x00000000

configuration for STM HW Events.

MDSS_VBIF_VBIF_STM_CONF

Bits	Name	Description
4:0	STM_GROUP_SEL	Select the STM Group TBD

0x01AC8270 MDSS_VBIF_VBIF_WR_BUF_FOR_AP**Type:** RW**Reset State:** 0x00000000

Write data buffer for AXI performance.

MDSS_VBIF_VBIF_WR_BUF_FOR_AP

Bits	Name	Description
0	WR_BUF_FOR_AP_A0	Optional feature: Write data buffer for AXI performance. A.K.A. Hold back AXI write request til write data is ready. (Write is granted by ARB, then write data from XIN is buffered in write data FIFO or passed through to AXI, then write request is issued to AXI, then wait for that write request (not data) to be accepted, then resume arbitration. So while this feature may improve efficiency of write data channel on AXI, it may reduce performance of both reads and writes for this core.) for AXI Master I/F 0.

**0x01AC8300+MDSS_VBIF_VBIF_PERF_CNT_ENn, n=[0..3]

**0x01AC8480+MDSS_VBIF_VBIF_MISR_CFG_An, n=[0..0]
0x4*n**
Type: RW**Reset State:** 0x00000000

Arbiter MISR configuration register

MDSS_VBIF_VBIF_MISR_CFG_An

Bits	Name	Type	Description
31	MISR_ERR	R	Indicates an error occurred. Currently this can only occur if the MISR is set to generate signatures based on read channel transactions and a transaction is processed where ASIZE does not match the bus width.
11:4	MISR_MID		Transactions must match this MID to be considered in the MISR signature unless MISR_IGNORE_MID is set.
3	MISR_IGNORE_MID		When set to 1 MISR_MID is ignored. Useful only in a limited number of circumstances.
2:1	MISR_INPUT_SEL		MISR input select. 0 - Address channel transactions. 1 - Read channel transactions. 2 - Write channel transactions. 3 - Reserved.

MDSS_VBIF_VBIF_MISR_CFG_An (cont.)

Bits	Name	Type	Description
0	MISR_EN		MISR enable

0x01AC8490 MDSS_VBIF_VBIF_MISR_COUNTER**Type:** RW**Reset State:** 0x00000000

MISR counter

MDSS_VBIF_VBIF_MISR_COUNTER

Bits	Name	Description
19:0	MISR_COUNTER	Specifies the number of transactions to accumulate in the MISR signature. If set to 0 it specifies an unlimited number of transactions. Note that in the case of read/write data transactions, a transaction consists of all the data beats associated with an address channel request. In other words the internal counter does not increment until the last data beat is seen.

**0x01AC8494+ MDSS_VBIF_VBIF_MISR_CLR_An, n=[0..0]
0x4*n****Type:** RW**Reset State:** 0x00000000

Clear MISR signature.

MDSS_VBIF_VBIF_MISR_CLR_An

Bits	Name	Description
0	MISR_CLR	Clear signature. This register should be set to 1 and back to 0 between tests if a second set of MISR signatures is to be collected. Also clears any errors.

**0x01AC84A4 MDSS_VBIF_VBIF_MISR_A0_SIGn, n=[0..3]
+0x4*n****Type:** R**Reset State:** 0x00000000

Arbiter 0 MISR signature.

MDSS_VBIF_VBIF_MISR_A0_SIGn

Bits	Name	Description
31:0	MISR_SIG	MISR signature

0x01AC9040 MDSS_VBIF_VBIF_STM_EN**Type:** RW**Reset State:** 0x00000000

Enable STM HW Events.

MDSS_VBIF_VBIF_STM_EN

Bits	Name	Description
0	STM_OUT_EN	Enable to start VBIF HW Events via qdss_stm_event output port

0x01ACA000 MDSS_VBIF_VBIF_DDR_OUTPUT_RECOVERABLE_HALT_CTRL0**Type:** RW**Reset State:** 0x00000000

Pause VBIF output

MDSS_VBIF_VBIF_DDR_OUTPUT_RECOVERABLE_HALT_CTRL0

Bits	Name	Description
0	DDR_OUTPUT_RECOVERABLE_HALT_REQ	When set this cause VBIF to stop issuing transactions onto the system bus.

0x01ACA004 MDSS_VBIF_VBIF_DDR_OUTPUT_RECOVERABLE_HALT_CTRL1**Type:** R**Reset State:** 0x00000000

Acknowledge for VBIF pause

MDSS_VBIF_VBIF_DDR_OUTPUT_RECOVERABLE_HALT_CTRL1

Bits	Name	Description
0	DDR_OUTPUT_RECOVERABLE_HALT_ACK	When this bit is set, after SW has issued a pause request, it indicates that VBIF is no longer sending out transactions and all outstanding transactions in the arbiters have been completed.

18 SDC1

18.1 SDC1_SDCC_SDCC5

0x07824000 SDC1_SDCC_MCI_POWER

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

(ARM name: MCIPower). This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again.

SDC1_SDCC_MCI_POWER

Bits	Name	Description
11	DML_SW_RST_WAIT_IDLE_DIS	If this bit is set, then SW_RST_REQ procedure before BAM_TRANS_RESET is not executed automatically.
10	SW_RST_WAIT_IDLE_DIS	If this bit is set, then SW_RST_REQ procedure is not executed automatically.
9	SW_RST_REQ	Before executing SW_RST or SW_RST_CONFIG, this bit should be set and SW needs to poll on it until it's being cleared. The bit is cleared after AXI master has finished processing the outstanding transactions and it's in IDLE state.
8	SW_RST_CONFIG	SW reset bit for the core without resetting configuration registers (MCI_POWER, MCI_CLK, MCI_INT_MASKn). In that case, SW will be able to reset the internal state machines, data path, etc. and it will be able to proceed to next transaction without reconfiguring the SDCC registers.
7	SW_RST	SW reset bit for the core. The impact of this reset bit will be similar to the impact of the reset from SW register in CLK_CTRL block. All SW registers and all internal logic is reset.

SDC1_SDCC_MCI_POWER (cont.)

Bits	Name	Description
6	OPEN_DRAIN	MCICMD Output Control. This bit is reserved for the use mentioned in the Description but it is not tested. The open drain mode is preserved such that when enabled, the command output is driven low when the logic is low and undriven (so that the pull up can pull high) when the logic is high. Whether this gets used in the system is up to SW/system but the HW does support this mode.
0	CONTROL	This register is used to control the operation of the memory controller. value 0: power-off value 1: power-on

0x07824004 SDC1_SDCC_MCI_CLK**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x01008000

(ARM name: MCIClock). This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again.

SDC1_SDCC_MCI_CLK

Bits	Name	Description
31	PWRSAVE_DLL	When this bit is set, DLL will get clock during transactions but not in idle. When this bit is cleared, DLL will get clock all the time so sdc4_dll_lock won't be de-asserted
30	SDIO_TRANS	When this bit is set in SDIO transaction, START_BIT_ERR status bit won't be raised. The reason is that interrupt period which is de-asserted only after the RX command can cause to wrong START_BIT_ERR detection. The START_BIT_ERR bit won't appear in MCI_STATUS when SDIO_TRANS is set
29	HCLK_IDLE_GATING	Additional CGC for HCLK was added which gates the HCLK for status bits. If this bit is set then HCLK is gated for these registers during IDLE
28	MCLK_IDLE_GATING	Additional CGC for MCLK was added, which gates the MCLK for status bits. If this bit is set then MCLK is gated for these registers during IDLE
27	INT_MCLK_ON	An internal CGC is located in MCLK domain. SW can enable the internal clock at IDLE time by writing '1' to this bit. If the bit is cleared, then the clock is gated at IDLE time

SDC1_SDCC_MCI_CLK (cont.)

Bits	Name	Description
26	SDCC_CLK_EXT_EN	Value 0 (default) - sdcc_clkout is driven via the clock pad and external clock can't be used for testing the cm_dll_sdc4. Value 1 - External clock can be used as a test clock.
25	RX_FLOW_TIMING	Configuration bit which selects the cycle which RxFlowControl will be asserted when UHS mode is used Value 0 (default) - RxFlowControl is asserted one clock before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 1). Value 1 - RxFlowControl is asserted two clocks before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 2).
24:23	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 1 - feedback clock from CLK pad Value 2 (default) - free running MCLK (gated between the transactions) Value 3 - free running MCLK divided by 2
22	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.
21	IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
20	CLK_FB_DLY_SEL	Selects the source of feedback clock used by the controller. Value 1 - output of cm_dll_sdc4 is used as feedback clock Value 0 - feedback clock from CLK pad is used
19:18	SD_DEV_SEL	Select the active device if more than one device are connected in shared bus mode. (range: '00' - '11').
17	HCLKON_SW_EN	SW enable of AHB clock request of SDCC5. value 0: HW clock request mechanism is used value 1: clock request signal is always high
16:14	SELECT_IN	Select to latch data and command coming in: value 000: on the falling edge of internal MCLK. value 001: on the rising edge of internal MCLK. value 010: using feedback clock (default). value 011: DDR mode. value 100: UHS mode - MCLK is used internally. value 101: UHS mode - divided frequency (MCLK/2) is used internally. value 110: e.MMC5.0 DDR200 mode.
13	INVERT_OUT	Clear (0) to change data and command going out on the falling edge. Set (1) to change data and command going out on the rising edge.
12	FLOW_ENA	Enable flow control: value 0: disable (default) value 1: enable

SDC1_SDCC_MCI_CLK (cont.)

Bits	Name	Description
11:10	WIDEBUS	Enable wide bus mode: value 00: 1 bit mode value 10: 4 bit mode value 01 or 11: 8 bit mode
9	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
8	ENABLE	Enable Prime-Cell MCI bus clock: value 0: clock disabled value 1: clock enabled

0x07824008 SDC1_SDCC_MCI_ARGUMENT**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000**SDC1_SDCC_MCI_ARGUMENT**

Bits	Name	Description
31:0	CMD_ARG	Command argument.

0x0782400C SDC1_SDCC_MCI_CMD**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MMCCCommand) CPSM: Command Path State Machine. This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again.

SDC1_SDCC_MCI_CMD

Bits	Name	Description
17	AUTO_CMD21	If set (1), CPSM sends CMD21 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4. CMD21 is supported in eMMC4.5 Spec.

SDC1_SDCC_MCI_CMD (cont.)

Bits	Name	Description
16	AUTO_CMD19	If set (1), CPSM sends CMD19 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4. CMD19 is supported in SD3.0 Spec.
15	CCS_DISABLE	If set (1), CPSM sends Command_Completion_Signal (CCS) disable sequence to the external CE-ATA device.
14	CCS_ENABLE	If set (1), CPSM waits for CCS from external card CE-ATA device.
13	MCIABORT	Signals the next command will be an abort (stop) command. This bit always read as (0) due to the hardware implementation. See a related note in next field
12	DAT_CMD	If set (1) indicates that this is a Command with Data. Note - MCIABORT and DAT_CMD bits don't have any effect on the CPSM. They are used to signal the SDIO Interrupt state machine that a Multi Block (examples: CMD18, CMD25, CMD53, etc. The rule is that each command with data must set this bit) data transaction is taking place. The DAT_CMD bit signals the start of the data transaction while the MCIABORT bit signals the end. For a pure SD Memory card, these bits are a don't care and should be set to zero by convention. However, some software drivers may chose to manipulate the bits in order to maintain compatibility with Combo cards and/or pure SDIO cards.
11	PROG_ENA	If set (1), PROG_DONE status bit will be asserted when busy is de-asserted. This bit is to be used with a stop or status command after a block write is performed. Does not effect CPSM.
10	ENABLE	The action of writing to this register (MCI_CMD) with this bit set (1), triggers CPSM to leave the Idle State.
9	PENDING	If set (1), CPSM waits for 'CmdPend' from the DPSM before it starts sending a command. This bit is designed to be used with SD CMD18 (READ_MULTIPLE_BLOCK) and SD CMD25 (WRITE_MULTIPLE_BLOCK) which must be terminated with a SD CMD12 (STOP_TRANSMISSION). After CMD18 or CMD25 is sent, the DPSM is enabled to send or receive data of amount MCI_DATA_LENGTH. After the DPSM finishes the transferring the data, it sends iCmdPend to the CPSM and goes idle. When the CPSM receives this signal, it sends the currently loaded command which software would normally establish as CMD12.
8	INTERRUPT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). The START, CMD_INDEX, ARGUMENT, and CRC are a total of 48 bits in length. If the INTERRUPT bit is zero, the CPSM will wait (63-47) 16 MCLK ticks for a response before going back to IDLE. If the INTERRUPT bit is set, the CPSM will wait indefinitely for a card response.

SDC1_SDCC_MCI_CMD (cont.)

Bits	Name	Description
7	LONGRSP	If set (1), receives a 136-bit long response.
6	RESPONSE	If set (1), CPSM waits for a response subject to INTERRUPT above.
5:0	CMD_INDEX	Command index.

0x07824010 SDC1_SDCC_MCI_RESP_CMD**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIRspCmd)

SDC1_SDCC_MCI_RESP_CMD

Bits	Name	Description
5:0	RESPCMD	Response command index.

**0x07824014+ SDC1_SDCC_MCI_RESPn, n=[0..3]
0x4*n****Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIResponse0-3). Note that MCIResponse3 has 31 bits; the other three (*RESP0, *RESP1, *RESP2) have 32 bits.

MCI_RESPn, n=[0..3]

SDC1_SDCC_MCI_RESPn

Bits	Name	Description
31:0	STATUS	Card status.

0x07824024 SDC1_SDCC_MCI_DATA_TIMER**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIDataTimer).

There is no way to disable this timer. The timer starts counting as soon as a transaction is initiated. The time counts in MCLK ticks.

SDC1_SDCC_MCI_DATA_TIMER

Bits	Name	Description
31:0	DATA_TIME	Data timeout period.

0x07824028 SDC1_SDCC_MCI_DATA_LENGTH

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

(ARM name: MCIDataLength)

Total number of bytes in the transaction regardless of mode (stream or block). In block mode, must be an exact multiple of block size. During an infinite transfer the value of DATALENGTH should be programmed to 0.

SDC1_SDCC_MCI_DATA_LENGTH

Bits	Name	Description
24:0	DATALENGTH	Data length value.

0x0782402C SDC1_SDCC_MCI_DATA_CTL

Type: RW

Clock: same rate as HCLK

Reset State: 0x00100000

(ARM name: MCIDataCtrl). Data Path State Machine (DPSM). This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again.

SDC1_SDCC_MCI_DATA_CTL

Bits	Name	Description
21	SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW

SDC1_SDCC_MCI_DATA_CTL (cont.)

Bits	Name	Description
20	RX_DATA_PEND	If set (1), timeout counter will start counting only after the RX command (with data) was sent instead of counting from initialization of DPSM. The feature is enabled by default.
19	AUTO_PROG_DONE	If set (1), automatic detection of PROG_DONE condition is executed without sending CMD12, CMD13, CMD52 or any other 'dummy' command. SW should set this bit in the following cases only: 1. When sending CMD53 for SDIO write transaction. 2. When sending CMD24. 3. When sending CMD25 and CMD23 was issued before to inform card about the exact number of blocks to be written (The rule is that this bit can be used for each command with data that doesn't need CMD12 for terminating the data or when it's prefixed by CMD23). 4. When sending CMD19 for testing bus procedure. CMD12 is not required in this case.
18	INFINITE_TRANSFER	If set (1), infinite transfer is enabled. MCI_DATA_LENGTH register should set to 0 during infinite transfer.
17	DATA_PEND	If set (1), DPSM waits for 'DataPend' from the CPSM before it enables the DPSM. This bit is designed to be used with SD CMD24 and CMD25 (WRITE_SINGLE_BLOCK and WRITE_MULTIPLE_BLOCK) to automatically start the DPSM after a normal (non-error) response is received. This register should be written with the enable bit and the pending bit asserted before MCI_CMD is enabled.
16:4	BLOCKSIZE	Data block length in bytes (1 to 4096).
3	DM_ENABLE	Enable DM interface: 0: DM disabled 1: DM enabled
2	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer
1	DIRECTION	Data transfer direction: 0: controller to card 1: card to controller
0	ENABLE	Data transfer enabled. If zero, DPSM unconditionally reset.

0x07824030 SDC1_SDCC_MCI_DATA_COUNT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIDataCnt)

NOTE There is no mechanism to ensure that a read of this counter will be accurate as it is not synchronized. The reason being the value read is async to the clock domain in which the reading is done. It is only useful as a debug tool for diagnostic purposes only.

SDC1_SDCC_MCI_DATA_COUNT

Bits	Name	Description
24:0	DATACOUNT	Value of data counter in MciDPSM block. Represents remaining data of transaction.

0x07824034 SDC1_SDCC_MCI_STATUS

Type: R

Clock: same rate as HCLK

Reset State: 0x000C0000

(ARM name: MCISStatus)

This register may need exclusion for QCSR POR Test for bits 25 and 22.

Static[30:26], [24:23] and [10:0]

These remain asserted until they are cleared by writing to the appropriate bit in the Clear Register (see MCI_CLEAR)

XCIS

The means used to send the SDIO external-card-interrupt-signal (XCIS) to the SDCC depends on the transfer mode: 1-bit, 4-bit, or 8-bit. Under 1 bit transfer mode, the XCIS has a dedicated physical connection to the SDCC. Hence once it is asserted, it remain at a high level. Under 4 and 8 bit transfe modes, the XCIS is time multiplexed with physical connection data bit 1. The XCIS is recognized as valid during specific time slots on data bit 1 by the SDCC. How this 'recognition' takes places shows up as different behaviors on SDIO_INTR_OPER, SDIO_INTR, and the actual interrupt sent to the ARM through MCI_INT_MASKn.

Special[25]

The SDIO_INTR_OPER indicator reflects the true state of XCIS as it would be observed inside the external SDIO card. As such, there is no bit 25 in MCI_CLEAR. The only way to clear SDIO_INTR_OPER is to clear the appropriate bit in the external card Common Card Control Registers (CCCR). Like 'static' above and 'dynamic' below, bit 25 in MCI_INT_MASKn controls actually sending this indicator value to the ARM. This indicator of XCIS is used for normal SDCC operation.

Special[22]

The SDIO_INTR indicator reflects that there has been a low-to-high transition on the connection as explained under XCIS above. This indicator is cleared via bit 22 of MCI_CLEAR but any low-to-high transition on the connection will set this indicator again. Further note that this indicator is not routed through the MCI_INT_MASKn to the ARM. For bit 22, the raw value of the connection is routed through the MCI_INT_MASKn to the ARM. As this raw connection is not aware of

specific time slots, the signal sent to the ARM generally toggles in an unpredictable fashion. This is generally not useful during normal SDCC operation. However, for wake-up with clocks off, the raw connection is desirable.

Dynamic[21:11]

These change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and de-asserted as data while written to the FIFO).

SDC1_SDCC_MCI_STATUS

Bits	Name	Description
31	STATUS2_INT	One of the error bits in MCI_STATUS2[4:1] register is set
30	AUTO_CMD19_TIMEOUT	Response or tuning pattern wasn't received after automatic CMD19's transmission. This status bit should be read only if AUTO_CMD19 (MCI_CMD(16)) was set.
29	BOOT_TIMEOUT	Data wasn't received within the valid time (according to MCI_CCS_TIMER) from the start of boot operation.
28	BOOT_ACK_ERR	Acknowledge pattern wasn't received correctly or not within the valid time (according to MCI_ACK_TIMER) from the start of boot operation.
27	BOOT_ACK_REC	Acknowledge pattern was received correctly.
26	CCS_TIMEOUT	CE-ATA Command Completion Signal timeout.
25	SDIO_INTR_OPER	SDIO interrupt indicator for normal operation.
24	ATA_CMD_COMPL	CE-ATA Command Completion Signal has been detected.
23	PROG_DONE	Programming done.
22	SDIO_INTR	SDIO interrupt indicator for wake-up.
21	RXDATA_AVLBL	Data available in receive FIFO. At least 1 word in the RX FIFO. SW can read 1 word only from the FIFO.
20	TXDATA_AVLBL	Data available in transmit FIFO. At least 1 word in the TX FIFO.
19	RXFIFO_EMPTY	Receive FIFO empty. SW can't read FIFO.
18	TXFIFO_EMPTY	Transmit FIFO empty. SW can write 8 words into the FIFO.
17	RXFIFO_FULL	Receive FIFO full. SW can read 8 words from the FIFO.
16	TXFIFO_FULL	Transmit FIFO full. TX FIFO contains 8 words. SW can't write to FIFO.
15	RXFIFO_HALF_FULL	Receive FIFO half full. SW can read 8 words from the FIFO.
14	TXFIFO_HALF_FULL	Transmit FIFO half full. SW can write 8 words into the FIFO.
13	RXACTIVE	Data receive in progress.
12	TXACTIVE	Data transmit in progress.
11	CMD_ACTIVE	Command transfer in progress.
10	DATA_BLK_END	Data block sent / received (CRC check passed).

SDC1_SDCC_MCI_STATUS (cont.)

Bits	Name	Description
9	START_BIT_ERR	Start Bit Error flag
8	DATAEND	Data end (data counter is zero).
7	CMD_SENT	Command sent (no response required).
6	CMD_RESPONSE_END	Command response received (CRC check passed).
5	RX_OVERRUN	Receive FIFO overrun error.
4	TX_UNDERRUN	Transmit FIFO underrun error.
3	DATA_TIMEOUT	Data timeout.
2	CMD_TIMEOUT	Command response timeout.
1	DATA_CRC_FAIL	Data block sent / received (CRC check failed).
0	CMD_CRC_FAIL	Command response received (CRC check failed).

0x07824038 SDC1_SDCC_MCI_CLEAR**Type:** W**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIClear)

SDC1_SDCC_MCI_CLEAR

Bits	Name	Description
30	AUTO_CMD19_TIMEOUT_CLR	Clears AUTO_CMD19_TIMEOUT flag.
29	BOOT_TIMEOUT_CLR	Clears BOOT_TIMEOUT flag.
28	BOOT_ACK_ERR_CLR	Clears BOOT_ACK_ERR flag.
27	BOOT_ACK_REC_CLR	Clears BOOT_ACK_REC flag.
26	CCS_TIMEOUT_CLR	Clears CCSTimeOut flag.
24	ATA_CMD_COMPL_CLR	Clears AtaCmdCompl flag.
23	PROG_DONE_CLR	Clears ProgDone flag.
22	SDIO_INTR_CLR	Clears SDIOInt flag.
10	DATA_BLK_END_CLR	Clears DataBlockEnd flag.
9	START_BIT_ERR_CLR	Clears StartBitErr flag.
8	DATA_END_CLR	Clears DataEnd flag.
7	CMD_SENT_CLR	Clears commandSent flag.

SDC1_SDCC_MCI_CLEAR (cont.)

Bits	Name	Description
6	CMD_RESP_END_CLT	Clears CmdRespEnd flag.
5	RX_OVERRUN_CLR	Clears RxOverrunClr flag.
4	TX_UNDERRUN_CLR	Clears TxUnderrun flag.
3	DATA_TIMEOUT_CLR	Clears DataTimeOut flag.
2	CMD_TIMEOUT_CLR	Clears CmdTimOutflag.
1	DATA_CRC_FAIL_CLR	Clears DataCrcFail flag.
0	CMD_CRC_FAIL_CLR	Clears CmdCrcFail flag.

**0x0782403C+ SDC1_SDCC_MCI_INT_MASKn, n=[0..1]
0x4*n****Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIMask0)

SDC1_SDCC_MCI_INT_MASKn

Bits	Name	Description
31	MASK31	MASK STATUS2_INT flag.
30	MASK30	MASK AUTO_CMD19_TIMEOUT flag.
29	MASK29	MASK BOOT_TIMEOUT flag.
28	MASK28	MASK BOOT_ACK_ERR flag.
27	MASK27	MASK BOOT_ACK_REC flag.
26	MASK26	MASK CCSTimeOut flag.
25	MASK25	MASK SDIOIntOper flag.

3	MASK3	MASK DataTimeOut flag.
2	MASK2	MASK CmdTimeOut flag.
1	MASK1	MASK DataCmdCrcFail flag.
0	MASK0	MASK CmdCrcFail flag.

0x07824044 SDC1_SDCC_MCI_FIFO_COUNT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

The SDCC core operates in two clock domains MCLK and HCLK. The CPSM and DPSM operate in MCLK domain and MciFifoDmaCtl (FIFO/DMA Controller) operates in HCLK domain. The MCI_FIFO_COUNT is a counter of FIFO Controller that monitors how many words of data are still needed to be transferred through the FIFO. At the beginning of data transaction the MCI_FIFO_COUNT counter will be loaded with the (MCI_DATA_LENGTH / 4) value and then will count down during the data transaction until it reach zero. This register is only useful for debug purposes and should not be used for normal operation since it does not reflect data which may or may not be in the pipeline.

SDC1_SDCC_MCI_FIFO_COUNT

Bits	Name	Description
23:0	DATA_COUNT	Remaining data.

0x07824048 SDC1_SDCC_MCI_BOOT**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Handling the boot operation.

SDC1_SDCC_MCI_BOOT

Bits	Name	Description
3	EARLY_ASSERT_CMD_LINE	If set to '1' then the CMD line is asserted by HW when all the data was received on the SD bus
2	BOOT_ACK_EN	If set to '1' then Host waits for acknowledge pattern after initiating the boot operation.
1	BOOT_EN	When this bit is asserted, the boot operation is initiated in both of the modes.
0	BOOT_MODE	If set to '1' then CMD line is low during the boot operation. If boot_mode = '0', then CMD0 with the argument 0xFFFFF0 is sent.

0x0782404C SDC1_SDCC_MCI_BOOT_ACK_TIMER**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Timer for boot operation - the time until receiving the acknowledge pattern.

SDC1_SDCC_MCI_BOOT_ACK_TIMER

Bits	Name	Description
31:0	BOOT_ACK_TIMER	Timer for counting the cycles from initiating the boot operation until the acknowledge pattern is accepted.

0x07824054 SDC1_SDCC_MCI_EMULATION_DLY_LINE**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

The register is responsible for handling DCM which is used in emulation supports 256 values of shift intervals so 8 bits are required (0:255). Bits [31:30] are used for emulation purposes only.

The procedure for activating the DCM is:

1. Setting bit 28 - DCM_RESET.
2. Clearing bit 28 - DCM_RESET.
3. Waiting until bit 29 DCM_LOCKED is high.
4. Writing a new phase in SD_CLK_DLY_CTRL field and setting the DCM_START bit (bit 30).

The clock's placement was executed by the DCM when DCM_DONE is asserted.

SDC1_SDCC_MCI_EMULATION_DLY_LINE

Bits	Name	Description
31	DCM_DONE	The shift process was finished in DCM and CMD19 can be sent towards the card. This is a read-only bit.
30	DCM_START	A new value of SD_CLK_DLY_CTRL is ready. Clears the DCM_DONE bit.
29	DCM_LOCKED	Reading the status of the LOCKED DCM's output which indicates that the output clock is ready for use.
28	DCM_RESET	Driving reset to DCM.
7:0	SD_CLK_DLY_CTRL	Input to DCM block in FPGA (8 bits). Controlling the change of the delay interval. The value's range may be 0-255 in DCM block.

0x07824058 SDC1_SDCC_MCI_CCS_TIMER

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

This register is used for operation with CE-ATA devices. The CCS timer starts to count at the end of SD transaction and it advances with every MCLK clock cycle. In boot operation this register is used for storing the number of cycles from initiating the boot operation until the first data is received.

SDC1_SDCC_MCI_CCS_TIMER

Bits	Name	Description
31:0	CCS_TIMER	CE-ATA Command Completion Signal timeout period.

0x0782405C SDC1_SDCC_MCI_RESPONSE_MASK

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

SDC1_SDCC_MCI_RESPONSE_MASK

Bits	Name	Description
31:0	RESPONSE_MASK	Mask used to verify the 32 status error bits. Active only when the data pending bit is set in the MCI_DATA_CTL register. When bit of this mask is set the corresponding bit from response [39:8] is checked to be 0 i.e. shows there no error. If all bits from mask shows no error the DPSM will be activated without waiting for software write.

0x07824060 SDC1_SDCC_MCI_DLL_CONFIG**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x60006400

This register configures the cm_dll_sdc4 for UHS mode.

SDC1_SDCC_MCI_DLL_CONFIG

Bits	Name	Description
31	SDC4_DIS_DOUT	When this bit equals to '0', the data which comes out from the dll is valid. When it equals to '1' this data isn't valid. The inversion of this bit is connected to dll's input - dll_en_dout
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 - 112 (MHz) Value 001 -112 - 125 Value 010 -125 - 137 Value 011 -137 - 150 Value 100 -150 - 162 Value 101 -162 - 175 Value 110 -175 - 187 Value 111 -187 - 200

SDC1_SDCC_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
23:20	CDR_SELECT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is '1')
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 2 cycles Value 01 - 4 cycles (default) Value 10 - 8 cycles Value 11 - 16 cycles
9	CDR_ALGORITHM_SEL	CDR algorithm select Value 0 - Edge (default) Value 1 - Level

SDC1_SDCC_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
0	CMD_DAT_TRACK_SEL	Select DAT or CMD lines for CDR tracking Value 0 - track DAT inputs (default) Value 1 - track CMD input

0x07824068 SDC1_SDCC_MCI_DLL_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

This register is connected to sdc4_status output of cm_dll_sdc4.

SDC1_SDCC_MCI_DLL_STATUS

Bits	Name	Description
12	SDC4_DTEST_MUXSEL	Digital test mux select
11	DDR_DLL_LOCK_JDR	Reserved
10:9	SDC4_DLL_DTEST_OUT_A TPG	SDC4_DLL_DTEST_OUT output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
8	SDC4_DLL_LOCK_ATPG	SDC4_DLL_LOCK output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC1_SDCC_MCI_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done

0x0782406C SDC1_SDCC_MCI_STATUS2**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Additional status and error bits.

SDC1_SDCC_MCI_STATUS2

Bits	Name	Description
8	BAM_AXI_MASTER_ERR	Error occurred on AXI master for BAM transaction. It is enabled if the field BAM_ERR_EN is set in MCI_HC_MODE register
7	AUTO_CDC_SW_CALIB_ERR	calibration error is received (CDC_ERROR_CODE isn't 0) during auto SW CDC calibration.
6	AUTO_CDC_SW_CALIB_TIMEOUT	CALIBRATION_DONE isn't received within the number of cycles which configured in CDC_CAL_TIMEOUT_THRESHOLD field (from CDC_AUTO_SW_CAL_CFG register).
5	DATA_AXI_MASTER_ERR	Error occurred on AXI master for data transaction
4	DATA_END_BIT_ERROR	The bit is set when the end bit of the received block was not 1 on all the data lines
3	CMD_END_BIT_ERROR	The bit is set when the end bit of the received response was not 1 on the command line

SDC1_SDCC_MCI_STATUS2 (cont.)

Bits	Name	Description
2	FIFO_EMPTY_ERROR	FIFO read attempt when FIFO was empty
1	FIFO_FULL_ERROR	write attempt when FIFO was full
0	MCLK_REG_WR_ACTIVE	Value 0 - No active register write to MCLK domain Value 1 - Active register write to MCLK domain. The bit indicates if a write operation to one of the following registers is in process (synchronization between HCLK and MCLK): MCI_POWER MCI_CLOCK MCI_CMD MCI_DATA_CTL

0x07824070 SDC1_SDCC_MCI_GENERICS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Generics list of each SDCC instance.

SDC1_SDCC_MCI_GENERICS

Bits	Name	Description
29	SWITCHABLE_SIGNALING_VOLTAGE	The core supports switching of IO signaling voltage.
28	BUS_18V_SUPPORT	The core supports 1.8v power supply to the bus.
27	BUS_30V_SUPPORT	The core supports 3.0v power supply to the bus.
26:23	SD_DATA_WIDTH	Number of DAT lines Value 4 - 4 DAT lines (SD, SDIO) Value 8 - 8 DAT lines (MMC, eMMC)
22:10	RAM_SIZE	Size of RAM size: Optional Values: 512, 1024, 2048 or 4096 bytes.
9	USE_SPS	Value 1 - BAM and DML are used and USB core is connected to SDCC5, Value 0 - BAM and DML are not used.
8:6	NUM_OF_DEV	Number of eSD or eSDIO devices supported on shared SD bus. Can be set from 1 to 4.
5:1	MAX_PIPES	Number of simultaneous parallel pipes supported by the BAM and attached peripheral pair. Can be set from 1 to 31.

SDC1_SDCC_MCI_GENERIC (cont.)

Bits	Name	Description
0	USE_DLL_SDC4	Enables the instantiation of cm_dll_sdc4. Value 0 - cm_dll_sdc4 isn't integrated with SDCC5 Value 1 - cm_dll_sdc4 is used with SDCC5.

0x07824074 SDC1_SDCC_MCI_FIFO_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00007800

Status bit of FIFO's fill level. Can be used for long accesses to FIFO using the FIFO_ALT register

SDC1_SDCC_MCI_FIFO_STATUS

Bits	Name	Description
18	RX_FIFO_512	512 bytes are ready in FIFO during RX transaction
17	RX_FIFO_256	256 bytes are ready in FIFO during RX transaction
16	RX_FIFO_128	128 bytes are ready in FIFO during RX transaction
15	RX_FIFO_64	64 bytes are ready in FIFO during RX transaction
14	TX_FIFO_512	available space in FIFO for 512 bytes during TX transaction
13	TX_FIFO_256	available space in FIFO for 256 bytes during TX transaction
12	TX_FIFO_128	available space in FIFO for 128 bytes during TX transaction
11	TX_FIFO_64	available space in FIFO for 64 bytes during TX transaction
10:0	FIFO_FILL_LEVEL	reflects the actual fill level of FIFO DPRAM during TX or RX transaction. Supported values are 0, 4, 8, ..., 1020, 1024

0x07824078 SDC1_SDCC_MCI_HC_MODE**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000**SDC1_SDCC_MCI_HC_MODE**

Bits	Name	Type	Description
21	PROGDONE_WO_CMD_RSP	RW	'0' (Default): we wait for cmd response end to detect progdone (legacy behavior). '1': we start looking for progdone without waiting for cmd response end but after 10 cycles from end bit of command

SDC1_SDCC_MCI_HC_MODE (cont.)

Bits	Name	Type	Description
20	AUTO_CMD12_CLR_CMDACTIVE	RW	'0' (Default): auto_cmd12 is not clearing cmdactive (bug fix). '1': auto_cmd12 is clearing cmdactive like previous behavior
19	WRAP_ERROR	RW	When the bit is set, the core responds with errors on WRAP transaction in configuration bus.
18:17	BUSY_CHECK_VALID_PERIOD	RW	Configuring the wait period between CRC token to BUSY period. Value 0 - waiting 7 cycles. The values of BUSY_CHECK_VALID_PERIOD is added to 7 cycles
16	BUSY_CHECK_VALID_ALWAYS	RW	In DDR200 mode, the end of busy should be checked after the CRC token was received. There is a counter of 4 cycles for this purpose. If this bit is set then the end of busy will be checked right after the crc token.
15	BAM_ERR_EN	RW	Enabling the assertion of BAM_AXI_MASTER_ERR field in MCISTATUS2
14	DIS_RST_AFTER_CRC_TO_KEN_DDR200	RW	Disabling the option to reset the RCLK's data registers in IO macro after each CRC token. The reset is needed if redundant RCLK is sent and BUSY is sampled into the FIFO as a data bit.
13	FF_CLK_SW_RST_DIS	RW	Disabling the SW reset in FF clock domain
12	IO_MACRO_SW_RST_PERIOD	R	When moving to DDR mode, reset period is generated for dividers. There is possibility to read from this bit if this period was finished
11	CLOCK_AFTER_EOB_DIS	RW	Disabling the 8 cycles after the CRC token when TxFlowControl is asserted before the end of the block
10	ADMA_INT_DATA	RW	If this bit is set, then the ADMA interrupt is set when the data was already transferred. If this bit is cleared, then the ADMA interrupt is set when the requests related to the descriptors were finished on address channel before the data itself is processed
9	BAM_CLK_EN_ACT	RW	If this bit is set, then bam_clk is gated when hc mode is enabled
8	ADMA_HPROT_DIS	R	If cleared then HPROT is changed in last burst of write transaction if block_count_en is 1, otherwise it will be for each end of descriptor. Not applicable for Gandalf - AXI Noc
7	ADMA_NON_WRD_ALIGN_DIS	R	If set the fix for non word aligned transfers in ADMA is disabled. Not applicable for Gandalf - AXI Noc
6	DEASSERT_HREADY_DATA_DIS	RW	if set, then hready won't be deasserted for access to Transfer Mode register in HC address. By default, the hready is deasserted for enabling the completion of synchronization period to MCLK before the next access
5	DEASSERT_HREADY_COMMAND_DIS	RW	if set ,then hready won't be deasserted for access to Command register in HC address. By default, the hready is deasserted for enabling the completion of synchronization period to MCLK before the next access

SDC1_SDCC_MCI_HC_MODE (cont.)

Bits	Name	Type	Description
4	IRQ_PCLK_DIS	RW	From tag sdcc5_p3q3r50, the interrupt and status bits are handled in PCLK domain only. If this bit is set, then the legacy architecture is used
3	SINGLE_NON32_ERROR	RW	if set , then a response error will be sent if single configuration access is executed in legacy mode with size of non 32 bits
2	WAIT_DLL_LOCK	RW	If this bit is set, the host controller isn writing to the async fifo unless DLL_LOCK of MCI_DLL_STATUS is equals to '1'
1	CYCLES_AFTER_EOB_DIS	RW	Enable bit for the fix that TxFlowControl isn't set until end of the block (CRC token reception) in the middle of TX transaction. The fix is required for releasing each BAM's descriptor separately without waiting to the next descriptor.
0	HC_MODE_EN	RW	Enabling the Host Controller Specification by setting this bit

**0x07824080+ SDC1_SDCC_MCI_FIFOn, n=[0..15]
0x4*n****Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000**SDC1_SDCC_MCI_FIFOn**

Bits	Name	Description
31:0	DATA	FIFO data. This register is aliased to 16 words, 0x080 - 0xBC. In SDCC3, an access to the FIFO was executed with 16 words so 16 addresses were defined. However, in SDCC5 only 8 words are used in each burst so only 8 addresses from the range should be used. When writing to the external SD_Card, writes to the data path FIFO. When reading from the external SD_Card, reads from the data path FIFO.

0x078240DC SDC1_SDCC_MCI_PWRCTL_STATUS_REG**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC. The different tasks are defined in this register

SDC1_SDCC_MCI_PWRCTL_STATUS_REG

Bits	Name	Description
3	IO_HIGH_V	SDCC driver orders that the I/O signaling level be switched to 3.0v. This interrupt is triggered when SDCC driver writes '0' to offset 03Eh in HC register (bit 3) or when SW reset for all is handled and last supported voltage was 1.8V. This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
2	IO_LOW_V	SDCC driver orders that the I/O signaling level be switched to 1.8v. This interrupt is triggered when SDCC driver writes '1' to offset 03Eh in HC register (bit 3). This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
1	BUS_ON	SDCC driver orders that the SD bus power be switched on. This interrupt is triggered when SDCC driver writes '1' to offset 029h in HC register (bit 0).
0	BUS_OFF	SDCC driver orders that the SD bus power be switched off. This interrupt is triggered when SDCC driver writes '0' to offset 029h in HC register (bit 0) or when SW reset for all is handled.

0x078240E0 SDC1_SDCC_MCI_PWRCTL_MASK_REG

Type: RW

Clock: PCLK

Reset State: 0x00000000

Mask register for MCI_PWRCTL_STATUS_REG

SDC1_SDCC_MCI_PWRCTL_MASK_REG

Bits	Name	Description
3	IO_HIGH_V	'1' - interrupt is enabled / '0' - interrupt is masked.
2	IO_LOW_V	'1' - interrupt is enabled / '0' - interrupt is masked.
1	BUS_ON	'1' - interrupt is enabled / '0' - interrupt is masked.
0	BUS_OFF	'1' - interrupt is enabled / '0' - interrupt is masked.

0x078240E4 SDC1_SDCC_MCI_PWRCTL_CLEAR_REG

Type: W

Clock: PCLK

Reset State: 0x00000000

Clear register for MCI_PWRCTL_STATUS_REG

SDC1_SDCC_MCI_PWRCTL_CLEAR_REG

Bits	Name	Description
3	IO_HIGH_V	Writing '1' clears bit 03 in PWRCTL_STATUS_REG
2	IO_LOW_V	Writing '1' clears bit 02 in PWRCTL_STATUS_REG
1	BUS_ON	Writing '1' clears bit 01 in PWRCTL_STATUS_REG
0	BUS_OFF	Writing '1' clears bit 00 in PWRCTL_STATUS_REG

0x078240E8 SDC1_SDCC_MCI_PWRCTL_CTL_REG

Type: RW

Clock: PCLK

Reset State: 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC and then the QCT SW driver needs to report success or fail to this register.

SDC1_SDCC_MCI_PWRCTL_CTL_REG

Bits	Name	Description
9	HC_CARD_STATE_STABLE	This bit is driving CARD_STATE_STABLE bit in Present State Register
8	RST_NOT_WAIT_PWRCTL_REG	RST process doesn't need to wait for accessing to MCI_PWRCTL_CTL_REG register
7:6	HC_WRITE_PROTECT_PAD	Value 0 inversion of HC_WRITE_PROTECT is connected to bit 19 in Present State Register. Value 1 input from PAD is used. Value 2 inversion of input from PAD is used
5	CARD_DETECT_PIN_LEVEL	This bit reflects the inverse value of the SD_CD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. value 1: card present value 0: no card present
4	HC_WRITE_PROTECT	This bit allows to disable the writing. value 0: write enabled value 1: write protected
3	IO_SIG_SWITCH_FAIL	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has failed.

SDC1_SDCC_MCI_PWRCTL_CTL_REG (cont.)

Bits	Name	Description
2	IO_SIG_SWITCH_SUCCESS	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has completed successfully.
1	BUS_ON_OFF_FAIL	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has failed.
0	BUS_ON_OFF_SUCCESS	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has completed successfully.

0x078240EC SDC1_SDCC_MCI_CLEAR2**Type:** W**Clock:** same rate as HCLK**Reset State:** 0x00000000

Clearing the error bits in MCI_STATUS2 register

SDC1_SDCC_MCI_CLEAR2

Bits	Name	Description
8	BAM_AXI_MASTER_ERR_CLR	BAM_AXI_MASTER_ERR clear bit
7	AUTO_CDC_SW_CALIB_ERR_CLR	AUTO_CDC_SW_CALIB_ERR clear bit.
6	AUTO_CDC_SW_CALIB_TOUT_CLR	AUTO_CDC_SW_CALIB_TOUT clear bit.
5	DATA_AXI_MASTER_ERR_CLR	DATA_AXI_MASTER_ERR clear bit
4	DATA_END_BIT_ERROR_CLR	DATA_END_BIT_ERROR clear bit
3	CMD_END_BIT_ERROR_CLR	CMD_END_BIT_ERROR clear bit
2	FIFO_EMPTY_ERROR_CLR	FIFO_EMPTY_ERROR clear bit
1	FIFO_FULL_ERROR_CLR	FIFO_FULL_ERROR clear bit

**0x078240F0+ SDC1_SDCC_MCI_INT_MASKINT2_n, n=[0..1]
0x4*n****Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Mask register for the MCI_STATUS2 register for each interrupt line

SDC1_SDCC_MCI_INT_MASKINT2_n

Bits	Name	Description
8	MASK8	BAM_AXI_MASTER_ERR mask bit
7	MASK7	AUTO_CDC_SW_CALIB_ERR mask bit.
6	MASK6	AUTO_CDC_SW_CALIB_TOUT mask bit.
5	MASK5	DATA_AXI_MASTER_ERR mask bit
4	MASK4	DATA_END_BIT_ERROR mask bit
3	MASK3	CMD_END_BIT_ERROR mask bit
2	MASK2	FIFO_EMPTY_ERROR mask bit
1	MASK1	FIFO_FULL_ERROR mask bit

0x07824100 SDC1_SDCC_CHAR_CMD

Type: RW

Clock: HCLK

Reset State: 0x00000000

Characterization config - 1 CMD line

SDC1_SDCC_CHAR_CMD

Bits	Name	Type	Description
15:8	CMDIN_ACTUAL	R	CMDIN storage for comparison. The incoming data is stored for debugging feature
7:0	CMDOUT_DATA_DIN_EXP	RW	CMDOUT for transmitting, CMDIN for compare. in TX testing the data is written in the register and should be transmitted outside from the core. In RX testing the incoming data is compared to the register's value

0x0782412C SDC1_SDCC_QSB_VALUES

Type: R

Clock: same rate as HCLK

Reset State: 0x00007991

configurable QSB values. Not applicabale for Gandalf - AXI Noc

SDC1_SDCC_QSB_VALUES

Bits	Name	Description
15	NON_BUF_BAM_BLOCK_END	Non bufferable/strongly ordered (hprot == 4'b0001/ memtype == 0) is driven in end of transaction by default. If setting this bit it will be driven for each block end
14	NOALLOCATE_VALUE	Driving noallocate value
13	RESERVED	Reserved
12	HPROT_VALUE_EN	Enabling the hprot values
11:8	HPROT_FOR_RDATA	hprot for read data. should be 9 by default so memtype is 2 (cachable)
7:4	HPROT_FOR_WDATA	hprot for write data during transaction or block. should be 9 by default so memtype is 2 (cachable)
3:0	HPROT_FOR_LAST_WDATA	hprot for last write data. should be 1 by default so memtype is 0 (strongly ordered)

0x07824130 SDC1_SDCC_QSB_AXI_VALUES**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x3E2218A8

configurable QSB AXI values

SDC1_SDCC_QSB_AXI_VALUES

Bits	Name	Type	Description
30	QSB_AXI_REDIRECT	RW	Driving QSB AXI output
29	QSB_AXI_ABURST	RW	Driving QSB AXI output
28:26	NUM_OUTSTANDING_DATA	RW	Configuring the number of outstanding transactions for the data. The descriptors accesses have more one outstanding request
25	PROCEED_AXI_AFTER_ERROR	RW	When error occurs on AXI master the traffic can continue or terminate. If this bit is set then the traffic continues and more requests are transmitted on the address channel
24	QSB_AXI_AFULL_CALC	RW	If this bit is set, then afull isn't '0' constantly but can be equal to '1' if all the beats have 8 bytes on the strobe lines
23	ONE_MID_SUPPORT	RW	If this bit is set, then only 1 MID is used for descriptors and data
22:20	RESERVED	RW	Reserved
19	SDCC5_HALT_REQ	R	Reading SDCC5_HALT_REQ input

SDC1_SDCC_QSB_AXI_VALUES (cont.)

Bits	Name	Type	Description
18	SDCC5_HALT_ACK	R	Reading SDCC5_HALT_ACK output
17	SDCC5_M_IDLE	R	Reading SDCC5_M_IDLE output
16	SDCC5_HALT_ACK_SW_EN	RW	Enabling the SW value for SDCC5_HALT_ACK
15	SDCC5_HALT_ACK_SW	RW	Driving SDCC5_HALT_ACK from SW and not by HW
14	SDCC5_M_IDLE_DIS	RW	If this bit is set, then sdcc5_m_idle will be tied low
13	QSB_AXI_INTERLEAVING_EN	RW	If the bit is set, then the controller can support interleaving between two bursts from the Noc. This option is disabled by default because Noc doesn't support interleaving but only re-ordering
12	RESERVED	RW	Reserved
11	RESERVED	RW	Reserved
10:9	RESERVED	RW	Reserved
8:6	RESERVED	RW	Reserved
5	RESERVED	RW	Reserved
4	RESERVED	RW	Reserved
3	RESERVED	RW	Reserved
2	QSB_AXI_OOOWR	RW	Driving QSB AXI output
1	QSB_AXI_OOORD	RW	Driving QSB AXI output
0	QSB_AXI_AFULL	RW	Driving QSB AXI output

0x07824134 SDC1_SDCC_AXI_DATA_ERR_DEBUG**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Debug details after error on AXI I/F

SDC1_SDCC_AXI_DATA_ERR_DEBUG

Bits	Name	Description
31	RESP_ERR_WR	If set, then the failed transaction was a write access
30:28	RESP_ERR_TID	The TID of the failed transaction
27:13	DESC_ADDR_35_21	Upper 15 bits of current address in address channel
12:0	DESC_ADDR_12_0	Lower 13 bits of current address in address channel

0x07824138 SDC1_SDCC_T4_DLY_CTRL**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x0000382B

Control register of T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC1_SDCC_T4_DLY_CTRL

Bits	Name	Description
15:14	T4_DLY_SPARE_CTL	
13	T4_DLY_POWERDOWN_EN	Powerdown enable. When asserted (default), it powers down the T/4 macro and shuts off all bias circuits.
12:11	T4_DLY_TESTOUT_SEL	Test output select. When toggled, it presents either the strb_in or strb_out on the analog test port for debug.
10	T4_DLY_BYPASS_EN	Bypass enable. When asserted it presents the strb_in on the strb_out port.
9	T4_DLY_CAL_START	Calibration start input. When asserted, it indicates the start of the calibration cycle.
8	T4_DLY_CAL_OVERRIDE	Calibration override input. When asserted, the internal delay line calibration is bypassed and the tby4_user_ctl<7:0> is used as the default code for the delay line.
7:0	T4_DLY_TARGET_CODE	T/4 delay target code. 0x2b gives delay of 1.25ns

0x0782413C SDC1_SDCC_T4_DLY_STAT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Status register T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC1_SDCC_T4_DLY_STAT

Bits	Name	Description
15:14	T4_DLY_SPARE_OUT	Spare status bits.
13	T4_DLY_CAL_DLY_CODE_FAST_RANGE	Calibrated delay code, indicates the fast range selection bit status.
12:6	T4_DLY_CAL_DLY_CODE_ISEL	Calibrated delay code, indicates the isel programming value for the bias generator.
5:4	T4_DLY_CAL_DLY_CODE_RSEL	Calibrated delay code, indicates the rsel programming value for the bias generator.
3:0	T4_DLY_STATE_DESC	T/4 state descriptor. Indicates the calibration status and result. value 4'b0000: Indicates Reset mode, waiting for cal_start signal. value 4'b0111: Indicates the fast range decision completion. value 4'b0100: Indicates rsel adjustment decision. value 4'b1011: Indicates isel adjustment decision. value 4'b1110: Indicates Normal end-of-cal. value 4'b1111: Indicates Maximum Delay Reached

0x07824140 SDC1_SDCC_CSR_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CTLR_CFG0 register configures the following:

SDC1_SDCC_CSR_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

SDC1_SDCC_CSR_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x07824144 SDC1_SDCC_CSR_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CTLR_CFG1 register configures the following:

SDC1_SDCC_CSR_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

SDC1_SDCC_CSR_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x07824148 SDC1_SDCC_CSR_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CAL_TIMER_CFG0 register configures the following:

SDC1_SDCC_CSR_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

SDC1_SDCC_CSR_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0782414C SDC1_SDCC_CSR_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CAL_TIMER_CFG1 register configures the following:

SDC1_SDCC_CSR_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x07824150 SDC1_SDCC_CSR_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_REFCOUNT_CFG register configures the following:

SDC1_SDCC_CSR_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x07824154 SDC1_SDCC_CSR_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register CSR_CDC_COARSE_CAL_CFG configures the following:

SDC1_SDCC_CSR_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x07824158 SDC1_SDCC_CSR_CDC_RSVD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_RSVD_CFG register configures the following:

SDC1_SDCC_CSR_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0782415C SDC1_SDCC_CSR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_OFFSET_CFG register configures the following:

SDC1_SDCC_CSR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count

SDC1_SDCC_CSR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x07824160 SDC1_SDCC_CSR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_DELAY_CFG register configures the following:

SDC1_SDCC_CSR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x07824164 SDC1_SDCC_CSR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_SW_MODE_CFG register configures the following:

SDC1_SDCC_CSR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0782416C SDC1_SDCC_CSR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_SW_OVRD_CFG register configures the following:

SDC1_SDCC_CSR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output

SDC1_SDCC_CSR_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
0	SW_OVRD_ENA	1'b1: Written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x07824170 SDC1_SDCC_CSR_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_SLAVE_DDA_CFG register configures the following:

SDC1_SDCC_CSR_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x07824174 SDC1_SDCC_CSR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The CSR_CDC_STATUS0 register configures the following:

SDC1_SDCC_CSR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x07824178 SDC1_SDCC_CSR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_STATUS1 register configures the following:

SDC1_SDCC_CSR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.

SDC1_SDCC_CSR_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x0782417C SDC1_SDCC_CSR_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The CSR_CDC_STATUS2 register configures the following:

SDC1_SDCC_CSR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x07824180 SDC1_SDCC_CSR_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_STATUS3 register configures the following:

SDC1_SDCC_CSR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x07824184 SDC1_SDCC_CSR_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The CSR_CDC_STATUS4 register configures the following:

SDC1_SDCC_CSR_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number of unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number of unit taps applied to delay array 0 of slave DDA

0x07824188 SDC1_SDCC_CSR_CDC_GEN_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000**SDC1_SDCC_CSR_CDC_GEN_CFG**

Bits	Name	Description
2	CDC_SDDA_EN	Enable CDC Slave DDA to generate 3/4T RCLK from cdc_out_2 output of CDC: 0 (default) - CDC Slave DDA is disabled and 3/4T clock is a falling edge of cdc_out_1 - CDC Slave DDA is enabled and 3/4T clock is a rising edge of cdc_out_2.
1	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
0	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)

0x0782418C SDC1_SDCC_CDC_AUTO_SW_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00F08000**SDC1_SDCC_CDC_AUTO_SW_CAL_CFG**

Bits	Name	Description
25	CDC_CAL_TIMEOUT_ENABLE	Enable for cdc calibration timeout counter.

SDC1_SDCC_CDC_AUTO_SW_CAL_CFG (cont.)

Bits	Name	Description
24	CDC_AUTO_SW_CAL_ENABLE	Enable for the Auto SW calibration Feature.
23:16	CDC_CAL_TIMEOUT_THRESHOLD	Sets the threshold for CDC calibration timeout during sw calibration triggered by the HW FSM. counts in 16xFF clock. Default is 0xF0 which is 255x16 FF clocks, which gives threshold of ~200 us
15:0	AUTO_TRIG_INTERVAL	Sets the load value of the counter that counts the interval between each sw calibration triggered by the HW FSM. this counter counts in sleep clock. Default is 0x8000 which is ~32,000 sleep clocks, which gives interval of ~1 sec

0x07824190 SDC1_SDCC_DDR200_STAT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000**SDC1_SDCC_DDR200_STAT**

Bits	Name	Description
0	CDC_CAL_VALID	CDC Calibration status: 0 - CDC isn't calibrated, 1 - CDC is calibrated and valid

0x07824194 SDC1_SDCC_DDR200_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Configuration bits for e.MMC5.0 DDR200 mode

SDC1_SDCC_DDR200_CFG

Bits	Name	Description
10	FF_CLK_DIS	The ff_clk to CDC/TBY4 is enabled by default. It can be disabled by setting this bit. The ff_clk is enabled to CDC and TBY4 according to CDC_T4_DLY_SEL field
9	VOLTAGE_MUX_SEL	select between 1.8v and 1.2v signals on sdcc5 IO interface with device. default is 0 to choose 1.8v

SDC1_SDCC_DDR200_CFG (cont.)

Bits	Name	Description
8:7	CDC_TRAFFIC_SEL	Selecting the method of cdc_traffic's assertions: Value 0 (default) - auto calibration with stand by feature. Value 1 - SW calibration before any transaction. Value 2 - automatic calibration with HW assertion of cdc_traffic.
6	START_CDC_TRAFFIC	This bit starts the cdc traffic assertion after calibration done is received.
5	CRC_TOKEN_SAMPL_FALL_EDGE	If set, the start bit of incoming CRC token in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
4	DATIN_SAMPL_FALL_EDGE	If set, the start bit of incoming data in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
3	CDC_T4_TEST_OUT_SEL	controls the mux between dll test_out and CDC test out. Default value is 0 (dll is chosen). When set - CDC test_out is chosen.
2	CMDIN_EDGE_SEL	Select sampling edge of CMD input when CMDIN_RCLK_EN is 1: 0 (default) - falling edge of RCLK, 1 - rising edge of RCLK
1	CMDIN_RCLK_EN	Enable CMD input sampling with RCLK: 0 (default) - CMD input is sampled by SD DLL output clock, 1 - CMD input is sampled by delayed RCLK
0	CDC_T4_DLY_SEL	Select block for RCLK delay: 0 (default) - use CM_DLL_SDC4

0x07824198 SDC1_SDCC_TIME_COUNT_CTRL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Control the performance counters

SDC1_SDCC_TIME_COUNT_CTRL

Bits	Name	Description
1	CMD_PERIOD	When this bit is set the commands periods are counted to the CMD_TIME counter
0	ENABLE	Enabling the performance counters

0x0782419C SDC1_SDCC_FLOW_CTRL_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the Flow Control period

SDC1_SDCC_FLOW_CTRL_TIME_COUNT

Bits	Name	Description
31:0	FLOW_CTRL_TIME	FlowControl periods are counted

0x078241A0 SDC1_SDCC_BUSY_TIME_COUNT

Type: R

Clock: HCLK

Reset State: 0x00000000

Counting the BUSY periods

SDC1_SDCC_BUSY_TIME_COUNT

Bits	Name	Description
31:0	BUSY_TIME	In Tx transaction, the BUSY periods are counted until the progdone is asserted. In Rx transaction, the periods between the blocks without flowcontrol is counted including the time until the first block is received after the command.

0x078241A4 SDC1_SDCC_DATA_TIME_COUNT

Type: R

Clock: HCLK

Reset State: 0x00000000

Counting the time of transaction

SDC1_SDCC_DATA_TIME_COUNT

Bits	Name	Description
31:0	DATA_TIME_CNT	In Tx transaction, the time is from ENabling the DPSM until progdone is asserted. In Rx transaction, the time is from the command transmission to de-assertion of RxActive.

0x078241A8 SDC1_SDCC_CMD_TIME_COUNT

Type: R

Clock: HCLK

Reset State: 0x00000000

Counting the time of transaction

SDC1_SDCC_CMD_TIME_COUNT

Bits	Name	Description
31:0	CMD_TIME	Counting the Command-Response periods of commands which relate to the transaction including auto commands. The counter is active when CMD_PERIOD is set.

0x078241AC SDC1_SDCC_MCI_DLL_CONFIG_2

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

Second register for DLL's configuration

SDC1_SDCC_MCI_DLL_CONFIG_2

Bits	Name	Description
3:2	DDR_TRAFFIC_INIT_SEL	Selecting how DDR_TRAFFIC_INIT will be driven to DLL. Value 00 - HW drives the DDR_TRAFFIC_INIT when DPSM is active and when CPSM is active if RCLK is expected during response. Value 01 - The value is driven by SW by SW_DDR_TRAFFIC_INIT bit. Value 10 - DDR_TRAFFIC_INIT to DLL is driven when sdc4_mclk is not gated. off.
1	DDR_TRAFFIC_INIT_SW	The signal should be high 3-4 cycles before RCLK is toggling. It should be high when MCLK is toggling.
0	DDR_CAL_EN	The signal is set after the configuration of MCI_DDR_CONFIG is finished. When the signal is low the TCXO domain is being reset.

0x078241B0 SDC1_SDCC_MCI_DDR_CONFIG

Type: RW

Clock: same rate as HCLK

Reset State: 0x80040853

Configuration of ddr_config input of DLL

SDC1_SDCC_MCI_DDR_CONFIG

Bits	Name	Description
31	PRG_DLY_EN	Enables Programmable delay for RCLK_IN
30	EXT_PRG_RCLK_DLY_EN	Enables external control of Programmable RCLK delayline

SDC1_SDCC_MCI_DDR_CONFIG (cont.)

Bits	Name	Description
29:27	EXT_PRG_RCLK_DLY_COD E	Used only if EXT_PRG_RCLK_DLY_EN is set. Configuring Programmable RCLK Delayline process code number.
26:21	EXT_PRG_RCLK_DLY	Used only if EXT_PRG_RCLK_DLY_EN is set. Programmable RCLK Delay line fine delay control.
20:12	TCXO_CYCLES_DLY_LINE	Number of TCXO clock cycles between finish of one delay line calibration and beginning of next delay line calibration.
11:9	TCXO_CYCLES_CNT	Number of TCXO clock cycles for which down counter is enabled for before making each inc/dec decision.
8:0	PRG_RCLK_DLY	These bits are controlled the programmable delay line. This bus is binary coded. Decimal value = (TCXO period * Decimal value of TCXO_CYCLES_CNT)/(2*delay needed). For 1.25ns the formula is $(52n*4/2*1.25) = 83$ in decimal.

0x07824400+ SDC1_SDCC_MCI_FIFO_ALTn, n=[0..255]
0x4*n
Type: RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Alternative register to MCI_FIFO (0x80-0xBC). The SW can use this register range (0x400-0x7FC) for accessing all the RAM range (1024 bytes) in FIFO mode. The advantage is that any byte in the RAM can be accessed without repeating the same address

SDC1_SDCC_MCI_FIFO_ALTn

Bits	Name	Description
31:0	DATA	WORD is written or received to/from the RAM in FIFO mode

18.2 SDC1_SDCC_SDCC5_HC**0x07824900 SDC1_SDCC_HC_REG_0_2****Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Argument 2 Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_0_2

Bits	Name	Description
31:0	ARG_2	Argument 2 field

0x07824904 SDC1_SDCC_HC_REG_4_6**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Block Size Register(15-0)

-Block Count Register(31-16)

SDC1_SDCC_HC_REG_4_6

Bits	Name	Description
31:16	BLK_CNT_FOR_CUR_TRANS	Blocks Count For Current Transfer field from Block Count Register
14:12	BLK_SIZE_HST_SDMA_BUFFER	Host SDMA Buffer Boundary field from Block Size Register
11:00	BLK_SIZE_TRANS	Transfer Block Size field from Block Size Register

0x07824908 SDC1_SDCC_HC_REG_8_A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Argument 1 Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_8_A

Bits	Name	Description
31:00	CMD_ARG_1	Command Argument 1 field

0x0782490C SDC1_SDCC_HC_REG_C_E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Transfer Mode Register(15-0)

-Command Register(31-16)

SDC1_SDCC_HC_REG_C_E

Bits	Name	Description
29:24	CMD_INDX	Command Index field from Command Register
23:22	CMD_TYPE	Command Type field from Command Register
21	CMD_DATA_PRESENT_SEL	Data Present Select field from Command Register
20	CMD_INDX_CHECK_EN	Command Index Check Enable field from Command Register
19	CMD_CRC_CHECK_EN	Command CRC Check Enable field from Command Register
17:16	CMD_RESP_TYPE_SEL	Response Type Select field from Command Register
5	TRANS_MODE_MULTI_SINGLE_BLK_SEL	Multi/Single Block Select from Transfer Mode Register
4	TRANS_MODE_DATA_DIRECTION_SEL	Data Transfer Direction Select from Transfer Mode Register
3:2	TRANS_MODE_AUTO_CMD_EN	Auto CMD Enable from Transfer Mode Register
1	TRANS_MODE_BLK_CNT_EN	Block Count Enable field from Transfer Mode Register
0	TRANS_MODE_DMA_EN	DMA Enable field from Transfer Mode Register

0x07824910 SDC1_SDCC_HC_REG_10_12**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_10_12

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Response bits 0-31

0x07824914 SDC1_SDCC_HC_REG_14_16**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_14_16

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Long Response bits 31-63

0x07824918 SDC1_SDCC_HC_REG_18_1A**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_18_1A

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Long Response bits 64-95

0x0782491C SDC1_SDCC_HC_REG_1C_1E**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_1C_1E

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Long Response bits 96-127

0x07824920 SDC1_SDCC_HC_REG_20_22**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Buffer Data Port Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_20_22

Bits	Name	Description
31:24	BUF_DATA_PORT_3	Byte 3 of Buffer Data
23:16	BUF_DATA_PORT_2	Byte 2 of Buffer Data
15:8	BUF_DATA_PORT_1	Byte 1 of Buffer Data
7:0	BUF_DATA_PORT_0	Byte 0 of Buffer Data

0x07824924 SDC1_SDCC_HC_REG_24_26**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00080000

Present State Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_24_26

Bits	Name	Description
25	SIGNALING_18_SWITCHING_STS	Bit it is cleared, by hardware, when host driver writes any value to 1.8V Signaling Enable field, indicating that a signal switching operation has started. Bit is set, by hardware, when switching operation succeeds.
24	PRESENT_STATE_CMD_LINE_SIGNAL_LEVEL	CMD Linr Signal Level field
23:20	PRESENT_STATE_DAT_3_0_LINE_SIGNAL_LEVEL	DAT[3:0] Line Signal Level field
19	PRESENT_STATE_WRITE_PROTECT_SWITCH_PIN_LEVEL	Write Protect Switch Pin Level field
18	PRESENT_STATE_CARD_DETECT_PIN_LEVEL	Card Detect Pin Level field
17	PRESENT_STATE_CARD_STATE_STABLE	Card State Stable field
16	PRESENT_STATE_CARD_INSERTED	Card Inserted field

SDC1_SDCC_HC_REG_24_26 (cont.)

Bits	Name	Description
11	PRESENT_STATE_BUF_RD_EN	Buffer Read Enable field
10	PRESENT_STATE_BUF_WR_EN	Buffer Write Enable field
9	PRESENT_STATE_RD_TRANS_ACT	Read Transfer Active field
8	PRESENT_STATE_WR_TRANS_ACT	Write Transfer Active field
3	PRESENT_STATE_RETUNING_REQ	Re-Tuning Request field
2	PRESENT_STATE_DATA_LINE_ACT	DAT Linr Active field
1	PRESENT_STATE_CMD_INHIBIT_DAT	Command Inhibit (DAT) field
0	PRESENT_STATE_CMD_INHIBIT_CMD	Command Inhibit (CMD) field

0x07824928 SDC1_SDCC_HC_REG_28_2A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of four registers from the SD Host Controller Standard Specification:

-Host Control 1 Register(7-0)

-Power Control Register(15-8)

-Block Gap Control Register(23-16)

-Wakeup Control Register(31-24)

SDC1_SDCC_HC_REG_28_2A

Bits	Name	Description
26	WKUP_EVENT_EN_ON_SD_CARD_REMOVAL	Wakeup Event Enable On SD Card Removal field from Wakeup Control Register
25	WKUP_EVENT_EN_ON_SD_CARD_INSERTION	Wakeup Event Enable On SD Card Insertion field from Wakeup Control Register
24	WKUP_EVENT_EN_ON_SD_CARD_INT	Wakeup Event Enable On Card Interrupt field from Wakeup Control Register
19	BLK_GAP_CTL_INT	Interrupt At Block Gap field from Block Gap Control Register

SDC1_SDCC_HC_REG_28_2A (cont.)

Bits	Name	Description
18	BLK_GAP_CTL_RD_WAIT	Read Wait Control field from Block Gap Control Register
17	BLK_GAP_CTL_CONTINUE_REQ	Continue Request field from Block Gap Control Register
16	BLK_GAP_CTL_STOP_GAP_REQ	Stop At Block Gap Request field from Block Gap Control Register
11:9	PWR_CTL_SD_BUS_VOLTAGE_SEL	SD Bus Voltage Select field from Power Control Register
8	PWR_CTL_SD_BUS_PWR	SD Bus Power field from Power Control Register
7	HST_CTL1_CARD_DETECT_SIGNAL_SEL	Card Detect Signal Selection field from Host Control 1 Register
6	HST_CTL1_CARD_DETECT_TEST_LEVEL	Card Detect Test Level field from Host Control 1 Register
5	HST_CTL1_EXTENDED_DATA_TRANS_WIDTH	Extended Data Transfer Width field from Host Control 1 Register
4:3	HST_CTL1_DMA_SEL	DMA Select field from Host Control 1 Register
2	HST_CTL1_HS_EN	High Speed Enable field from Host Control 1 Register
1	HST_CTL1_DATA_TRANS_WIDTH	Data Transfer Width field from Host Control 1 Register
0	HST_CTL1_LED_CTL	LED Control field from Host Control 1 Register

0x0782492C SDC1_SDCC_HC_REG_2C_2E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000001

Combination of three registers from the SD Host Controller Standard Specification:

-Clock Control Register(15-0)

-Timeout Control Register(23-16)

-Software Reset Register(31-24)

SDC1_SDCC_HC_REG_2C_2E

Bits	Name	Type	Description
26	SW_RST_DAT_LINE	RW	Software Reset For DAT Line field from Software Reset Register
25	SW_RST_CMD_LINE	RW	Software Reset For CMD Line field from Software Reset Register

SDC1_SDCC_HC_REG_2C_2E (cont.)

Bits	Name	Type	Description
24	SW_RST_FOR_ALL	RW	Software Reset For All field from Software Reset Register
19:16	DATA_TIMEOUT_COUNTER	RW	Data Timeout Counter Value field from Timeout Control Register. The reserved value 0xF is translated to maximum number of cycles - $2^{32}-1$
15:8	CLK_CTL_SDCLK_FREQ_SEL	RW	SDCLK Frequency Select field from Clock Control Register
7:6	CLK_CTL_SDCLK_FREQ_SEL_MSB	RW	Upper Bits of SDCLK Frequency Select field from Clock Control Register
5	CLK_CTL_GEN_SEL	RW	Clock Generator Select field from Clock Control Register
2	CLK_CTL_SDCLK_EN	RW	SD Clock Enable field from Clock Control Register
1	CLK_CTL_INTERNAL_CLK_STABLE	R	Internal Clock Stable field from Clock Control Register
0	CLK_CTL_INTERNAL_CLK_EN	RW	Internal Clock Enable field from Clock Control Register

0x07824930 SDC1_SDCC_HC_REG_30_32**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Normal Interrupt Status Register(15-0)

-Error Interrupt Status Register(31-16)

SDC1_SDCC_HC_REG_30_32

Bits	Name	Type	Description
31:28	ERR_INT_STS_VENDOR_SPECIFIC	RW	Vendor Specific Error Status field from Error Interrupt Status Register
26	ERR_INT_STS_TUNING_ERROR	RW	Tuning Error field from Error Interrupt Status Register
25	ERR_INT_STS_ADMA_ERR	RW	ADMA Error field from Error Interrupt Status Register
24	ERR_INT_STS_AUTO_CMD_ERR	RW	Auto CMD Error field from Error Interrupt Status Register
23	ERR_INT_STS_CURRENT_LIMIT_ERR	RW	Current Limit Error field from Error Interrupt Status Register
22	ERR_INT_STS_DATA_END_BIT_ERR	RW	Data End Bit Error field from Error Interrupt Status Register

SDC1_SDCC_HC_REG_30_32 (cont.)

Bits	Name	Type	Description
21	ERR_INT_STS_DATA_CRC_ERR	RW	Data CRC Error field from Error Interrupt Status Register
20	ERR_INT_STS_DATA_TIMEOUT_ERR	RW	Data Timeout Error field from Error Interrupt Status Register
19	ERR_INT_STS_CMD_IDX_ERR	RW	Command Index Error field from Error Interrupt Status Register
18	ERR_INT_STS_CMD_END_BIT_ERR	RW	Command End Bit Error field from Error Interrupt Status Register
17	ERR_INT_STS_CMD_CRC_ERR	RW	Command CRC Error field from Error Interrupt Status Register
16	ERR_INT_STS_CMD_TIMEOUT_ERR	RW	Command Timeout Error field from Error Interrupt Status Register
15	NORMAL_INT_STS_ERR_INT	R	Error Interrupt field from Normal Interrupt Status Register
12	NORMAL_INT_STS_RETUNING_EVENT	R	Re-Tuning Event field from Normal Interrupt Status Register
11	NORMAL_INT_STS_INT_C	R	INT_C field from Normal Interrupt Status Register
10	NORMAL_INT_STS_INT_B	R	INT_B field from Normal Interrupt Status Register
9	NORMAL_INT_STS_INT_A	R	INT_A field from Normal Interrupt Status Register
8	NORMAL_INT_STS_CARD_INT	R	Card Interrupt field from Normal Interrupt Status Register
7	NORMAL_INT_STS_CARD_REMOVAL	RW	Card Removal field from Normal Interrupt Status Register
6	NORMAL_INT_STS_CARD_INSERTION	RW	Card Insertion field from Normal Interrupt Status Register
5	NORMAL_INT_STS_BUF_RD_READY	RW	Buffer Read Ready field from Normal Interrupt Status Register
4	NORMAL_INT_STS_BUF_WR_READY	RW	Buffer Write Ready field from Normal Interrupt Status Register
3	NORMAL_INT_STS_DMA_INT	RW	DMA Interrupt field from Normal Interrupt Status Register
2	NORMAL_INT_STS_BLK_GAP_EVENT	RW	Block Gap Event field from Normal Interrupt Status Register
1	NORMAL_INT_STS_TRANS_COMPLETE	RW	Transfer Complete field from Normal Interrupt Status Register
0	NORMAL_INT_STS_CMD_COMPLETE	RW	Command Complete field from Normal Interrupt Status Register

0x07824934 SDC1_SDCC_HC_REG_34_36**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Normal Interrupt Status Enable Register(15-0)

-Error Interrupt Status Enable Register(31-16)

SDC1_SDCC_HC_REG_34_36

Bits	Name	Description
31:28	ERR_INT_STS_EN_VENDOR_SPECIFIC_ERR	Vendor Specific Error Status Enable field from Error Interrupt Status Enable Register
26	ERR_INT_STS_EN_TUNING_ERR	Tuning Error Status Enable field from Error Interrupt Status Enable Register
25	ERR_INT_STS_EN_ADMA_ERR	ADMA Error Status Enable field from Error Interrupt Status Enable Register
24	ERR_INT_STS_EN_AUTO_CMD_ERR	Auto CMD Error Status Enable field from Error Interrupt Status Enable Register
23	ERR_INT_STS_EN_CURRENT_LIMIT_ERR	Current Limit Error Status Enable field from Error Interrupt Status Enable Register
22	ERR_INT_STS_EN_DATA_END_BIT_ERR	Data End Bit Error Status Enable field from Error Interrupt Status Enable Register
21	ERR_INT_STS_EN_DATA_CRC_ERR	Data CRC Error Status Enable field from Error Interrupt Status Enable Register
20	ERR_INT_STS_EN_DATA_TIMEOUT	Data Timeout Error Status Enable field from Error Interrupt Status Enable Register
19	ERR_INT_STS_EN_CMD_INDEX_ERR	Command Index Error Status Enable field from Error Interrupt Status Enable Register
18	ERR_INT_STS_EN_CMD_END_BIT_ERR	Command End Bit Error Status Enable field from Error Interrupt Status Enable Register
17	ERR_INT_STS_EN_CMD_CRC_ERR	Command CRC Error Status Enable field from Error Interrupt Status Enable Register
16	ERR_INT_STS_EN_CMD_TIMEOUT	Command Timeout Error Status Enable field from Error Interrupt Status Enable Register
12	NORMAL_INT_STS_EN_RE_TUNING_EVENT	Re-Tuning Event Status Enable field from Normal Interrupt Status Enable Register
11	NORMAL_INT_STS_EN_INT_C	INT_C Status Enable field from Normal Interrupt Status Enable Register
10	NORMAL_INT_STS_EN_INT_B	INT_B Status Enable field from Normal Interrupt Status Enable Register

SDC1_SDCC_HC_REG_34_36 (cont.)

Bits	Name	Description
9	NORMAL_INT_STS_EN_INT_A	INT_A Status Enable field from Normal Interrupt Status Enable Register
8	NORMAL_INT_STS_EN_CARD_INT	Card Interrupt Status Enable field from Normal Interrupt Status Enable Register
7	NORMAL_INT_STS_EN_CARD_REMOVAL	Card Removal Status Enable field from Normal Interrupt Status Enable Register
6	NORMAL_INT_STS_EN_CARD_INSERTION	Card Insertion Status Enable field from Normal Interrupt Status Enable Register
5	NORMAL_INT_STS_EN_BUFFER_RD_READY	Buffer Read Ready Status Enable field from Normal Interrupt Status Enable Register
4	NORMAL_INT_STS_EN_BUFFER_WR_READY	Buffer Write Ready Status Enable field from Normal Interrupt Status Enable Register
3	NORMAL_INT_STS_EN_DMA_A_INT	DMA Interrupt Status Enable field from Normal Interrupt Status Enable Register
2	NORMAL_INT_STS_EN_BLOCK_GAP_EVENT	Block Gap Event Status Enable field from Normal Interrupt Status Enable Register
1	NORMAL_INT_STS_EN_TRANSFER_COMPLETE	Transfer Complete Status Enable field from Normal Interrupt Status Enable Register
0	NORMAL_INT_STS_EN_COMMAND_COMPLETE	Command Complete Status Enable field from Normal Interrupt Status Enable Register

0x07824938 SDC1_SDCC_HC_REG_38_3A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Normal Interrupt Signal Enable Register(15-0)

-Error Interrupt Signal Enable Register(31-16)

SDC1_SDCC_HC_REG_38_3A

Bits	Name	Type	Description
31:28	ERR_INT_SIGNAL_EN_VENDOR_SPECIFIC_ERR	RW	Vendor Specific Error Signal Enable field from Error Interrupt Signal Enable Register
26	ERR_INT_SIGNAL_EN_TUNING_ERR	RW	Tuning Error Signal Enable field from Error Interrupt Signal Enable Register
25	ERR_INT_SIGNAL_EN_ADMA_ERR	RW	ADMA Error Signal Enable field from Error Interrupt Signal Enable Register

SDC1_SDCC_HC_REG_38_3A (cont.)

Bits	Name	Type	Description
24	ERR_INT_SIGNAL_EN_AU TO_CMD_ERR	RW	Auto CMD Error Signal Enable field from Error Interrupt Signal Enable Register
23	ERR_INT_SIGNAL_EN_CU RRENT_LIMIT_ERR	RW	Current Limit Error Signal Enable field from Error Interrupt Signal Enable Register
22	ERR_INT_SIGNAL_EN_DAT A_END_BIT_ERR	RW	Data End Bit Error Signal Enable field from Error Interrupt Signal Enable Register
21	ERR_INT_SIGNAL_EN_DAT A_CRC_ERR	RW	Data CRC Error Signal Enable field from Error Interrupt Signal Enable Register
20	ERR_INT_SIGNAL_EN_DAT A_TIMEOUT	RW	Data Timeout Error Signal Enable field from Error Interrupt Signal Enable Register
19	ERR_INT_SIGNAL_EN_CM D_INDX_ERR	RW	Command Index Error Signal Enable field from Error Interrupt Signal Enable Register
18	ERR_INT_SIGNAL_EN_CM D_END_BIT_ERR	RW	Command End Bit Error Signal Enable field from Error Interrupt Signal Enable Register
17	ERR_INT_SIGNAL_EN_CM D_CRC_ERR	RW	Command CRC Error Signal Enable field from Error Interrupt Signal Enable Register
16	ERR_INT_SIGNAL_EN_CM D_TIMEOUT	RW	Command Timeout Error Signal Enable field from Error Interrupt Signal Enable Register
15	NORMAL_INT_SIGNAL_EN _ERR_INT	R	Error Interrupt Signal Enable field from Normal Interrupt Signal Enable Register
12	NORMAL_INT_SIGNAL_EN _RETUNING_EVENT	RW	Re-Tuning Event Signal Enable field from Normal Interrupt Signal Enable Register
11	NORMAL_INT_SIGNAL_EN _INT_C	RW	INT_C Signal Enable field from Normal Interrupt Signal Enable Register
10	NORMAL_INT_SIGNAL_EN _INT_B	RW	INT_B Signal Enable field from Normal Interrupt Signal Enable Register
9	NORMAL_INT_SIGNAL_EN _INT_A	RW	INT_A Signal Enable field from Normal Interrupt Signal Enable Register
8	NORMAL_INT_SIGNAL_EN _CARD_INT	RW	Card Interrupt Signal Enable field from Normal Interrupt Signal Enable Register
7	NORMAL_INT_SIGNAL_EN _CARD_REMOVAL	RW	Card Removal Signal Enable field from Normal Interrupt Signal Enable Register
6	NORMAL_INT_SIGNAL_EN _CARD_INSERTION	RW	Card Insertion Signal Enable field from Normal Interrupt Signal Enable Register
5	NORMAL_INT_SIGNAL_EN _BUF_RD_READY	RW	Buffer Read Ready Signal Enable field from Normal Interrupt Signal Enable Register
4	NORMAL_INT_SIGNAL_EN _BUF_WR_READY	RW	Buffer Write Ready Signal Enable field from Normal Interrupt Signal Enable Register
3	NORMAL_INT_SIGNAL_EN _DMA_INT	RW	DMA Interrupt Signal Enable field from Normal Interrupt Signal Enable Register

SDC1_SDCC_HC_REG_38_3A (cont.)

Bits	Name	Type	Description
2	NORMAL_INT_SIGNAL_EN_BLK_GAP_EVENT	RW	Block Gap Event Signal Enable field from Normal Interrupt Signal Enable Register
1	NORMAL_INT_SIGNAL_EN_TRANS_COMPLETE	RW	Transfer Complete Signal Enable field from Normal Interrupt Signal Enable Register
0	NORMAL_INT_SIGNAL_EN_CMD_COMPLETE	RW	Command Complete Signal Enable field from Normal Interrupt Signal Enable Register

0x0782493C SDC1_SDCC_HC_REG_3C_3E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Auto CMD Error Status Register(15-0)

-Host Control 2 Register(31-16)

SDC1_SDCC_HC_REG_3C_3E

Bits	Name	Type	Description
31	HST_CTL2_PRESET_VALUE_EN	RW	Preset Value Enable field from Host Control2 Register
30	HST_CTL2_ASYNC_INTERRUPT_ENABLE	RW	Asynchronous Interrupt Enable field from Host Control2 Register
23	HST_CTL2_SAMPLING_CLOCK_SELECT	RW	Sampling Clock Select field from Host Control2 Register
22	HST_CTL2_EXECUTE_TUNING	RW	Execute Tuning field from Host Control2 Register
21:20	HST_CTL2_DRIVER_STRENGTH_SELECT	RW	Driver Strength Select field from Host Control2 Register
19	HST_CTL2_SIGNALING_1_8V_ENABLE	RW	1.8V Signaling Enable field from Host Control2 Register
18:16	HST_CTL2_UHS_MODE_SELECT	RW	UHS Mode Select field from Host Control2 Register
7	AUTO_CMD_NOT_ISSUED_BY_AUTO_CMD12	R	Command Not issued By Auto CMD12 Error field from Auto CMD Error Status Register
4	AUTO_CMD_INDEX_ERROR	R	Auto CMD Index Error field from Auto CMD Error Status Register
3	AUTO_CMD_END_BIT_ERROR	R	Auto CMD End Bit Error field from Auto CMD Error Status Register

SDC1_SDCC_HC_REG_3C_3E (cont.)

Bits	Name	Type	Description
2	AUTO_CMD_CRC_ERR	R	Auto CMD CRC Error field from Auto CMD Error Status Register
1	AUTO_CMD_TIMEOUT	R	Auto CMD Timeout Error field from Auto CMD Error Status Register
0	AUTO_CMD12_NOT_EXEC	R	Auto CMD12 Not Executed field from Auto CMD Error Status Register

0x07824940 SDC1_SDCC_HC_REG_40_42**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x3029C8B2

The 32 LSBs of the Capabilities Register in SD Host Controller Standard Specification

SDC1_SDCC_HC_REG_40_42

Bits	Name	Description
31:30	CAPABILITIES_SLOT_TYPE	Slot Type field from Capabilities Register
29	CAPABILITIES_ASYNC_INT_SUPPORT	Asynchronous Interrupt Support field from Capabilities Register
28	CAPABILITIES_SYS_BUS_SUPPORT_64_BIT	64 bit System Bus Support field from Capabilities Register
26	CAPABILITIES_VOLTAGE_SUPPORT_1_8V	Voltage Support 1.8v field from Capabilities Register
25	CAPABILITIES_VOLTAGE_SUPPORT_3_0V	Voltage Support 3.0v field from Capabilities Register
24	CAPABILITIES_VOLTAGE_SUPPORT_3_3V	Voltage Support 3.3v field from Capabilities Register
23	CAPABILITIES_SUSPEND_RESUME_SUPPORT	Suspend Resume Support field from Capabilities Register
22	CAPABILITIES_SDMA_SUPPORT	SDMA Support field from Capabilities Register
21	CAPABILITIES_HS_SUPPORT	High Speed Support field from Capabilities Register
19	CAPABILITIES_ADMA2_SUPPORT	ADMA2 Support field from Capabilities Register
18	CAPABILITIES_SUPPORT_8_BIT	8 bit Supported For Embedded Product field from Capabilities Register
17:16	CAPABILITIES_MAX_BLK_LENGTH	Max Block Length field from Capabilities Register

SDC1_SDCC_HC_REG_40_42 (cont.)

Bits	Name	Description
15:8	CAPABILITIES_BASE_SDCLK_FREQ	Base Clock Frequency For SD Clock field from Capabilities Register
7	CAPABILITIES_TIMEOUT_CLK_UNIT	Timeout Clock Unit field from Capabilities Register
5:0	CAPABILITIES_TIMEOUT_CLK_FREQ	Timeout Clock Frequency field from Capabilities Register

0x07824944 SDC1_SDCC_HC_REG_44_46**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00008007

The 32 MSBs of the Capabilities Register in SD Host Controller Standard Specification

SDC1_SDCC_HC_REG_44_46

Bits	Name	Description
23:16	CAPABILITIES_CLK_MULTIPLIER	Clock Multiplier field from Capabilities Register
15:14	CAPABILITIES_RETUNING_MODE	Re-Tuning Modes field from Capabilities Register
13	CAPABILITIES_USE_TUNING_FOR_SDR50	Use Tuning for SDR50 field from Capabilities Register
11:8	CAPABILITIES_TIMER_CNT_FOR_RETUNING	Timer Count for Re-Tuning field from Capabilities Register
6	CAPABILITIES_DRIVER_TYPE_D_SUPPORT	Driver Type D Support field from Capabilities Register
5	CAPABILITIES_DRIVER_TYPE_C_SUPPORT	Driver Type C Support field from Capabilities Register
4	CAPABILITIES_DRIVER_TYPE_A_SUPPORT	Driver Type A Support field from Capabilities Register
2	CAPABILITIES_DDR_50_SUPPORT	DDR50 Support field from Capabilities Register
1	CAPABILITIES_SDR_104_SUPPORT	SDR104 Support field from Capabilities Register
0	CAPABILITIES_SDR_50_SUPPORT	SDR50 Support field from Capabilities Register

0x07824948 SDC1_SDCC_HC_REG_48_4A**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Maximum Current Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_48_4A

Bits	Name	Description
23:16	MAX_CURRENT_1_8V	Maximum Current for 1.8v field from Maximum Current Capabilities Register
15:08	MAX_CURRENT_3_0V	Maximum Current for 3.0v field from Maximum Current Capabilities Register
07:00	MAX_CURRENT_3_3V	Maximum Current for 3.3v field from Maximum Current Capabilities Register

0x07824950 SDC1_SDCC_HC_REG_50_52**Type:** W**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Force Event Register for Auto CMD Error Status(15-0)

-Force Event Register for Error Interrupt Status(31-16)

SDC1_SDCC_HC_REG_50_52

Bits	Name	Description
31:28	FORCE_EVENT_FOR_ERR_VENDOR_SPECIFIC_ERR_STS	Force Event for Vendor Specific Error Status field from Force Event Register for Error Interrupt Status
25	FORCE_EVENT_FOR_ERR_ADMA	Force Event for ADMA Error field from Force Event Register for Error Interrupt Status
24	FORCE_EVENT_FOR_ERR_AUTO_CMD	Force Event for Auto CMD Error field from Force Event Register for Error Interrupt Status
23	FORCE_EVENT_FOR_ERR_CURRENT_LIMIT	Force Event for Current Limit Error field from Force Event Register for Error Interrupt Status
22	FORCE_EVENT_FOR_ERR_DATA_END_BIT	Force Event for Data End Bit Error field from Force Event Register for Error Interrupt Status
21	FORCE_EVENT_FOR_ERR_DATA_CRC	Force Event for Data CRC Error field from Force Event Register for Error Interrupt Status

SDC1_SDCC_HC_REG_50_52 (cont.)

Bits	Name	Description
20	FORCE_EVENT_FOR_ERR_DATA_TIMEOUT	Force Event for Data Timeout Error field from Force Event Register for Error Interrupt Status
19	FORCE_EVENT_FOR_ERR_CMD_INDX	Force Event for Command Index Error field from Force Event Register for Error Interrupt Status
18	FORCE_EVENT_FOR_ERR_CMD_END_BIT	Force Event for Command End Bit Error field from Force Event Register for Error Interrupt Status
17	FORCE_EVENT_FOR_ERR_CMD_CRC	Force Event for Command CRC Error field from Force Event Register for Error Interrupt Status
16	FORCE_EVENT_FOR_ERR_CMD_TIMEOUT	Force Event for Command Timeout Error field from Force Event Register for Error Interrupt Status
7	FORCE_EVENT_FOR_CMD_NOT_ISSUED_BY_AUTO_CMD12	Force Event for Command Not Issued By Auto CMD12 Error field from Force Event Register for Auto CMD Error Status
4	FORCE_EVENT_FOR_AUTO_CMD_INDX_ERR	Force Event for Auto CMD Index Error field from Force Event Register for Auto CMD Error Status
3	FORCE_EVENT_FOR_AUTO_CMD_END_BIT_ERR	Force Event for Auto CMD End Bit Error field from Force Event Register for Auto CMD Error Status
2	FORCE_EVENT_FOR_AUTO_CMD_CRC_ERR	Force Event for Auto CMD CRC Error field from Force Event Register for Auto CMD Error Status
1	FORCE_EVENT_FOR_AUTO_CMD_TIMEOUT_ERR	Force Event for Auto CMD Timeout Error field from Force Event Register for Auto CMD Error Status
0	FORCE_EVENT_FOR_AUTO_CMD12_NOT_EXEC	Force Event for Auto CMD12 Not Executed field from Force Event Register for Auto CMD Error Status

0x07824954 SDC1_SDCC_HC_REG_54_56**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

The 7 LSBs are the ADMA Error Status Register in SD Host Controller Standard Specification.
The Bits 31-8 are unused.

SDC1_SDCC_HC_REG_54_56

Bits	Name	Description
2	ADMA_LENGTH_MISMATCH_ERR	ADMA Length Mismatch Error field from ADMA Error Status Register
1:0	ADMA_ERR_STATE	ADMA Error State field from ADMA Error Status Register

0x07824958 SDC1_SDCC_HC_REG_58_5A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

The 32 LSBs of the ADMA System Address Register in SD Host Controller Standard Specification

SDC1_SDCC_HC_REG_58_5A

Bits	Name	Description
31:00	ADMA_SYS_ADDRESS	ADMA System Address field from ADMA System Address Register

0x0782495C SDC1_SDCC_HC_REG_5C_5E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

The 32 MSBs of the ADMA System Address Register in SD Host Controller Standard Specification

SDC1_SDCC_HC_REG_5C_5E

Bits	Name	Description
31:00	ADMA_SYS_ADDRESS_64	upper 32 bits of ADMA System Address field from ADMA System Address Register

0x07824960 SDC1_SDCC_HC_REG_60_62**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00040000

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for Initialization Register(15-0)

-Preset Value for Default Speed Register(31-16)

SDC1_SDCC_HC_REG_60_62

Bits	Name	Description
31:30	DEFAULT_SPEED_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for Default Speed

SDC1_SDCC_HC_REG_60_62 (cont.)

Bits	Name	Description
26	DEFAULT_SPEED_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for Default Speed
25:16	DEFAULT_SPEED_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for Default Speed
15:14	INIT_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for Initialization
10	INIT_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for Initialization
9:0	INIT_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for Initialization

0x07824964 SDC1_SDCC_HC_REG_64_66**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00040002

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for High Speed Register(15-0)

-Preset Value for SDR12 Register

SDC1_SDCC_HC_REG_64_66

Bits	Name	Description
31:30	SDR12_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR12
26	SDR12_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR12
25:16	SDR12_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR12
15:14	HS_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for High Speed
10	HS_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for High Speed
9:0	HS_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for High Speed

0x07824968 SDC1_SDCC_HC_REG_68_6A**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00010002

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for SDR25 Register(15-0)

-Preset Value for SDR50 Register

SDC1_SDCC_HC_REG_68_6A

Bits	Name	Description
31:30	SDR50_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR50
26	SDR50_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR50
25:16	SDR50_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR50
15:14	SDR25_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR25
10	SDR25_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR25
9:0	SDR25_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR25

0x0782496C SDC1_SDCC_HC_REG_6C_6E**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00020000

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for SDR104 Register(15-0)

-Preset Value for DDR50 Register

SDC1_SDCC_HC_REG_6C_6E

Bits	Name	Description
31:30	DDR50_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for DDR50
26	DDR50_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for DDR50
25:16	DDR50_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for DDR50
15:14	SDR104_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR104

SDC1_SDCC_HC_REG_6C_6E (cont.)

Bits	Name	Description
10	SDR104_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR104
9:0	SDR104_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR104

0x078249E0 SDC1_SDCC_HC_REG_E0_E2**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Shared Bus Control Register in SD Host Controller Standard Specification.

SDC1_SDCC_HC_REG_E0_E2

Bits	Name	Type	Description
30:24	SHARED_BUS_CTL_BACK_END_PWR	RW	Back End Power Control field from Shared Bus Control Register
22:20	SHARED_BUS_INT_PIN_SEL	RW	
18:16	SHARED_BUS_CTL_CLK_PIN_SEL	RW	Clock Pin Select field from Shared Bus Control Register
14:8	SHARED_BUS_CTL_BUS_WIDTH_PRESET	R	Bus Width Preset field from Shared Bus Control Register
5:4	SHARED_BUS_CTL_NUM_INTERRUPT_INPUT_PINS	R	Number Of Interrupt Input Pins field from Shared Bus Control Register
2:0	SHARED_BUS_CTL_NUM_CLK_PINS	R	Number of Clock Pins field from Shared Bus Control Register

0x078249FC SDC1_SDCC_HC_REG_FC_FE**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00020000

Combination of two registers from the SD Host Controller Standard Specification:

-Slot Interrupt Status Register(15-0)

-Host Controller Version Register

SDC1_SDCC_HC_REG_FC_FE

Bits	Name	Type	Description
31:24	HC_VENDOR_VERSION_NUM	R	Vendor Version Number field from Host Controller Version Register
23:16	HC_SPEC_VERSION_NUM	R	Specification Version Number field from Host Controller Version Register
7:0	INT_SIGNAL_FOR_EACH_SLOT	RW	Interrupt Signal For Each Slot field from Slot Interrupt Status Register

0x07824A00 SDC1_SDCC_HC_REG_DLL_CONFIG**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x60006400

This register configures the DLL's inputs.

SDC1_SDCC_HC_REG_DLL_CONFIG

Bits	Name	Description
31	SDC4_DIS_DOUT	When this bit equals to '0', the data which comes out from the dll is valid. When it equals to '1' this data isn't valid. The inversion of this bit is connected to dll's input - dll_en_dout
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 - 112 (MHz) Value 001 -112 - 125 Value 010 -125 - 137 Value 011 -137 - 150 Value 100 -150 - 162 Value 101 -162 - 175 Value 110 -175 - 187 Value 111 -187 - 200

SDC1_SDCC_HC_REG_DLL_CONFIG (cont.)

Bits	Name	Description
23:20	CDR_SELECT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is '1')
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 2 cycles Value 01 - 4 cycles (default) Value 10 - 8 cycles Value 11 - 16 cycles
9	CDR_ALGORITHM_SEL	CDR algorithm select Value 0 - Edge (default) Value 1 - Level

SDC1_SDCC_HC_REG_DLL_CONFIG (cont.)

Bits	Name	Description
0	CMD_DAT_TRACK_SEL	Select DAT or CMD lines for CDR tracking Value 0 - track DAT inputs (default) Value 1 - track CMD input

0x07824A08 SDC1_SDCC_HC_REG_DLL_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

This register is connected to cm_dll_sdc4's status output.

SDC1_SDCC_HC_REG_DLL_STATUS

Bits	Name	Description
12	SDC4_DTEST_MUXSEL	Digital test mux select
11	DDR_DLL_LOCK_JDR	Reserved
10:9	SDC4_DLL_DTEST_OUT_A TPG	SDC4_DLL_DTEST_OUT output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
8	SDC4_DLL_LOCK_ATPG	SDC4_DLL_LOCK output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC1_SDCC_HC_REG_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done

0x07824A0C SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000A1C**SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC**

Bits	Name	Description
31:22	HC_AUTO_CMD_COUNTER	This counter will determine the time between two auto commands transmissions
21:19	HC_SELECT_IN	Selecting the SD controller's mode. Equivalent to SELECT_IN filed in MCI_CLK
18	HC_SELECT_IN_EN	Enabling the selection of mode via the vendor specific register
17	ADMA_DESC_PRIORITY	If set (1) then the ADMA's descriptors SM gets priority on the data accesses. Not Applicabale for Gandalf.
16	HC_IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
15	HC_IO_PAD_PWR_SWITCH_EN	This Bit enables the use of HC_IO_PAD_PWR_SWITCH
14	HC_IGNORE_CTOUT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). See note #4 below.

SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC (cont.)

Bits	Name	Description
13	HC_SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
12	HC_INVERT_OUT	value: 0 data and cmd are driven by falling edge value 1: data and cmd are driven by rising edge.
11	HC_INVERT_OUT_EN	value 1: HC_INVERT_OUT is driven by bit 12 of HC_VENDOR_SPECIFIC_FUNC (HC_INVERT_OUT) value 0: HC_INVERT_OUT is driven by HST_CTL1_HS_EN .
10	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer. Can be used in bus testing procedure
9:8	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 1 - feedback clock from CLK pad Value 2 (default) - free running MCLK (gated between the transactions) Value 3 - free running MCLK divided by 2
7	ADMA_ERR_SIZE_EN	enabling interrupt for mismatch error in ADMA2
6	HC_AUTO_CMD21_EN	Enabling bit for the auto command 21 option. value 0: disable value 1:enable
5	HC_AUTO_CMD19_EN	Enabling bit for the auto command 19 option. value 0: disable value 1:enable
4	HC_HCLKON_SW_EN	SW enable of AHB clock request of SDCC5. value 0: HW clock request mechanism is used value 1: clock request signal is always high
3	ADMA_BUSREQ_EN	enabling the fix in ADMA2 for busrequest
2	FLOW_EN	Enable flow control: value 0: disable value 1: enable (default)
1	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
0	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.

0x07824A10 SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC2**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0xF88218A8**SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC2**

Bits	Name	Type	Description
31	QSB_AXI_ABURST	RW	Driving QSB AXI output
30:28	NUM_OUTSTANDING_DATA	RW	Configuring the number of outstanding transactions for the data. The descriptors accesses have more one outstanding request
27	PROCEED_AXI_AFTER_ERROR	RW	When error occurs on AXI master the traffic can continue or terminate. If this bit is set then the traffic continues and more requests are transmitted on the address channel
26	QSB_AXI_AFULL_CALC	RW	If this bit is set, then afull isn't '0' constantly but can be equal to '1' if all the beats have 8 bytes on the strobe lines
25	ONE_MID_SUPPORT	RW	If this bit is set, then only 1 MID is used for descriptors and data
24:22	RESERVED	RW	Reserved
21	HC_SW_RST_REQ	RW	Before executing HC_SW_RST_FOR_ALL or HC_SW_RST_FOR_DAT this bit can be set and SW needs to polls on it until it's being cleared. The bit is cleared after AXI master (QMB) has finished processing the outstanding transactions and it's in IDLE state. This bit can be useful for HPI feature.
20	HC_SW_RST_WAIT_IDLE_DIS	RW	When this bit is cleared, the HC_SW_RST is executed only after the AXI master (QMB) is in IDLE state. This bit Can be used for HPI feature instead of polling on HC_SW_RST_REQ bit. This bit should be cleared for SW reset from unknown states.
19	SDCC5_HALT_REQ	R	Reading SDCC5_HALT_REQ input
18	SDCC5_HALT_ACK	R	Reading SDCC5_HALT_ACK output
17	SDCC5_M_IDLE	R	Reading SDCC5_M_IDLE output
16	SDCC5_HALT_ACK_SW_EN	RW	Enabling the SW value for SDCC5_HALT_ACK
15	SDCC5_HALT_ACK_SW	RW	Driving SDCC5_HALT_ACK from SW and not by HW
14	SDCC5_M_IDLE_DIS	RW	If this bit is set, then sdcc5_m_idle will be tied low
13	QSB_AXI_INTERLEAVING_EN	RW	If the bit is set, then the controller can support interleaving between two bursts from the Noc. This option is disabled by default because Noc doesn't support interleaving but only re-ordering
12	RESERVED	RW	Reserved

SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC2 (cont.)

Bits	Name	Type	Description
11	RESERVED	RW	Reserved
10:9	RESERVED	RW	Reserved
8:6	RESERVED	RW	Reserved
5	RESERVED	RW	Reserved
4	RESERVED	RW	Reserved
3	RESERVED	RW	Reserved
2	QSB_AXI_OOOWR	RW	Driving QSB AXI output
1	QSB_AXI_OOORD	RW	Driving QSB AXI output
0	QSB_AXI_AFULL	RW	Driving QSB AXI output

0x07824A14 SDC1_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR0**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Last AHB address phase before response error was detected

SDC1_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR0

Bits	Name	Description
31	RESP_ERR_WR	If set, then the failed transaction was a write access
30:28	RESP_ERR_TID	The TID of the failed transaction
27:13	DESC_ADDR_35_21	Upper 15 bits of current address in address channel
12:0	DESC_ADDR_12_0	Lower 13 bits of current address in address channel

0x07824A18 SDC1_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR1**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Last AHB attributes before response error was detected

SDC1_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR1

Bits	Name	Description
21:20	AHB_MON_HTRANS	Htrans control bits from AHB in the last address phase before getting the response error
19	AHB_MON_WO_REQ	indication that the current master got the response error w/o asserting hbusreq
18:16	AHB_MON_HBURST	Hburst control bits from AHB in the last address phase before getting the response error
15	AHB_MON_HWRITE	Hwrite control bits from AHB in the last address phase before getting the response error
14:12	AHB_MON_HSIZE	Hsize control bits from AHB in the last address phase before getting the response error
11:8	AHB_MON_HPROT	Hprot control bits from AHB in the last address phase before getting the response error
7:0	AHB_MON_CUR_MASTER	Indication on the last bus master which accessed to AHB bus

0x07824A1C SDC1_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES0**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

driving the HC_REG_40_42 register

SDC1_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES0

Bits	Name	Description
31:30	VS_CAPABILITIES_SLOT_T YPE	Slot Type field from Capabilities Register
29	VS_CAPABILITIES_ASYNC_ INT_SUPPORT	Asynchronous Interrupt Support field from Capabilities Register
28	VS_CAPABILITIES_SYS_BU S_SUPPORT_64_BIT	64 bit System Bus Support field from Capabilities Register
26	VS_CAPABILITIES_VOLTAG E_SUPPORT_1_8V	Voltage Support 1.8v field from Capabilities Register
25	VS_CAPABILITIES_VOLTAG E_SUPPORT_3_0V	Voltage Support 3.0v field from Capabilities Register
24	VS_CAPABILITIES_VOLTAG E_SUPPORT_3_3V	Voltage Support 3.3v field from Capabilities Register
23	VS_CAPABILITIES_SUSPE ND_RESUME_SUPPORT	Suspend Resume Support field from Capabilities Register

SDC1_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES0 (cont.)

Bits	Name	Description
22	VS_CAPABILITIES_SDMA_SUPPORT	SDMA Support field from Capabilities Register
21	VS_CAPABILITIES_HS_SUPPORT	High Speed Support field from Capabilities Register
19	VS_CAPABILITIES_ADMA2_SUPPORT	ADMA2 Support field from Capabilities Register
18	VS_CAPABILITIES_SUPPОРТ_8_BIT	8 bit Supported For Embedded Product field from Capabilities Register
17:16	VS_CAPABILITIES_MAX_BLOCK_LENGTH	Max Block Length field from Capabilities Register
15:8	VS_CAPABILITIES_BASE_SDCLK_FREQ	Base Clock Frequency For SD Clock field from Capabilities Register
7	VS_CAPABILITIES_TIMEOUT_CLK_UNIT	Timeout Clock Unit field from Capabilities Register
5:0	VS_CAPABILITIES_TIMEOUT_CLK_FREQ	Timeout Clock Frequency field from Capabilities Register

0x07824A20 SDC1_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES1**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x02008007

driving the HC_REG_44_46 register and spec version

SDC1_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES1

Bits	Name	Description
31:24	SPEC_VERSION	driving HC_SPEC_VERSION_NUM field in HC_REG_FC_FE register
23:16	VS_CAPABILITIES_CLK_MULTIPLIER	Clock Multiplier field from Capabilities Register
15:14	VS_CAPABILITIES_RETUNING_MODE	Re-Tuning Modes field from Capabilities Register
13	VS_CAPABILITIES_USE_TUNING_FOR_SDR50	Use Tuning for SDR50 field from Capabilities Register
11:8	VS_CAPABILITIES_TIMER_CNT_FOR_RETUNING	Timer Count for Re-Tuning field from Capabilities Register
6	VS_CAPABILITIES_DRIVER_TYPE_D_SUPPORT	Driver Type D Support field from Capabilities Register

SDC1_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES1 (cont.)

Bits	Name	Description
5	VS_CAPABILITIES_DRIVER_TYPE_C_SUPPORT	Driver Type C Support field from Capabilities Register
4	VS_CAPABILITIES_DRIVER_TYPE_A_SUPPORT	Driver Type A Support field from Capabilities Register
2	VS_CAPABILITIES_DDR_50_SUPPORT	DDR50 Support field from Capabilities Register
1	VS_CAPABILITIES_SDR_104_SUPPORT	SDR104 Support field from Capabilities Register
0	VS_CAPABILITIES_SDR_50_SUPPORT	SDR50 Support field from Capabilities Register

0x07824A24 SDC1_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_CTRL**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x0000382B

Control register of T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC1_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_CTRL

Bits	Name	Description
15:14	T4_DLY_SPARE_CTL	
13	T4_DLY_POWERDOWN_EN	Powerdown enable. When asserted (default), it powers down the T/4 macro and shuts off all bias circuits.
12:11	T4_DLY_TESTOUT_SEL	Test output select. When toggled, it presents either the strb_in or strb_out on the analog test port for debug.
10	T4_DLY_BYPASS_EN	Bypass enable. When asserted it presents the strb_in on the strb_out port.
9	T4_DLY_CAL_START	Calibration start input. When asserted, it indicates the start of the calibration cycle.
8	T4_DLY_CAL_OVERRIDE	Calibration override input. When asserted, the internal delay line calibration is bypassed and the tby4_user_ctl<7:0> is used as the default code for the delay line.
7:0	T4_DLY_TARGET_CODE	T/4 delay target code. 0x2b gives delay of 1.25ns

0x07824A28 SDC1_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_STAT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Status register T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC1_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_STAT

Bits	Name	Description
15:14	T4_DLY_SPARE_OUT	Spare status bits.
13	T4_DLY_CAL_DLY_CODE_FAST_RANGE	Calibrated delay code, indicates the fast range selection bit status.
12:6	T4_DLY_CAL_DLY_CODE_ISEL	Calibrated delay code, indicates the isel programming value for the bias generator.
5:4	T4_DLY_CAL_DLY_CODE_RSEL	Calibrated delay code, indicates the rsel programming value for the bias generator.
3:0	T4_DLY_STATE_DESC	T/4 state descriptor. Indicates the calibration status and result. value 4'b0000: Indicates Reset mode, waiting for cal_start signal. value 4'b0111: Indicates the fast range decision completion. value 4'b0100: Indicates rsel adjustment decision. value 4'b1011: Indicates isel adjustment decision. value 4'b1110: Indicates Normal end-of-cal. value 4b'1111: Indicates Maximum Delay Reached

0x07824A30 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x07824A34 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x07824A38 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x07824A3C SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG1 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x07824A40 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x07824A44 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register HC_VENDOR_SPECIFIC_CSR_CDC_COARSE_CAL_CFG configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x07824A48 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_RSVD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_RSVD_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x07824A4C SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_OFFSET_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x07824A50 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_DELAY_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x07824A54 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_SW_MODE_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x07824A5C SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTEN_R_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
0	SW_OVRD_ENA	1'b1: written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x07824A60 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_SLAVE_DDA_CFG register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x07824A64 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS0 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x07824A68 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x07824A6C SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS2 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x07824A70 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS3 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x07824A74 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS4 register configures the following:

SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number of unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number of unit taps applied to delay array 0 of slave DDA

0x07824A78 SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_GEN_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000**SDC1_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_GEN_CFG**

Bits	Name	Description
2	CDC_SDDA_EN	Enable CDC Slave DDA to generate 3/4T RCLK from cdc_out_2 output of CDC: 0 (default) - CDC Slave DDA is disabled and 3/4T clock is a falling edge of cdc_out_2, 1 - CDC Slave DDA is enabled and 3/4T clock is a rising edge of cdc_out_2.
1	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
0	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)

0x07824A7C SDC1_SDCC_HC_VENDOR_SPECIFIC_CDC_AUTO_SW_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00F08000**SDC1_SDCC_HC_VENDOR_SPECIFIC_CDC_AUTO_SW_CAL_CFG**

Bits	Name	Description
25	CDC_CAL_TIMEOUT_ENABLE	Enable for cdc calibration timeout counter.

SDC1_SDCC_HC_VENDOR_SPECIFIC_CDC_AUTO_SW_CAL_CFG (cont.)

Bits	Name	Description
24	CDC_AUTO_SW_CAL_ENABLE	Enable for the Auto SW calibration Feature.
23:16	CDC_CAL_TIMEOUT_THRESHOLD	Sets the threshold for CDC calibration timeout during sw calibration triggered by the HW FSM. counts in 16xFF clock. Default is 0xF0 which is 255x16 FF clocks, which gives threshold of ~200 us
15:0	AUTO_TRIG_INTERVAL	Sets the load value of the counter that counts the interval between each sw calibration triggered by the HW FSM. this counter counts in sleep clock. Default is 0x8000 which is ~32,000 sleep clocks, which gives interval of ~1 sec

0x07824A80 SDC1_SDCC_HC_VENDOR_SPECIFIC_DDR200_STAT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000**SDC1_SDCC_HC_VENDOR_SPECIFIC_DDR200_STAT**

Bits	Name	Description
0	CDC_CAL_VALID	CDC Calibration status: 0 - CDC isn't calibrated, 1 - CDC is calibrated and valid

0x07824A84 SDC1_SDCC_HC_VENDOR_SPECIFIC_DDR200_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000**SDC1_SDCC_HC_VENDOR_SPECIFIC_DDR200_CFG**

Bits	Name	Description
10	FF_CLK_DIS	The ff_clk to CDC/TBY4 is enabled by default. It can be disabled by setting this bit. The ff_clk is enabled to CDC and TBY4 according to CDC_T4_DLY_SEL field
9	VOLTAGE_MUX_SEL	select between 1.8v and 1.2v signals on sdcc5 IO interface with device. default is 0 to choose 1.8v
8:7	CDC_TRAFFIC_SEL	Selecting the method of cdc_traffic's assertions: Value 0 (default) - auto calibration with stand by feature. Value 1 - SW calibration before any transaction. Value 2 - automatic calibration with HW assertion of cdc_traffic

SDC1_SDCC_HC_VENDOR_SPECIFIC_DDR200_CFG (cont.)

Bits	Name	Description
6	START_CDC_TRAFFIC	This bit starts the cdc traffic assertion after calibration done is received
5	CRC_TOKEN_SAMPL_FALL_EDGE	If set, the start bit of incoming CRC token in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
4	DATIN_SAMPL_FALL_EDGE	If set, the start bit of incoming data in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
3	CDC_T4_TEST_OUT_SEL	controls the mux between cm_dll_sdc4 testout and CDC test out. When set - CDC test_out is chosen
2	CMDIN_EDGE_SEL	Select sampling edge of CMD input when CMDIN_RCLK_EN is 1: 0 (default) - falling edge of RCLK, 1 - rising edge of RCLK
1	CMDIN_RCLK_EN	Enable CMD input sampling with RCLK: 0 (default) - CMD input is sampled by SD DLL output clock, 1 - CMD input is sampled by delayed RCLK
0	CDC_T4_DLY_SEL	Select block for RCLK delay: 0 (default) - CM_DLL_SDC4

0x07824A88 SDC1_SDCC_HC_VENDOR_SPECIFIC_TIME_COUNT_CTRL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Control the performance counters

SDC1_SDCC_HC_VENDOR_SPECIFIC_TIME_COUNT_CTRL

Bits	Name	Description
1	CMD_PERIOD	When this bit is set the commands periods are counted to the CMD_TIME counter
0	ENABLE	Enabling the performance counters

0x07824A8C SDC1_SDCC_HC_VENDOR_SPECIFIC_FLOW_CTRL_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the Flow Control period

SDC1_SDCC_HC_VENDOR_SPECIFIC_FLOW_CTRL_TIME_COUNT

Bits	Name	Description
31:0	FLOW_CTRL_TIME	FlowControl periods are counted

0x07824A90 SDC1_SDCC_HC_VENDOR_SPECIFIC_BUSY_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the BUSY periods

SDC1_SDCC_HC_VENDOR_SPECIFIC_BUSY_TIME_COUNT

Bits	Name	Description
31:0	BUSY_TIME	In Tx transaction, the BUSY periods are counted until the progdone is asserted. In Rx transaction, the periods between the blocks without flowcontrol is counted including the time until the first block is received after the command.

0x07824A94 SDC1_SDCC_HC_VENDOR_SPECIFIC_DATA_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the time of transaction

SDC1_SDCC_HC_VENDOR_SPECIFIC_DATA_TIME_COUNT

Bits	Name	Description
31:0	DATA_TIME	In Tx transaction, the time is from ENabling the DPSM until progdone is asserted. In Rx transaction, the time is from the command transmission to de-assertion of RxActive.

0x07824A98 SDC1_SDCC_HC_VENDOR_SPECIFIC_CMD_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the time of transaction

SDC1_SDCC_HC_VENDOR_SPECIFIC_CMD_TIME_COUNT

Bits	Name	Description
31:0	CMD_TIME	Counting the Command-Response periods of commands which relate to the transaction including auto commands. The counter is active when CMD_PERIOD is set.

0x07824A9C SDC1_SDCC_HC_VENDOR_SPECIFIC_ERR_INT_STS

Type: R

Clock: HCLK

Reset State: 0x00000000

Details of the vendor specific errors

SDC1_SDCC_HC_VENDOR_SPECIFIC_ERR_INT_STS

Bits	Name	Description
1	AUTO_CDC_SW_CALIB_ERR	calibration error is received (CDC_ERROR_CODE isn't 0) during auto SW CDC calibration
0	AUTO_CDC_SW_CALIB_TIMEOUT	CALIBRATION_DONE isn't received within the number of cycles which configured in CDC_CAL_TIMEOUT_THRESHOLD field (from CDC_AUTO_SW_CAL_CFG register)

0x07824AA0 SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_STATUS_REG

Type: R

Clock: PCLK

Reset State: 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC. The different tasks are defined in this register

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_STATUS_REG

Bits	Name	Description
3	IO_HIGH_V	SDCC driver orders that the I/O signaling level be switched to 3.0v. This interrupt is triggered when SDCC driver writes '0' to offset 03Eh in HC register (bit 3) or when SW reset for all is handled and last supported voltage was 1.8V. This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_STATUS_REG (cont.)

Bits	Name	Description
2	IO_LOW_V	SDCC driver orders that the I/O signaling level be switched to 1.8v. This interrupt is triggered when SDCC driver writes '1' to offset 03Eh in HC register (bit 3). This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
1	BUS_ON	SDCC driver orders that the SD bus power be switched on. This interrupt is triggered when SDCC driver writes '1' to offset 029h in HC register (bit 0).
0	BUS_OFF	SDCC driver orders that the SD bus power be switched off. This interrupt is triggered when SDCC driver writes '0' to offset 029h in HC register(bit 0) or when SW reset for all is handled.

0x07824AA4 SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_MASK_REG**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Mask register for MCI_PWRCTL_STATUS_REG

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_MASK_REG

Bits	Name	Description
3	IO_HIGH_V	'1' - interrupt is enabled / '0' - interrupt is masked.
2	IO_LOW_V	'1' - interrupt is enabled / '0' - interrupt is masked.
1	BUS_ON	'1' - interrupt is enabled / '0' - interrupt is masked.
0	BUS_OFF	'1' - interrupt is enabled / '0' - interrupt is masked.

0x07824AA8 SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CLEAR_REG**Type:** W**Clock:** PCLK**Reset State:** 0x00000000

Clear register for MCI_PWRCTL_STATUS_REG

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CLEAR_REG

Bits	Name	Description
3	IO_HIGH_V	Writing '1' clears bit 03 in PWRCTL_STATUS_REG
2	IO_LOW_V	Writing '1' clears bit 02 in PWRCTL_STATUS_REG
1	BUS_ON	Writing '1' clears bit 01 in PWRCTL_STATUS_REG

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CLEAR_REG (cont.)

Bits	Name	Description
0	BUS_OFF	Writing '1' clears bit 00 in PWRCTL_STATUS_REG

0x07824AAC SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CTL_REG**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC and then the QCT SW driver needs to report success or fail to this register

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CTL_REG

Bits	Name	Description
9	HC_CARD_STATE_STABLE	This bit is driving CARD_STATE_STABLE bit in Present State Register
8	RST_NOT_WAIT_PWRCTL_REG	RST process doesn't need to wait for accessing to MCI_PWRCTL_CTL_REG register
7:6	HC_WRITE_PROTECT_PAD	Value 0 inversion of HC_WRITE_PROTECT is connected to bit 19 in Present State Register. Value 1 input from PAD is used. Value 2 inversion of input from PAD is used
5	CARD_DETECT_PIN_LEVEL	This bit reflects the inverse value of the SDCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. value 1: card present value 0: no card present
4	HC_WRITE_PROTECT	This bit allows to disable the writing. value 0: write enabled value 1: write protected
3	IO_SIG_SWITCH_FAIL	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has failed.
2	IO_SIG_SWITCH_SUCCESS	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has completed successfully.
1	BUS_ON_OFF_FAIL	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has failed.

SDC1_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CTL_REG (cont.)

Bits	Name	Description
0	BUS_ON_OFF_SUCCESS	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has completed successfully.

0x07824AB0 SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC3**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Vendor specific register #3

SDC1_SDCC_HC_VENDOR_SPECIFIC_FUNC3

Bits	Name	Description
4	QSB_AXI_REDIRECT	Driving QSB AXI output
3	PWRSAVE_DLL	When this bit is set, DLL will get clock during transactions but not in idle. When this bit is cleared, DLL will get clock all the time so sdc4_dll_lock won't be de-asserted
2	SDIO_TRANS	When this bit is set in SDIO transaction, START_BIT_ERR status bit won't be raised. The reason is that interrupt period which is de-asserted only after the RX command can cause to wrong START_BIT_ERR detection. The START_BIT_ERR bit won't appear in MCI_STATUS when SDIO_TRANS is set
1	HCLK_IDLE_GATING	Additional CGC for HCLK was added, which gates the HCLK for status bits. If this bit is set then HCLK is gated for these registers during IDLE
0	MCLK_IDLE_GATING	Additional CGC for MCLK was added, which gates the MCLK for status bits. If this bit is set then MCLK is gated for these registers during IDLE

0x07824AB4 SDC1_SDCC_HC_REG_DLL_CONFIG_2**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000**SDC1_SDCC_HC_REG_DLL_CONFIG_2**

Bits	Name	Description
3:2	DDR_TRAFFIC_INIT_SEL	
1	DDR_TRAFFIC_INIT_SW	

SDC1_SDCC_HC_REG_DLL_CONFIG_2 (cont.)

Bits	Name	Description
0	DDR_CAL_EN	

0x07824AB8 SDC1_SDCC_HC_REG_DDR_CONFIG**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x80040853

Configuration of ddr_config input of DLL.

SDC1_SDCC_HC_REG_DDR_CONFIG

Bits	Name	Description
31	PRG_DLY_EN	Enables Programmable delay for RCLK_IN
30	EXT_PRG_RCLK_DLY_EN	Enables external control of Programmable RCLK delayline
29:27	EXT_PRG_RCLK_DLY_CODE	Used only if EXT_PRG_RCLK_DLY_EN is set. Configuring Programmable RCLK Delayline process code number.
26:21	EXT_PRG_RCLK_DLY	Used only if EXT_PRG_RCLK_DLY_EN is set. Programmable RCLK Delay line fine delay control.
20:12	TCXO_CYCLES_DLY_LINE	Number of TCXO clock cycles between finish of one delay line calibration and beginning of next delay line calibration.
11:9	TCXO_CYCLES_CNT	Number of TCXO clock cycles for which down counter is enabled for before making each inc/dec decision.
8:0	PRG_RCLK_DLY	These bits are controlled the programmable delay line. This bus is binary coded. Decimal value = (TCXO period * Decimal value of TCXO_CYCLES_CNT)/(2*delay needed). For 1.25ns the formula is $(52n^4/2*1.25) = 83$ in decimal.

19 SDC2

19.1 SDC2_SDCC_SDCC5

0x07864000 SDC2_SDCC_MCI_POWER

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

(ARM name: MCIPower). This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again.

SDC2_SDCC_MCI_POWER

Bits	Name	Description
11	DML_SW_RST_WAIT_IDLE_DIS	If this bit is set, then SW_RST_REQ procedure before BAM_TRANS_RESET is not executed automatically.
10	SW_RST_WAIT_IDLE_DIS	If this bit is set, then SW_RST_REQ procedure is not executed automatically.
9	SW_RST_REQ	Before executing SW_RST or SW_RST_CONFIG, this bit should be set and SW needs to poll on it until it's being cleared. The bit is cleared after AXI master has finished processing the outstanding transactions and it's in IDLE state.
8	SW_RST_CONFIG	SW reset bit for the core without resetting configuration registers (MCI_POWER, MCI_CLK, MCI_INT_MASKn). In that case, SW will be able to reset the internal state machines, data path, etc. and it will be able to proceed to next transaction without reconfiguring the SDCC registers.
7	SW_RST	SW reset bit for the core. The impact of this reset bit will be similar to the impact of the reset from SW register in CLK_CTRL block. All SW registers and all internal logic is reset.

SDC2_SDCC_MCI_POWER (cont.)

Bits	Name	Description
6	OPEN_DRAIN	MCICMD Output Control. This bit is reserved for the use mentioned in the Description but it is not tested. The open drain mode is preserved such that when enabled, the command output is driven low when the logic is low and undriven (so that the pull up can pull high) when the logic is high. Whether this gets used in the system is up to SW/system but the HW does support this mode.
0	CONTROL	This register is used to control the operation of the memory controller. value 0: power-off value 1: power-on

0x07864004 SDC2_SDCC_MCI_CLK**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x01008000

(ARM name: MCIClock). This register must be updated to the MCLK domain so subsequent writes to this register will be ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register again.

SDC2_SDCC_MCI_CLK

Bits	Name	Description
31	PWRSAVE_DLL	When this bit is set, DLL will get clock during transactions but not in idle. When this bit is cleared, DLL will get clock all the time so sdc4_dll_lock won't be de-asserted
30	SDIO_TRANS	When this bit is set in SDIO transaction, START_BIT_ERR status bit won't be raised. The reason is that interrupt period which is de-asserted only after the RX command can cause to wrong START_BIT_ERR detection. The START_BIT_ERR bit won't appear in MCI_STATUS when SDIO_TRANS is set
29	HCLK_IDLE_GATING	Additional CGC for HCLK was added, which gates the HCLK for status bits. If this bit is set then HCLK is gated for these registers during IDLE
28	MCLK_IDLE_GATING	Additional CGC for MCLK was added, which gates the MCLK for status bits. If this bit is set then MCLK is gated for these registers during IDLE
27	INT_MCLK_ON	An internal CGC is located in MCLK domain. SW can enable the internal clock at IDLE time by writing '1' to this bit. If the bit is cleared, then the clock is gated at IDLE time

SDC2_SDCC_MCI_CLK (cont.)

Bits	Name	Description
26	SDCC_CLK_EXT_EN	Value 0 (default) - sdcc_clkout is driven via the clock pad and external clock can't be used for testing the cm_dll_sdc4. Value 1 - External clock can be used as a test clock.
25	RX_FLOW_TIMING	Configuration bit which selects the cycle which RxFlowControl will be asserted when UHS mode is used Value 0 (default) - RxFlowControl is asserted one clock before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 1). Value 1 - RxFlowControl is asserted two clocks before the end bit is received in DPSM (NextBlkTCnt in DPSM equals to 2).
24:23	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 1 - feedback clock from CLK pad Value 2 (default) - free running MCLK (gated between the transactions) Value 3 - free running MCLK divided by 2
22	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.
21	IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
20	CLK_FB_DLY_SEL	Selects the source of feedback clock used by the controller. Value 1 - output of cm_dll_sdc4 is used as feedback clock Value 0 - feedback clock from CLK pad is used
19:18	SD_DEV_SEL	Select the active device if more than one device are connected in shared bus mode. (range: '00' - '11').
17	HCLKON_SW_EN	SW enable of AHB clock request of SDCC5. value 0: HW clock request mechanism is used value 1: clock request signal is always high
16:14	SELECT_IN	Select to latch data and command coming in: value 000: on the falling edge of internal MCLK. value 001: on the rising edge of internal MCLK. value 010: using feedback clock (default). value 011: DDR mode. value 100: UHS mode - MCLK is used internally. value 101: UHS mode - divided frequency (MCLK/2) is used internally. value 110: e.MMC5.0 DDR200 mode.
13	INVERT_OUT	Clear (0) to change data and command going out on the falling edge. Set (1) to change data and command going out on the rising edge.
12	FLOW_ENA	Enable flow control: value 0: disable (default) value 1: enable

SDC2_SDCC_MCI_CLK (cont.)

Bits	Name	Description
11:10	WIDEBUS	Enable wide bus mode: value 00: 1 bit mode value 10: 4 bit mode value 01 or 11: 8 bit mode
9	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
8	ENABLE	Enable Prime-Cell MCI bus clock: value 0: clock disabled value 1: clock enabled

0x07864008 SDC2_SDCC_MCI_ARGUMENT**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000**SDC2_SDCC_MCI_ARGUMENT**

Bits	Name	Description
31:0	CMD_ARG	Command argument.

0x0786400C SDC2_SDCC_MCI_CMD**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MMCCCommand) CPSM: Command Path State Machine. This register must be updated to the MCLK domain so subsequent writes to this register will be

ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of

MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register

again.

SDC2_SDCC_MCI_CMD

Bits	Name	Description
17	AUTO_CMD21	If set (1), CPSM sends CMD21 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4. CMD21 is supported in eMMC4.5 Spec.
16	AUTO_CMD19	If set (1), CPSM sends CMD19 automatically before sending CMD17 or CMD18. This sequence is needed for CDR auto-calibration of cm_dll_sdc4. CMD19 is supported in SD3.0 Spec.
15	CCS_DISABLE	If set (1), CPSM sends Command_Completion_Signal (CCS) disable sequence to the external CE-ATA device.
14	CCS_ENABLE	If set (1), CPSM waits for CCS from external card CE-ATA device.
13	MCIABORT	Signals the next command will be an abort (stop) command. This bit always read as (0) due to the hardware implementation. See a related note in next field
12	DAT_CMD	If set (1) indicates that this is a Command with Data. Note - MCIABORT and DAT_CMD bits do not have any effect on the CPSM. They are used to signal the SDIO Interrupt state machine that a Multi Block (examples: CMD18, CMD25, CMD53, etc. The rule is that each command with data must set this bit) data transaction is taking place. The DAT_CMD bit signals the start of the data transaction while the MCIABORT bit signals the end. For a pure SD Memory card, these bits are a don't care and should be set to zero by convention. However, some software drivers may chose to manipulate the bits in order to maintain compatibility with Combo cards and/or pure SDIO cards.
11	PROG_ENA	If set (1), PROG_DONE status bit will be asserted when busy is de-asserted. This bit is to be used with a stop or status command after a block write is performed. Does not effect CPSM.
10	ENABLE	The action of writing to this register (MCI_CMD) with this bit set (1), triggers CPSM to leave the Idle State.
9	PENDING	If set (1), CPSM waits for 'CmdPend' from the DPSM before it starts sending a command. This bit is designed to be used with SD CMD18 (READ_MULTIPLE_BLOCK) and SD CMD25 (WRITE_MULTIPLE_BLOCK) which must be terminated with a SD CMD12 (STOP_TRANSMISSION). After CMD18 or CMD25 is sent, the DPSM is enabled to send or receive data of amount MCI_DATA_LENGTH. After the DPSM finishes the transferring the data, it sends ¡CmdPend! to the CPSM and goes idle. When the CPSM receives this signal, it sends the currently loaded command which software would normally establish as CMD12.

SDC2_SDCC_MCI_CMD (cont.)

Bits	Name	Description
8	INTERRUPT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). The START, CMD_INDEX, ARGUMENT, and CRC are a total of 48 bits in length. If the INTERRUPT bit is zero, the CPSM will wait (63-47) 16 MCLK ticks for a response before going back to IDLE. If the INTERRUPT bit is set, the CPSM will wait indefinitely for a card response.
7	LONGRSP	If set (1), receives a 136-bit long response.
6	RESPONSE	If set (1), CPSM waits for a response subject to INTERRUPT above.
5:0	CMD_INDEX	Command index.

0x07864010 SDC2_SDCC_MCI_RESP_CMD**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIRspCmd)

SDC2_SDCC_MCI_RESP_CMD

Bits	Name	Description
5:0	RESPCMD	Response command index.

**0x07864014+ SDC2_SDCC_MCI_RESPn, n=[0..3]
0x4*n****Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIResponse0-3). Note that MCIResponse3 has 31 bits; the other three (*RESP0, *RESP1, *RESP2) have 32 bits.

MCI_RESPn, n=[0..3]

SDC2_SDCC_MCI_RESPn

Bits	Name	Description
31:0	STATUS	Card status.

0x07864024 SDC2_SDCC_MCI_DATA_TIMER**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIDataTimer).

There is no way to disable this timer. The timer starts counting as soon as a transaction is initiated. The time counts in MCLK ticks.

SDC2_SDCC_MCI_DATA_TIMER

Bits	Name	Description
31:0	DATA_TIME	Data timeout period.

0x07864028 SDC2_SDCC_MCI_DATA_LENGTH**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIDataLength)

Total number of bytes in the transaction regardless of mode (stream or block). In block mode, must be an exact multiple of block size. During an infinite transfer the value of DATALENGTH should be programmed to 0.

SDC2_SDCC_MCI_DATA_LENGTH

Bits	Name	Description
24:0	DATALLENGTH	Data length value.

0x0786402C SDC2_SDCC_MCI_DATA_CTL**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00100000

(ARM name: MCIDataCtrl). Data Path State Machine (DPSM). This register must be updated to the MCLK domain so subsequent writes to this register will be

ignored until 3 MCLK and 3 HCLK have passed. SW should wait until bit 0 (MCLK_REG_WR_ACTIVE) of

MCI_STATUS2 register is 0, after writing to MCI_POWER register and before accessing this register

again.

SDC2_SDCC_MCI_DATA_CTL

Bits	Name	Description
21	SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
20	RX_DATA_PEND	If set (1), timeout counter will start counting only after the RX command (with data) was sent instead of counting from initialization of DPSM. The feature is enabled by default.
19	AUTO_PROG_DONE	If set (1), automatic detection of PROG_DONE condition is executed without sending CMD12, CMD13, CMD52 or any other 'dummy' command. SW should set this bit in the following cases only: 1. When sending CMD53 for SDIO write transaction. 2. When sending CMD24. 3. When sending CMD25 and CMD23 was issued before to inform card about the exact number of blocks to be written (The rule is that this bit can be used for each command with data that doesn't need CMD12 for terminating the data or when it's prefixed by CMD23). 4. When sending CMD19 for testing bus procedure. CMD12 is not required in this case.
18	INFINITE_TRANSFER	If set (1), infinite transfer is enabled. MCI_DATA_LENGTH register should set to 0 during infinite transfer.
17	DATA_PEND	If set (1), DPSM waits for 'DataPend' from the CPSM before it enables the DPSM. This bit is designed to be used with SD CMD24 and CMD25 (WRITE_SINGLE_BLOCK and WRITE_MULTIPLE_BLOCK) to automatically start the DPSM after a normal (non-error) response is received. This register should be written with the enable bit and the pending bit asserted before MCI_CMD is enabled.
16:4	BLOCKSIZE	Data block length in bytes (1 to 4096).
3	DM_ENABLE	Enable DM interface: 0: DM disabled 1: DM enabled
2	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer
1	DIRECTION	Data transfer direction: 0: controller to card 1: card to controller
0	ENABLE	Data transfer enabled. If zero, DPSM unconditionally reset.

0x07864030 SDC2_SDCC_MCI_DATA_COUNT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIDataCnt)

NOTE There is no mechanism to ensure that a read of this counter will be accurate as it is not synchronized. The reason being the value read is async to the clock domain in which the reading is done. It is only useful as a debug tool for diagnostic purposes only.

SDC2_SDCC_MCI_DATA_COUNT

Bits	Name	Description
24:0	DATA_COUNT	Value of data counter in MciDPSM block. Represents remaining data of transaction.

0x07864034 SDC2_SDCC_MCI_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x000C0000

(ARM name: MCIStatus)

This register may need exclusion for QCSR POR Test for bits 25 and 22.

Static[30:26], [24:23] and [10:0]

These remain asserted until they are cleared by writing to the appropriate bit in the Clear Register (see MCI_CLEAR)

XCIS

The means used to send the SDIO external-card-interrupt-signal (XCIS) to the SDCC depends on the transfer mode: 1-bit, 4-bit, or 8-bit. Under 1 bit transfer mode, the XCIS has a dedicated physical connection to the SDCC. Hence once it is asserted, it remain at a high level. Under 4 and 8 bit transfe modes, the XCIS is time multiplexed with physical connection data bit 1. The XCIS is recognized as valid during specific time slots on data bit 1 by the SDCC. How this 'recognition' takes places shows up as different behaviors on SDIO_INTR_OPER, SDIO_INTR, and the actual interrupt sent to the ARM through MCI_INT_MASKn.

Special[25]

The SDIO_INTR_OPER indicator reflects the true state of XCIS as it would be observed inside the external SDIO card. As such, there is no bit 25 in MCI_CLEAR. The only way to clear SDIO_INTR_OPER is to clear the appropriate bit in the external card Common Card Control Registers (CCCR). Like 'static' above and 'dynamic' below, bit 25 in MCI_INT_MASKn controls

actually sending this indicator value to the ARM. This indicator of XCIS is used for normal SDCC operation.

Special[22]

The SDIO_INTR indicator reflects that there has been a low-to-high transition on the connection as explained under XCIS above. This indicator is cleared via bit 22 of MCI_CLEAR but any low-to-high transition on the connection will set this indicator again. Further note that this indicator is not routed through the MCI_INT_MASKn to the ARM. For bit 22, the raw value of the connection is routed through the MCI_INT_MASKn to the ARM. As this raw connection is not aware of specific time slots, the signal sent to the ARM generally toggles in an unpredictable fashion. This is generally not useful during normal SDCC operation. However, for wake-up with clocks off, the raw connection is desirable.

Dynamic[21:11]

These change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and de-asserted as data while written to the FIFO).

SDC2_SDCC_MCI_STATUS

Bits	Name	Description
31	STATUS2_INT	One of the error bits in MCI_STATUS2[4:1] register is set
30	AUTO_CMD19_TIMEOUT	Response or tuning pattern wasn't received after automatic CMD19's transmission. This status bit should be read only if AUTO_CMD19 (MCI_CMD(16)) was set.
29	BOOT_TIMEOUT	Data wasn't received within the valid time (according to MCI_CCS_TIMER) from the start of boot operation.
28	BOOT_ACK_ERR	Acknowledge pattern wasn't received correctly or not within the valid time (according to MCI_ACK_TIMER) from the start of boot operation.
27	BOOT_ACK_REC	Acknowledge pattern was received correctly.
26	CCS_TIMEOUT	CE-ATA Command Completion Signal timeout.
25	SDIO_INTR_OPER	SDIO interrupt indicator for normal operation.
24	ATA_CMD_COMPL	CE-ATA Command Completion Signal has been detected.
23	PROG_DONE	Programming done.
22	SDIO_INTR	SDIO interrupt indicator for wake-up.
21	RXDATA_AVLBL	Data available in receive FIFO. At least 1 word in the RX FIFO. SW can read 1 word only from the FIFO.
20	TXDATA_AVLBL	Data available in transmit FIFO. At least 1 word in the TX FIFO.
19	RXFIFO_EMPTY	Receive FIFO empty. SW can't read FIFO.
18	TXFIFO_EMPTY	Transmit FIFO empty. SW can write 8 words into the FIFO.
17	RXFIFO_FULL	Receive FIFO full. SW can read 8 words from the FIFO.

SDC2_SDCC_MCI_STATUS (cont.)

Bits	Name	Description
16	TXFIFO_FULL	Transmit FIFO full. TX FIFO contains 8 words. SW can't write to FIFO.
15	RXFIFO_HALF_FULL	Receive FIFO half full. SW can read 8 words from the FIFO.
14	TXFIFO_HALF_FULL	Transmit FIFO half full. SW can write 8 words into the FIFO.
13	RXACTIVE	Data receive in progress.
12	TXACTIVE	Data transmit in progress.
11	CMD_ACTIVE	Command transfer in progress.
10	DATA_BLK_END	Data block sent / received (CRC check passed).
9	START_BIT_ERR	Start Bit Error flag
8	DATAEND	Data end (data counter is zero).
7	CMD_SENT	Command sent (no response required).
6	CMD_RESPONSE_END	Command response received (CRC check passed).
5	RX_OVERRUN	Receive FIFO overrun error.
4	TX_UNDERRUN	Transmit FIFO underrun error.
3	DATA_TIMEOUT	Data timeout.
2	CMD_TIMEOUT	Command response timeout.
1	DATA_CRC_FAIL	Data block sent / received (CRC check failed).
0	CMD_CRC_FAIL	Command response received (CRC check failed).

0x07864038 SDC2_SDCC_MCI_CLEAR**Type:** W**Clock:** same rate as HCLK**Reset State:** 0x00000000

(ARM name: MCIClear)

SDC2_SDCC_MCI_CLEAR

Bits	Name	Description
30	AUTO_CMD19_TIMEOUT_CLR	Clears AUTO_CMD19_TIMEOUT flag.
29	BOOT_TIMEOUT_CLR	Clears BOOT_TIMEOUT flag.
28	BOOT_ACK_ERR_CLR	Clears BOOT_ACK_ERR flag.
27	BOOT_ACK_REC_CLR	Clears BOOT_ACK_REC flag.
26	CCS_TIMEOUT_CLR	Clears CCSTimeOut flag.

SDC2_SDCC_MCI_CLEAR (cont.)

Bits	Name	Description
24	ATA_CMD_COMPL_CLR	Clears AtaCmdCompl flag.
23	PROG_DONE_CLR	Clears ProgDone flag.
22	SDIO_INTR_CLR	Clears SDIOInt flag.
10	DATA_BLK_END_CLR	Clears DataBlockEnd flag.
9	START_BIT_ERR_CLR	Clears StartBitErr flag.
8	DATA_END_CLR	Clears DataEnd flag.
7	CMD_SENT_CLR	Clears commandSent flag.
6	CMD_RESP_END_CLT	Clears CmdRespEnd flag.
5	RX_OVERRUN_CLR	Clears RxOverrunClr flag.
4	TX_UNDERRUN_CLR	Clears TxUnderrun flag.
3	DATA_TIMEOUT_CLR	Clears DataTimeOut flag.
2	CMD_TIMEOUT_CLR	Clears CmdTimOutflag.
1	DATA_CRC_FAIL_CLR	Clears DataCrcFail flag.
0	CMD_CRC_FAIL_CLR	Clears CmdCrcFail flag.

1	MASK1	MASK DataCmdCrcFail flag.
0	MASK0	MASK CmdCrcFail flag.

0x07864044 SDC2_SDCC_MCI_FIFO_COUNT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

The SDCC core operates in two clock domains MCLK and HCLK. The CPSM and DPSM operate in MCLK domain and MciFifoDmaCtl (FIFO/DMA Controller) operates in HCLK domain. The MCI_FIFO_COUNT is a counter of FIFO Controller that monitors how many words of data are still needed to be transferred through the FIFO. At the beginning of data transaction the MCI_FIFO_COUNT counter will be loaded with the (MCI_DATA_LENGTH / 4) value and then

will count down during the data transaction until it reach zero. This register is only useful for debug purposes and should not be used for normal operation since it does not reflect data which may or may not be in the pipeline.

SDC2_SDCC_MCI_FIFO_COUNT

Bits	Name	Description
23:0	DATA_COUNT	Remaining data.

0x07864048 SDC2_SDCC_MCI_BOOT

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

Handling the boot operation.

SDC2_SDCC_MCI_BOOT

Bits	Name	Description
3	EARLY_ASSERT_CMD_LINE	If set to '1' then the CMD line is asserted by HW when all the data was received on the SD bus
2	BOOT_ACK_EN	If set to '1' then Host waits for acknowledge pattern after initiating the boot operation.
1	BOOT_EN	When this bit is asserted, the boot operation is initiated in both of the modes.
0	BOOT_MODE	If set to '1' then CMD line is low during the boot operation. If boot_mode = '0', then CMD0 with the argument 0xFFFFFFFFFA is sent.

0x0786404C SDC2_SDCC_MCI_BOOT_ACK_TIMER

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

Timer for boot operation - the time until receiving the acknowledge pattern.

SDC2_SDCC_MCI_BOOT_ACK_TIMER

Bits	Name	Description
31:0	BOOT_ACK_TIMER	Timer for counting the cycles from initiating the boot operation until the acknowledge pattern is accepted.

0x07864054 SDC2_SDCC_MCI_EMULATION_DLY_LINE**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

The register is responsible for handling DCM which is used in emulation supports 256 values of shift intervals so 8 bits are required (0:255). Bits [31:30] are used for emulation purposes only.

The procedure for activating the DCM is:

1. Setting bit 28 - DCM_RESET.
2. Clearing bit 28 - DCM_RESET.
3. Waiting until bit 29 DCM_LOCKED is high.
4. Writing a new phase in SD_CLK_DLY_CTRL field and setting the DCM_START bit (bit 30).

The clock's placement was executed by the DCM when DCM_DONE is asserted.

SDC2_SDCC_MCI_EMULATION_DLY_LINE

Bits	Name	Description
31	DCM_DONE	The shift process was finished in DCM and CMD19 can be sent towards the card. This is a read-only bit.
30	DCM_START	A new value of SD_CLK_DLY_CTRL is ready. Clears the DCM_DONE bit.
29	DCM_LOCKED	Reading the status of the LOCKED DCM's output which indicates that the output clock is ready for use.
28	DCM_RESET	Driving reset to DCM.
7:0	SD_CLK_DLY_CTRL	Input to DCM block in FPGA (8 bits). Controlling the change of the delay interval. The value's range may be 0-255 in DCM block.

0x07864058 SDC2_SDCC_MCI_CCS_TIMER**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

This register is used for operation with CE-ATA devices. The CCS timer starts to count at the end of SD transaction and it advances with every MCLK clock cycle. In boot operation this register is used for storing the number of cycles from initiating the boot operation until the first data is received.

SDC2_SDCC_MCI_CCS_TIMER

Bits	Name	Description
31:0	CCS_TIMER	CE-ATA Command Completion Signal timeout period.

0x0786405C SDC2_SDCC_MCI_RESPONSE_MASK**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000**SDC2_SDCC_MCI_RESPONSE_MASK**

Bits	Name	Description
31:0	RESPONSE_MASK	Mask used to verify the 32 status error bits. Active only when the data pending bit is set in the MCI_DATA_CTL register. When bit of this mask is set the corresponding bit from response [39:8] is checked to be 0 i.e. shows there no error. If all bits from mask shows no error the DPSM will be activated without waiting for software write.

0x07864060 SDC2_SDCC_MCI_DLL_CONFIG**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x60006400

This register configures the cm_dll_sdc4 for UHS mode.

SDC2_SDCC_MCI_DLL_CONFIG

Bits	Name	Description
31	SDC4_DIS_DOUT	When this bit equals to '0', the data which comes out from the dll is valid. When it equals to '1' this data isn't valid. The inversion of this bit is connected to dll's input - dll_en_dout
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution

SDC2_SDCC_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 - 112 (MHz) Value 001 -112 - 125 Value 010 -125 - 137 Value 011 -137 - 150 Value 100 -150 - 162 Value 101 -162 - 175 Value 110 -175 - 187 Value 111 -187 - 200
23:20	CDR_SELECT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is '1')
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80

SDC2_SDCC_MCI_DLL_CONFIG (cont.)

Bits	Name	Description
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 2 cycles Value 01 - 4 cycles (default) Value 10 - 8 cycles Value 11 - 16 cycles
9	CDR_ALGORITHM_SEL	CDR algorithm select Value 0 - Edge (default) Value 1 - Level
0	CMD_DAT_TRACK_SEL	Select DAT or CMD lines for CDR tracking Value 0 - track DAT inputs (default) Value 1 - track CMD input

0x07864068 SDC2_SDCC_MCI_DLL_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

This register is connected to sdc4_status output of cm_dll_sdc4.

SDC2_SDCC_MCI_DLL_STATUS

Bits	Name	Description
12	SDC4_DTEST_MUXSEL	Digital test mux select
11	DDR_DLL_LOCK_JDR	Reserved
10:9	SDC4_DLL_DTEST_OUT_A TPG	SDC4_DLL_DTEST_OUT output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
8	SDC4_DLL_LOCK_ATPG	SDC4_DLL_LOCK output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC2_SDCC_MCI_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done

0x0786406C SDC2_SDCC_MCI_STATUS2**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Additional status and error bits.

SDC2_SDCC_MCI_STATUS2

Bits	Name	Description
8	BAM_AXI_MASTER_ERR	Error occurred on AXI master for BAM transaction. It is enabled if the field BAM_ERR_EN is set in MCI_HC_MODE register
7	AUTO_CDC_SW_CALIB_ERR	calibration error is received (CDC_ERROR_CODE isn't 0) during auto SW CDC calibration.
6	AUTO_CDC_SW_CALIB_TIMEOUT	CALIBRATION_DONE isn't received within the number of cycles which configured in CDC_CAL_TIMEOUT_THRESHOLD field (from CDC_AUTO_SW_CAL_CFG register).
5	DATA_AXI_MASTER_ERR	Error occurred on AXI master for data transaction
4	DATA_END_BIT_ERROR	The bit is set when the end bit of the received block was not 1 on all the data lines
3	CMD_END_BIT_ERROR	The bit is set when the end bit of the received response was not 1 on the command line

SDC2_SDCC_MCI_STATUS2 (cont.)

Bits	Name	Description
2	FIFO_EMPTY_ERROR	FIFO read attempt when FIFO was empty
1	FIFO_FULL_ERROR	write attempt when FIFO was full
0	MCLK_REG_WR_ACTIVE	Value 0 - No active register write to MCLK domain Value 1 - Active register write to MCLK domain. The bit indicates if a write operation to one of the following registers is in process (synchronization between HCLK and MCLK): MCI_POWER MCI_CLOCK MCI_CMD MCI_DATA_CTL

0x07864070 SDC2_SDCC_MCI_GENERICS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Generics list of each SDCC instance.

SDC2_SDCC_MCI_GENERICS

Bits	Name	Description
29	SWITCHABLE_SIGNALING_VOLTAGE	The core supports switching of IO signaling voltage.
28	BUS_18V_SUPPORT	The core supports 1.8v power supply to the bus.
27	BUS_30V_SUPPORT	The core supports 3.0v power supply to the bus.
26:23	SD_DATA_WIDTH	Number of DAT lines Value 4 - 4 DAT lines (SD, SDIO) Value 8 - 8 DAT lines (MMC, eMMC)
22:10	RAM_SIZE	Size of RAM size: Optional Values: 512, 1024, 2048 or 4096 bytes.
9	USE_SPS	Value 1 - BAM and DML are used and USB core is connected to SDCC5, Value 0 - BAM and DML are not used.
8:6	NUM_OF_DEV	Number of eSD or eSDIO devices supported on shared SD bus. Can be set from 1 to 4.
5:1	MAX_PIPES	Number of simultaneous parallel pipes supported by the BAM and attached peripheral pair. Can be set from 1 to 31.

SDC2_SDCC_MCI_GENERIC (cont.)

Bits	Name	Description
0	USE_DLL_SDC4	Enables the instantiation of cm_dll_sdc4. Value 0 - cm_dll_sdc4 isn't integrated with SDCC5 Value 1 - cm_dll_sdc4 is used with SDCC5.

0x07864074 SDC2_SDCC_MCI_FIFO_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00007800

Status bit of FIFO's fill level. Can be used for long accesses to FIFO using the FIFO_ALT register

SDC2_SDCC_MCI_FIFO_STATUS

Bits	Name	Description
18	RX_FIFO_512	512 bytes are ready in FIFO during RX transaction
17	RX_FIFO_256	256 bytes are ready in FIFO during RX transaction
16	RX_FIFO_128	128 bytes are ready in FIFO during RX transaction
15	RX_FIFO_64	64 bytes are ready in FIFO during RX transaction
14	TX_FIFO_512	available space in FIFO for 512 bytes during TX transaction
13	TX_FIFO_256	available space in FIFO for 256 bytes during TX transaction
12	TX_FIFO_128	available space in FIFO for 128 bytes during TX transaction
11	TX_FIFO_64	available space in FIFO for 64 bytes during TX transaction
10:0	FIFO_FILL_LEVEL	reflects the actual fill level of FIFO DPRAM during TX or RX transaction. Supported values are 0, 4, 8, ..., 1020, 1024

0x07864078 SDC2_SDCC_MCI_HC_MODE**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Enabling the Host Controller Specification

SDC2_SDCC_MCI_HC_MODE

Bits	Name	Type	Description
21	PROGDONE_WO_CMD_RESP	RW	'0' (Default): we wait for cmd response end to detect progdone (legacy behavior). '1': we start looking for progdone without waiting for cmd response end but after 10 cycles from end bit of command
20	AUTO_CMD12_CLR_CMDACTIVE	RW	'0' (Default): auto_cmd12 is not clearing cmdactive (bug fix). '1': auto_cmd12 is clearing cmdactive like previous behavior
19	WRAP_ERROR	RW	When the bit is set, the core responds with errors on WRAP transaction in configuration bus.
18:17	BUSY_CHECK_VALID_PERIOD	RW	Configuring the wait period between CRC token to BUSY period. Value 0 - waiting 7 cycles. The values of BUSY_CHECK_VALID_PERIOD is added to 7 cycles
16	BUSY_CHECK_VALID_ALWAYS	RW	In DDR200 mode, the end of busy should be checked after the CRC token was received. There is a counter of 4 cycles for this purpose. If this bit is set then the end of busy will be checked right after the crc token.
15	BAM_ERR_EN	RW	Enabling the assertion of BAM_AXI_MASTER_ERR field in MCISTATUS2
14	DIS_RST_AFTER_CRC_TO_KEN_DDR200	RW	Disabling the option to reset the RCLK's data registers in IO macro after each CRC token. The reset is needed if redundant RCLK is sent and BUSY is sampled into the FIFO as a data bit.
13	FF_CLK_SW_RST_DIS	RW	Disabling the SW reset in FF clock domain
12	IO_MACRO_SW_RST_PERIOD	R	When moving to DDR mode, reset period is generated for dividers. There is possibility to read from this bit if this period was finished
11	CLOCK_AFTER_EOB_DIS	RW	Disabling the 8 cycles after the CRC token when TxFlowControl is asserted before the end of the block
10	ADMA_INT_DATA	RW	If this bit is set, then the ADMA interrupt is set when the data was already transferred. If this bit is cleared, then the ADMA interrupt is set when the requests related to the descriptors were finished on address channel before the data itself is processed
9	BAM_CLK_EN_ACT	RW	If this bit is set, then bam_clk is gated when hc mode is enabled
8	ADMA_HPROT_DIS	R	If cleared then HPROT is changed in last burst of write transaction if block_count_en is 1, otherwise it will be for each end of descriptor. Not applicable for Gandalf - AXI Noc
7	ADMA_NON_WRD_ALIGN_DIS	R	If set the fix for non word aligned transfers in ADMA is disabled. Not applicable for Gandalf - AXI Noc

SDC2_SDCC_MCI_HC_MODE (cont.)

Bits	Name	Type	Description
6	DEASSERT_HREADY_DAT_DIS	RW	if set, then hready won't be deasserted for access to Transfer Mode register in HC address. By default, the hready is deasserted for enabling the completion of synchronization period to MCLK before the next access
5	DEASSERT_HREADY_CMD_DIS	RW	if set ,then hready won't be deasserted for access to Command register in HC address. By default, the hready is deasserted for enabling the completion of synchronization period to MCLK before the next access
4	IRQ_PCLK_DIS	RW	From tag sdcc5_p3q3r50, the interrupt and status bits are handled in PCLK domain only. If this bit is set, then the legacy architecture is used
3	SINGLE_NON32_ERROR	RW	if set , then a response error will be sent if single configuration access is executed in legacy mode with size of non 32 bits
2	WAIT_DLL_LOCK	RW	If this bit is set, the host controller isn writing to the async fifo unless DLL_LOCK of MCI_DLL_STATUS is equals to '1'
1	CYCLES_AFTER_EOB_DIS	RW	Enable bit for the fix that TxFlowControl isn't set until end of the block (CRC token reception) in the middle of TX transaction. The fix is required for releasing each BAM's descriptor seperately without waiting to the next descriptor.
0	HC_MODE_EN	RW	Enabling the Host Controller Specification by setting this bit

0x07864080+ SDC2_SDCC_MCI_FIFO_n, n=[0..15]
0x4*n

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

SDC2_SDCC_MCI_FIFO_n

Bits	Name	Description
31:0	DATA	FIFO data. This register is aliased to 16 words, 0x080 - 0xBC. In SDCC3, an access to the FIFO was executed with 16 words so 16 addresses were defined. However, in SDCC5 only 8 words are used in each burst so only 8 addresses from the range should be used. When writing to the external SD_Card, writes to the data path FIFO. When reading from the external SD_Card, reads from the data path FIFO.

0x078640DC SDC2_SDCC_MCI_PWRCTL_STATUS_REG**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC. The different tasks are defined in this register

SDC2_SDCC_MCI_PWRCTL_STATUS_REG

Bits	Name	Description
3	IO_HIGH_V	SDCC driver orders that the I/O signaling level be switched to 3.0v. This interrupt is triggered when SDCC driver writes '0' to offset 03Eh in HC register (bit 3) or when SW reset for all is handled and last supported voltage was 1.8V. This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
2	IO_LOW_V	SDCC driver orders that the I/O signaling level be switched to 1.8v. This interrupt is triggered when SDCC driver writes '1' to offset 03Eh in HC register (bit 3). This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
1	BUS_ON	SDCC driver orders that the SD bus power be switched on. This interrupt is triggered when SDCC driver writes '1' to offset 029h in HC register (bit 0).
0	BUS_OFF	SDCC driver orders that the SD bus power be switched off. This interrupt is triggered when SDCC driver writes '0' to offset 029h in HC register(bit 0) or when SW reset for all is handled.

0x078640E0 SDC2_SDCC_MCI_PWRCTL_MASK_REG**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Mask register for MCI_PWRCTL_STATUS_REG

SDC2_SDCC_MCI_PWRCTL_MASK_REG

Bits	Name	Description
3	IO_HIGH_V	'1' - interrupt is enabled / '0' - interrupt is masked.
2	IO_LOW_V	'1' - interrupt is enabled / '0' - interrupt is masked.
1	BUS_ON	'1' - interrupt is enabled / '0' - interrupt is masked.
0	BUS_OFF	'1' - interrupt is enabled / '0' - interrupt is masked.

0x078640E4 SDC2_SDCC_MCI_PWRCTL_CLEAR_REG**Type:** W**Clock:** PCLK**Reset State:** 0x00000000

Clear register for MCI_PWRCTL_STATUS_REG

SDC2_SDCC_MCI_PWRCTL_CLEAR_REG

Bits	Name	Description
3	IO_HIGH_V	Writing '1' clears bit 03 in PWRCTL_STATUS_REG
2	IO_LOW_V	Writing '1' clears bit 02 in PWRCTL_STATUS_REG
1	BUS_ON	Writing '1' clears bit 01 in PWRCTL_STATUS_REG
0	BUS_OFF	Writing '1' clears bit 00 in PWRCTL_STATUS_REG

0x078640E8 SDC2_SDCC_MCI_PWRCTL_CTL_REG**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC and then the QCT SW driver needs to report success or fail to this register

SDC2_SDCC_MCI_PWRCTL_CTL_REG

Bits	Name	Description
9	HC_CARD_STATE_STABLE	This bit is driving CARD_STATE_STABLE bit in Present State Register
8	RST_NOT_WAIT_PWRCTL_REG	RST process doesn't need to wait for accessing to MCI_PWRCTL_CTL_REG register
7:6	HC_WRITE_PROTECT_PAD	Value 0 inversion of HC_WRITE_PROTECT is connected to bit 19 in Present State Register. Value 1 input from PAD is used. Value 2 inversion of input from PAD is used
5	CARD_DETECT_PIN_LEVEL	This bit reflects the inverse value of the SDCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. value 1: card present value 0: no card present

SDC2_SDCC_MCI_PWRCTL_CTL_REG (cont.)

Bits	Name	Description
4	HC_WRITE_PROTECT	This bit allows to disable the writing. value 0: write enabled value 1: write protected
3	IO_SIG_SWITCH_FAIL	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has failed.
2	IO_SIG_SWITCH_SUCCESS	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has completed successfully.
1	BUS_ON_OFF_FAIL	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has failed.
0	BUS_ON_OFF_SUCCESS	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has completed successfully.

0x078640EC SDC2_SDCC_MCI_CLEAR2**Type:** W**Clock:** same rate as HCLK**Reset State:** 0x00000000

Clearing the error bits in MCI_STATUS2 register

SDC2_SDCC_MCI_CLEAR2

Bits	Name	Description
8	BAM_AXI_MASTER_ERR_CLR	BAM_AXI_MASTER_ERR clear bit
7	AUTO_CDC_SW_CALIB_ERR_CLR	AUTO_CDC_SW_CALIB_ERR clear bit.
6	AUTO_CDC_SW_CALIB_TOUT_CLR	AUTO_CDC_SW_CALIB_TOUT clear bit.
5	DATA_AXI_MASTER_ERR_CLR	DATA_AXI_MASTER_ERR clear bit
4	DATA_END_BIT_ERROR_CLR	DATA_END_BIT_ERROR clear bit
3	CMD_END_BIT_ERROR_CLR	CMD_END_BIT_ERROR clear bit
2	FIFO_EMPTY_ERROR_CLR	FIFO_EMPTY_ERROR clear bit
1	FIFO_FULL_ERROR_CLR	FIFO_FULL_ERROR clear bit

**0x078640F0+ SDC2_SDCC_MCI_INT_MASKINT2_n, n=[0..1]
0x4*n**
Type: RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Mask register for the MCI_STATUS2 register for each interrupt line

SDC2_SDCC_MCI_INT_MASKINT2_n

Bits	Name	Description
8	MASK8	BAM_AXI_MASTER_ERR mask bit
7	MASK7	AUTO_CDC_SW_CALIB_ERR mask bit.
6	MASK6	AUTO_CDC_SW_CALIB_TOUT mask bit.
5	MASK5	DATA_AXI_MASTER_ERR mask bit
4	MASK4	DATA_END_BIT_ERROR mask bit
3	MASK3	CMD_END_BIT_ERROR mask bit
2	MASK2	FIFO_EMPTY_ERROR mask bit
1	MASK1	FIFO_FULL_ERROR mask bit

0x07864100 SDC2_SDCC_CHAR_CMD
Type: RW**Clock:** HCLK**Reset State:** 0x00000000

Characterization config - 1 CMD line

SDC2_SDCC_CHAR_CMD

Bits	Name	Type	Description
15:8	CMDIN_ACTUAL	R	CMDIN storage for comparison. The incoming data is stored for debugging feature
7:0	CMDOUT_DATA_DIN_EXP	RW	CMDOUT for transmitting, CMDIN for compare. in TX testing the data is written in the register and should be transmitted outside from the core. In RX testing the incoming data is compared to the register's value

0x0786412C SDC2_SDCC_QSB_VALUES**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00007991

configurable QSB values. Not applicabale for Gandalf - AXI Noc

SDC2_SDCC_QSB_VALUES

Bits	Name	Description
15	NON_BUF_BAM_BLOCK_END	Non bufferable/strongly ordered (hprot == 4'b0001/ memtype == 0) is driven in end of transaction by default. If setting this bit it will be driven for each block end
14	NOALLOCATE_VALUE	Driving noallocate value
13	RESERVED	Reserved
12	HPROT_VALUE_EN	Enabling the hprot values
11:8	HPROT_FOR_RDATA	hprot for read data. should be 9 by default so memtype is 2 (cachable)
7:4	HPROT_FOR_WDATA	hprot for write data during transaction or block. should be 9 by default so memtype is 2 (cachable)
3:0	HPROT_FOR_LAST_WDATA	hprot for last write data. should be 1 by default so memtype is 0 (strongly ordered)

0x07864130 SDC2_SDCC_QSB_AXI_VALUES**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x3E2218A8

configurable QSB AXI values

SDC2_SDCC_QSB_AXI_VALUES

Bits	Name	Type	Description
30	QSB_AXI_REDIRECT	RW	Driving QSB AXI output
29	QSB_AXI_ABURST	RW	Driving QSB AXI output
28:26	NUM_OUTSTANDING_DATA	RW	Configuring the number of outstanding transactions for the data. The descriptors accesses have more one outstanding request
25	PROCEED_AXI_AFTER_ERROR	RW	When error occurs on AXI master the traffic can continue or terminate. If this bit is set then the traffic continues and more requests are transmitted on the address channel

SDC2_SDCC_QSB_AXI_VALUES (cont.)

Bits	Name	Type	Description
24	QSB_AXI_AFULL_CALC	RW	If this bit is set, then afull isn't '0' constantly but can be equal to '1' if all the beats have 8 bytes on the strobe lines
23	ONE_MID_SUPPORT	RW	If this bit is set, then only 1 MID is used for descriptors and data
22:20	RESERVED	RW	Reserved
19	SDCC5_HALT_REQ	R	Reading SDCC5_HALT_REQ input
18	SDCC5_HALT_ACK	R	Reading SDCC5_HALT_ACK output
17	SDCC5_M_IDLE	R	Reading SDCC5_M_IDLE output
16	SDCC5_HALT_ACK_SW_EN	RW	Enabling the SW value for SDCC5_HALT_ACK
15	SDCC5_HALT_ACK_SW	RW	Driving SDCC5_HALT_ACK from SW and not by HW
14	SDCC5_M_IDLE_DIS	RW	If this bit is set, then sdcc5_m_idle will be tied low
13	QSB_AXI_INTERLEAVING_EN	RW	If the bit is set, then the controller can support interleaving between two bursts from the Noc. This option is disabled by default because Noc doesn't support interleaving but only re-ordering
12	RESERVED	RW	Reserved
11	RESERVED	RW	Reserved
10:9	RESERVED	RW	Reserved
8:6	RESERVED	RW	Reserved
5	RESERVED	RW	Reserved
4	RESERVED	RW	Reserved
3	RESERVED	RW	Reserved
2	QSB_AXI_OOOWR	RW	Driving QSB AXI output
1	QSB_AXI_OOORD	RW	Driving QSB AXI output
0	QSB_AXI_AFULL	RW	Driving QSB AXI output

0x07864134 SDC2_SDCC_AXI_DATA_ERR_DEBUG**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Debug details after error on AXI I/F

SDC2_SDCC_AXI_DATA_ERR_DEBUG

Bits	Name	Description
31	RESP_ERR_WR	If set, then the failed transaction was a write access
30:28	RESP_ERR_TID	The TID of the failed transaction
27:13	DESC_ADDR_35_21	Upper 15 bits of current address in address channel
12:0	DESC_ADDR_12_0	Lower 13 bits of current address in address channel

0x07864138 SDC2_SDCC_T4_DLY_CTRL**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x0000382B

Control register of T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC2_SDCC_T4_DLY_CTRL

Bits	Name	Description
15:14	T4_DLY_SPARE_CTL	
13	T4_DLY_POWERDOWN_EN	Powerdown enable. When asserted (default), it powers down the T/4 macro and shuts off all bias circuits.
12:11	T4_DLY_TESTOUT_SEL	Test output select. When toggled, it presents either the strb_in or strb_out on the analog test port for debug.
10	T4_DLY_BYPASS_EN	Bypass enable. When asserted it presents the strb_in on the strb_out port.
9	T4_DLY_CAL_START	Calibration start input. When asserted, it indicates the start of the calibration cycle.
8	T4_DLY_CAL_OVERRIDE	Calibration override input. When asserted, the internal delay line calibration is bypassed and the tby4_user_ctl<7:0> is used as the default code for the delay line.
7:0	T4_DLY_TARGET_CODE	T/4 delay target code. 0x2b gives delay of 1.25ns

0x0786413C SDC2_SDCC_T4_DLY_STAT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Status register T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC2_SDCC_T4_DLY_STAT

Bits	Name	Description
15:14	T4_DLY_SPARE_OUT	Spare status bits.
13	T4_DLY_CAL_DLY_CODE_FAST_RANGE	Calibrated delay code, indicates the fast range selection bit status.
12:6	T4_DLY_CAL_DLY_CODE_ISEL	Calibrated delay code, indicates the isel programming value for the bias generator.
5:4	T4_DLY_CAL_DLY_CODE_RSEL	Calibrated delay code, indicates the rsel programming value for the bias generator.
3:0	T4_DLY_STATE_DESC	T/4 state descriptor. Indicates the calibration status and result. value 4'b0000: Indicates Reset mode, waiting for cal_start signal. value 4'b0111: Indicates the fast range decision completion. value 4'b0100: Indicates rsel adjustment decision. value 4'b1011: Indicates isel adjustment decision. value 4'b1110: Indicates Normal end-of-cal. value 4b'1111: Indicates Maximum Delay Reached

0x07864140 SDC2_SDCC_CSR_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CTLR_CFG0 register configures the following:

SDC2_SDCC_CSR_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration

SDC2_SDCC_CSR_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x07864144 SDC2_SDCC_CSR_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CTLR_CFG1 register configures the following:

SDC2_SDCC_CSR_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1

SDC2_SDCC_CSR_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x07864148 SDC2_SDCC_CSR_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CAL_TIMER_CFG0 register configures the following:

SDC2_SDCC_CSR_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0786414C SDC2_SDCC_CSR_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_CAL_TIMER_CFG1 register configures the following:

SDC2_SDCC_CSR_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x07864150 SDC2_SDCC_CSR_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_REFCOUNT_CFG register configures the following:

SDC2_SDCC_CSR_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x07864154 SDC2_SDCC_CSR_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register CSR_CDC_COARSE_CAL_CFG configures the following:

SDC2_SDCC_CSR_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x07864158 SDC2_SDCC_CSR_CDC_RSVD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_RSVD_CFG register configures the following:

SDC2_SDCC_CSR_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0786415C SDC2_SDCC_CSR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_OFFSET_CFG register configures the following:

SDC2_SDCC_CSR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count

SDC2_SDCC_CSR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x07864160 SDC2_SDCC_CSR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_DELAY_CFG register configures the following:

SDC2_SDCC_CSR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x07864164 SDC2_SDCC_CSR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_SW_MODE_CFG register configures the following:

SDC2_SDCC_CSR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.

SDC2_SDCC_CSR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0786416C SDC2_SDCC_CSR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_SW_OVRD_CFG register configures the following:

SDC2_SDCC_CSR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x07864170 SDC2_SDCC_CSR_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_SLAVE_DDA_CFG register configures the following:

SDC2_SDCC_CSR_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x07864174 SDC2_SDCC_CSR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The CSR_CDC_STATUS0 register configures the following:

SDC2_SDCC_CSR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.

SDC2_SDCC_CSR_CDC_STATUS0 (cont.)

Bits	Name	Description
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x07864178 SDC2_SDCC_CSR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_STATUS1 register configures the following:

SDC2_SDCC_CSR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x0786417C SDC2_SDCC_CSR_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The CSR_CDC_STATUS2 register configures the following:

SDC2_SDCC_CSR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x07864180 SDC2_SDCC_CSR_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The CSR_CDC_STATUS3 register configures the following:

SDC2_SDCC_CSR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x07864184 SDC2_SDCC_CSR_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The CSR_CDC_STATUS4 register configures the following:

SDC2_SDCC_CSR_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x07864188 SDC2_SDCC_CSR_CDC_GEN_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000**SDC2_SDCC_CSR_CDC_GEN_CFG**

Bits	Name	Description
2	CDC_SDDA_EN	Enable CDC Slave DDA to generate 3/4T RCLK from cdc_out_2 output of CDC: 0 (default) - CDC Slave DDA is disabled and 3/4T clock is a falling edge of cdc_out, 1 - CDC Slave DDA is enabled and 3/4T clock is a rising edge of cdc_out_2.
1	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
0	CDC_SWITCH_BYPASS_OF F	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)

0x0786418C SDC2_SDCC_CDC_AUTO_SW_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00F08000

Auto SW calibration configuration bits.

SDC2_SDCC_CDC_AUTO_SW_CAL_CFG

Bits	Name	Description
25	CDC_CAL_TIMEOUT_ENABLE	Enable for cdc calibration timeout counter.
24	CDC_AUTO_SW_CAL_ENABLE	Enable for the Auto SW calibration Feature.
23:16	CDC_CAL_TIMEOUT_THRESHOLD	Sets the threshold for CDC calibration timeout during sw calibration triggered by the HW FSM. counts in 16xFF clock. Default is 0xF0 which is 255x16 FF clocks, which gives threshold of ~200 us
15:0	AUTO_TRIG_INTERVAL	Sets the load value of the counter that counts the interval between each sw calibration triggered by the HW FSM. this counter counts in sleep clock. Default is 0x8000 which is ~32,000 sleep clocks, which gives interval of ~1 sec

0x07864190 SDC2_SDCC_DDR200_STAT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Status bits for e.MMC5.0 DDR200 mode.

SDC2_SDCC_DDR200_STAT

Bits	Name	Description
0	CDC_CAL_VALID	CDC Calibration status: 0 - CDC isn't calibrated, 1 - CDC is calibrated and valid

0x07864194 SDC2_SDCC_DDR200_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Configuration bits for e.MMC5.0 DDR200 mode

SDC2_SDCC_DDR200_CFG

Bits	Name	Description
10	FF_CLK_DIS	The ff_clk to CDC/TBY4 is enabled by default. It can be disabled by setting this bit. The ff_clk is enabled to CDC and TBY4 according to CDC_T4_DLY_SEL field
9	VOLTAGE_MUX_SEL	select between 1.8v and 1.2v signals on sdcc5 IO interface with device. default is 0 to choose 1.8v
8:7	CDC_TRAFFIC_SEL	Selecting the method of cdc_traffic's assertions: Value 0 (default) - auto calibration with stand by feature. Value 1 - SW calibration before any transaction. Value 2 - automatic calibration with HW assertion of cdc_traffic.
6	START_CDC_TRAFFIC	This bit starts the cdc traffic assertion after calibration done is received.
5	CRC_TOKEN_SAMPL_FALL_EDGE	If set, the start bit of incoming CRC token in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
4	DATIN_SAMPL_FALL_EDGE	If set, the start bit of incoming data in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
3	CDC_T4_TEST_OUT_SEL	controls the mux between dll test_out and CDC test out. Default value is 0 (dll is chosen). When set - CDC test_out is chosen.
2	CMDIN_EDGE_SEL	Select sampling edge of CMD input when CMDIN_RCLK_EN is 1: 0 (default) - falling edge of RCLK, 1 - rising edge of RCLK

SDC2_SDCC_DDR200_CFG (cont.)

Bits	Name	Description
1	CMDIN_RCLK_EN	Enable CMD input sampling with RCLK: 0 (default) - CMD input is sampled by SD DLL output clock, 1 - CMD input is sampled by delayed RCLK
0	CDC_T4_DLY_SEL	Select block for RCLK delay: 0 (default) - use CM_DLL_SDC4

0x07864198 SDC2_SDCC_TIME_COUNT_CTRL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Control the performance counters

SDC2_SDCC_TIME_COUNT_CTRL

Bits	Name	Description
1	CMD_PERIOD	When this bit is set the commands periods are counted to the CMD_TIME counter
0	ENABLE	Enabling the performance counters

0x0786419C SDC2_SDCC_FLOW_CTRL_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the Flow Control period

SDC2_SDCC_FLOW_CTRL_TIME_COUNT

Bits	Name	Description
31:0	FLOW_CTRL_TIME	FlowControl periods are counted

0x078641A0 SDC2_SDCC_BUSY_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the BUSY periods

SDC2_SDCC_BUSY_TIME_COUNT

Bits	Name	Description
31:0	BUSY_TIME	In Tx transaction, the BUSY periods are counted until the progdone is asserted. In Rx transaction, the periods between the blocks without flowcontrol is counted including the time until the first block is received after the command.

0x078641A4 SDC2_SDCC_DATA_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the time of transaction

SDC2_SDCC_DATA_TIME_COUNT

Bits	Name	Description
31:0	DATA_TIME_CNT	In Tx transaction, the time is from ENabling the DPSM until progdone is asserted. In Rx transaction, the time is from the command transmission to de-assertion of RxActive.

0x078641A8 SDC2_SDCC_CMD_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the time of transaction

SDC2_SDCC_CMD_TIME_COUNT

Bits	Name	Description
31:0	CMD_TIME	Counting the Command-Response periods of commands which relate to the transaction including auto commands. The counter is active when CMD_PERIOD is set.

0x078641AC SDC2_SDCC_MCI_DLL_CONFIG_2**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Second register for DLL's configuration

SDC2_SDCC_MCI_DLL_CONFIG_2

Bits	Name	Description
3:2	DDR_TRAFFIC_INIT_SEL	Selecting how DDR_TRAFFIC_INIT will be driven to DLL. Value 00 - HW drives the DDR_TRAFFIC_INIT when DPSM is active and when CPSM is active if RCLK is expected during response. Value 01 - The value is driven by SW by SW_DDR_TRAFFIC_INIT bit. Value 10 - DDR_TRAFFIC_INIT to DLL is driven when sdc4_mclk is not gated. off.
1	DDR_TRAFFIC_INIT_SW	The signal should be high 3-4 cycles before RCLK is toggling. It should be high when MCLK is toggling.
0	DDR_CAL_EN	The signal is set after the configuration of MCI_DDR_CONFIG is finished. When the signal is low the TCXO domain is being reset.

0x078641B0 SDC2_SDCC_MCI_DDR_CONFIG

Type: RW

Clock: same rate as HCLK

Reset State: 0x80040853

Configuration of ddr_config input of DLL

SDC2_SDCC_MCI_DDR_CONFIG

Bits	Name	Description
31	PRG_DLY_EN	Enables Programmable delay for RCLK_IN
30	EXT_PRG_RCLK_DLY_EN	Enables external control of Programmable RCLK delayline
29:27	EXT_PRG_RCLK_DLY_CODE	Used only if EXT_PRG_RCLK_DLY_EN is set. Configuring Programmable RCLK Delayline process code number.
26:21	EXT_PRG_RCLK_DLY	Used only if EXT_PRG_RCLK_DLY_EN is set. Programmable RCLK Delay line fine delay control.
20:12	TCXO_CYCLES_DLY_LINE	Number of TCXO clock cycles between finish of one delay line calibration and beginning of next delay line calibration.
11:9	TCXO_CYCLES_CNT	Number of TCXO clock cycles for which down counter is enabled for before making each inc/dec decision.
8:0	PRG_RCLK_DLY	These bits are controlled the programmable delay line. This bus is binary coded. Decimal value = (TCXO period * Decimal value of TCXO_CYCLES_CNT)/(2*delay needed). For 1.25ns the formula is $(52n \cdot 4/2 \cdot 1.25) = 83$ in decimal.

**0x07864400+ SDC2_SDCC_MCI_FIFO_ALTn, n=[0..255]
0x4*n****Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Alternative register to MCI_FIFO (0x80-0xBC). The SW can use this register range (0x400-0x7FC) for accessing all the RAM range (1024 bytes) in FIFO mode. The advantage is that any byte in the RAM can be accessed without repeating the same address

SDC2_SDCC_MCI_FIFO_ALTn

Bits	Name	Description
31:0	DATA	WORD is written or received to/from the RAM in FIFO mode

19.2 SDC2_SDCC_SDCC5_HC**0x07864900 SDC2_SDCC_HC_REG_0_2****Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Argument 2 Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_0_2

Bits	Name	Description
31:0	ARG_2	Argument 2 field

0x07864904 SDC2_SDCC_HC_REG_4_6**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Block Size Register(15-0)

-Block Count Register(31-16)

SDC2_SDCC_HC_REG_4_6

Bits	Name	Description
31:16	BLK_CNT_FOR_CUR_TRANS	Blocks Count For Current Transfer field from Block Count Register
14:12	BLK_SIZE_HST_SDMA_BUFFER	Host SDMA Buffer Boundary field from Block Size Register
11:00	BLK_SIZE_TRANS	Transfer Block Size field from Block Size Register

0x07864908 SDC2_SDCC_HC_REG_8_A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Argument 1 Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_8_A

Bits	Name	Description
31:00	CMD_ARG_1	Command Argument 1 field

0x0786490C SDC2_SDCC_HC_REG_C_E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Transfer Mode Register(15-0)

-Command Register(31-16)

SDC2_SDCC_HC_REG_C_E

Bits	Name	Description
29:24	CMD_INDX	Command Index field from Command Register
23:22	CMD_TYPE	Command Type field from Command Register
21	CMD_DATA_PRESENT_SEL	Data Present Select field from Command Register
20	CMD_INDX_CHECK_EN	Command Index Check Enable field from Command Register
19	CMD_CRC_CHECK_EN	Command CRC Check Enable field from Command Register

SDC2_SDCC_HC_REG_C_E (cont.)

Bits	Name	Description
17:16	CMD_RESP_TYPE_SEL	Response Type Select field from Command Register
5	TRANS_MODE_MULTI_SINGLE_BLK_SEL	Multi/Single Block Select from Transfer Mode Register
4	TRANS_MODE_DATA_DIRECTION_SEL	Data Transfer Direction Select from Transfer Mode Register
3:2	TRANS_MODE_AUTO_CMD_EN	Auto CMD Enable from Transfer Mode Register
1	TRANS_MODE_BLK_CNT_EN	Block Count Enable field from Transfer Mode Register
0	TRANS_MODE_DMA_EN	DMA Enable field from Transfer Mode Register

0x07864910 SDC2_SDCC_HC_REG_10_12**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_10_12

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Response bits 0-31

0x07864914 SDC2_SDCC_HC_REG_14_16**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_14_16

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Long Response bits 31-63

0x07864918 SDC2_SDCC_HC_REG_18_1A**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_18_1A

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Long Response bits 64-95

0x0786491C SDC2_SDCC_HC_REG_1C_1E**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Response Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_1C_1E

Bits	Name	Description
31:0	CMD_RESP	Command Response field - Long Response bits 96-127

0x07864920 SDC2_SDCC_HC_REG_20_22**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Buffer Data Port Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_20_22

Bits	Name	Description
31:24	BUF_DATA_PORT_3	Byte 3 of Buffer Data
23:16	BUF_DATA_PORT_2	Byte 2 of Buffer Data
15:8	BUF_DATA_PORT_1	Byte 1 of Buffer Data
7:0	BUF_DATA_PORT_0	Byte 0 of Buffer Data

0x07864924 SDC2_SDCC_HC_REG_24_26**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00080000

Present State Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_24_26

Bits	Name	Description
25	SIGANLING_18_SWITCHING_STS	Bit it is cleared, by hardware, when host driver writes any value to 1.8V Signaling Enable field, indicating that a signal switching operation has started. Bit is set, by hardware, when switching operation succeeds.
24	PRESENT_STATE_CMD_LINE_SIGNAL_LEVEL	CMD Linr Signal Level field
23:20	PRESENT_STATE_DAT_3_0_LINE_SIGNAL_LEVEL	DAT[3:0] Line Signal Level field
19	PRESENT_STATE_WR_PROTECT_SWITCH_PIN_LEVEL	Write Protect Switch Pin Level field
18	PRESENT_STATE_CARD_DETECT_PIN_LEVEL	Card Detect Pin Level field
17	PRESENT_STATE_CARD_STATE_STABLE	Card State Stable field
16	PRESENT_STATE_CARD_INSERTED	Card Inserted field
11	PRESENT_STATE_BUF_READ_EN	Buffer Read Enable field
10	PRESENT_STATE_BUF_WRITE_EN	Buffer Write Enable field
9	PRESENT_STATE_READ_TRANSFER_ACTIVE	Read Transfer Active field
8	PRESENT_STATE_WRITE_TRANSFER_ACTIVE	Write Transfer Active field
3	PRESENT_STATE_RETUNING_REQ	Re-Tuning Request field
2	PRESENT_STATE_DAT_LINE_ACTIVE	DAT Linr Active field
1	PRESENT_STATE_CMD_INHIBIT_DAT	Command Inhibit (DAT) field
0	PRESENT_STATE_CMD_INHIBIT_CMD	Command Inhibit (CMD) field

0x07864928 SDC2_SDCC_HC_REG_28_2A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of four registers from the SD Host Controller Standard Specification:

-Host Control 1 Register(7-0)

-Power Control Register(15-8)

-Block Gap Control Register(23-16)

-Wakeup Control Register(31-24)

SDC2_SDCC_HC_REG_28_2A

Bits	Name	Description
26	WKUP_EVENT_EN_ON_SD_CARD_REMOVAL	Wakeup Event Enable On SD Card Removal field from Wakeup Control Register
25	WKUP_EVENT_EN_ON_SD_CARD_INSERTION	Wakeup Event Enable On SD Card Insertion field from Wakeup Control Register
24	WKUP_EVENT_EN_ON_SD_CARD_INT	Wakeup Event Enable On Card Interrupt field from Wakeup Control Register
19	BLK_GAP_CTL_INT	Interrupt At Block Gap field from Block Gap Control Register
18	BLK_GAP_CTL_RD_WAIT	Read Wait Control field from Block Gap Control Register
17	BLK_GAP_CTL_CONTINUE_REQ	Continue Request field from Block Gap Control Register
16	BLK_GAP_CTL_STOP_GAP_REQ	Stop At Block Gap Request field from Block Gap Control Register
11:9	PWR_CTL_SD_BUS_VOLTAGE_SEL	SD Bus Voltage Select field from Power Control Register
8	PWR_CTL_SD_BUS_PWR	SD Bus Power field from Power Control Register
7	HST_CTL1_CARD_DETECT_SIGNAL_SEL	Card Detect Signal Selection field from Host Control 1 Register
6	HST_CTL1_CARD_DETECT_TEST_LEVEL	Card Detect Test Level field from Host Control 1 Register
5	HST_CTL1_EXTENDED_DATA_TRANS_WIDTH	Extended Data Transfer Width field from Host Control 1 Register
4:3	HST_CTL1_DMA_SEL	DMA Select field from Host Control 1 Register
2	HST_CTL1_HS_EN	High Speed Enable field from Host Control 1 Register
1	HST_CTL1_DATA_TRANS_WIDTH	Data Transfer Width field from Host Control 1 Register
0	HST_CTL1_LED_CTL	LED Control field from Host Control 1 Register

0x0786492C SDC2_SDCC_HC_REG_2C_2E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000001

Combination of three registers from the SD Host Controller Standard Specification:

-Clock Control Register(15-0)

-Timeout Control Register(23-16)

-Software Reset Register(31-24)

SDC2_SDCC_HC_REG_2C_2E

Bits	Name	Type	Description
26	SW_RST_DAT_LINE	RW	Software Reset For DAT Line field from Software Reset Register
25	SW_RST_CMD_LINE	RW	Software Reset For CMD Line field from Software Reset Register
24	SW_RST_FOR_ALL	RW	Software Reset For All field from Software Reset Register
19:16	DATA_TIMEOUT_COUNTER	RW	Data Timeout Counter Value field from Timeout Control Register. The reserved value 0xF is translated to maximum number of cycles - $2^{32}-1$
15:8	CLK_CTL_SDCLK_FREQ_SEL	RW	SDCLK Frequency Select field from Clock Control Register
7:6	CLK_CTL_SDCLK_FREQ_SEL_MSB	RW	Upper Bits of SDCLK Frequency Select field from Clock Control Register
5	CLK_CTL_GEN_SEL	RW	Clock Generator Select field from Clock Control Register
2	CLK_CTL_SDCLK_EN	RW	SD Clock Enable field from Clock Control Register
1	CLK_CTL_INTERNAL_CLK_STABLE	R	Internal Clock Stable field from Clock Control Register
0	CLK_CTL_INTERNAL_CLK_EN	RW	Internal Clock Enable field from Clock Control Register

0x07864930 SDC2_SDCC_HC_REG_30_32**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Normal Interrupt Status Register(15-0)

-Error Interrupt Status Register(31-16)

SDC2_SDCC_HC_REG_30_32

Bits	Name	Type	Description
31:28	ERR_INT_STS_VENDOR_SPECIFIC	RW	Vendor Specific Error Status field from Error Interrupt Status Register
26	ERR_INT_STS_TUNING_ERROR	RW	Tuning Error field from Error Interrupt Status Register
25	ERR_INT_STS_ADMA_ERR	RW	ADMA Error field from Error Interrupt Status Register
24	ERR_INT_STS_AUTO_CMD_ERR	RW	Auto CMD Error field from Error Interrupt Status Register
23	ERR_INT_STS_CURRENT_LIMIT_ERR	RW	Current Limit Error field from Error Interrupt Status Register
22	ERR_INT_STS_DATA_END_BIT_ERR	RW	Data End Bit Error field from Error Interrupt Status Register
21	ERR_INT_STS_DATA_CRC_ERR	RW	Data CRC Error field from Error Interrupt Status Register
20	ERR_INT_STS_DATA_TIMEOUT_ERR	RW	Data Timeout Error field from Error Interrupt Status Register
19	ERR_INT_STS_CMD_INDEX_ERR	RW	Command Index Error field from Error Interrupt Status Register
18	ERR_INT_STS_CMD_END_BIT_ERR	RW	Command End Bit Error field from Error Interrupt Status Register
17	ERR_INT_STS_CMD_CRC_ERR	RW	Command CRC Error field from Error Interrupt Status Register
16	ERR_INT_STS_CMD_TIMEOUT_ERR	RW	Command Timeout Error field from Error Interrupt Status Register
15	NORMAL_INT_STS_ERROR_INTERRUPT	R	Error Interrupt field from Normal Interrupt Status Register
12	NORMAL_INT_STS_RETUNING_EVENT	R	Re-Tuning Event field from Normal Interrupt Status Register
11	NORMAL_INT_STS_INT_C	R	INT_C field from Normal Interrupt Status Register
10	NORMAL_INT_STS_INT_B	R	INT_B field from Normal Interrupt Status Register
9	NORMAL_INT_STS_INT_A	R	INT_A field from Normal Interrupt Status Register
8	NORMAL_INT_STS_CARD_INTERRUPT	R	Card Interrupt field from Normal Interrupt Status Register
7	NORMAL_INT_STS_CARD_REMOVAL	RW	Card Removal field from Normal Interrupt Status Register
6	NORMAL_INT_STS_CARD_INSERTION	RW	Card Insertion field from Normal Interrupt Status Register

SDC2_SDCC_HC_REG_30_32 (cont.)

Bits	Name	Type	Description
5	NORMAL_INT_STS_BUF_RD_READY	RW	Buffer Read Ready field from Normal Interrupt Status Register
4	NORMAL_INT_STS_BUF_WR_READY	RW	Buffer Write Ready field from Normal Interrupt Status Register
3	NORMAL_INT_STS_DMA_INTERRUPT	RW	DMA Interrupt field from Normal Interrupt Status Register
2	NORMAL_INT_STS_BLK_GAP_EVENT	RW	Block Gap Event field from Normal Interrupt Status Register
1	NORMAL_INT_STS_TRANSFER_COMPLETE	RW	Transfer Complete field from Normal Interrupt Status Register
0	NORMAL_INT_STS_CMD_COMPLETE	RW	Command Complete field from Normal Interrupt Status Register

0x07864934 SDC2_SDCC_HC_REG_34_36**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Normal Interrupt Status Enable Register(15-0)

-Error Interrupt Status Enable Register(31-16)

SDC2_SDCC_HC_REG_34_36

Bits	Name	Description
31:28	ERR_INT_STS_EN_VENDOR_SPECIFIC_ERR	Vendor Specific Error Status Enable field from Error Interrupt Status Enable Register
26	ERR_INT_STS_EN_TUNING_ERR	Tuning Error Status Enable field from Error Interrupt Status Enable Register
25	ERR_INT_STS_EN_ADMA_ERR	ADMA Error Status Enable field from Error Interrupt Status Enable Register
24	ERR_INT_STS_EN_AUTO_CMD_ERR	Auto CMD Error Status Enable field from Error Interrupt Status Enable Register
23	ERR_INT_STS_EN_CURRENT_LIMIT_ERR	Current Limit Error Status Enable field from Error Interrupt Status Enable Register
22	ERR_INT_STS_EN_DATA_END_BIT_ERR	Data End Bit Error Status Enable field from Error Interrupt Status Enable Register
21	ERR_INT_STS_EN_DATA_CRC_ERR	Data CRC Error Status Enable field from Error Interrupt Status Enable Register

SDC2_SDCC_HC_REG_34_36 (cont.)

Bits	Name	Description
20	ERR_INT_STS_EN_DATA_TIMEOUT	Data Timeout Error Status Enable field from Error Interrupt Status Enable Register
19	ERR_INT_STS_EN_CMD_IDX_ERR	Command Index Error Status Enable field from Error Interrupt Status Enable Register
18	ERR_INT_STS_EN_CMD_END_BIT_ERR	Command End Bit Error Status Enable field from Error Interrupt Status Enable Register
17	ERR_INT_STS_EN_CMD_CRC_ERR	Command CRC Error Status Enable field from Error Interrupt Status Enable Register
16	ERR_INT_STS_EN_CMD_TIMEOUT	Command Timeout Error Status Enable field from Error Interrupt Status Enable Register
12	NORMAL_INT_STS_EN_RE_TUNING_EVENT	Re-Tuning Event Status Enable field from Normal Interrupt Status Enable Register
11	NORMAL_INT_STS_EN_INT_C	INT_C Status Enable field from Normal Interrupt Status Enable Register
10	NORMAL_INT_STS_EN_INT_B	INT_B Status Enable field from Normal Interrupt Status Enable Register
9	NORMAL_INT_STS_EN_INT_A	INT_A Status Enable field from Normal Interrupt Status Enable Register
8	NORMAL_INT_STS_EN_CARD_INT	Card Interrupt Status Enable field from Normal Interrupt Status Enable Register
7	NORMAL_INT_STS_EN_CARD_REMOVAL	Card Removal Status Enable field from Normal Interrupt Status Enable Register
6	NORMAL_INT_STS_EN_CARD_INSERTION	Card Insertion Status Enable field from Normal Interrupt Status Enable Register
5	NORMAL_INT_STS_EN_BUFFER_RD_READY	Buffer Read Ready Status Enable field from Normal Interrupt Status Enable Register
4	NORMAL_INT_STS_EN_BUFFER_WR_READY	Buffer Write Ready Status Enable field from Normal Interrupt Status Enable Register
3	NORMAL_INT_STS_EN_DMA_A_INT	DMA Interrupt Status Enable field from Normal Interrupt Status Enable Register
2	NORMAL_INT_STS_EN_BLOCK_GAP_EVENT	Block Gap Event Status Enable field from Normal Interrupt Status Enable Register
1	NORMAL_INT_STS_EN_TRANSFER_COMPLETE	Transfer Complete Status Enable field from Normal Interrupt Status Enable Register
0	NORMAL_INT_STS_EN_COMMAND_COMPLETE	Command Complete Status Enable field from Normal Interrupt Status Enable Register

0x07864938 SDC2_SDCC_HC_REG_38_3A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Normal Interrupt Signal Enable Register(15-0)

-Error Interrupt Signal Enable Register(31-16)

SDC2_SDCC_HC_REG_38_3A

Bits	Name	Type	Description
31:28	ERR_INT_SIGNAL_EN_VE NDOR_SPECIFIC_ERR	RW	Vendor Specific Error Signal Enable field from Error Interrupt Signal Enable Register
26	ERR_INT_SIGNAL_EN_TU NING_ERR	RW	Tuning Error Signal Enable field from Error Interrupt Signal Enable Register
25	ERR_INT_SIGNAL_EN_AD MA_ERR	RW	ADMA Error Signal Enable field from Error Interrupt Signal Enable Register
24	ERR_INT_SIGNAL_EN_AU TO_CMD_ERR	RW	Auto CMD Error Signal Enable field from Error Interrupt Signal Enable Register
23	ERR_INT_SIGNAL_EN_CU RRENT_LIMIT_ERR	RW	Current Limit Error Signal Enable field from Error Interrupt Signal Enable Register
22	ERR_INT_SIGNAL_EN_DAT A_END_BIT_ERR	RW	Data End Bit Error Signal Enable field from Error Interrupt Signal Enable Register
21	ERR_INT_SIGNAL_EN_DAT A_CRC_ERR	RW	Data CRC Error Signal Enable field from Error Interrupt Signal Enable Register
20	ERR_INT_SIGNAL_EN_DAT A_TIMEOUT	RW	Data Timeout Error Signal Enable field from Error Interrupt Signal Enable Register
19	ERR_INT_SIGNAL_EN_CM D_INDXX_ERR	RW	Command Index Error Signal Enable field from Error Interrupt Signal Enable Register
18	ERR_INT_SIGNAL_EN_CM D_END_BIT_ERR	RW	Command End Bit Error Signal Enable field from Error Interrupt Signal Enable Register
17	ERR_INT_SIGNAL_EN_CM D_CRC_ERR	RW	Command CRC Error Signal Enable field from Error Interrupt Signal Enable Register
16	ERR_INT_SIGNAL_EN_CM D_TIMEOUT	RW	Command Timeoutout Error Signal Enable field from Error Interrupt Signal Enable Register
15	NORMAL_INT_SIGNAL_EN _ERR_INT	R	Error Interrupt Signal Enable field from Normal Interrupt Signal Enable Register
12	NORMAL_INT_SIGNAL_EN _RETUNING_EVENT	RW	Re-Tuning Event Signal Enable field from Normal Interrupt Signal Enable Register
11	NORMAL_INT_SIGNAL_EN _INT_C	RW	INT_C Signal Enable field from Normal Interrupt Signal Enable Register

SDC2_SDCC_HC_REG_38_3A (cont.)

Bits	Name	Type	Description
10	NORMAL_INT_SIGNAL_EN_INT_B	RW	INT_B Signal Enable field from Normal Interrupt Signal Enable Register
9	NORMAL_INT_SIGNAL_EN_INT_A	RW	INT_A Signal Enable field from Normal Interrupt Signal Enable Register
8	NORMAL_INT_SIGNAL_EN_CARD_INT	RW	Card Interrupt Signal Enable field from Normal Interrupt Signal Enable Register
7	NORMAL_INT_SIGNAL_EN_CARD_REMOVAL	RW	Card Removal Signal Enable field from Normal Interrupt Signal Enable Register
6	NORMAL_INT_SIGNAL_EN_CARD_INSERTION	RW	Card Insertion Signal Enable field from Normal Interrupt Signal Enable Register
5	NORMAL_INT_SIGNAL_EN_BUF_RD_READY	RW	Buffer Read Ready Signal Enable field from Normal Interrupt Signal Enable Register
4	NORMAL_INT_SIGNAL_EN_BUF_WR_READY	RW	Buffer Write Ready Signal Enable field from Normal Interrupt Signal Enable Register
3	NORMAL_INT_SIGNAL_EN_DMA_INT	RW	DMA Interrupt Signal Enable field from Normal Interrupt Signal Enable Register
2	NORMAL_INT_SIGNAL_EN_BLK_GAP_EVENT	RW	Block Gap Event Signal Enable field from Normal Interrupt Signal Enable Register
1	NORMAL_INT_SIGNAL_EN_TRANS_COMPLETE	RW	Transfer Complete Signal Enable field from Normal Interrupt Signal Enable Register
0	NORMAL_INT_SIGNAL_EN_CMD_COMPLETE	RW	Command Complete Signal Enable field from Normal Interrupt Signal Enable Register

0x0786493C SDC2_SDCC_HC_REG_3C_3E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Auto CMD Error Status Register(15-0)

-Host Control 2 Register(31-16)

SDC2_SDCC_HC_REG_3C_3E

Bits	Name	Type	Description
31	HST_CTL2_PRESET_VALUE_EN	RW	Preset Value Enable field from Host Control2 Register
30	HST_CTL2_ASYNC_INT_EN	RW	Asynchronous Interrupt Enable field from Host Control2 Register

SDC2_SDCC_HC_REG_3C_3E (cont.)

Bits	Name	Type	Description
23	HST_CTL2_SAMPL_CLK_SEL	RW	Sampling Clock Select field from Host Control2 Register
22	HST_CTL2_EXEC_TUNING	RW	Execute Tuning field from Host Control2 Register
21:20	HST_CTL2_DRIVER_STRENGTH_SEL	RW	Driver Strength Select field from Host Control2 Register
19	HST_CTL2_SIGNALING_1_8_EN	RW	1.8V Signaling Enable field from Host Control2 Register
18:16	HST_CTL2_UHS_MODE_SEL	RW	UHS Mode Select field from Host Control2 Register
7	AUTO_CMD_NOT_ISSUED_BY_AUTO_CMD12	R	Command Not issued By Auto CMD12 Error field from Auto CMD Error Status Register
4	AUTO_CMD_INDX_ERR	R	Auto CMD Index Error field from Auto CMD Error Status Register
3	AUTO_CMD_END_BIT_ERR	R	Auto CMD End Bit Error field from Auto CMD Error Status Register
2	AUTO_CMD_CRC_ERR	R	Auto CMD CRC Error field from Auto CMD Error Status Register
1	AUTO_CMD_TIMEOUT	R	Auto CMD Timeout Error field from Auto CMD Error Status Register
0	AUTO_CMD12_NOT_EXEC	R	Auto CMD12 Not Executed field from Auto CMD Error Status Register

0x07864940 SDC2_SDCC_HC_REG_40_42**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x3029C8B2

The 32 LSBs of the Capabilities Register in SD Host Controller Standard Specification

SDC2_SDCC_HC_REG_40_42

Bits	Name	Description
31:30	CAPABILITIES_SLOT_TYPE	Slot Type field from Capabilities Register
29	CAPABILITIES_ASYNC_INT_SUPPORT	Asynchronous Interrupt Support field from Capabilities Register
28	CAPABILITIES_SYS_BUS_SUPPORT_64_BIT	64 bit System Bus Support field from Capabilities Register
26	CAPABILITIES_VOLTAGE_SUPPORT_1_8V	Voltage Support 1.8v field from Capabilities Register

SDC2_SDCC_HC_REG_40_42 (cont.)

Bits	Name	Description
25	CAPABILITIES_VOLTAGE_SUPPORT_3_0V	Voltage Support 3.0v field from Capabilities Register
24	CAPABILITIES_VOLTAGE_SUPPORT_3_3V	Voltage Support 3.3v field from Capabilities Register
23	CAPABILITIES_SUSPEND_RESUME_SUPPORT	Suspend Resume Support field from Capabilities Register
22	CAPABILITIES_SDMA_SUPPORT	SDMA Support field from Capabilities Register
21	CAPABILITIES_HS_SUPPORT	High Speed Support field from Capabilities Register
19	CAPABILITIES_ADMA2_SUPPORT	ADMA2 Support field from Capabilities Register
18	CAPABILITIES_SUPPORT_8_BIT	8 bit Supported For Embedded Product field from Capabilities Register
17:16	CAPABILITIES_MAX_BLK_LENGTH	Max Block Length field from Capabilities Register
15:8	CAPABILITIES_BASE_SDCLK_FREQ	Base Clock Frequency For SD Clock field from Capabilities Register
7	CAPABILITIES_TIMEOUT_CLOCK_UNIT	Timeout Clock Unit field from Capabilities Register
5:0	CAPABILITIES_TIMEOUT_CLOCK_FREQ	Timeout Clock Frequency field from Capabilities Register

0x07864944 SDC2_SDCC_HC_REG_44_46**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00008007

The 32 MSBs of the Capabilities Register in SD Host Controller Standard Specification

SDC2_SDCC_HC_REG_44_46

Bits	Name	Description
23:16	CAPABILITIES_CLK_MULTIPLIER	Clock Multiplier field from Capabilities Register
15:14	CAPABILITIES_RETUNING_MODE	Re-Tuning Modes field from Capabilities Register
13	CAPABILITIES_USE_TUNING_FOR_SDR50	Use Tuning for SDR50 field from Capabilities Register

SDC2_SDCC_HC_REG_44_46 (cont.)

Bits	Name	Description
11:8	CAPABILITIES_TIMER_CNT_FOR_RETUNING	Timer Count for Re-Tuning field from Capabilities Register
6	CAPABILITIES_DRIVER_TYPE_D_SUPPORT	Driver Type D Support field from Capabilities Register
5	CAPABILITIES_DRIVER_TYPE_C_SUPPORT	Driver Type C Support field from Capabilities Register
4	CAPABILITIES_DRIVER_TYPE_A_SUPPORT	Driver Type A Support field from Capabilities Register
2	CAPABILITIES_DDR_50_SUPPORT	DDR50 Support field from Capabilities Register
1	CAPABILITIES_SDR_104_SUPPORT	SDR104 Support field from Capabilities Register
0	CAPABILITIES_SDR_50_SUPPORT	SDR50 Support field from Capabilities Register

0x07864948 SDC2_SDCC_HC_REG_48_4A**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Maximum Current Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_48_4A

Bits	Name	Description
23:16	MAX_CURRENT_1_8V	Maximum Current for 1.8v field from Maximum Current Capabilities Register
15:08	MAX_CURRENT_3_0V	Maximum Current for 3.0v field from Maximum Current Capabilities Register
07:00	MAX_CURRENT_3_3V	Maximum Current for 3.3v field from Maximum Current Capabilities Register

0x07864950 SDC2_SDCC_HC_REG_50_52**Type:** W**Clock:** same rate as HCLK**Reset State:** 0x00000000

Combination of two registers from the SD Host Controller Standard Specification:

-Force Event Register for Auto CMD Error Status(15-0)

-Force Event Register for Error Interrupt Status(31-16)

SDC2_SDCC_HC_REG_50_52

Bits	Name	Description
31:28	FORCE_EVENT_FOR_ERR_VENDOR_SPECIFIC_ERR_STS	Force Event for Vendor Specific Error Status field from Force Event Register for Error Interrupt Status
25	FORCE_EVENT_FOR_ERR_ADMA	Force Event for ADMA Error field from Force Event Register for Error Interrupt Status
24	FORCE_EVENT_FOR_ERR_AUTO_CMD	Force Event for Auto CMD Error field from Force Event Register for Error Interrupt Status
23	FORCE_EVENT_FOR_ERR_CURRENT_LIMIT	Force Event for Current Limit Error field from Force Event Register for Error Interrupt Status
22	FORCE_EVENT_FOR_ERR_DATA_END_BIT	Force Event for Data End Bit Error field from Force Event Register for Error Interrupt Status
21	FORCE_EVENT_FOR_ERR_DATA_CRC	Force Event for Data CRC Error field from Force Event Register for Error Interrupt Status
20	FORCE_EVENT_FOR_ERR_DATA_TIMEOUT	Force Event for Data Timeout Error field from Force Event Register for Error Interrupt Status
19	FORCE_EVENT_FOR_ERR_CMD_INDX	Force Event for Command Index Error field from Force Event Register for Error Interrupt Status
18	FORCE_EVENT_FOR_ERR_CMD_END_BIT	Force Event for Command End Bit Error field from Force Event Register for Error Interrupt Status
17	FORCE_EVENT_FOR_ERR_CMD_CRC	Force Event for Command CRC Error field from Force Event Register for Error Interrupt Status
16	FORCE_EVENT_FOR_ERR_CMD_TIMEOUT	Force Event for Command Timeout Error field from Force Event Register for Error Interrupt Status
7	FORCE_EVENT_FOR_CMD_NOT_ISSUED_BY_AUTO_CMD12	Force Event for Command Not Issued By Auto CMD12 Error field from Force Event Register for Auto CMD Error Status
4	FORCE_EVENT_FOR_AUTO_CMD_INDX_ERR	Force Event for Auto CMD Index Error field from Force Event Register for Auto CMD Error Status
3	FORCE_EVENT_FOR_AUTO_CMD_END_BIT_ERR	Force Event for Auto CMD End Bit Error field from Force Event Register for Auto CMD Error Status
2	FORCE_EVENT_FOR_AUTO_CMD_CRC_ERR	Force Event for Auto CMD CRC Error field from Force Event Register for Auto CMD Error Status
1	FORCE_EVENT_FOR_AUTO_CMD_TIMEOUT_ERR	Force Event for Auto CMD Timeout Error field from Force Event Register for Auto CMD Error Status
0	FORCE_EVENT_FOR_AUTO_CMD12_NOT_EXEC	Force Event for Auto CMD12 Not Executed field from Force Event Register for Auto CMD Error Status

0x07864954 SDC2_SDCC_HC_REG_54_56**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

The 7 LSBs are the ADMA Error Status Register in SD Host Controller Standard Specification.
The Bits 31-8 are unused.

SDC2_SDCC_HC_REG_54_56

Bits	Name	Description
2	ADMA_LENGTH_MISMATCH_ERR	ADMA Length Mismatch Error field from ADMA Error Status Register
1:0	ADMA_ERR_STATE	ADMA Error State field from ADMA Error Status Register

0x07864958 SDC2_SDCC_HC_REG_58_5A**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

The 32 LSBs of the ADMA System Address Register in SD Host Controller Standard Specification

SDC2_SDCC_HC_REG_58_5A

Bits	Name	Description
31:00	ADMA_SYS_ADDRESS	ADMA System Address field from ADMA System Address Register

0x0786495C SDC2_SDCC_HC_REG_5C_5E**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

The 32 MSBs of the ADMA System Address Register in SD Host Controller Standard Specification

SDC2_SDCC_HC_REG_5C_5E

Bits	Name	Description
31:00	ADMA_SYS_ADDRESS_64	upper 32 bits of ADMA System Address field from ADMA System Address Register

0x07864960 SDC2_SDCC_HC_REG_60_62**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00040000

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for Initialization Register(15-0)

-Preset Value for Default Speed Register(31-16)

SDC2_SDCC_HC_REG_60_62

Bits	Name	Description
31:30	DEFAULT_SPEED_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for Default Speed
26	DEFAULT_SPEED_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for Default Speed
25:16	DEFAULT_SPEED_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for Default Speed
15:14	INIT_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for Initialization
10	INIT_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for Initialization
9:0	INIT_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for Initialization

0x07864964 SDC2_SDCC_HC_REG_64_66**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00040002

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for High Speed Register(15-0)

-Preset Value for SDR12 Register

SDC2_SDCC_HC_REG_64_66

Bits	Name	Description
31:30	SDR12_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR12
26	SDR12_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR12

SDC2_SDCC_HC_REG_64_66 (cont.)

Bits	Name	Description
25:16	SDR12_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR12
15:14	HS_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for High Speed
10	HS_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for High Speed
9:0	HS_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for High Speed

0x07864968 SDC2_SDCC_HC_REG_68_6A**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00010002

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for SDR25 Register(15-0)

-Preset Value for SDR50 Register

SDC2_SDCC_HC_REG_68_6A

Bits	Name	Description
31:30	SDR50_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR50
26	SDR50_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR50
25:16	SDR50_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR50
15:14	SDR25_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR25
10	SDR25_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR25
9:0	SDR25_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR25

0x0786496C SDC2_SDCC_HC_REG_6C_6E**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00020000

Combination of two registers from the SD Host Controller Standard Specification:

-Preset Value for SDR104 Register(15-0)

-Preset Value for DDR50 Register

SDC2_SDCC_HC_REG_6C_6E

Bits	Name	Description
31:30	DDR50_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for DDR50
26	DDR50_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for DDR50
25:16	DDR50_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for DDR50
15:14	SDR104_DRIVER_STRENGTH_SEL	Driver Strength Select Value field from Preset Value for SDR104
10	SDR104_CLK_GEN_SEL	Clock Generator Select Value field from Preset Value for SDR104
9:0	SDR104_SDCLK_FREQ_SEL	SDCLK Frequency Select Value field from Preset Value for SDR104

0x078649E0 SDC2_SDCC_HC_REG_E0_E2

Type: RW

Clock: same rate as HCLK

Reset State: 0x00000000

Shared Bus Control Register in SD Host Controller Standard Specification.

SDC2_SDCC_HC_REG_E0_E2

Bits	Name	Type	Description
30:24	SHARED_BUS_CTL_BACK_END_PWR	RW	Back End Power Control field from Shared Bus Control Register
22:20	SHARED_BUS_INT_PIN_SEL	RW	
18:16	SHARED_BUS_CTL_CLK_PIN_SEL	RW	Clock Pin Select field from Shared Bus Control Register
14:8	SHARED_BUS_CTL_BUS_WIDTH_PRESET	R	Bus Width Preset field from Shared Bus Control Register
5:4	SHARED_BUS_CTL_NUM_INTERRUPT_INPUT_PINS	R	Number Of Interrupt Input Pins field from Shared Bus Control Register
2:0	SHARED_BUS_CTL_NUM_CLK_PINS	R	Number of Clock Pins field from Shared Bus Control Register

0x078649FC SDC2_SDCC_HC_REG_FC_FE**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00020000

Combination of two registers from the SD Host Controller Standard Specification:

-Slot Interrupt Status Register(15-0)

-Host Controller Version Register

SDC2_SDCC_HC_REG_FC_FE

Bits	Name	Type	Description
31:24	HC_VENDOR_VERSION_NUM	R	Vendor Version Number field from Host Controller Version Register
23:16	HC_SPEC_VERSION_NUM	R	Specification Version Number field from Host Controller Version Register
7:0	INT_SIGNAL_FOR_EACH_SLOT	RW	Interrupt Signal For Each Slot field from Slot Interrupt Status Register

0x07864A00 SDC2_SDCC_HC_REG_DLL_CONFIG**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x60006400

This register configures the DLL's inputs.

SDC2_SDCC_HC_REG_DLL_CONFIG

Bits	Name	Description
31	SDC4_DIS_DOUT	When this bit equals to '0', the data which comes out from the dll is valid. When it equals to '1' this data isn't valid. The inversion of this bit is connected to dll's input - dll_en_dout
30	DLL_RST	Setting this bit to 1 resets cm_dll_sdc4. cm_dll_sdc4 should be reset every time the MCLK frequency is changed.
29	PDN	Power Down Value 0 - analog blocks are enabled Value 1 - analog blocks are powered down (default)
28	CK_INTP_SEL	Selects interpolator output
27	CK_INTP_EN	Enable clock interpolation for finer resolution

SDC2_SDCC_HC_REG_DLL_CONFIG (cont.)

Bits	Name	Description
26:24	MCLK_FREQ	Frequency of MCLK Value 000 -100 - 112 (MHz) Value 001 -112 - 125 Value 010 -125 - 137 Value 011 -137 - 150 Value 100 -150 - 162 Value 101 -162 - 175 Value 110 -175 - 187 Value 111 -187 - 200
23:20	CDR_SELECT	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
19	CDR_EXT_EN	Enable external control of cdr phase select
18	CK_OUT_EN	Enable output clock (default value is '1')
17	CDR_EN	Enable CDR function
16	DLL_EN	Enable DLL function
15:14	CDR_UPD_RATE	CDR update rate, low pass filtering window of CDR Max update rate: Value 00 - 0.5 MCLK frequency Value 01 - 0.25 MCLK Frequency (default) Value 10 - 0.125 MCLK frequency Value 11 - 1/16 MCLK Frequency
13:12	DLL_UPD_RATE	DLL update rate Value 00 - sdc4_mclk/10 Value 01 - sdc4_mclk/20 Value 10 - sdc4_mclk/40 (default) Value 11 - sdc4_mclk/80

SDC2_SDCC_HC_REG_DLL_CONFIG (cont.)

Bits	Name	Description
11:10	DLL_PHASE_DET	DLL phase detector low pass average window Value 00 - 2 cycles Value 01 - 4 cycles (default) Value 10 - 8 cycles Value 11 - 16 cycles
9	CDR_ALGORITHM_SEL	CDR algorithm select Value 0 - Edge (default) Value 1 - Level
0	CMD_DAT_TRACK_SEL	Select DAT or CMD lines for CDR tracking Value 0 - track DAT inputs (default) Value 1 - track CMD input

0x07864A08 SDC2_SDCC_HC_REG_DLL_STATUS**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

This register is connected to cm_dll_sdc4's status output.

SDC2_SDCC_HC_REG_DLL_STATUS

Bits	Name	Description
12	SDC4_DTEST_MUXSEL	Digital test mux select
11	DDR_DLL_LOCK_JDR	Reserved
10:9	SDC4_DLL_DTEST_OUT_A TPG	SDC4_DLL_DTEST_OUT output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
8	SDC4_DLL_LOCK_ATPG	SDC4_DLL_LOCK output from DLL after a clock mux with sampled JDRs for ATPG mode. This bit helps collecting coverage on DLL's output
7	DLL_LOCK	DLL lock status Value 0 - Not locked Value 1 - Locked

SDC2_SDCC_HC_REG_DLL_STATUS (cont.)

Bits	Name	Description
6:3	CDR_PHASE	CDR phase select (gray coded) Value 0000 - phase 0 Value 0001 - phase 1 Value 0011 - phase 2 Value 0010 - phase 3 Value 0110 - phase 4 Value 0111 - phase 5 Value 0101 - phase 6 Value 0100 - phase 7 Value 1100 - phase 8 Value 1101 - phase 9 Value 1111 - phase 10 Value 1110 - phase 11 Value 1010 - phase 12 Value 1011 - phase 13 Value 1001 - phase 14 Value 1000 - phase 15
2	DDLL_COARSE_CAL	Value 1 - done Value 0 - not done

0x07864A0C SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000A1C**SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC**

Bits	Name	Description
31:22	HC_AUTO_CMD_COUNTER	This counter will determine the time between two auto commands transmissions
21:19	HC_SELECT_IN	Selecting the SD controller's mode. Equivalent to SELECT_IN filed in MCI_CLK
18	HC_SELECT_IN_EN	Enabling the selection of mode via the vendor specific register
17	ADMA_DESC_PRIORITY	If set (1) then the ADMA's descriptors SM gets priority on the data accesses. Not Applicabale for Gandalf.
16	HC_IO_PAD_PWR_SWITCH	Indication to Pad that power has to be switched from 3.3V to 1.8V.
15	HC_IO_PAD_PWR_SWITCH_EN	This Bit enables the use of HC_IO_PAD_PWR_SWITCH
14	HC_IGNORE_CTOUT	If set (1), CPSM disables command timer and waits for interrupt request (Card Response). See note #4 below.

SDC2_SDC_C_HC_VENDOR_SPECIFIC_FUNC (cont.)

Bits	Name	Description
13	HC_SW_SDC4_CMD19	The input of cm_dll_sdc4 - sdc4_cmd19 can be driven by SW if AUTO_CMD19 (bit 16 in MCI_CMD) feature is not used. Value 1 - sdc4_cmd19 is driven by SW Value 0 (default) - sdc4_cmd19 is driven by HW
12	HC_INVERT_OUT	value: 0 data and cmd are driven by falling edge value 1: data and cmd are driven by rising edge.
11	HC_INVERT_OUT_EN	value 1: HC_INVERT_OUT is driven by bit 12 of HC_VENDOR_SPECIFIC_FUNC (HC_INVERT_OUT) value 0: HC_INVERT_OUT is driven by HST_CTL1_HS_EN .
10	MODE	Data transfer mode: 0: block data transfer 1: stream data transfer. Can be used in bus testing procedure
9:8	SDC4_MCLK_SEL	Selects the sdc4_mclk - input clock of cm_dll_sdc4 Value 1 - feedback clock from CLK pad Value 2 (default) - free running MCLK (gated between the transactions) Value 3 - free running MCLK divided by 2
7	ADMA_ERR_SIZE_EN	enabling interrupt for mismatch error in ADMA2
6	HC_AUTO_CMD21_EN	Enabling bit for the auto command 21 option. value 0: disable value 1:enable
5	HC_AUTO_CMD19_EN	Enabling bit for the auto command 19 option. value 0: disable value 1:enable
4	HC_HCLKON_SW_EN	SW enable of AHB clock request of SDCC5. value 0: HW clock request mechanism is used value 1: clock request signal is always high
3	ADMA_BUSREQ_EN	enabling the fix in ADMA2 for busrequest
2	FLOW_EN	Enable flow control: value 0: disable value 1: enable (default)
1	PWRSAVE	Disable Prime-Cell MCI clock output when bus is idle to save power. value 0: Power save disabled - always enabled if bit 8 is set. value 1: Power save enabled - clock enabled only when bus is active and bit 8 is set.
0	CLK_INV	When set(1), the input clock which is inserted into the input macros is inverted.

0x07864A10 SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC2**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0xF88218A8**SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC2**

Bits	Name	Type	Description
31	QSB_AXI_ABURST	RW	Driving QSB AXI output
30:28	NUM_OUTSTANDING_DATA	RW	Configuring the number of outstanding transactions for the data. The descriptors accesses have more one outstanding request
27	PROCEED_AXI_AFTER_ERROR	RW	When error occurs on AXI master the traffic can continue or terminate. If this bit is set then the traffic continues and more requests are transmitted on the address channel
26	QSB_AXI_AFULL_CALC	RW	If this bit is set, then afull isn't '0' constantly but can be equal to '1' if all the beats have 8 bytes on the strobe lines
25	ONE_MID_SUPPORT	RW	If this bit is set, then only 1 MID is used for descriptors and data
24:22	RESERVED	RW	Reserved
21	HC_SW_RST_REQ	RW	Before executing HC_SW_RST_FOR_ALL or HC_SW_RST_FOR_DAT this bit can be set and SW needs to polls on it until it's being cleared. The bit is cleared after AXI master (QMB) has finished processing the outstanding transactions and it's in IDLE state. This bit can be useful for HPI feature.
20	HC_SW_RST_WAIT_IDLE_DIS	RW	When this bit is cleared, the HC_SW_RST is executed only after the AXI master (QMB) is in IDLE state. This bit Can be used for HPI feature instead of polling on HC_SW_RST_REQ bit. This bit should be cleared for SW reset from unknown states.
19	SDCC5_HALT_REQ	R	Reading SDCC5_HALT_REQ input
18	SDCC5_HALT_ACK	R	Reading SDCC5_HALT_ACK output
17	SDCC5_M_IDLE	R	Reading SDCC5_M_IDLE output
16	SDCC5_HALT_ACK_SW_EN	RW	Enabling the SW value for SDCC5_HALT_ACK
15	SDCC5_HALT_ACK_SW	RW	Driving SDCC5_HALT_ACK from SW and not by HW
14	SDCC5_M_IDLE_DIS	RW	If this bit is set, then sdcc5_m_idle will be tied low
13	QSB_AXI_INTERLEAVING_EN	RW	If the bit is set, then the controller can support interleaving between two bursts from the Noc. This option is disabled by default because Noc doesn't support interleaving but only re-ordering
12	RESERVED	RW	Reserved

SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC2 (cont.)

Bits	Name	Type	Description
11	RESERVED	RW	Reserved
10:9	RESERVED	RW	Reserved
8:6	RESERVED	RW	Reserved
5	RESERVED	RW	Reserved
4	RESERVED	RW	Reserved
3	RESERVED	RW	Reserved
2	QSB_AXI_OOOWR	RW	Driving QSB AXI output
1	QSB_AXI_OOORD	RW	Driving QSB AXI output
0	QSB_AXI_AFULL	RW	Driving QSB AXI output

0x07864A14 SDC2_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR0**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Last AHB address phase before response error was detected

SDC2_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR0

Bits	Name	Description
31	RESP_ERR_WR	If set, then the failed transaction was a write access
30:28	RESP_ERR_TID	The TID of the failed transaction
27:13	DESC_ADDR_35_21	Upper 15 bits of current address in address channel
12:0	DESC_ADDR_12_0	Lower 13 bits of current address in address channel

0x07864A18 SDC2_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR1**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Last AHB attributes before response error was detected

SDC2_SDCC_HC_VENDOR_SPECIFIC_ADMA_ERR_ADDR1

Bits	Name	Description
21:20	AHB_MON_HTRANS	Htrans control bits from AHB in the last address phase before getting the response error
19	AHB_MON_WO_REQ	indication that the current master got the response error w/o asserting hbusreq
18:16	AHB_MON_HBURST	Hburst control bits from AHB in the last address phase before getting the response error
15	AHB_MON_HWRITE	Hwrite control bits from AHB in the last address phase before getting the response error
14:12	AHB_MON_HSIZE	Hsize control bits from AHB in the last address phase before getting the response error
11:8	AHB_MON_HPROT	Hprot control bits from AHB in the last address phase before getting the response error
7:0	AHB_MON_CUR_MASTER	Indication on the last bus master which accessed to AHB bus

0x07864A1C SDC2_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES0**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

driving the HC_REG_40_42 register

SDC2_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES0

Bits	Name	Description
31:30	VS_CAPABILITIES_SLOT_T YPE	Slot Type field from Capabilities Register
29	VS_CAPABILITIES_ASYNC_ INT_SUPPORT	Asynchronous Interrupt Support field from Capabilities Register
28	VS_CAPABILITIES_SYS_BU S_SUPPORT_64_BIT	64 bit System Bus Support field from Capabilities Register
26	VS_CAPABILITIES_VOLTAG E_SUPPORT_1_8V	Voltage Support 1.8v field from Capabilities Register
25	VS_CAPABILITIES_VOLTAG E_SUPPORT_3_0V	Voltage Support 3.0v field from Capabilities Register
24	VS_CAPABILITIES_VOLTAG E_SUPPORT_3_3V	Voltage Support 3.3v field from Capabilities Register
23	VS_CAPABILITIES_SUSPE ND_RESUME_SUPPORT	Suspend Resume Support field from Capabilities Register

SDC2_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES0 (cont.)

Bits	Name	Description
22	VS_CAPABILITIES_SDMA_SUPPORT	SDMA Support field from Capabilities Register
21	VS_CAPABILITIES_HS_SUPPORT	High Speed Support field from Capabilities Register
19	VS_CAPABILITIES_ADMA2_SUPPORT	ADMA2 Support field from Capabilities Register
18	VS_CAPABILITIES_SUPPORT_8_BIT	8 bit Supported For Embedded Product field from Capabilities Register
17:16	VS_CAPABILITIES_MAX_BLOCK_LENGTH	Max Block Length field from Capabilities Register
15:8	VS_CAPABILITIES_BASE_SDCLK_FREQ	Base Clock Frequency For SD Clock field from Capabilities Register
7	VS_CAPABILITIES_TIMEOUT_CLK_UNIT	Timeout Clock Unit field from Capabilities Register
5:0	VS_CAPABILITIES_TIMEOUT_CLK_FREQ	Timeout Clock Frequency field from Capabilities Register

0x07864A20 SDC2_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES1**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x02008007

driving the HC_REG_44_46 register and spec version

SDC2_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES1

Bits	Name	Description
31:24	SPEC_VERSION	driving HC_SPEC_VERSION_NUM field in HC_REG_FC_FE register
23:16	VS_CAPABILITIES_CLK_MULTIPLIER	Clock Multiplier field from Capabilities Register
15:14	VS_CAPABILITIES_RETUNING_MODE	Re-Tuning Modes field from Capabilities Register
13	VS_CAPABILITIES_USE_TUNING_FOR_SDR50	Use Tuning for SDR50 field from Capabilities Register
11:8	VS_CAPABILITIES_TIMER_COUNT_FOR_RETUNING	Timer Count for Re-Tuning field from Capabilities Register
6	VS_CAPABILITIES_DRIVER_TYPE_D_SUPPORT	Driver Type D Support field from Capabilities Register

SDC2_SDCC_HC_VENDOR_SPECIFIC_CAPABILITIES1 (cont.)

Bits	Name	Description
5	VS_CAPABILITIES_DRIVER_TYPE_C_SUPPORT	Driver Type C Support field from Capabilities Register
4	VS_CAPABILITIES_DRIVER_TYPE_A_SUPPORT	Driver Type A Support field from Capabilities Register
2	VS_CAPABILITIES_DDR_50_SUPPORT	DDR50 Support field from Capabilities Register
1	VS_CAPABILITIES_SDR_104_SUPPORT	SDR104 Support field from Capabilities Register
0	VS_CAPABILITIES_SDR_50_SUPPORT	SDR50 Support field from Capabilities Register

0x07864A24 SDC2_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_CTRL**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x0000382B

Control register of T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC2_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_CTRL

Bits	Name	Description
15:14	T4_DLY_SPARE_CTL	
13	T4_DLY_POWERDOWN_EN	Powerdown enable. When asserted (default), it powers down the T/4 macro and shuts off all bias circuits.
12:11	T4_DLY_TESTOUT_SEL	Test output select. When toggled, it presents either the strb_in or strb_out on the analog test port for debug.
10	T4_DLY_BYPASS_EN	Bypass enable. When asserted it presents the strb_in on the strb_out port.
9	T4_DLY_CAL_START	Calibration start input. When asserted, it indicates the start of the calibration cycle.
8	T4_DLY_CAL_OVERRIDE	Calibration override input. When asserted, the internal delay line calibration is bypassed and the tby4_user_ctl<7:0> is used as the default code for the delay line.
7:0	T4_DLY_TARGET_CODE	T/4 delay target code. 0x2b gives delay of 1.25ns

0x07864A28 SDC2_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_STAT**Type:** R**Clock:** same rate as HCLK**Reset State:** 0x00000000

Status register T/4 Delay element which is used in e.MMC5.0 DDR mode.

SDC2_SDCC_HC_VENDOR_SPECIFIC_T4_DLY_STAT

Bits	Name	Description
15:14	T4_DLY_SPARE_OUT	Spare status bits.
13	T4_DLY_CAL_DLY_CODE_FAST_RANGE	Calibrated delay code, indicates the fast range selection bit status.
12:6	T4_DLY_CAL_DLY_CODE_ISEL	Calibrated delay code, indicates the isel programming value for the bias generator.
5:4	T4_DLY_CAL_DLY_CODE_RSEL	Calibrated delay code, indicates the rsel programming value for the bias generator.
3:0	T4_DLY_STATE_DESC	T/4 state descriptor. Indicates the calibration status and result. value 4'b0000: Indicates Reset mode, waiting for cal_start signal. value 4'b0111: Indicates the fast range decision completion. value 4'b0100: Indicates rsel adjustment decision. value 4'b1011: Indicates isel adjustment decision. value 4'b1110: Indicates Normal end-of-cal. value 4b'1111: Indicates Maximum Delay Reached

0x07864A30 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0

Bits	Name	Description
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x07864A34 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x07864A38 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG0 (cont.)

Bits	Name	Description
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x07864A3C SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG1 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x07864A40 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_REFCOUNT_CFG (cont.)

Bits	Name	Description
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x07864A44 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register HC_VENDOR_SPECIFIC_CSR_CDC_COARSE_CAL_CFG configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x07864A48 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_RSVD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_RSVD_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x07864A4C SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_OFFSET_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x07864A50 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_DELAY_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x07864A54 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_SW_MODE_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x07864A5C SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTER_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
0	SW_OVRD_ENA	1'b1: written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x07864A60 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_SLAVE_DDA_CFG register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x07864A64 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS0 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration state machine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x07864A68 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS1 (cont.)

Bits	Name	Description
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x07864A6C SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS2 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x07864A70 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS3 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x07864A74 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The HC_VENDOR_SPECIFIC_CSR_CDC_STATUS4 register configures the following:

SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number of unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number of unit taps applied to delay array 0 of slave DDA

0x07864A78 SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_GEN_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000**SDC2_SDCC_HC_VENDOR_SPECIFIC_CSR_CDC_GEN_CFG**

Bits	Name	Description
2	CDC_SDDA_EN	Enable CDC Slave DDA to generate 3/4T RCLK from cdc_out_2 output of CDC: 0 (default) - CDC Slave DDA is disabled and 3/4T clock is a falling edge of cdc_out_1, 1 - CDC Slave DDA is enabled and 3/4T clock is a rising edge of cdc_out_2.
1	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
0	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)

0x07864A7C SDC2_SDCC_HC_VENDOR_SPECIFIC_CDC_AUTO_SW_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00F08000

Auto SW calibration configuration bits.

SDC2_SDCC_HC_VENDOR_SPECIFIC_CDC_AUTO_SW_CAL_CFG

Bits	Name	Description
25	CDC_CAL_TIMEOUT_ENABLE	Enable for cdc calibration timeout counter.
24	CDC_AUTO_SW_CAL_ENABLE	Enable for the Auto SW calibration Feature.
23:16	CDC_CAL_TIMEOUT_THRESHOLD	Sets the threshold for CDC calibration timeout during sw calibration triggered by the HW FSM. counts in 16xFF clock. Default is 0xF0 which is 255x16 FF clocks, which gives threshold of ~200 us
15:0	AUTO_TRIG_INTERVAL	Sets the load value of the counter that counts the interval between each sw calibration triggered by the HW FSM. this counter counts in sleep clock. Default is 0x8000 which is ~32,000 sleep clocks, which gives interval of ~1 sec

0x07864A80 SDC2_SDCC_HC_VENDOR_SPECIFIC_DDR200_STAT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Status bits for e.MMC5.0 DDR200 mode.

SDC2_SDCC_HC_VENDOR_SPECIFIC_DDR200_STAT

Bits	Name	Description
0	CDC_CAL_VALID	CDC Calibration status: 0 - CDC isn't calibrated, 1 - CDC is calibrated and valid

0x07864A84 SDC2_SDCC_HC_VENDOR_SPECIFIC_DDR200_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Configuration bits for e.MMC5.0 DDR200 mode.

SDC2_SDCC_HC_VENDOR_SPECIFIC_DDR200_CFG

Bits	Name	Description
10	FF_CLK_DIS	The ff_clk to CDC/TBY4 is enabled by default. It can be disabled by setting this bit. The ff_clk is enabled to CDC and TBY4 according to CDC_T4_DLY_SEL field

SDC2_SDCC_HC_VENDOR_SPECIFIC_DDR200_CFG (cont.)

Bits	Name	Description
9	VOLTAGE_MUX_SEL	select between 1.8v and 1.2v signals on sdcc5 IO interface with device. default is 0 to choose 1.8v
8:7	CDC_TRAFFIC_SEL	Selecting the method of cdc_traffic's assertions: Value 0 (default) - auto calibration with stand by feature. Value 1 - SW calibration before any transaction. Value 2 - automatic calibration with HW assertion of cdc_traffic
6	START_CDC_TRAFFIC	This bit starts the cdc traffic assertion after calibration done is received
5	CRC_TOKEN_SAMPL_FALL_EDGE	If set, the start bit of incoming CRC token in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
4	DATIN_SAMPL_FALL_EDGE	If set, the start bit of incoming data in DDR200 mode is sampled in falling edge. If this bit is cleared (default) then the start bit is detected in rising edge
3	CDC_T4_TEST_OUT_SEL	controls the mux between cm_dll_sdc4 testout and CDC test out. When set - CDC test_out is chosen
2	CMDIN_EDGE_SEL	Select sampling edge of CMD input when CMDIN_RCLK_EN is 1: 0 (default) - falling edge of RCLK, 1 - rising edge of RCLK
1	CMDIN_RCLK_EN	Enable CMD input sampling with RCLK: 0 (default) - CMD input is sampled by SD DLL output clock, 1 - CMD input is sampled by delayed RCLK
0	CDC_T4_DLY_SEL	Select block for RCLK delay: 0 (default) - CM_DLL_SDC4

0x07864A88 SDC2_SDCC_HC_VENDOR_SPECIFIC_TIME_COUNT_CTRL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Control the performance counters

SDC2_SDCC_HC_VENDOR_SPECIFIC_TIME_COUNT_CTRL

Bits	Name	Description
1	CMD_PERIOD	When this bit is set the commands periods are counted to the CMD_TIME counter
0	ENABLE	Enabling the performance counters

0x07864A8C SDC2_SDCC_HC_VENDOR_SPECIFIC_FLOW_CTRL_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the Flow Control period

SDC2_SDCC_HC_VENDOR_SPECIFIC_FLOW_CTRL_TIME_COUNT

Bits	Name	Description
31:0	FLOW_CTRL_TIME	FlowControl periods are counted

0x07864A90 SDC2_SDCC_HC_VENDOR_SPECIFIC_BUSY_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the BUSY periods

SDC2_SDCC_HC_VENDOR_SPECIFIC_BUSY_TIME_COUNT

Bits	Name	Description
31:0	BUSY_TIME	In Tx transaction, the BUSY periods are counted until the progdone is asserted. In Rx transaction, the periods between the blocks without flowcontrol is counted including the time until the first block is received after the command.

0x07864A94 SDC2_SDCC_HC_VENDOR_SPECIFIC_DATA_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the time of transaction

SDC2_SDCC_HC_VENDOR_SPECIFIC_DATA_TIME_COUNT

Bits	Name	Description
31:0	DATA_TIME	In Tx transaction, the time is from ENabling the DPSM until progdone is asserted. In Rx transaction, the time is from the command transmission to de-assertion of RxActive.

0x07864A98 SDC2_SDCC_HC_VENDOR_SPECIFIC_CMD_TIME_COUNT**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Counting the time of transaction

SDC2_SDCC_HC_VENDOR_SPECIFIC_CMD_TIME_COUNT

Bits	Name	Description
31:0	CMD_TIME	Counting the Command-Response periods of commands which relate to the transaction including auto commands. The counter is active when CMD_PERIOD is set.

0x07864A9C SDC2_SDCC_HC_VENDOR_SPECIFIC_ERR_INT_STS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Details of the vendor specific errors

SDC2_SDCC_HC_VENDOR_SPECIFIC_ERR_INT_STS

Bits	Name	Description
1	AUTO_CDC_SW_CALIB_ERR	calibration error is received (CDC_ERROR_CODE isn't 0) during auto SW CDC calibration
0	AUTO_CDC_SW_CALIB_TIMEOUT	CALIBRATION_DONE isn't received within the number of cycles which configured in CDC_CAL_TIMEOUT_THRESHOLD field (from CDC_AUTO_SW_CAL_CFG register)

0x07864AA0 SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_STATUS_REG**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC. The different tasks are defined in this register

SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_STATUS_REG

Bits	Name	Description
3	IO_HIGH_V	SDCC driver orders that the I/O signaling level be switched to 3.0v. This interrupt is triggered when SDCC driver writes '0' to offset 03Eh in HC register (bit 3) or when SW reset for all is handled and last supported voltage was 1.8V. This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
2	IO_LOW_V	SDCC driver orders that the I/O signaling level be switched to 1.8v. This interrupt is triggered when SDCC driver writes '1' to offset 03Eh in HC register (bit 3). This logic is enabled when SWITCHABLE_SIGNALING_VOLTAGE=true
1	BUS_ON	SDCC driver orders that the SD bus power be switched on. This interrupt is triggered when SDCC driver writes '1' to offset 029h in HC register (bit 0).
0	BUS_OFF	SDCC driver orders that the SD bus power be switched off. This interrupt is triggered when SDCC driver writes '0' to offset 029h in HC register (bit 0) or when SW reset for all is handled.

0x07864AA4 SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_MASK_REG**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Mask register for MCI_PWRCTL_STATUS_REG

SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_MASK_REG

Bits	Name	Description
3	IO_HIGH_V	'1' - interrupt is enabled / '0' - interrupt is masked.
2	IO_LOW_V	'1' - interrupt is enabled / '0' - interrupt is masked.
1	BUS_ON	'1' - interrupt is enabled / '0' - interrupt is masked.
0	BUS_OFF	'1' - interrupt is enabled / '0' - interrupt is masked.

0x07864AA8 SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CLEAR_REG**Type:** W**Clock:** PCLK**Reset State:** 0x00000000

Clear register for MCI_PWRCTL_STATUS_REG

SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CLEAR_REG

Bits	Name	Description
3	IO_HIGH_V	Writing '1' clears bit 03 in PWRCTL_STATUS_REG
2	IO_LOW_V	Writing '1' clears bit 02 in PWRCTL_STATUS_REG
1	BUS_ON	Writing '1' clears bit 01 in PWRCTL_STATUS_REG
0	BUS_OFF	Writing '1' clears bit 00 in PWRCTL_STATUS_REG

0x07864AAC SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CTL_REG**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

HC Spec Defines power and IO voltage switch bits. The information is sent by a dedicated interrupt to the QCT SW driver for handling the power and voltage tasks with PMIC and then the QCT SW driver needs to report success or fail to this register.

SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CTL_REG

Bits	Name	Description
9	HC_CARD_STATE_STABLE	This bit is driving CARD_STATE_STABLE bit in Present State Register
8	RST_NOT_WAIT_PWRCTL_REG	RST process doesn't need to wait for accessing to MCI_PWRCTL_CTL_REG register
7:6	HC_WRITE_PROTECT_PAD	Value 0 inversion of HC_WRITE_PROTECT is connected to bit 19 in Present State Register. Value 1 input from PAD is used. Value 2 inversion of input from PAD is used
5	CARD_DETECT_PIN_LEVEL	This bit reflects the inverse value of the SDCCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. value 1: card present value 0: no card present
4	HC_WRITE_PROTECT	This bit allows to disable the writing. value 0: write enabled value 1: write protected
3	IO_SIG_SWITCH_FAIL	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has failed.

SDC2_SDCC_HC_VENDOR_SPECIFIC_PWRCTL_CTL_REG (cont.)

Bits	Name	Description
2	IO_SIG_SWITCH_SUCCES S	Host controller clears this bit when it fires either I/O Low V interrupt or I/O High V interrupt. SDCC power control software writes '1' to indicate the signal switch has completed successfully.
1	BUS_ON_OFF_FAIL	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has failed.
0	BUS_ON_OFF_SUCCESS	Host controller clears this bit when it fires either Bus ON interrupt or Bus OFF interrupt. SDCC power control software writes '1' to indicate the requested operation has completed successfully.

0x07864AB0 SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC3**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

Vendor specific register #3

SDC2_SDCC_HC_VENDOR_SPECIFIC_FUNC3

Bits	Name	Description
4	QSB_AXI_REDIRECT	Driving QSB AXI output
3	PWRSAVE_DLL	When this bit is set, DLL will get clock during transactions but not in idle. When this bit is cleared, DLL will get clock all the time so sdc4_dll_lock won't be de-asserted
2	SDIO_TRANS	When this bit is set in SDIO transaction, START_BIT_ERR status bit won't be raised. The reason is that interrupt period which is de-asserted only after the RX command can cause to wrong START_BIT_ERR detection. The START_BIT_ERR bit won't appear in MCI_STATUS when SDIO_TRANS is set
1	HCLK_IDLE_GATING	Additional CGC for HCLK was added, which gates the HCLK for status bits. If this bit is set then HCLK is gated for these registers during IDLE
0	MCLK_IDLE_GATING	Additional CGC for MCLK was added, which gates the MCLK for status bits. If this bit is set then MCLK is gated for these registers during IDLE

0x07864AB4 SDC2_SDCC_HC_REG_DLL_CONFIG_2**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x00000000

SDC2_SDCC_HC_REG_DLL_CONFIG_2

Bits	Name	Description
3:2	DDR_TRAFFIC_INIT_SEL	
1	DDR_TRAFFIC_INIT_SW	
0	DDR_CAL_EN	

0x07864AB8 SDC2_SDCC_HC_REG_DDR_CONFIG**Type:** RW**Clock:** same rate as HCLK**Reset State:** 0x80040853

Configuration of ddr_config input of DLL

SDC2_SDCC_HC_REG_DDR_CONFIG

Bits	Name	Description
31	PRG_DLY_EN	Enables Programmable delay for RCLK_IN
30	EXT_PRG_RCLK_DLY_EN	Enables external control of Programmable RCLK delayline
29:27	EXT_PRG_RCLK_DLY_CODE	Used only if EXT_PRG_RCLK_DLY_EN is set. Configuring Programmable RCLK Delayline process code number.
26:21	EXT_PRG_RCLK_DLY	Used only if EXT_PRG_RCLK_DLY_EN is set. Programmable RCLK Delay line fine delay control.
20:12	TCXO_CYCLES_DLY_LINE	Number of TCXO clock cycles between finish of one delay line calibration and beginning of next delay line calibration.
11:9	TCXO_CYCLES_CNT	Number of TCXO clock cycles for which down counter is enabled for before making each inc/dec decision.
8:0	PRG_RCLK_DLY	These bits are controlled the programmable delay line. This bus is binary coded. Decimal value = (TCXO period * Decimal value of TCXO_CYCLES_CNT)/(2*delay needed). For 1.25ns the formula is $(52n*4/2*1.25) = 83$ in decimal.

20 BLSP

20.1 BLSP1_BAM

20.1.1 BLSP1_BLSP_BAM_BAM_BAM

0x07884000 BLSP1_BLSP_BAM_BAM_BAM_CTRL

Type: RW

Clock: bam_clk

Reset State: 0x00020000

BAM Control register allows global controls for the BAM.

BLSP1_BLSP_BAM_BAM_BAM_CTRL

Bits	Name	Description
20	BAM_MESS_ONLY_CANCE L_WB	When active (1) - BAM will DROP former descriptor write-backing and Interrupt firing when former descriptor has been closed (accumulated=acknoledged) and ack_on_sucess with EOT ans size 0 arrived (messaging only). When legacy mode is used (0) - This said a case then the former descriptor has been closed (accumulated=acknowledged) and ack_on_sucess with EOT and size 0 arrived (messaging only). In this case the FIFO-pointer has been already advanced before the ack_on_sucess arives and therefore we do write-back to former descriptor and fire interrupt. 1'b1 - Drop WB and Interrupt 1'b0 - legacy.
19	CACHE_MISS_ERR_RESP_ EN	When set to '1', upon local ahb access results with cache miss, the bam_ndp will not stall the bus, and finish the access with error response. This bit is relevant for BAM_NDP only.

BLSP1_BLSP_BAM_BAM_BAM_CTRL (cont.)

Bits	Name	Description
18:17	LOCAL_CLK_GATING	These Bits enables power saving by using a local clock gating cell. Bit 17: 1'b1 - CGC is on, so that the clock is controled by the HW - this is the reset value. 1'b0 - CGC is off so that the clock is free runing Bit 18: Reserved bit for future improvements.
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1'b1 - Enable Power Saving Mode 1'b0 - Disable Power Saving Mode
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1'b1 - Enabled 1'b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2'b00 - Cache when current descriptor has less than 64 bytes left. 2'b01 - Cache when current descriptor has less than 128 bytes left. 2'b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2'b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
11:5	RESERVED	Reserved

BLSP1_BLSP_BAM_BAM_BAM_CTRL (cont.)

Bits	Name	Description
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1'b1 - Enabled 1'b0 - Disabled Available in BAM only
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x07884040 BLSP1_BLSP_BAM_BAM_BAM_TIMER**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

BLSP1_BLSP_BAM_BAM_BAM_TIMER

Bits	Name	Description
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms ~ 6 seconds

0x07884044 BLSP1_BLSP_BAM_BAM_BAM_TIMER_CTRL**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

BLSP1_BLSP_BAM_BAM_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x07884008 BLSP1_BLSP_BAM_BAM_BAM_DESC_CNT_TRSHLD

Type: RW

Clock: bam_clk

Reset State: 0x00000001

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

BLSP1_BLSP_BAM_BAM_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. The minimum allowed value is 1 (value 0 is not allowed). Available in BAM only

0x07884014 BLSP1_BLSP_BAM_BAM_BAM_IRQ_STTS

Type: R

Clock: bam_clk

Reset State: 0x00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

BLSP1_BLSP_BAM_BAM_BAM_IRQ_STTS

Bits	Name	Description
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	This interrupt is for DEBUG purpose only. It should not be used in normal SW flows. The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only

0x07884018 BLSP1_BLSP_BAM_BAM_BAM_IRQ_CLR

Type: W

Clock: bam_clk

Reset State: 0x00000000

Writing to this register causes the interrupt to clear.

BLSP1_BLSP_BAM_BAM_BAM_IRQ_CLR

Bits	Name	Description
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged

BLSP1_BLSP_BAM_BAM_BAM_IRQ_CLR (cont.)

Bits	Name	Description
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only

0x0788401C BLSP1_BLSP_BAM_BAM_BAM_IRQ_EN**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

BLSP1_BLSP_BAM_BAM_BAM_IRQ_EN

Bits	Name	Description
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only

0x0788407C BLSP1_BLSP_BAM_BAM_BAM_CNFG_BITS**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

BLSP1_BLSP_BAM_BAM_BAM_CNFG_BITS

Bits	Name	Description
31	AOS_OVERFLOW_PRVNT	This bit enables overflow prevention when Sideband block accumulates ack_on_success updates from peripherals to values higher than 0x7fff. '1' - enable ack-on_success overflow prevention. If current ack_on_success update causes overflow accept_ack_on_success_toggle will not approve the update until SB accumulator is cleared. '0' - disable ack-on_success overflow prevention. Available in BAM-NDP only. Default value is '0' (Legacy). Recommended value is '1'.
30	MULTIPLE_EVENTS_DESC_AVAIL_EN	This is an enable bit for supporting multiple events received by a Producer BAM2BAM and makes BAM-NDP to notify a correct desc_cache_avail bus. It fixed CR: QCTDD00209370.
29	MULTIPLE_EVENTS_SIZE_EN	This is an enable bit for supporting multiple events received by a Producer BAM2BAM and makes BAM-NDP delivering correct descriptor sizes on local_ahb bit. It fixed CR: QCTDD00209379.
28	BAM_ZLT_W_CD_SUPPORT	Recommended value: 1 Enables support of ZLT (i.e. a zero-sized descriptor) before a command-descriptor. Specifically it supports a case on a pipe without any data-descriptors but with ZLT descriptors and Command-descriptors only. This allows putting NWD bit in the ZLT descriptor (instead of in the CMD) which results in better performance than using the NWD in the command-descriptor. Available in BAM-Lite Only.
27	BAM_CD_ENABLE	Recommended value: 1 Enables the command descriptor feature.
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1'b1 - Enable Fix 1'b0 - Disable Available in BAM/BAM-NDP only

BLSP1_BLSP_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset.. 1'b1 - Enable Fix 1'b0 - Disable Available in BAM only
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM/BAM-NDP only
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there're available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission savepoint, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1'b1 - Enabled 1'b0 - Disable Available in BAM/BAM-NDP only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1'b1 - Enable 1'b0 - Disable Available in BAM/BAM-NDP only

BLSP1_BLSP_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1'b1 - Enable 1'b0 - Disable Available in BAM only
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix). 1'b1 - Enable 1'b0 - Disable Available in BAM only

BLSP1_BLSP_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. Irrelevant field for BAM-NDP. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reseted pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1'b1 - Enable external block pipe reset 1'b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. 1'b1 - Enable 1'b0 - Disable Available in BAM only
3	RESERVED	Reserved
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It's invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1'b1 - Enable 1'b0 - Disable Available in BAM only
1:0	RESERVED	Reserved

0x07885000 BLSP1_BLSP_BAM_BAM_BAM_REVISION**Type:** R**Clock:** bam_clk**Reset State:** Undefined

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

BLSP1_BLSP_BAM_BAM_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter.
23	CMD_DESC_EN	This indicates BAM has Command Descriptor feature enabled in HW.
22:21	DESC_CACHE_DEPTH	This field indicates the Per-Pipe-Descriptor-Cache. could be 1-4: 2'b00 - Descriptor Cache Depth of 1. 2'b01 - Descriptor Cache Depth of 2. 2'b10 - Descriptor Cache Depth of 3. 2'b11 - Descriptor Cache Depth of 4. Valid only for BAM_NDP.
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	RESERVED	Reserved
15	RESERVED	Reserved

BLSP1_BLSP_BAM_BAM_BAM_REVISION (cont.)

Bits	Name	Description
14	AXI_ACTIVE	This field indicates BAM_NDP uses internal AXI bridge on the master port.
13:12	CE_BUFFER_SIZE	This field indicates the size (in Data words) of the buffer which stores the command elements. Each command element includes 4 words. 2'b00 - 4 Words (one command element). 2'b10 - 8 Words (2 command elements). 2'b11 - 16 Words (4 command elements). Valid Only if CMD_DESC_EN = 1'b1.
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRC*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRC*_EE _n registers exist for n=[0..3].
7:0	RESERVED	Reserved

0x07885008 BLSP1_BLSP_BAM_BAM_BAM_NUM_PIPES**Type:** R**Clock:** bam_clk**Reset State:** Undefined

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

BLSP1_BLSP_BAM_BAM_BAM_NUM_PIPES

Bits	Name	Description
31:24	RESERVED	Reserved
23:16	RESERVED	Reserved
15:14	BAM_DATA_ADDR_BUS_WIDTH	This field indicates BAM data bus address width: 2'b00 - 32bit address width (legacy - all chips before Gandalf) 2'b01 - 36bit address width (Gandalf and later) 2'b1x - Reserved for future widening
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x07885024 BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_CTRL**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_CTRL

Bits	Name	Description
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x07885028 BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x0788502C BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_DATA**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x07885100 BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_LSB**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

Relevant only on 36 bit address BAM.

BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_LSB

Bits	Name	Description
31:0	BAM_ERR_ADDR	32 LSB of HADDR

0x07885104 BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_MSB**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

Relevant only on 36 bit address BAM.

BLSP1_BLSP_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_MSB

Bits	Name	Description
3:0	BAM_ERR_ADDR	4 MSB of Address (bits 35 to 32) of HADDR

0x07886000 BLSP1_BLSP_BAM_BAM_BAM_TRUST_REG

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This Register holds the BAM Trusted configurations.

This register cannot be reset by any SW reset. Only HW reset applies.

BLSP1_BLSP_BAM_BAM_BAM_TRUST_REG

Bits	Name	Description
13	LOCK_EE_CTRL	This bit controls if the EE setting defined in the TRUST registers will be taken into account for the pipe lock grouping decoding. 1'b0 - Only P_LOCK_GROUP is checked for pipe locking. 1'b1 - Both BAM_P_EE and P_LOCK_GROUP are checked for pipe locking.
12:8	RESERVED	Reserved
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable

BLSP1_BLSP_BAM_BAM_BAM_TRUST_REG (cont.)

Bits	Name	Description
2:0	BAM_EE	This Field Indicates the EE # (0-7) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE # set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 3'b000 - EE0 3'b001 - EE1 3'b010 - EE2 3'b011 - EE3 3'b100 - EE4 3'b101 - EE5 3'b110 - EE6 3'b111 - EE7

0x07886020+ BLSP1_BLSP_BAM_BAM_BAM_P_TRUST_REGn, n=[0..30]
0x4*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This Register holds the BAM Trusted configurations.

This register cannot be reset by any SW reset. Only HW reset applies. When using a non-secured BAM, it is reset by the BAM HW Reset.

BLSP1_BLSP_BAM_BAM_BAM_P_TRUST_REGn

Bits	Name	Description
12:8	RESERVED	Reserved
7:3	BAM_P_SUP_GROUP	Super-Group is the upper division of the pipes compared to the pipe-group division. When any pipe locks or unlocks the BAM, all the pipes which are in a different super-group will NOT be affected. Only the pipes within the same super-group of the locker are affected. Usually pipes which belongs to different peripherals which share the same BAM, would be in a different super-groups

BLSP1_BLSP_BAM_BAM_BAM_P_TRUST_REGn (cont.)

Bits	Name	Description
2:0	BAM_P_EE	This Field Indicates the EE # (0-7) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE # set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 3'b000 - EE0 3'b001 - EE1 3'b010 - EE2 3'b011 - EE3 3'b100 - EE4 3'b101 - EE5 3'b110 - EE6 3'b111 - EE7

**0x07887000+ BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_EEn, n=[0..7]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bfit per each pipe in the BAM.

**0x07887004+ BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_MSK_EEn, n=[0..7]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: ENABLE_BAM_INTERRUPT (Enable BAM interrupt) 0x0: DISABLE_BAM_INTERRUPT (Disable BAM interrupt)
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: ENABLE_PIPE_INTERRUPT (Enable Pipe interrupt) 0x0: DISABLE_PIPE_INTERRUPT (Disable Pipe interrupt)

0x07887008+ BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..7] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x0788700C+ BLSP1_BLSP_BAM_BAM_BAM_PIPE_ATTR_EEn, n=[0..7] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

The register shows the pipes attributed to a specific EE, and an indication if BAM is enabled.

The reset value written above is true only if EE>0. For BAM_PIPE_ATTR_EE0 the default value is: Bits [MAX_PIPES-1:0] = 1 , Bits [31: MAX_PIPES] = 0 .

BLSP1_BLSP_BAM_BAM_BAM_PIPE_ATTR_EEn

Bits	Name	Description
31	BAM_ENABLED	1'b1 - BAM is Enabled. 1'b0 - BAM Disabled.
30:0	P_ATTR	If bit 'i' == 1'b1 - Pipe 'i' is attributed to this EE.

0x07887010 BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS

Type: R

Clock: bam_clk

Reset State: 0x00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x07887014 BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_MSK

Type: RW

Clock: bam_clk

Reset State: 0x00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: ENABLE_BAM_INTERRUPT (Enable BAM interrupt) 0x0: DISABLE_BAM_INTERRUPT (Disable BAM interrupt)
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: ENABLE_PIPE_INTERRUPT (Enable Pipe interrupt) 0x0: DISABLE_PIPE_INTERRUPT (Disable Pipe interrupt)

0x07887018 BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_UNMASKED**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level. This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

BLSP1_BLSP_BAM_BAM_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x07897000+ 4096*n BLSP1_BLSP_BAM_BAM_BAM_P_CTRLn, n=[0..30]**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Control register provides various controls for the pipe.

BLSP1_BLSP_BAM_BAM_BAM_P_CTRLn

Bits	Name	Description
20:16	P_LOCK_GROUP	Pipe's lock group. Upon a lock request on this pipe, all pipes related to different pipe group and different EE (see PIPE_TRUST_REG) will be locked.

BLSP1_BLSP_BAM_BAM_BAM_P_CTRLn (cont.)

Bits	Name	Description
11	P_WRITE_NWD	BAM-Lite feature. Applicable to BAM2BAM producer pipes only. When this bit is set for producer B2B pipe, NWD bit (bit number 28 in the second word of descriptor) will be written with EOT into the generated descriptor for the consumer usage. This bit is not applicable in pipes belong to a Peripheral which uses messaging_only (e.g. USB2).
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be prefetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.

BLSP1_BLSP_BAM_BAM_BAM_P_CTRLn (cont.)

Bits	Name	Description
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only. When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode. This field is NOT supported in BAM-NDP (i.e. no streaming mode in NDP).
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe

**0x07897004+ BLSP1_BLSP_BAM_BAM_BAM_P_RSTn, n=[0..30]
4096*n****Type:** W**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

Note: Software can invoke pipe reset only after it make sure that the pipe is 'quiet'.

('quiet' - No data transaction or command-descriptor is active at the time.

BAM_P_RSTn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_RSTn

Bits	Name	Description
0	P_SW_RST	This resets the pipe and it's registers, (Both Flip-Flops and RAM). Software can invoke pipe reset only after it make sure that the pipe is 'quiet'. 1'b1 - Reset 1'b0 - Do Nothing

**0x07897008+ BLSP1_BLSP_BAM_BAM_BAM_P_HALTn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Halt register Enables/Disables the Halt Sequence. Refer to the Software Procedures chapter for the Halt Sequence Procedure.

This is a self-modifying register.

BLSP1_BLSP_BAM_BAM_BAM_P_HALTn

Bits	Name	Description
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. See the Software Procedures chapter. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it. See the Software Procedure chapter for the detailed flow.

0x07897010+ BLSP1_BLSP_BAM_BAM_BAM_P_IRQ_STTSn, n=[0..30] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

BLSP1_BLSP_BAM_BAM_BAM_P_IRQ_STTSn

Bits	Name	Description
7	P_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
6	P_PIPE_RST_ERROR_IRQ	Unsuccessful Pipe Reset operation. Pipe reset timer expired.
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer

BLSP1_BLSP_BAM_BAM_BAM_P_IRQ_STTSn (cont.)

Bits	Name	Description
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSN_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

**0x07897014+ BLSP1_BLSP_BAM_BAM_BAM_P_IRQ_CLRN, n=[0..30]

**0x0789701C+ BLSP1_BLSP_BAM_BAM_BAM_P_TIMERn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This register counts the idle time of the pipe.

BAM_P_TIMERn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_TIMERn

Bits	Name	Description
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms ~ 6 seconds

**0x07897020+ BLSP1_BLSP_BAM_BAM_BAM_P_TIMER_CTRLn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by a PARAMETER value of the BAM, and uses a separate clock, the inactivity_timers_clk. This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32kHz clock. This allows the bam_clk to be turned-off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM PARAMETER. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting.

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH parameter constant. These parameters should be taken into account when setting this register. For example: for inactivity_timer_clk period of 1us and parameter is 3 and P_TIMER_THRSHLD is 10 will indicate the $2^3 * 1\mu s * 10$ which is 80us of inactivity in a pipe before sending an interrupt.

The general formula is: $2^{\text{INACTIVITY_TIMER_WIDTH}} * \text{clock_period} * \text{P_TIMER_THRSHLD}$.

BLSP1_BLSP_BAM_BAM_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESHOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

**0x07897024+ BLSP1_BLSP_BAM_BAM_BAM_P_PRDCR_SDBNDn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

BLSP1_BLSP_BAM_BAM_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer. relevant for system mode only. The sideband-Inform block which responsible for reading descriptor has updated the SB block (which responsible for publishing to peripheral) with all of its read descriptors.
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value. The toggle polarity of the publishment (each publishment changes its polarity).
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value. The possible values are only: 0000 or 0001 (means desc-fifo-full).
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value. The accumulated bytes_free which are available for peripheral to use

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

BLSP1_BLSP_BAM_BAM_BAM_P_CNSTRM_SDBNDn

Bits	Name	Description
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer. The sideband-Inform block which responsible for reading descriptor has updated the SB block (which responsible for publishing to peripheral) with all of its read descriptors.
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r. BAM is waiting for Peripheral to acknowledge the former publish.
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle. The Peripheral's acknowledgement for the publish. This is a toggling signal (each ack will be inverted to its former).
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r. The Peripheral's sampled acknowledgement for the publish. This is a toggling signal (each ack will be inverted to its former).
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value. The toggle polarity of the publishment (each publishment changes its polarity).
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value. The possible values of BAM_P_CTRL field are: 0100 - Means immediate command (could be only in bam-ndp). 0001 - Means End-Of-Transaction (EOT). 0011 - means End-Of-Transaction with Notify-When-Done (NWD). 0000 - Neither Immediate-command nor EOT nor NWD.
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value. The size of the current publish.

**0x07897800+ BLSP1_BLSP_BAM_BAM_BAM_P_SW_OFSTSn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_SW_OFSTSn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode. This Field is NOT available in BAM-NDP
15:0	SW_DESC_OFST	Descriptor FIFO offset.

4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will

write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

BAM_P_EVNT_REGn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

0x0789781C+ BLSP1_BLSP_BAM_BAM_BAM_P_DESC_FIFO_ADDRn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

BAM_P_DESC_FIFO_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x07897820+ BLSP1_BLSP_BAM_BAM_BAM_P_FIFO_SIZESn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

BAM_P_FIFO_SIZES_n, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_FIFO_SIZES_n

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space. ALWAYS write 16'b0 to this field of P_DATA_FIFO_SIZE unless you work in BAM2BAM producer mode (also known as peer mode). NOTE: Data fifo size should not be bigger than 32KB.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors. Size of descriptor fifo must be 16 bytes and above.

0x07897824+ BLSP1_BLSP_BAM_BAM_BAM_P_DATA_FIFO_ADDR_n, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

BAM_P_DATA_FIFO_ADDR_n, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_DATA_FIFO_ADDR_n

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

0x07897828+ BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_GEN_TRSHLD_n, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When aBAM pushes/pops this number of bytes to/from the pipe an event to the

other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

0x0789782C+ BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_DEST_ADDRn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

BAM_P_EVNT_DEST_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x07897830+ BLSP1_BLSP_BAM_BAM_BAM_P_DF_CNTXT_n, n=[0..30] 4096*n

15:0	SI_DESC_OFST	The Descriptor Fifo Offset pointer stored by the Sideband Inform state machine.

**0x07897900+ BLSP1_BLSP_BAM_BAM_BAM_P_PSM_CNTXT_3_LSBn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Internal Context of Pipe & Writeback state machines.

Relevant only on 36 bit address BAM.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_PSM_CNTXT_3_n, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_PSM_CNTXT_3_LSBn

Bits	Name	Description
31:0	PSM_DESC_ADDR	32 LSB of The Data Address provided in the current descriptor from the Writeback state machine.

**0x07897904+ BLSP1_BLSP_BAM_BAM_BAM_P_PSM_CNTXT_3_MSBn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Internal Context of Pipe & Writeback state machines.

Relevant only on 36 bit address BAM.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_PSM_CNTXT_3_n, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_PSM_CNTXT_3_MSBn

Bits	Name	Description
3:0	PSM_DESC_ADDR	4 MSB of address (bits 35 to 32) of the Data Address provided in the current descriptor from the Writeback state machine.

**0x07897910+ BLSP1_BLSP_BAM_BAM_BAM_P_DESC_FIFO_ADDR_LSBn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the LSB of Address of the Descriptor Fifo beginning.

Relevant only on 36 bit address BAM.

NOTE This register is used by all modes.

BAM_P_DESC_FIFO_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_DESC_FIFO_ADDR_LSBn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	32 LSB of address of the Descriptors Fifo. This address must be 8 bytes aligned.

**0x07897914+ BLSP1_BLSP_BAM_BAM_BAM_P_DESC_FIFO_ADDR_MSBn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the MSB of Address of the Descriptor Fifo beginning.

Relevant only on 36 bit address BAM.

NOTE This register is used by all modes.

BAM_P_DESC_FIFO_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_DESC_FIFO_ADDR_MSBn

Bits	Name	Description
3:0	P_DESC_FIFO_ADDR	4 MSB of address (bits 35 to 32) of Address of the Descriptors Fifo. This address must be 8 bytes aligned.

**0x07897920+ BLSP1_BLSP_BAM_BAM_BAM_P_DATA_FIFO_ADDR_LSBn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

Relevant only on 36 bit address BAM.

BAM_P_DATA_FIFO_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_DATA_FIFO_ADDR_LSBn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	32 LSB of Data Address Space beginning. Relevant only on 36 bit address BAM.

0x07897924+ BLSP1_BLSP_BAM_BAM_BAM_P_DATA_FIFO_ADDR_MSBn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

Relevant only on 36 bit address BAM.

BAM_P_DATA_FIFO_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_DATA_FIFO_ADDR_MSBn

Bits	Name	Description
3:0	P_DATA_FIFO_ADDR	4 MSB of Address (bits 35 to 32) of Data Address Space beginning. Relevant only on 36 bit address BAM.

0x07897930+ BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_DEST_ADDR_LSBn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

Relevant only on 36 bit address BAM.

BAM_P_EVNT_DEST_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_DEST_ADDR_LSBn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	32 LSB of Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe. Relevant only on 36 bit address BAM.

0x07897934+ BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_DEST_ADDR_MSBn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

Relevant only on 36 bit address BAM.

BAM_P_EVNT_DEST_ADDRn, n=[0..30]

BLSP1_BLSP_BAM_BAM_BAM_P_EVNT_DEST_ADDR_MSBn

Bits	Name	Description
3:0	P_EVNT_DEST_ADDR	4 MSB of Address (bits 35 to 32) of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe. Relevant only on 36 bit address BAM.

20.2 BLSP1_BLSP_UART0_UART_DM

0x078AF000 BLSP1_BLSP_UART0_UART_DM_MR1

Type: RW

Clock: AHB_CLK

Reset State: 0x00000000

The UART_DM_MR1 register is the UART mode register #1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

BLSP1_BLSP_UART0_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with field AUTO_RFR_LEVEL0 to program the level in the receive FIFO at which the Ready-For-Receive signal (RFR_N) toggles, if programmed to do so (see RX_RDY_CTL field of this register). When RX-FIFO level is greater than the value in fields AUTO_RFR_LEVEL1 and AUTO_RFR_LEVEL0, signal will indicate Not-Ready (RFR_N high). Otherwise signal will indicate Ready RFR_N low. Configured value should be higher/equal than RFRW value, otherwise the watermark will never be reached. Value of this register is in words and can be programmed from 1 to $2^{\text{RAM_ADDR_WIDTH}}$. - Only RAM_ADDR_WIDTH + 1:8 bits of this field are generated.
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the RX channel FIFO is at the level programmed in bits [31:8,5:0] of this register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of field AUTO_RFR_LEVEL1.

0x078AF004 BLSP1_BLSP_UART0_UART_DM_MR2**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

See description of UART_DM_MR1 register.

BLSP1_BLSP_UART0_UART_DM_MR2

Bits	Name	Description
10	RFR_CTS_LOOPBACK	Enables internal loopback between RFR_N of RX channel and CTS_N of TX channel if set. For this feature to be enabled, data loopback must also be enabled (LOOPBACK bit of this register).
9	RX_ERROR_CHAR_OFF	When this bit is set, characters received with parity or framing errors get discarded and not moved to the RX channel. Otherwise they enter RX channel as any valid character.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is set, the zero character received at rx_break event get discarded and not moved to the RX channel. Otherwise it enters RX-channel as any valid character.
7	LOOPBACK	When set - data output of transmitter is fed back to the data input of the receiver, i.e. TX-pin is connected to RX-pin. Might be used with flow-control loopback (RFR_CTS_LOOPBACK bit above).
6	ERROR_MODE	This bit controls the operation of the two status register bits for the RX channel (parity or framing error and received break, see UART_DM_SR register). - When clear (0), the UART operates in character mode and the status bits apply only to the last character received. - When set (1), the UART operates in block mode and both bits are sticky, i.e. they go high once an error/break-event is detected and go low only after reset error status command is issued (see UART_DM_CR register).
5:4	BITS_PER_CHAR	These bits determine how many data bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: ENUM_5_BITS (5 bits) 0x1: ENUM_6_BITS (6 bits) 0x2: ENUM_7_BITS (7 bits) 0x3: ENUM_8_BITS (8 bits)
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. This configuration only applies to UART/IrDA interfaces, for SIM interface see SIM_STOP_BIT_LEN field of UART_DM_SIM_CFG register. 0x0: ENUM_0_563 (0.563 (9/16) bit times) 0x1: ENUM_1_000_BIT_TIME (1.000 bit time) 0x2: ENUM_1_563 (1.563 (1+9/16) bit times) 0x3: ENUM_2_000_BIT_TIMES (2.000 bit times)

BLSP1_BLSP_UART0_UART_DM_MR2 (cont.)

Bits	Name	Description
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: NO_PARITY (no parity - last data-bit is followed by a stop-bit) 0x1: ODD_PARITY (odd parity - parity-bit ensures number of ones in data-bits+parity-bit is odd) 0x2: EVEN_PARITY (even parity - parity-bit ensures number of ones in data-bits+parity-bit is even) 0x3: SPACE_PARITY (space parity - parity is always '0')

0x078AF008 BLSP1_BLSP_UART0_UART_DM_CSR_SR_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_CSR or UART_DM_SR.

BLSP1_BLSP_UART0_UART_DM_CSR_SR_DEPRECATED

Bits	Name	Description
31:0	UART_DM_CSR_SR_DEPRECATED	

0x078AF010 BLSP1_BLSP_UART0_UART_DM_CR_MISR_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_CR or UART_DM_MISR.

BLSP1_BLSP_UART0_UART_DM_CR_MISR_DEPRECATED

Bits	Name	Description
31:0	UART_DM_CR_MISR_DEPRECATED	

0x078AF014 BLSP1_BLSP_UART0_UART_DM_IMR_ISR_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_IMR or UART_DM_ISR.

BLSP1_BLSP_UART0_UART_DM_IMR_ISR_DEPRECATED

Bits	Name	Description
31:0	UART_DM_IMR_ISR_DEPRECATED	

0x078AF018 BLSP1_BLSP_UART0_UART_DM_IPR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0xFFFFFFFF9F

The UART_DM_IPR register is the UART interrupt programming register.

BLSP1_BLSP_UART0_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	The stale character time-out duration field contains a number from 1 to $2^{30} - 1$. This number determines how many character times must elapse before a stale event is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Never set this fields to 0 while RX channel is operational. Do not re-configure while an RX-transfer is active. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Currently not in use. Setting (1) to this bit enables the sample data mode. In this mode start bit is sampled along with the data of the UART character. Works only in 'Packet mode' (See the CR register, CHANNEL_COMMAND bit for more information).
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bitfield is the LSbits of the STALE_TIMEOUT bitfield.

0x078AF01C BLSP1_BLSP_UART0_UART_DM_TFWR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

BLSP1_BLSP_UART0_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and $2^{\text{RAM_ADDR_WIDTH}} - 1$, that determines the level of the transmit (TX) FIFO at which space_avail_req signal is asserted in BAM mode or TXLEV interrupt is asserted in non-BAM mode. The signal/interrupt is asserted when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. Notice that the value is in words. See UART_DM_ISR register for TXLEV interrupt description. - Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x078AF020 BLSP1_BLSP_UART0_UART_DM_RFWR**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

BLSP1_BLSP_UART0_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and $2^{\text{RAM_ADDR_WIDTH}} - 1$, that determines the level of the receive (RX) FIFO at which data_avail_req signal is asserted in BAM mode or RXLEV interrupt is asserted in non-BAM mode. The signal/interrupt is asserted when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. Configured value should be lower/equal than AUTO_RFR_LEVEL value, otherwise the watermark will never be reached. Notice that the value is in words. See UART_DM_ISR register for TXLEV interrupt description - Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x078AF024 BLSP1_BLSP_UART0_UART_DM_HCR

Type: RW
Clock: AHB_CLK
Reset State: 0x00000000

Configures Hunt-Character value.

BLSP1_BLSP_UART0_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x078AF034 BLSP1_BLSP_UART0_UART_DM_DMRX

Type: RW
Clock: AHB_CLK
Reset State: 0x00000000

Initializes RX transfer and configures maximal length in bytes of the transfer.

BLSP1_BLSP_UART0_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	A write to RX_DM_CRCI_CHARS initializes RX transfer in SW (FIFO) mode, with written value configuring the maximal length in bytes of the transfer. In BAM-mode, only the value held in this register impacts the data-flow and not the write-event. A write-value of 0 is not valid. Read of UART_DM_DMRX register is returns the number of characters that were received since the end of the last RX transfer. To read back the last value written to this register use UART_DM_DMRX_DBG register. Refer to UART_DM_BCR register description for additional constraints on the value to be written to this register.

0x078AF038 BLSP1_BLSP_UART0_UART_DM_IRDA_RX_TOTAL_SNAP_DEPRECATED

Type: RW
Clock: AHB_CLK
Reset State: Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_IRDA or UART_DM_RX_TOTAL_SNAP.

BLSP1_BLSP_UART0_UART_DM_IRDA_RX_TOTAL_SNAP_DEPRECATED

Bits	Name	Description
31:0	UART_DM_IRDA_RX_TOTAL_SNAP_DEPRECATED	

0x078AF03C BLSP1_BLSP_UART0_UART_DM_DMEN**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_DMEN register defines the DMA used by the core and the data packing mode for TX and RX channels.

BLSP1_BLSP_UART0_UART_DM_DMEN

Bits	Name	Description
5	RX_SC_ENABLE	- Set (1) for work in Single-Character mode for RX channel (every character received is zero-padded into a word). - Clearing this bit requires resetting the receiver.
4	TX_SC_ENABLE	- Set (1) for work in Single-Character mode for TX channel (Only LSB byte of each word get transmitted). - Clearing this bit requires resetting the transmitter.
3	RX_BAM_ENABLE	- Set (1) this bit to enable RX BAM interface (BAM-mode). - Clear (0) this bit to disable RX BAM interface (SW/FIFO mode). Clearing this bit requires resetting the receiver (see UART_DM_CR register).
2	TX_BAM_ENABLE	- Set (1) this bit to enable TX BAM interface (BAM-mode). - Clear (0) this bit to disable TX BAM interface (SW/FIFO mode). Clearing this bit requires resetting the transmitter(see UART_DM_CR register).
1	RESERVED_1	
0	RESERVED_2	

0x078AF040 BLSP1_BLSP_UART0_UART_DM_NO_CHARS_FOR_TX**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Initialization of TX transfer in SW/FIFO mode.

BLSP1_BLSP_UART0_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty as indicated by TX_READY interrupt (see UART_DM_ISR register for description) or after a TX-channel reset. It is used by the TX-channel in SW/FIFO mode to calculate how many characters to transmit in the last word. Any additional writes to the TX FIFO beyond TX_TOTAL_TRANS_LEN characters will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking buffer (not all may have been transmitted at that point though).

0x078AF044 BLSP1_BLSP_UART0_UART_DM_BADR**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

Configures FIFO division between RX-FIFO and TX-FIFO.

BLSP1_BLSP_UART0_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM ($2^{\text{RAM_ADDR_WIDTH}}$, 32-bit entries). This register controls the division of the memory between the RX and TX FIFOs. The division must be a multiple of 4 entries for legacy reasons, therefore bits 1:0 of this register are not used. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is $2^{\text{RAM_ADDR_WIDTH}} - \text{RX_BASE_ADDR}$. * The default is $\text{RX_BASE_ADDR} = 2^{(\text{RAM_ADDR_WIDTH} - 1)}$ * Only $\text{RAM_ADDR_WIDTH} - 1:2$ bits are generated.

0x078AF04C BLSP1_BLSP_UART0_UART_DM_TXFS**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

TX channel status register.

BLSP1_BLSP_UART0_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. - Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x078AF050 BLSP1_BLSP_UART0_UART_DM_RXFS**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

RX channel status register.

BLSP1_BLSP_UART0_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid word. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. Note: The Uart does not keep track of non-valid characters in each word.

0x078AF060 BLSP1_BLSP_UART0_UART_DM_MISR_MODE**Type:** RW**Clock:** WR_CLK**Reset State:** Undefined

BLSP1_BLSP_UART0_UART_DM_MISR_MODE

BLSP1_BLSP_UART0_UART_DM_MISR_VAL

Bits	Name	Description
9:0	VAL	Current MISR state

0x078AF070 BLSP1_BLSP_UART0_UART_DM_TF_RF_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_TF or UART_DM_RF.

BLSP1_BLSP_UART0_UART_DM_TF_RF_DEPRECATED

Bits	Name	Description
31:0	UART_DM_TF_RF_DEPRECATED	

0x078AF074 BLSP1_BLSP_UART0_UART_DM_TF_RF_2_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_TF_2 or UART_DM_RF_2.

BLSP1_BLSP_UART0_UART_DM_TF_RF_2_DEPRECATED

Bits	Name	Description
31:0	UART_DM_TF_RF_2_DEPRECATED	

0x078AF078 BLSP1_BLSP_UART0_UART_DM_TF_RF_3_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_TF_3 or UART_DM_RF_3.

BLSP1_BLSP_UART0_UART_DM_TF_RF_3_DEPRECATED

Bits	Name	Description
31:0	UART_DM_TF_RF_3_DEPRECATED	

0x078AF07C BLSP1_BLSP_UART0_UART_DM_TF_RF_4_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_TF_4 or UART_DM_RF_4.

BLSP1_BLSP_UART0_UART_DM_TF_RF_4_DEPRECATED

Bits	Name	Description
31:0	UART_DM_TF_RF_4_DEPRECATED	

0x078AF080 BLSP1_BLSP_UART0_UART_DM_SIM_CFG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

* This register is generated only when SIM_GLUE_GEN generic equals 1.

BLSP1_BLSP_UART0_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), any re-transmission signal from the UIM card will be ignored (The transmission portion of the SIM interface operates in block mode T=1). When clear (0), re-transmission will be executed upon request (the transmission portion of the SIM interface operates in asynchronous transfer mode T=0). Note that the operation of this function is conditional upon SIM_SEL field being set (1) to designate the UIM_IF mode of operation.

BLSP1_BLSP_UART0_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
16	UIM_RX_MODE	When this bit is set (1), error-signal indication will not be generated by the receiver (the receive portion of the SIM interface operates in block mode T=1). When clear (0), error signal will be generated when a character error is detected (the receive portion of the SIM interface operates in asynchronous transfer mode T=0). Note that the operation of this function is conditional upon SIM_SEL field being set (1) to designate the UIM_IF mode of operation.
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x1: ENUM_1_BIT_TIMES (1 bit times) 0x2: ENUM_2_BIT_TIMES (2 bit times) 11 111110: 254 bit times)
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (UIM_CLK runs at the TD8 frequency (same frequency as SIM-SRC_CLK)) 0x0: TD4 (UIM_CLK runs at the TD4 frequency (1/2 the frequency of SIM-SRC_CLK))
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: HIGH (high) 0x0: LOW (low)
4	RESERVED	
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	When set (1), UART_DM will operate in SIM/UIM interface mode. When cleared (0), SIM/UIM interface is disabled.

0x078AF0A0 BLSP1_BLSP_UART0_UART_DM_CSR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_CSR register is the UART clock selection register. This register is used to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

Data-rate of receiver/transmitter is UART-CLK frequency divided by the integer matching the configured value below:

0xF = 16

0xE = 32

0xD = 48

0xC = 64

0xB = 96

0xA = 128

0x9 = 192

0x8 = 256

0x7 = 384

0x6 = 512

0x5 = 768

0x4 = 1536

0x3 = 3072

0x2 = 6144

0x1 = 12288

0x0 = 24576

BLSP1_BLSP_UART0_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the values above to select the receive bit rate.
3:0	UART_TX_CLK_SEL	Use the values above to select the transmit bit rate.

0x078AF0A4 BLSP1_BLSP_UART0_UART_DM_SR**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

BLSP1_BLSP_UART0_UART_DM_SR

Bits	Name	Description
11:10	TRANS_END_TRIGGER	RX-transfer-end event type. Stores trigger for last transfer end: '00' for no trigger, '01' for DMRX-event, '10' for timeout stale, '11' for SW stale.
9	TRANS_ACTIVE	Transfer Active bit.
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.

BLSP1_BLSP_UART0_UART_DM_SR (cont.)

Bits	Name	Description
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x078AF0A8 BLSP1_BLSP_UART0_UART_DM_CR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Channel-commands:

0x00 - Null Command - Does nothing.

0x01 - Reset Receiver - Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.

0x02 - Reset Transmitter - Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.

0x03 - Reset error status - Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.

0x04 - Reset break change interrupt - Clears the break change interrupt status bit.

0x05 - Start break - Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.

0x06 - Stop break - If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.

0x07 - Reset CTS_N - Clears ISR bit 5.

0x08 - Reset stale interrupt - Clears the stale interrupt.

0x09 - Packet mode - Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.

0x0A - test_parity_on - Internal use only.

0x0B - test_frame_on - Internal use only.

0x0C - Mode reset - Turns off the sample data mode.

0x0D - Set RFR - Asserts the ready for receiving signal (actual flow-control port is active-low (rfr_n) and will go low following this command).

0x0E - Reset RFR - Deasserts the ready for receiving signal (actual flow-control port is active-low (rfr_n) and will go high following this command).

0x0F - uart_reset_int - Internal use only.

0x10 - Reset TX_ERROR - Clears TX_ERROR

0x11 - Clear TX_DONE - Clears the TX_DONE interrupt (ISR bit 9)

0x12 - Reset break start interrupt - Clears the break start interrupt status bit.

0x13 - Reset break end interrupt - Clears the break end interrupt status bit.

0x14 - Reset par_frame_err interrupt - Clears the par_frame_err interrupt status bit.

0x15 - Start RX BAM IFC - Initialize producer sidebands towards BAM after reset.

0x16 - Start TX BAM IFC - Initialize consumer sidebands towards BAM after reset.

0x17 - WWT counter enable - Enable WWT counter & IRQ.

0x18 - WWT counter disable - Disable WWT counter & IRQ.

0x19 - Clear TX_WR_ERROR IRQ - Clears TX write error interrupt status bit.

0x1A - Clear RX_RD_ERROR IRQ - Clears RX read error interrupt status bit.

0x1B - Clear TX_COMP IRQ - Clears TX complete interrupt status bit.

0x1C - Clear WWT IRQ - Clears WWT timeout interrupt status bit.

General-commands:

0x0 - Null Command - Does nothing.

0x1 - CR Protection Enable - Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.

0x2 - CR Protection Disable - Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.

0x3 - Reset TX-Ready interrupt - Clears the TX_READY interrupt.

0x4 - SW Force Stale - Causes a stale event (even if stale events are disabled).

0x5 - Enable Stale Event - Enables the stale event mechanism

0x6 - Disable Stale Event - Enables the stale event mechanism

0x7 - RESERVED

BLSP1_BLSP_UART0_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bitfield.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table .
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the channel-command as listed in the register decription.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x078AF0AC BLSP1_BLSP_UART0_UART_DM_MISR

Type: R

Clock: AHB_CLK

Reset State: 0x00000000

BLSP1_BLSP_UART0_UART_DM_MISR

Bits	Name	Description
16:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the 'AND' of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is $\text{misr} \leq (\text{isr}(16 \text{ DOWNT} 7) \text{ AND } \text{imr}(16 \text{ DOWNT} 7)) \text{ \& '0' \& } (\text{isr}(5 \text{ DOWNT} 0) \text{ AND } \text{imr}(5 \text{ DOWNT} 0)).$

0x078AF0B0 BLSP1_BLSP_UART0_UART_DM_IMR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal. (See UART_DM_ISR register)

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

BLSP1_BLSP_UART0_UART_DM_IMR

Bits	Name	Description
16	WWT_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
15	TXCOMP_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
14	RX_RD_ERROR_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
13	TX_WR_ERROR_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
12	PAR_FRAME_ERR_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
11	RXBREAK_END	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
10	RXBREAK_START	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
9	TX_DONE	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
8	TX_ERROR	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
7	TX_READY	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
6	CURRENT_CTS	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
5	DELTA_CTS	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).

BLSP1_BLSP_UART0_UART_DM_IMR (cont.)

Bits	Name	Description
4	RXLEV	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
3	RXSTALE	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
2	RXBREAK_CHANGE	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
1	RXHUNT	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
0	TXLEV	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).

0x078AF0B4 BLSP1_BLSP_UART0_UART_DM_ISR**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

BLSP1_BLSP_UART0_UART_DM_ISR

Bits	Name	Description
16	WWT_IRQ	WWT timeout reached interrupt. Fired after WWT timer was enabled and no data was received during the configured time that follows. Cleared by issuing CHANNEL_COMMAND = CLEAR_WWT_IRQ (UART_DM_CR register).
15	TXCOMP_IRQ	TX-complete interrupt. Fired when TX channel finished transmitting all of TX-transfer's data and no new transfer was initiated. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_COMP_IRQ (UART_DM_CR register).
14	RX_RD_ERROR_IRQ	RX-FIFO empty read error. Fired when AHB master is trying to read from an empty RX-FIFO. Cleared by issuing CHANNEL_COMMAND = CLEAR_RX_RD_ERROR_IRQ (UART_DM_CR register).
13	TX_WR_ERROR_IRQ	TX-FIFO full write error. Fired when AHB master is trying to write into a full TX-FIFO. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_WR_ERROR_IRQ (UART_DM_CR register).

BLSP1_BLSP_UART0_UART_DM_ISR (cont.)

Bits	Name	Description
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted (See UART_DM_SR register). Cleared by issuing CHANNEL_COMMAND = RESET_PAR_FRAME_ERR_IRQ (UART_DM_CR register).
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. Cleared by issuing CHANNEL_COMMAND = RESET_BREAK_END_IRQ (UART_DM_CR register).
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. Cleared by issuing CHANNEL_COMMAND = RESET_BREAK_START_IRQ (UART_DM_CR register).
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_DONE_IRQ (UART_DM_CR register). - This bit is generated only when SIM_GLUE_GEN generic equals 1.
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_ERROR_IRQ (UART_DM_CR register). - This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. Note: There may be characters in the unpack buffer or in the shift register. Cleared by issuing GENERAL_COMMAND = RESET_TX_READY_IRQ (UART_DM_CR register)
6	CURRENT_CTS	This bit indicates the current state of the CTS input, high ('1') meaning peer is not ready for data reception, low ('0') - peer is ready. The toggling of this bit does not generate an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. Cleared by issuing CHANNEL_COMMAND = RESET_CTS_N (UART_DM_CR register).
4	RXLEV	This bit is set when a word is loaded into the receive FIFO that brings the total number of words in the FIFO above the programmed watermark level in the FIFO watermark register (UART_DM_RFWR). This bit is cleared after enough words have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that an RX-transfer has finished (See UART_DM HPG for more information). Cleared by issuing CHANNEL_COMMAND = RESET_STALE_IRQ (UART_DM_CR register).

BLSP1_BLSP_UART0_UART_DM_ISR (cont.)

Bits	Name	Description
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. Cleared by issuing CHANNEL_COMMAND = RESET_BREAK_CHANGE_IRQ (UART_DM_CR register). A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. Cleared by issuing CHANNEL_COMMAND = RESET_ERROR_STATUS (UART_DM_CR register).
0	TXLEV	This bit is set (1) when a word which is transferred from the transmit FIFO to the transmit shift register brings the total number of words in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough words have been written to the FIFO to bring the level above the programmed watermark level. Since this bit does not have a Clear command, during interrupt handling this bit must be masked (using the matching bit in UART_DM_IMR) until writing additional data for transmission is required. After data is written, this interrupt-bit should be unmasked.

0x078AF0B8 BLSP1_BLSP_UART0_UART_DM_IRDA**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data paths have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

* The register is generated only when IRDA_IFC_GEN generic equals 1.

BLSP1_BLSP_UART0_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	- Set (1) for 1/4 bit-time pulse length (Medium rate) - Clear (0) for 3/16 bit-time pulse length (Low rate)

BLSP1_BLSP_UART0_UART_DM_IRDA (cont.)

Bits	Name	Description
3	IRDA_LOOPBACK	- This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. - Set (1) this bit for an inverted polarity. - Clear (0) this bit for a non-inverted polarity.
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. - Set (1) this bit for inverted the polarity. - Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	- Set (1) this bit to enable the IRDA transceiver. - Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x078AF0BC BLSP1_BLSP_UART0_UART_DM_RX_TOTAL_SNAP**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART0_UART_DM_RX_TOTAL_SNAP**

Bits	Name	Description
23:0	RX_TOTAL_BYTES	?RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see UART_DM HPG for more information). Rx transfer ends when one of the conditions is met: - The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at ?Transfer initialization?. - A stale event occurred (flush operation already performed if was needed)

0x078AF0C0 BLSP1_BLSP_UART0_UART_DM_WWT_TIMEOUT**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART0_UART_DM_WWT_TIMEOUT**

Bits	Name	Description
24:0	WWT_TIMEOUT	timeout value for WWT mechanism.

0x078AF180 BLSP1_BLSP_UART0_UART_DM_UIM_CFG

Type: RW
Clock: AHB_CLK
Reset State: 0x00001703

Configuration register for UIM-controller (linked with this UART_DM). Reset value relevant to UIM-controller HW-reset and not a UART_DM HW-reset. Writing to this register requires waiting until UIM-WRITE is done (indication by status-bit or interrupt) before attempting an additional write/read one of UIM_CFG/UIM_CMD registers.

BLSP1_BLSP_UART0_UART_DM_UIM_CFG

Bits	Name	Description
15	BATT_ALARM_QUICK_DROP_EN	When set, deactivation sequence resulted from battery-alarm will drop all UIM-lines immediately. Otherwise, lines will be dropped gradually.
14	TESTBUS_EN	When set, UIM-controller will output testbus signals on the testbus port. Otherwise, testbus port will be driven with zeros.
13	SW_RESET	When set, UIM-controller will be at reset state.
12	MODE18	Configures PAD's working reference voltage (set to '0' for 3V, '1' for 1.8V).
11	RESERVED_1	
10	PMIC_ALARM_EN	Enables messaging on the alarm-line to notify PMIC to drop card's voltage supply. Set to enable messaging, clear to disable.
9	BATT_ALARM_TRIGGER_EN	Enables triggering of deactivation sequence when battery-alarm detected. Set to enable triggering, clear to disable.
8	UIM_RMV_TRIGGER_EN	Enables triggering of deactivation sequence when card-removal detected. Set to enable triggering, clear to disable.
7	RESERVED_2	
6	UIM_CARD_EVENTS_ENABLE	When cleared, UIM-controller will not react to any card-event (insertion/removal). When set, UIM-controller reacts to these events and considered active. This bit should be set only after/during UIM_PRESENT_POLARITY bit is configured so UIM-controller will not interpret card-events incorrectly due to a wrong polarity configuration (the reset-value of the polarity might not match the actual one).
5	UIM_PRESENT_POLARITY	Determines value interpretation of uim_present signal. Setting this bit to '1' indicates that a uim-card present in the uim-slot will return the value '1' on uim_present line & '0' when a card is not present. Setting this bit to '0' indicates that a uim-card present in the uim-slot will return the value '0' on uim_present line & '1' when a card is not present.
4:0	EVENT_DEBOUNCE_TIME	Configures debounce-time of card-removal/insertion events (in sleep-clk cycles).

0x078AF184 BLSP1_BLSP_UART0_UART_DM_UIM_CMD**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined

Command register for UIM-controller (linked with this UART_DM). Writing to this register requires waiting until UIM-WRITE is done (indication by status-bit or interrupt) before attempting an additional write/read one of UIM_CFG/UIM_CMD registers.

BLSP1_BLSP_UART0_UART_DM_UIM_CMD

Bits	Name	Description
1	RECOVER_FROM_HW_DEACTIVATION	Writing '1' to this bit will cause the UIM-io-ctrl to exit override state and reflect UIM signals from UART_DM to the UIM card. Setting both bits of this register to '1' will cause neither of the commands to be executed.
0	INITIATE_HW_DEACTIVATION	Initiates a HW deactivation sequence when writing '1' to this bit. This executes the sequence on the uim_data, uim_clk & uim_rst_n lines and alerts the PMIC to cut the power-supply to the card afterwards. Setting both bits of this register to '1' will cause neither of the commands to be executed.

0x078AF188 BLSP1_BLSP_UART0_UART_DM_UIM_IO_STATUS**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000002**BLSP1_BLSP_UART0_UART_DM_UIM_IO_STATUS**

Bits	Name	Description
2	UIM_IO_WRITE_IN_PROGRESS	Asserted after UIM-write (UIM_CFG/UIM_CMD register write) while write is being propagated into the UIM-IO-controller. An additional read/write to UIM_CFG/UIM_CMD register should be done while high. De-asserted when write finishes propagating.
1	UIM_DEACTIVATION_STATUS	Indicates whether a HW deactivation sequence was performed and sequence recovery hasn't been executed yet. This bit is set when the sequence is initiated either by a HW trigger (batt_alarm, card-removal) or a SW trigger ('initiate_shutdown_sequence' bit in CMD register). Cleared after executing a 'recover_from_hw_deactivation' command.
0	CARD_PRESENCE	Indication on card presence in slot. High when card present, low otherwise.

0x078AF18C BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_ISR**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_ISR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Asserted when UIM-write had finished. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.

BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_ISR (cont.)

Bits	Name	Description
3	HW_SEQUENCE_FINISH	Asserted when UIM-controller's HW-deactivation sequence has been initiated and finished. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.
2	BATT_ALARM	Set to high when battery-alarm indication received. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.
1	UIM_CARD_INSERTION	Set to high when card insertion indication received. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.
0	UIM_CARD_REMOVAL	Set to high when card removal indication received. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.

0x078AF190 BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_MISR**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_MISR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	See UART_DM_UIM_IRQ_ISR for field descriptions.
3	HW_SEQUENCE_FINISH	See UART_DM_UIM_IRQ_ISR for field descriptions.
2	BATT_ALARM	See UART_DM_UIM_IRQ_ISR for field descriptions.
1	UIM_CARD_INSERTION	See UART_DM_UIM_IRQ_ISR for field descriptions.
0	UIM_CARD_REMOVAL	See UART_DM_UIM_IRQ_ISR for field descriptions.

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
3	HW_SEQUENCE_FINISH	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
2	BATT_ALARM	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
1	UIM_CARD_INSERTION	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
0	UIM_CARD_REMOVAL	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.

0x078AF198 BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_IMR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_IMR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
3	HW_SEQUENCE_FINISH	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
2	BATT_ALARM	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
1	UIM_CARD_INSERTION	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
0	UIM_CARD_REMOVAL	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.

0x078AF19C BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_IMR_SET**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined**BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_IMR_SET**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
3	HW_SEQUENCE_FINISH	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
2	BATT_ALARM	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
1	UIM_CARD_INSERTION	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
0	UIM_CARD_REMOVAL	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.

0x078AF1A0 BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_IMR_CLR**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined**BLSP1_BLSP_UART0_UART_DM_UIM_IRQ_IMR_CLR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
3	HW_SEQUENCE_FINISH	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
2	BATT_ALARM	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
1	UIM_CARD_INSERTION	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
0	UIM_CARD_REMOVAL	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.

20.3 BLSP1_BLSP_UART1_UART_DM**0x078B0000 BLSP1_BLSP_UART1_UART_DM_MR1****Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_MR1 register is the UART mode register #1. It is used, along with UART_DM_MR2, to configure the operational mode of the UART.

BLSP1_BLSP_UART1_UART_DM_MR1

Bits	Name	Description
31:8	AUTO_RFR_LEVEL1	These bits are used, along with field AUTO_RFR_LEVEL0 to program the level in the receive FIFO at which the Ready-For-Receive signal (RFR_N) toggles, if programmed to do so (see RX_RDY_CTL field of this register). When RX-FIFO level is greater than the value in fields AUTO_RFR_LEVEL1 and AUTO_RFR_LEVEL0, signal will indicate Not-Ready (RFR_N high). Otherwise signal will indicate Ready RFR_N low. Configured value should be higher/equal than RFRW value, otherwise the watermark will never be reached. Value of this register is in words and can be programmed from 1 to 2^{RAM_ADDR_WIDTH}. - Only RAM_ADDR_WIDTH + 1:8 bits of this field are generated.

BLSP1_BLSP_UART1_UART_DM_MR1 (cont.)

Bits	Name	Description
7	RX_RDY_CTL	Setting (1) this bit enables the automatic ready-for-receiving (RFR_N) control for the receiver. RFR_N is turned off, or set (1), when a valid start bit is received and the RX channel FIFO is at the level programmed in bits [31:8,5:0] of this register. When the FIFO level falls back to the programmed level, the RFR_N signal is turned on, or clear (0). When this feature is off, the RFR_N signal can be used by normal signal port bit manipulation (see UART_DM_CR register).
6	CTS_CTL	When this bit is set(1), the transmitter checks the CTS_N input to determine whether to begin transmission of a new character. If CTS_N is low, the character is sent. Otherwise the transmitter continues marking until CTS_N goes low, then the next character is transmitted. A change on CTS_N during the transmission of a character has no effect on that character. When this bit is clear(0), the CTS_N input for the channel has no effect on the transmitter.
5:0	AUTO_RFR_LEVEL0	See the description of field AUTO_RFR_LEVEL1.

0x078B0004 BLSP1_BLSP_UART1_UART_DM_MR2**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

See description of UART_DM_MR1 register.

BLSP1_BLSP_UART1_UART_DM_MR2

Bits	Name	Description
10	RFR_CTS_LOOPBACK	Enables internal loopback between RFR_N of RX channel and CTS_N of TX channel if set. For this feature to be enabled, data loopback must also be enabled (LOOPBACK bit of this register).
9	RX_ERROR_CHAR_OFF	When this bit is set, characters received with parity or framing errors get discarded and not moved to the RX channel. Otherwise they enter RX channel as any valid character.
8	RX_BREAK_ZERO_CHAR_OFF	When this bit is set, the zero character received at rx_break event get discarded and not moved to the RX channel. Otherwise it enters RX-channel as any valid character.
7	LOOPBACK	When set - data output of transmitter is fed back to the data input of the receiver, i.e. TX-pin is connected to RX-pin. Might be used with flow-control loopback (RFR_CTS_LOOPBACK bit above).

BLSP1_BLSP_UART1_UART_DM_MR2 (cont.)

Bits	Name	Description
6	ERROR_MODE	This bit controls the operation of the two status register bits for the RX channel (parity or framing error and received break, see UART_DM_SR register). - When clear (0), the UART operates in character mode and the status bits apply only to the last character received. - When set (1), the UART operates in block mode and both bits are sticky, i.e. they go high once an error/break-event is detected and go low only after reset error status command is issued (see UART_DM_CR register).
5:4	BITS_PER_CHAR	These bits determine how many data bits are transmitted or received per character, not including the start, stop, and parity bits. 0x0: ENUM_5_BITS (5 bits) 0x1: ENUM_6_BITS (6 bits) 0x2: ENUM_7_BITS (7 bits) 0x3: ENUM_8_BITS (8 bits)
3:2	STOP_BIT_LEN	This field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 9/16, 1, 1+ 9/16, and 2 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. This configuration only applies to UART/IrDA interfaces, for SIM interface see SIM_STOP_BIT_LEN field of UART_DM_SIM_CFG register. 0x0: ENUM_0_563 (0.563 (9/16) bit times) 0x1: ENUM_1_000_BIT_TIME (1.000 bit time) 0x2: ENUM_1_563 (1.563 (1+9/16) bit times) 0x3: ENUM_2_000_BIT_TIMES (2.000 bit times)
1:0	PARITY_MODE	These bits determine which parity mode is used. The user can select between odd, even, space, or no parity. 0x0: NO_PARITY (no parity - last data-bit is followed by a stop-bit) 0x1: ODD_PARITY (odd parity - parity-bit ensures number of ones in data-bits+parity-bit is odd) 0x2: EVEN_PARITY (even parity - parity-bit ensures number of ones in data-bits+parity-bit is even) 0x3: SPACE_PARITY (space parity - parity is always '0')

0x078B0008 BLSP1_BLSP_UART1_UART_DM_CSR_SR_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_CSR or UART_DM_SR.

BLSP1_BLSP_UART1_UART_DM_CSR_SR_DEPRECATED

Bits	Name	Description
31:0	UART_DM_CSR_SR_DEPRECATED	

0x078B0010 BLSP1_BLSP_UART1_UART_DM_CR_MISR_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_CR or UART_DM_MISR.

BLSP1_BLSP_UART1_UART_DM_CR_MISR_DEPRECATED

Bits	Name	Description
31:0	UART_DM_CR_MISR_DEPRECATED	

0x078B0014 BLSP1_BLSP_UART1_UART_DM_IMR_ISR_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_IMR or UART_DM_ISR.

BLSP1_BLSP_UART1_UART_DM_IMR_ISR_DEPRECATED

Bits	Name	Description
31:0	UART_DM_IMR_ISR_DEPRECATED	

0x078B0018 BLSP1_BLSP_UART1_UART_DM_IPR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0xFFFFFFFF9F

The UART_DM_IPR register is the UART interrupt programming register.

BLSP1_BLSP_UART1_UART_DM_IPR

Bits	Name	Description
31:7	STALE_TIMEOUT_MSB	The stale character time-out duration field contains a number from 1 to $2^{30} - 1$. This number determines how many character times must elapse before a stale event is generated. This character time is defined as 10 times the bit rate. It is reset whenever a data bit is received. Never set this fields to 0 while RX channel is operational. Do not re-configure while an RX-transfer is active. Note the discontinuity in the bit assignments.
6	SAMPLE_DATA	Currently not in use. Setting (1) to this bit enables the sample data mode. In this mode start bit is sampled along with the data of the UART character. Works only in 'Packet mode' (See the CR register, CHANNEL_COMMAND bit for more information).
5	RESERVED	
4:0	STALE_TIMEOUT_LSB	This bitfield is the LSbits of the STALE_TIMEOUT bitfield.

0x078B001C BLSP1_BLSP_UART1_UART_DM_TFWR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_TFWR register is the UART transmit FIFO watermark register.

BLSP1_BLSP_UART1_UART_DM_TFWR

Bits	Name	Description
31:0	TFW	These bits contain a number, between 0 and $2^{\text{RAM_ADDR_WIDTH}} - 1$, that determines the level of the transmit (TX) FIFO at which space_avail_req signal is asserted in BAM mode or TXLEV interrupt is asserted in non-BAM mode. The signal/interrupt is asserted when the FIFO level (number of TX words in the FIFO) is less than or equal to the value in TFWR. Notice that the value is in words. See UART_DM_ISR register for TXLEV interrupt description. - Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x078B0020 BLSP1_BLSP_UART1_UART_DM_RFWR**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

The UART_DM_RFWR register is the UART receive FIFO watermark register.

BLSP1_BLSP_UART1_UART_DM_RFWR

Bits	Name	Description
31:0	RFW	These bits contain a number, between 0 and $2^{\text{RAM_ADDR_WIDTH}} - 1$, that determines the level of the receive (RX) FIFO at which data_avail_req signal is asserted in BAM mode or RXLEV interrupt is asserted in non-BAM mode. The signal/interrupt is asserted when the FIFO level (number of words in the RX FIFO) is greater than the value in RFWR. Configured value should be lower/equal than AUTO_RFR_LEVEL value, otherwise the watermark will never be reached. Notice that the value is in words. See UART_DM_ISR register for TXLEV interrupt description - Only RAM_ADDR_WIDTH -1:0 bits are generated.

0x078B0024 BLSP1_BLSP_UART1_UART_DM_HCR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Configures Hunt-Character value.

BLSP1_BLSP_UART1_UART_DM_HCR

Bits	Name	Description
7:0	DATA	The UART_DM_HCR register is the UART hunt character register, which contains the character for which the receiver looks to assert a hunt character received interrupt.

0x078B0034 BLSP1_BLSP_UART1_UART_DM_DMRX**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Initializes RX transfer and configures maximal length in bytes of the transfer.

BLSP1_BLSP_UART1_UART_DM_DMRX

Bits	Name	Description
24:0	RX_DM_CRCI_CHARS	A write to RX_DM_CRCI_CHARS initializes RX transfer in SW (FIFO) mode, with written value configuring the maximal length in bytes of the transfer. In BAM-mode, only the value held in this register impacts the data-flow and not the write-event. A write-value of 0 is not valid. Read of UART_DM_DMRX register is returns the number of characters that were received since the end of the last RX transfer. To read back the last value written to this register use UART_DM_DMRX_DBG register. Refer to UART_DM_BCR register description for additional constraints on the value to be written to this register.

0x078B0038 BLSP1_BLSP_UART1_UART_DM_IRDA_RX_TOTAL_SNAP_DEPRECATED**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

This register is deprecated and remains only for backward-compatibility. Use UART_DM_IRDA or UART_DM_RX_TOTAL_SNAP.

BLSP1_BLSP_UART1_UART_DM_IRDA_RX_TOTAL_SNAP_DEPRECATED

Bits	Name	Description
31:0	UART_DM_IRDA_RX_TOTAL_SNAP_DEPRECATED	

0x078B003C BLSP1_BLSP_UART1_UART_DM_DMEN**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_DMEN register defines the DMA used by the core and the data packing mode for TX and RX channels.

BLSP1_BLSP_UART1_UART_DM_DMEN

Bits	Name	Description
5	RX_SC_ENABLE	- Set (1) for work in Single-Character mode for RX channel (every character received is zero-padded into a word). - Clearing this bit requires resetting the receiver.

BLSP1_BLSP_UART1_UART_DM_DMEN (cont.)

Bits	Name	Description
4	TX_SC_ENABLE	- Set (1) for work in Single-Character mode for TX channel (Only LSB byte of each word get transmitted). - Clearing this bit requires resetting the transmitter.
3	RX_BAM_ENABLE	- Set (1) this bit to enable RX BAM interface (BAM-mode). - Clear (0) this bit to disable RX BAM interface (SW/FIFO mode). Clearing this bit requires resetting the receiver (see UART_DM_CR register).
2	TX_BAM_ENABLE	- Set (1) this bit to enable TX BAM interface (BAM-mode). - Clear (0) this bit to disable TX BAM interface (SW/FIFO mode). Clearing this bit requires resetting the transmitter(see UART_DM_CR register).
1	RESERVED_1	
0	RESERVED_2	

0x078B0040 BLSP1_BLSP_UART1_UART_DM_NO_CHARS_FOR_TX**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Initialization of TX transfer in SW/FIFO mode.

BLSP1_BLSP_UART1_UART_DM_NO_CHARS_FOR_TX

Bits	Name	Description
23:0	TX_TOTAL_TRANS_LEN	The total number of characters for transmission. Before writing a new value, the TX FIFO must be empty as indicated by TX_READY interrupt (see UART_DM_ISR register for description) or after a TX-channel reset. It is used by the TX-channel in SW/FIFO mode to calculate how many characters to transmit in the last word. Any additional writes to the TX FIFO beyond TX_TOTAL_TRANS_LEN characters will be discarded. A TX_READY interrupt is triggered after TX_TOTAL_TRANS_LEN number of characters were moved from the TX FIFO to the unpacking buffer (not all may have been transmitted at that point though).

0x078B0044 BLSP1_BLSP_UART1_UART_DM_BADR**Type:** RW**Clock:** AHB_CLK**Reset State:** Undefined

Configures FIFO division between RX-FIFO and TX-FIFO.

BLSP1_BLSP_UART1_UART_DM_BADR

Bits	Name	Description
31:2	RX_BASE_ADDR	RX FIFO base address. Both FIFOs use the same RAM ($2^{\text{RAM_ADDR_WIDTH}}$, 32-bit entries). This register controls the division of the memory between the RX and TX FIFOs. The division must be a multiple of 4 entries for legacy reasons, therefore bits 1:0 of this register are not used. The size of the TX FIFO equals RX_BASE_ADDR. The size of the RX FIFO is $2^{\text{RAM_ADDR_WIDTH}} - \text{RX_BASE_ADDR}$. * The default is $\text{RX_BASE_ADDR} = 2^{(\text{RAM_ADDR_WIDTH} - 1)}$ * Only RAM_ADDR_WIDTH -1:2 bits are generated.

0x078B004C BLSP1_BLSP_UART1_UART_DM_TXFS**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

TX channel status register.

BLSP1_BLSP_UART1_UART_DM_TXFS

Bits	Name	Description
31:14	TX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. - Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	TX_ASYNC_FIFO_STATE	TX asynchronous fifo status - number of characters in the TX asynchronous FIFO.
9:7	TX_BUFFER_STATE	TX unpacking buffer status - number of bytes in the unpacking buffer
6:0	TX_FIFO_STATE_LSB	TX FIFO status - number of words in the TX FIFO

0x078B0050 BLSP1_BLSP_UART1_UART_DM_RXFS**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

RX channel status register.

BLSP1_BLSP_UART1_UART_DM_RXFS

Bits	Name	Description
31:14	RX_FIFO_STATE_MSB	The msb of TX_FIFO_STATE bitfield. Only RAM_ADDR_WIDTH +4 +3 -1:14 bits are generated.
13:10	RX_ASYNC_FIFO_STATE	RX asynchronous fifo status - number of characters in the RX asynchronous FIFO.
9:7	RX_BUFFER_STATE	RX packing buffer status - number of bytes in the packing buffer
6:0	RX_FIFO_STATE_LSB	The number of entries in the RX FIFO that have at least one valid word. It is incremented each time a word is moved from the packing register to the RX FIFO. It is decremented each time a word is read from the RX FIFO. Note: The Uart does not keep track of non-valid characters in each word.

0x078B0060 BLSP1_BLSP_UART1_UART_DM_MISR_MODE**Type:** RW**Clock:** WR_CLK**Reset State:** Undefined**BLSP1_BLSP_UART1_UART_DM_MISR_MODE**

This register is deprecated and remains only for backward-compatibility. Use UART_DM_TF_4 or UART_DM_RF_4.

BLSP1_BLSP_UART1_UART_DM_TF_RF_4_DEPRECATED

Bits	Name	Description
31:0	UART_DM_TF_RF_4_DEPR ECATED	

0x078B0080 BLSP1_BLSP_UART1_UART_DM_SIM_CFG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_SIM_CFG register is used to configure the SIM interface for the UART.

* This register is generated only when SIM_GLUE_GEN generic equals 1.

BLSP1_BLSP_UART1_UART_DM_SIM_CFG

Bits	Name	Description
17	UIM_TX_MODE	When this bit is set (1), any re-transmission signal from the UIM card will be ignored (The transmission portion of the SIM interface operates in block mode T=1). When clear (0), re-transmission will be executed upon request (the transmission portion of the SIM interface operates in asynchronous transfer mode T=0). Note that the operation of this function is conditional upon SIM_SEL field being set (1) to designate the UIM_IF mode of operation.
16	UIM_RX_MODE	When this bit is set (1), error-signal indication will not be generated by the receiver (the receive portion of the SIM interface operates in block mode T=1). When clear (0), error signal will be generated when a character error is detected (the receive portion of the SIM interface operates in asynchronous transfer mode T=0). Note that the operation of this function is conditional upon SIM_SEL field being set (1) to designate the UIM_IF mode of operation.
15:8	SIM_STOP_BIT_LEN	In UIM_IF mode, this field programs the duration of the stop bit that is appended to each transmitted character. The stop bit duration can be 1 to 254 bit times. The receiver only samples the stop bit once, regardless of the programmed stop bit length. 0x1: ENUM_1_BIT_TIMES (1 bit times) 0x2: ENUM_2_BIT_TIMES (2 bit times) 11 111110: 254 bit times)
7	SIM_CLK_ON	When this bit is set(1), the UIM_CLK is turned on at either the TD8 or TD4 frequency, as indicated by bit6(UIM_CLK_TD8_SEL). When this bit is cleared, the UIM_CLK is stopped either LOW or HIGH, as indicated by bit 5(UIM_CLK_STOP_HIGH).
6	SIM_CLK_TD8_SEL	This bit selects the UIM_CLK frequency at which the UIM_CLK is turned on. 0x1: TD8 (UIM_CLK runs at the TD8 frequency (same frequency as SIM-SRC_CLK)) 0x0: TD4 (UIM_CLK runs at the TD4 frequency (1/2 the frequency of SIM-SRC_CLK))
5	SIM_CLK_STOP_HIGH	This bit indicates at what point - high or low - the UIM_CLK will stop. 0x1: HIGH (high) 0x0: LOW (low)

BLSP1_BLSP_UART1_UART_DM_SIM_CFG (cont.)

Bits	Name	Description
4	RESERVED	
3	MASK_RX	Setting (1) this bit masks off any 0 on the RX line, which prevents the receiver from seeing the START bit. Set (1) this bit if you do not want to receive the data you transmit.
2	SWAP_D	Setting (1) this bit causes the UIM_IF to swap the 8 data bits (making MSB into LSB, bit 6 into bit1, and so on) before it is read by the microprocessor.
1	INV_D	Set (1) this bit to cause the UIM_IF to invert the 8 data bit before it is read by the microprocessor.
0	SIM_SEL	When set (1), UART_DM will operate in SIM/UIM interface mode. When cleared (0), SIM/UIM interface is disabled.

0x078B00A0 BLSP1_BLSP_UART1_UART_DM_CSR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_CSR register is the UART clock selection register. This register is used to determine the bit rate for the transmitter and receiver. The transmitter and receiver can be clocked at different rates.

Data-rate of receiver/transmitter is UART-CLK frequency divided by the integer matching the configured value below:

0xF = 16

0xE = 32

0xD = 48

0xC = 64

0xB = 96

0xA = 128

0x9 = 192

0x8 = 256

0x7 = 384

0x6 = 512

0x5 = 768

0x4 = 1536

0x3 = 3072

0x2 = 6144

0x1 = 12288

0x0 = 24576

BLSP1_BLSP_UART1_UART_DM_CSR

Bits	Name	Description
7:4	UART_RX_CLK_SEL	Use the values above to select the receive bit rate.
3:0	UART_TX_CLK_SEL	Use the values above to select the transmit bit rate.

0x078B00A4 BLSP1_BLSP_UART1_UART_DM_SR**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

The UART_DM_SR register is the UART status register. This register is used to obtain the current state of the UART subsystem. This register is updated asynchronously.

BLSP1_BLSP_UART1_UART_DM_SR

Bits	Name	Description
11:10	TRANS_END_TRIGGER	RX-transfer-end event type. Stores trigger for last transfer end: '00' for no trigger, '01' for DMRX-event, '10' for timeout stale, '11' for SW stale.
9	TRANS_ACTIVE	Transfer Active bit.
8	RX_BREAK_START_LAST	When break start is detected, this bit is set (1). When break end was detected, this bit is reset (0).
7	HUNT_CHAR	When set (1), this bit indicates that the programmed character in the UART_DM_HCR register was received. If programmed, this condition causes the RXHUNT bit to be set (1) in the UART_DM_ISR register. This bit is cleared by issuing a reset error status command.

BLSP1_BLSP_UART1_UART_DM_SR (cont.)

Bits	Name	Description
6	RX_BREAK	When set (1), this bit indicates that an all-zero character of the programmed length was received without a stop bit. If a break begins in the middle of a character, it is detected if the condition remains until the end of the next character time. Only one all zero character is written into the FIFO upon receiving the break. After the RX input returns high for at least half a bit time, then more characters are accepted by the receiver. Whenever the break condition starts or stops as defined above, the RXBREAK bit is set (1) in the UART_DM_ISR register. This bit is appended to the character in the receive FIFO.
5	PAR_FRAME_ERR	A parity error occurs if parity is programmed to be checked and an incoming character is received with incorrect parity. A framing error occurs when the RX input is low while the stop bit is being sampled. This bit is sampled in the middle of the first stop bit position, regardless of the programmed length of the stop bit. This error bit is appended to the character in the receive FIFO.
4	UART_OVERRUN	An overrun error occurs if one or more incoming characters are lost. This happens when the receive FIFO is full, the packing buffer is full and another character has been received in the shift register. The character in the receive shift register is lost. Upon overrun, this status bit remains high until cleared by a reset error status command.
3	TXEMT	This bit is set (1) when the transmitter under-runs. It is set after the transmission of the stop bit at the end of a character, if there are no characters waiting to be sent. It is reset when a character is written to the transmit FIFO.
2	TXRDY	This bit indicates that the transmit FIFO has space in it. It is reset when the FIFO becomes full and set when space becomes available again. Any characters that are written to the FIFO while this bit is low is lost.
1	RXFULL	This bit is set (1) when the receive FIFO becomes full. It is reset when the CPU reads a word.
0	RXRDY	This bit is set (1) when there is a word in the receive FIFO waiting to be read. It is reset when the last word currently stored in the FIFO is read.

0x078B00A8 BLSP1_BLSP_UART1_UART_DM_CR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_CR register is the UART command register. This register is used to issue specific commands to the UART subsystem. This register is updated asynchronously.

CAUTION Do not reset the transmitter and disable it at the same time. Do not reset the receiver and disable it at the same time.

Channel-commands:

0x00 - Null Command - Does nothing.

0x01 - Reset Receiver - Resets the receiver as if a hardware reset were issued. The receiver is disabled and the FIFO, packing buffer and shift registers are flushed.

0x02 - Reset Transmitter - Resets the transmitter as if a hardware reset were issued. The transmitter signal goes high (marking) and the FIFO, unpacking register and shift register are flushed.

0x03 - Reset error status - Clears the overrun error and hunt char received status bits in both the character and block error modes. In the block error mode, it clears the error status and received break.

0x04 - Reset break change interrupt - Clears the break change interrupt status bit.

0x05 - Start break - Forces the transmitter signal low. The transmitter must be enabled. If the transmitter is busy, the break is started when all characters in the transmit FIFO and the transmit shift register have been completely sent.

0x06 - Stop break - If executed while channel is breaking, this command causes the transmitter signal to go high. The signal remains high for at least one bit time before sending out a new character.

0x07 - Reset CTS_N - Clears ISR bit 5.

0x08 - Reset stale interrupt - Clears the stale interrupt.

0x09 - Packet mode - Turns on the sample data mode, which causes the receiver to sample the receive data stream at 16 times the programmed baud rate. The data is sampled with the start of the start bit, or the first data bit, and continued until the marking state. To exit this state, write 1100 in the command field.

0x0A - test_parity_on - Internal use only.

0x0B - test_frame_on - Internal use only.

0x0C - Mode reset - Turns off the sample data mode.

0x0D - Set RFR - Asserts the ready for receiving signal (actual flow-control port is active-low (rfr_n) and will go low following this command).

0x0E - Reset RFR - Deasserts the ready for receiving signal (actual flow-control port is active-low (rfr_n) and will go high following this command).

0x0F - uart_reset_int - Internal use only.

0x10 - Reset TX_ERROR - Clears TX_ERROR

0x11 - Clear TX_DONE - Clears the TX_DONE interrupt (ISR bit 9)

0x12 - Reset break start interrupt - Clears the break start interrupt status bit.

0x13 - Reset break end interrupt - Clears the break end interrupt status bit.

- 0x14 - Reset par_frame_err interrupt - Clears the par_frame_err interrupt status bit.
- 0x15 - Start RX BAM IFC - Initialize producer sidebands towards BAM after reset.
- 0x16 - Start TX BAM IFC - Initialize consumer sidebands towards BAM after reset.
- 0x17 - WWT counter enable - Enable WWT counter & IRQ.
- 0x18 - WWT counter disable - Disable WWT counter & IRQ.
- 0x19 - Clear TX_WR_ERROR IRQ - Clears TX write error interrupt status bit.
- 0x1A - Clear RX_RD_ERROR IRQ - Clears RX read error interrupt status bit.
- 0x1B - Clear TX_COMP IRQ - Clears TX complete interrupt status bit.
- 0x1C - Clear WWT IRQ - Clears WWT timeout interrupt status bit.

General-commands:

- 0x0 - Null Command - Does nothing.
- 0x1 - CR Protection Enable - Enables CR HW protection. When two consecutive writes to the CR are detected, the second write is delayed until the command of the first write is finished. The delay is done by de-asserting the AHB ready and this ensures that the first command completes and the second one will be executed right afterward.
- 0x2 - CR Protection Disable - Disables CR HW protection. SW is responsible for managing delay between writes to the CR register.
- 0x3 - Reset TX-Ready interrupt - Clears the TX_READY interrupt.
- 0x4 - SW Force Stale - Causes a stale event (even if stale events are disabled).
- 0x5 - Enable Stale Event - Enables the stale event mechanism
- 0x6 - Disable Stale Event - Enables the stale event mechanism
- 0x7 - RESERVED

BLSP1_BLSP_UART1_UART_DM_CR

Bits	Name	Description
11	CHANNEL_COMMAND_MSB	This is the msb of the CHANNEL_COMMAND bitfield.
10:8	GENERAL_COMMAND	Writing the appropriate value to these bits executes the commands that are listed in Table .
7:4	CHANNEL_COMMAND_LSB	Writing the appropriate value to these bits along with bit 11,executes the channel-command as listed in the register decription.
3	UART_TX_DISABLE	This command terminates the operation of the transmitter after any character in the transmit shift register is sent.

BLSP1_BLSP_UART1_UART_DM_CR (cont.)

Bits	Name	Description
2	UART_TX_EN	This command enables the operation of the transmitter.
1	UART_RX_DISABLE	This command immediately terminates the operation of the channel receiver and any incoming characters are lost. None of the receiver status bits are affected by this command and characters that are already in the receive FIFO remain there.
0	UART_RX_EN	This command enables the channel receiver.

0x078B00AC BLSP1_BLSP_UART1_UART_DM_MISR**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_MISR**

Bits	Name	Description
16:0	UART_MISR	The UART_DM_MISR register is the masked interrupt status register. A read from this register returns the 'AND' of the UART_DM_ISR and the UART_DM_IMR registers. This register is updated asynchronously. This bit field is $\text{misr} \leq (\text{isr}(16 \text{ DOWNT0 } 7) \text{ AND } \text{imr}(16 \text{ DOWNT0 } 7)) \text{ \& '0' \& } (\text{isr}(5 \text{ DOWNT0 } 0) \text{ AND } \text{imr}(5 \text{ DOWNT0 } 0)).$

0x078B00B0 BLSP1_BLSP_UART1_UART_DM_IMR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_IMR register is the UART interrupt mask register. This register is used to enable the corresponding functions in the UART_DM_ISR register. Setting (1) a bit in the UART_DM_IMR register causes an interrupt to be generated, if the corresponding bit in the UART_DM_ISR register is set. Clearing (0) a bit in the UART_DM_IMR register causes the setting of the corresponding bit in the UART_DM_ISR register to have no effect on the interrupt signal. (See UART_DM_ISR register)

Bit 6 of the UART_DM_IMR register, CURRENT_CTS, is slightly different. If the current value of the CTS is one (1), no interrupt is generated. However, the user can use bit 6 in this register to mask the CTS value when reading the UART_DM_MISR register or as a general-purpose bit.

BLSP1_BLSP_UART1_UART_DM_IMR

Bits	Name	Description
16	WWT_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
15	TXCOMP_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
14	RX_RD_ERROR_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
13	TX_WR_ERROR_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
12	PAR_FRAME_ERR_IRQ	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
11	RXBREAK_END	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
10	RXBREAK_START	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
9	TX_DONE	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
8	TX_ERROR	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
7	TX_READY	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
6	CURRENT_CTS	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
5	DELTA_CTS	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
4	RXLEV	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
3	RXSTALE	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
2	RXBREAK_CHANGE	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
1	RXHUNT	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).
0	TXLEV	Masking bit of the matching field interrupt bit (See UART_DM_ISR for field descriptions).

0x078B00B4 BLSP1_BLSP_UART1_UART_DM_ISR**Type:** R**Clock:** AHB_CLK**Reset State:** Undefined

The UART_DM_ISR register is the UART interrupt status register. This register provides the current status of the possible interrupt conditions. If one of these bits is set (1), and the corresponding bit in the UART_DM_IMR register is set (1), an interrupt is generated (with the exception of bit 6, CURRENT_CTS). If the corresponding bit in the UART_DM_IMR register is clear (0), setting one of these bits has no effect on the UART interrupt request signal. This register is updated asynchronously.

BLSP1_BLSP_UART1_UART_DM_ISR

Bits	Name	Description
16	WWT_IRQ	WWT timeout reached interrupt. Fired after WWT timer was enabled and no data was received during the configured time that follows. Cleared by issuing CHANNEL_COMMAND = CLEAR_WWT_IRQ (UART_DM_CR register).
15	TXCOMP_IRQ	TX-complete interrupt. Fired when TX channel finished transmitting all of TX-transfer's data and no new transfer was initiated. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_COMP_IRQ (UART_DM_CR register).
14	RX_RD_ERROR_IRQ	RX-FIFO empty read error. Fired when AHB master is trying to read from an empty RX-FIFO. Cleared by issuing CHANNEL_COMMAND = CLEAR_RX_RD_ERROR_IRQ (UART_DM_CR register).
13	TX_WR_ERROR_IRQ	TX-FIFO full write error. Fired when AHB master is trying to write into a full TX-FIFO. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_WR_ERROR_IRQ (UART_DM_CR register).
12	PAR_FRAME_ERR_IRQ	This bit is asserted in the same condition at which PAR_FRAME_ERR status bit is asserted (See UART_DM_SR register). Cleared by issuing CHANNEL_COMMAND = RESET_PAR_FRAME_ERR_IRQ (UART_DM_CR register).
11	RXBREAK_END	This bit is set (1) if the end of a break condition is detected. Cleared by issuing CHANNEL_COMMAND = RESET_BREAK_END_IRQ (UART_DM_CR register).
10	RXBREAK_START	This bit is set (1) if the start of a break condition is detected. Cleared by issuing CHANNEL_COMMAND = RESET_BREAK_START_IRQ (UART_DM_CR register).
9	TX_DONE	This bit is used only in UIM/SIM_IF mode. Set (1) this bit when the last byte in the transmitter has been sent. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_DONE_IRQ (UART_DM_CR register). - This bit is generated only when SIM_GLUE_GEN generic equals 1.

BLSP1_BLSP_UART1_UART_DM_ISR (cont.)

Bits	Name	Description
8	TX_ERROR	Only used in UIM_IF mode. Set (1) this bit to indicate that there has been parity error during transmission. Cleared by issuing CHANNEL_COMMAND = CLEAR_TX_ERROR_IRQ (UART_DM_CR register). - This bit is generated only when SIM_GLUE_GEN generic equals 1.
7	TX_READY	This bit, when set(1), indicates that: 1. TX FIFO is empty. 2. The value written in NO_CHARS_FOR_TX register equals the number of bytes written to the TX FIFO since the register was updated. Note: There may be characters in the unpack buffer or in the shift register. Cleared by issuing GENERAL_COMMAND = RESET_TX_READY_IRQ (UART_DM_CR register)
6	CURRENT_CTS	This bit indicates the current state of the CTS input, high ('1') meaning peer is not ready for data reception, low ('0') - peer is ready. The toggling of this bit does not generate an interrupt.
5	DELTA_CTS	This bit, when set (1), indicates that the CTS input has changed states. Cleared by issuing CHANNEL_COMMAND = RESET_CTS_N (UART_DM_CR register).
4	RXLEV	This bit is set when a word is loaded into the receive FIFO that brings the total number of words in the FIFO above the programmed watermark level in the FIFO watermark register (UART_DM_RFWR). This bit is cleared after enough words have been read to bring the level equal to or below the programmed watermark level.
3	RXSTALE	This bit indicates that an RX-transfer has finished (See UART_DM HPG for more information). Cleared by issuing CHANNEL_COMMAND = RESET_STALE_IRQ (UART_DM_CR register).
2	RXBREAK_CHANGE	This bit is set (1) if the start or end of a break condition is detected. Cleared by issuing CHANNEL_COMMAND = RESET_BREAK_CHANGE_IRQ (UART_DM_CR register). A detected break is defined as an all-zeros character with an invalid stop bit AND LOW PARITY. The end of a break is defined as a mark condition (1) at least 1/2 bit width. A detected break occupies one position in the Rx FIFO.
1	RXHUNT	This bit is set (1) when an incoming character matches the value programmed into the UART_DM_HCR register. Cleared by issuing CHANNEL_COMMAND = RESET_ERROR_STATUS (UART_DM_CR register).

BLSP1_BLSP_UART1_UART_DM_ISR (cont.)

Bits	Name	Description
0	TXLEV	This bit is set (1) when a word which is transferred from the transmit FIFO to the transmit shift register brings the total number of words in the FIFO below or equal to the programmed watermark level in the UART_DM_TFWR register. This bit is cleared (0) after enough words have been written to the FIFO to bring the level above the programmed watermark level. Since this bit does not have a Clear command, during interrupt handling this bit must be masked (using the matching bit in UART_DM_IMR) until writing additional data for transmission is required. After data is written, this interrupt-bit should be unmasked.

0x078B00B8 BLSP1_BLSP_UART1_UART_DM_IRDA**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The UART_DM_IRDA register enables the IRDA function, selects a loopback, and allows inversion of RX and TX data. This register also controls the IRDA transceiver that optionally interfaces between the UART and the DP_RX_DATA and DP_TX_DATA pins.

The UART proper is a standard RX/TX configuration that converts the serial pin input and output lines to 8-bit data for the microprocessor. The configuration contains receive and transmit blocks, a control block, a bit rate generator for RX and TX, and FIFO interfaces with the microprocessor data bus. The IRDA register provides the means of switching IRDA circuits into the serial I/O lines and the IRDA function is normally switched out. The IRDA modulator/demodulator may be enabled or disabled under microprocessor control. When enabled, the RX and TX data paths have individual inversion select bits, so external true or inverted drivers may be used in the signal path.

* The register is generated only when IRDA_IFC_GEN generic equals 1.

BLSP1_BLSP_UART1_UART_DM_IRDA

Bits	Name	Description
4	MEDIUM_RATE_EN	- Set (1) for 1/4 bit-time pulse length (Medium rate) - Clear (0) for 3/16 bit-time pulse length (Low rate)
3	IRDA_LOOPBACK	- This bit loops the IRDA modulated TX line back into the IRDA RX line. The normal UART loopback mode must be off in order to see this effect.
2	INVERT_IRDA_TX	This bit inverts the polarity of the IRDA modulated signal on the DP_TX_DATA pin. - Set (1) this bit for an inverted polarity. - Clear (0) this bit for a non-inverted polarity.

BLSP1_BLSP_UART1_UART_DM_IRDA (cont.)

Bits	Name	Description
1	INVERT_IRDA_RX	This bit inverts the polarity of the IRDA received signal on the DP_RX_DATA pin. - Set (1) this bit for inverted the polarity. - Clear (0) this bit for non-inverted polarity.
0	IRDA_EN	- Set (1) this bit to enable the IRDA transceiver. - Clear (0) this bit to bypass the IRDA transceiver and ignore the other bits of this register.

0x078B00BC BLSP1_BLSP_UART1_UART_DM_RX_TOTAL_SNAP**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_RX_TOTAL_SNAP**

Bits	Name	Description
23:0	RX_TOTAL_BYTES	?RX_TOTAL_SNAP register holds the number of characters received since the end of last Rx transfer. It is updated at the end of an Rx transfer (see UART_DM HPG for more information). Rx transfer ends when one of the conditions is met: - The number of characters which were received since the end of the previous transfer equals the value which was written to DMRX at ?Transfer initialization?. - A stale event occurred (flush operation already performed if was needed)

0x078B00C0 BLSP1_BLSP_UART1_UART_DM_WWT_TIMEOUT**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_WWT_TIMEOUT**

Bits	Name	Description
24:0	WWT_TIMEOUT	timeout value for WWT mechanism.

0x078B00C4 BLSP1_BLSP_UART1_UART_DM_CLK_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_CLK_CTRL**

Bits	Name	Description
23	UART_IRDA_CLK_CGC_OPEN	Forces UART IRDA-clock (uart_tx_clk) CGC to open when set.

0x078B0180 BLSP1_BLSP_UART1_UART_DM_UIM_CFG

Type: RW
Clock: AHB_CLK
Reset State: 0x00001703

Configuration register for UIM-controller (linked with this UART_DM). Reset value relevant to UIM-controller HW-reset and not a UART_DM HW-reset. Writing to this register requires waiting until UIM-WRITE is done (indication by status-bit or interrupt) before attempting an additional write/read one of UIM_CFG/UIM_CMD registers.

BLSP1_BLSP_UART1_UART_DM_UIM_CFG

Bits	Name	Description
15	BATT_ALARM_QUICK_DROP_EN	When set, deactivation sequence resulted from battery-alarm will drop all UIM-lines immediately. Otherwise, lines will be dropped gradually.
14	TESTBUS_EN	When set, UIM-controller will output testbus signals on the testbus port. Otherwise, testbus port will be driven with zeros.
13	SW_RESET	When set, UIM-controller will be at reset state.
12	MODE18	Configures PAD's working reference voltage (set to '0' for 3V, '1' for 1.8V).
11	RESERVED_1	
10	PMIC_ALARM_EN	Enables messaging on the alarm-line to notify PMIC to drop card's voltage supply. Set to enable messaging, clear to disable.
9	BATT_ALARM_TRIGGER_EN	Enables triggering of deactivation sequence when battery-alarm detected. Set to enable triggering, clear to disable.
8	UIM_RMV_TRIGGER_EN	Enables triggering of deactivation sequence when card-removal detected. Set to enable triggering, clear to disable.
7	RESERVED_2	
6	UIM_CARD_EVENTS_ENABLE	When cleared, UIM-controller will not react to any card-event (insertion/removal). When set, UIM-controller reacts to these events and considered active. This bit should be set only after/during UIM_PRESENT_POLARITY bit is configured so UIM-controller will not interpret card-events incorrectly due to a wrong polarity configuration (the reset-value of the polarity might not match the actual one).
5	UIM_PRESENT_POLARITY	Determines value interpretation of uim_present signal. Setting this bit to '1' indicates that a uim-card present in the uim-slot will return the value '1' on uim_present line & '0' when a card is not present. Setting this bit to '0' indicates that a uim-card present in the uim-slot will return the value '0' on uim_present line & '1' when a card is not present.
4:0	EVENT_DEBOUNCE_TIME	Configures debounce-time of card-removal/insertion events (in sleep-clk cycles).

0x078B0184 BLSP1_BLSP_UART1_UART_DM_UIM_CMD**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined

Command register for UIM-controller (linked with this UART_DM). Writing to this register requires waiting until UIM-WRITE is done (indication by status-bit or interrupt) before attempting an additional write/read one of UIM_CFG/UIM_CMD registers.

BLSP1_BLSP_UART1_UART_DM_UIM_CMD

Bits	Name	Description
1	RECOVER_FROM_HW_DEACTIVATION	Writing '1' to this bit will cause the UIM-io-ctrl to exit override state and reflect UIM signals from UART_DM to the UIM card. Setting both bits of this register to '1' will cause neither of the commands to be executed.
0	INITIATE_HW_DEACTIVATION	Initiates a HW deactivation sequence when writing '1' to this bit. This executes the sequence on the uim_data, uim_clk & uim_rst_n lines and alerts the PMIC to cut the power-supply to the card afterwards. Setting both bits of this register to '1' will cause neither of the commands to be executed.

0x078B0188 BLSP1_BLSP_UART1_UART_DM_UIM_IO_STATUS**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000002**BLSP1_BLSP_UART1_UART_DM_UIM_IO_STATUS**

Bits	Name	Description
2	UIM_IO_WRITE_IN_PROGRESS	Asserted after UIM-write (UIM_CFG/UIM_CMD register write) while write is being propagated into the UIM-IO-controller. An additional read/write to UIM_CFG/UIM_CMD register should be done while high. De-asserted when write finishes propagating.
1	UIM_DEACTIVATION_STATUS	Indicates whether a HW deactivation sequence was performed and sequence recovery hasn't been executed yet. This bit is set when the sequence is initiated either by a HW trigger (batt_alarm, card-removal) or a SW trigger ('initiate_shutdown_sequence' bit in CMD register). Cleared after executing a 'recover_from_hw_deactivation' command.
0	CARD_PRESENCE	Indication on card presence in slot. High when card present, low otherwise.

0x078B018C BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_ISR**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_ISR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Asserted when UIM-write had finished. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.

BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_ISR (cont.)

Bits	Name	Description
3	HW_SEQUENCE_FINISH	Asserted when UIM-controller's HW-deactivation sequence has been initiated and finished. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.
2	BATT_ALARM	Set to high when battery-alarm indication received. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.
1	UIM_CARD_INSERTION	Set to high when card insertion indication received. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.
0	UIM_CARD_REMOVAL	Set to high when card removal indication received. Cleared by writing '1' to matching field in UART_DM_UIM_IRQ_CLR.

0x078B0190 BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_MISR**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_MISR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	See UART_DM_UIM_IRQ_ISR for field descriptions.
3	HW_SEQUENCE_FINISH	See UART_DM_UIM_IRQ_ISR for field descriptions.
2	BATT_ALARM	See UART_DM_UIM_IRQ_ISR for field descriptions.
1	UIM_CARD_INSERTION	See UART_DM_UIM_IRQ_ISR for field descriptions.
0	UIM_CARD_REMOVAL	See UART_DM_UIM_IRQ_ISR for field descriptions.

0x078B0194 BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_CLR**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined**BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_CLR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
3	HW_SEQUENCE_FINISH	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
2	BATT_ALARM	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
1	UIM_CARD_INSERTION	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.
0	UIM_CARD_REMOVAL	Clears matching bit in UART_DM_UIM_IRQ_ISR/MISR.

0x078B0198 BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_IMR**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_IMR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
3	HW_SEQUENCE_FINISH	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
2	BATT_ALARM	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
1	UIM_CARD_INSERTION	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.
0	UIM_CARD_REMOVAL	When set, matching bit in UART_DM_UIM_IRQ_MISR will reflect the matching bit in UART_DM_UIM_IRQ_ISR. Otherwise, the matching bit in UART_DM_UIM_IRQ_MISR will be a constant '0'.

0x078B019C BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_IMR_SET**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined**BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_IMR_SET**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
3	HW_SEQUENCE_FINISH	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
2	BATT_ALARM	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
1	UIM_CARD_INSERTION	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.
0	UIM_CARD_REMOVAL	Write '1' to set the matching bit in UART_DM_UIM_IRQ_IMR.

0x078B01A0 BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_IMR_CLR**Type:** W**Clock:** AHB_CLK**Reset State:** Undefined**BLSP1_BLSP_UART1_UART_DM_UIM_IRQ_IMR_CLR**

Bits	Name	Description
4	UIM_IO_WRITE_DONE	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
3	HW_SEQUENCE_FINISH	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
2	BATT_ALARM	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
1	UIM_CARD_INSERTION	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.
0	UIM_CARD_REMOVAL	Write '1' to clear the matching bit in UART_DM_UIM_IRQ_IMR.

20.4 BLSP1_BLSP_QUP0_QUP**0x078B5000 BLSP1_BLSP_QUP0_QUP_CONFIG****Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

o N equals 8 or less - shift 24

o N equals 16 to 9 - shift 16

o N equals 24 to 17 - shift 8

o N equals 32 to 25 - no shift

BLSP1_BLSP_QUP0_QUP_CONFIG

Bits	Name	Description
16	EN_EXT_OUT_FLAG	Enable Extended OUTPUT/INPUT_SERVICE_FLAG interrupt generation. When this bit is set, the behavior of the *_SERVICE_FLAG and MAX_OUTPUT_DONE_FLAG changes. Service flag and the done flag are not set till the last SPI or I2C transfer has completed. a) For SPI: 1. The shifting needs to complete 2. Clock stopped if CLK_ALWAYS_ON=0, 3. CS, if used, de-asserted b) For I2C, 1. The ACK needs to complete 2. STOP condition done generated (Attention need to be put in synchronizing the last transaction with STOP tag) 3. clock and data wires return to high condition When this bit is clear, the legacy behavior is applicable. Under legacy, the DONE_FLAG is set when: 1. MX_*_COUNT is reached 2. The output FIFO is empty 3. Last bit was sent on the link Under legacy, the flag interrupt is generated before the last transfer is complete on the external interface.
15	CORE_EXTRA_CLK_ON_EN	Enable additional transfer based qup_core_clk gating for power save. When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on.
14	FIFO_CLK_GATE_EN	When set to 0, fifo clock is mostly on - legacy mode. When set to 1, fifo clock is turned off dynamically.
13	CORE_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
12	APP_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
11:8	MINI_CORE	value: 0000 null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 reserved value: 0100 reserved value: 0101 reserved value: 0110 reserved value: 0111 reserved See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a 'don't care'. The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.

BLSP1_BLSP_QUP0_QUP_CONFIG (cont.)

Bits	Name	Description
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS#_N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	QUP_HREADY_CTRL	When set to 0, qup will not stall the AHB bus (legacy mode). When set to 1, qup may stall the AHB bus until register access is done.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x078B5004 BLSP1_BLSP_QUP0_QUP_STATE**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000001C**BLSP1_BLSP_QUP0_QUP_STATE**

Bits	Name	Type	Description
6	I2C_FLUSH	RW	Flushing an i2c transfer requires using version 2 tags. FLUSH should be used in BAM mode only. Setting this bit to 1 will flush all tags and tag related data besides EOT until FLUSH STOP tag is encountered. Setting this bit to 0 has no impact. Reading this bit returns the flush operation status - 0 = ongoing, 1 = done.
5	WAIT_FOR_EOT	RW	Only applicable when moving to RUN_STATE using command descriptor in SPI mode with NO_OUTPUT. Setting this bit to 1 will stall the done_toggle_com indication until basi_trans_end_pro is asserted. This will prevent the next command descriptor to start prematurely.
4	I2C_MAST_GEN	R	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	R	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	R	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.

BLSP1_BLSP_QUP0_QUP_STATE (cont.)

Bits	Name	Type	Description
1:0	STATE	RW	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to '01', the mini-core and related logic is released from reset and enters the RUN_STATE. When set to '11', the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete.

0x078B5008 BLSP1_BLSP_QUP0_QUP_IO_MODES**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000A5

Unless otherwise stated, register bits written return the value when read.

Notes:

a. 'Packing' occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. 'Un-Packing' occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

c. INPUT_MODE and OUTPUT_MODE should be both in BAM_Mode or both in non BAM_Mode.

BLSP1_BLSP_QUP0_QUP_IO_MODES

Bits	Name	Type	Description
16	OUTPUT_BIT_SHIFT_EN	RW	If set, enables the QUP output FIFO block to do bit shifting on the output data.
15	PACK_EN	RW	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	RW	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.

BLSP1_BLSP_QUP0_QUP_IO_MODES (cont.)

Bits	Name	Type	Description
13:12	INPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	R	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
1:0	OUTPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x078B500C BLSP1_BLSP_QUP0_QUP_SW_RESET**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero. The AHB clock domain reset will stay asserted until either the spi_clk or i2c_clk domains are reset. It is prohibited to write to any QUP register during this period and failing to do so will cause an ERROR response on the

AHB bus. In order to avoid this SW should poll the QUP_STATE[STATE_VALID] bit until it is asserted.

BLSP1_BLSP_QUP0_QUP_SW_RESET

Bits	Name	Description
31:0	QUP_SW_RESET	

0x078B5014 BLSP1_BLSP_QUP0_QUP_TRANSFER_CANCEL

Type: RW

Clock: crif_clk

Reset State: 0x00000000

BLSP1_BLSP_QUP0_QUP_TRANSFER_CANCEL

Bits	Name	Type	Description
15:8	TRANSFER_CANCEL_ID	RW	This field include the id of the transfer that is scheduled for cancellation. This field is valid when asserting TRANSFER_CANCEL bit. A value of 0xFF will cancel the current transfer regardless of its LOCAL_ID. Canceling an i2c transfer requires using version 2 tags.
7	TRANSFER_CANCEL	W	Setting this bit to 1 will cause the HW to go to pause_state when the LOCAL_ID = TRANSFER_CANCEL_ID. This would allow flushing the rest of the transfer in order to implement cancel API. Canceling an i2c transfer requires using version 2 tags.

0x078B5018 BLSP1_BLSP_QUP0_QUP_OPERATIONAL

Type: RW

Clock: crif_clk

Reset State: 0x000000C0

Refer to the chapter on 'QUP Software Considerations' regarding the correct interpretation of the various service interrupts generated by QUP and their relation to these register bits.

BLSP1_BLSP_QUP0_QUP_OPERATIONAL

Bits	Name	Description
15	NWD	Notify When Done (NWD). Read only status bit which when set indicates a NWD acknowledgement is outstanding. This bit is set by QUP hardware when NWD is signaled from BAM. This bit is cleared by QUP hardware when the NWD request is acknowledged by assertion of done_toggle. This bit is always unconditionally cleared in RESET_STATE.

BLSP1_BLSP_QUP0_QUP_OPERATIONAL (cont.)

Bits	Name	Description
14	DONE_TOGGLE	Read only status bit which provides the current state of the side-band done_toggle signal sent to BAM. At each NWD acknowledgement, this bit toggles.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Bam_Mode (for debug only).
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Bam_Mode (for debug only).
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.

0x078B501C BLSP1_BLSP_QUP0_QUP_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP0_QUP_ERROR_FLAGS

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ERR	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.

0x078B5020 BLSP1_BLSP_QUP0_QUP_ERROR_FLAGS_EN

Type: RW

Clock: crif_clk

Reset State: 0x0000003C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP0_QUP_ERROR_FLAGS_EN

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR_EN	If set, enables output over run error generation.
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.

0x078B5028 BLSP1_BLSP_QUP0_QUP_OPERATIONAL_MASK

Type: RW

Clock: crif_clk

Reset State: 0x00000000

This register masks several QUP_OPERATIONAL flags from creating an interrupt .

BLSP1_BLSP_QUP0_QUP_OPERATIONAL_MASK

Bits	Name	Description
9	INPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.
8	OUTPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.

0x078B5100 BLSP1_BLSP_QUP0_QUP_MX_OUTPUT_COUNT

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not effect the count.

Notes:

a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

BLSP1_BLSP_QUP0_QUP_MX_OUTPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_OUTPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_OUTPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_OUTPUT_COUNT	RW	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x078B5104 BLSP1_BLSP_QUP0_QUP_MX_OUTPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_QUP_MX_OUTPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x078B510C BLSP1_BLSP_QUP0_QUP_OUTPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP0_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	OUTPUT_FIFO_WORD_CNT	Number of words in the output FIFO.

**0x078B5110+ BLSP1_BLSP_QUP0_QUP_OUTPUT_FIFOc, c=[0..15]
0x4*c****Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

BLSP1_BLSP_QUP0_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x078B5150 BLSP1_BLSP_QUP0_QUP_MX_WRITE_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

BLSP1_BLSP_QUP0_QUP_MX_WRITE_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_WRITE_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_WRITE_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_WRITE_COUNT	RW	The number of 'writes' of size N. This is used only if the core is in FIFO_Mode.

0x078B5154 BLSP1_BLSP_QUP0_QUP_MX_WRITE_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_QUP_MX_WRITE_CNT_CURRENT**

Bits	Name	Description
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

0x078B5200 BLSP1_BLSP_QUP0_QUP_MX_INPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Bam_Mode (for non-balanced SPI). The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

BLSP1_BLSP_QUP0_QUP_MX_INPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_INPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_INPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_INPUT_COUNT	RW	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x078B5204 BLSP1_BLSP_QUP0_QUP_MX_INPUT_CNT_CURRENT

Type: R

Clock: crif_clk

Reset State: 0x00000000

BLSP1_BLSP_QUP0_QUP_MX_INPUT_CNT_CURRENT

Bits	Name	Description
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x078B5208 BLSP1_BLSP_QUP0_QUP_MX_READ_COUNT

Type: RW

Clock: crif_clk

Reset State: 0x00000000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

BLSP1_BLSP_QUP0_QUP_MX_READ_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_READ_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_READ_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_READ_COUNT	RW	The number of 'reads' of size N. This is used only if the core is in FIFO_Mode.

0x078B520C BLSP1_BLSP_QUP0_QUP_MX_READ_CNT_CURRENT

Type: R

Clock: crif_clk

Reset State: 0x00000000

BLSP1_BLSP_QUP0_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x078B5214 BLSP1_BLSP_QUP0_QUP_INPUT_FIFO_WORD_CNT

Type: R

Clock: crif_clk

Reset State: 0x00000000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated. Hence, when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP0_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

0x078B5218+ BLSP1_BLSP_QUP0_QUP_INPUT_FIFOc, c=[0..15]
0x4*c

Type: R

Clock: crif_clk

Reset State: Undefined

Consecutive reads to this address reads the input FIFO contents on a FIFO basis. The max address to read the input FIFO is 0x254.

BLSP1_BLSP_QUP0_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

0x078B5300 BLSP1_BLSP_QUP0_SPI_CONFIG

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

BLSP1_BLSP_QUP0_SPI_CONFIG

Bits	Name	Type	Description
10	HS_MODE	RW	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	RW	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	RW	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
5	SLAVE_OPERATION	R	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.

0x078B5304 BLSP1_BLSP_QUP0_SPI_IO_CONTROL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

BLSP1_BLSP_QUP0_SPI_IO_CONTROL

Bits	Name	Description
11	FORCE_CS	When this bit is set, the chip select is asserted unconditionally with no relationship to QUP_STATE or transaction state.
10	CLK_IDLE_HIGH	When set to 1, spi_clk will be high when spi is idle (spi_cs is not asserted). When cleared to 0, spi_clk will be low when spi is idle (spi_cs is not asserted).
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS#_N respectively. Setting any of this bit to '1', makes the associated SPI_CS#_N active HIGH. This field is a 'don't care' in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_#N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a 'don't care' in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS#_N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS#_N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x078B5308 BLSP1_BLSP_QUP0_SPI_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP0_SPI_ERROR_FLAGS

Bits	Name	Description
3	TRANSFER_CANCEL_DONE	This bit is set (1) when the SPI controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
2	TRANSFER_CANCEL_ID_MATCH	This bit is set (1) when the SPI controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x078B530C BLSP1_BLSP_QUP0_SPI_ERROR_FLAGS_EN

Type: RW

Clock: crif_clk

Reset State: 0x0000000C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP0_SPI_ERROR_FLAGS_EN

Bits	Name	Description
3	TRANSFER_CANCEL_DONE_EN	If set, enables generating the transfer cancel done indication.
2	TRANSFER_CANCEL_ID_MATCH_EN	If set, enables generating the transfer cancel ID match indication.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x078B5310 BLSP1_BLSP_QUP0_SPI_DEASSERT_WAIT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the de-assertion wait time of SPI_CS#_N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

BLSP1_BLSP_QUP0_SPI_DEASSERT_WAIT

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the deasserted time of SPI_CS#_N. Only applies to MASTER operation. For SLAVE operation, this field is a 'don't care'. A value of zero indicates SPI_CS#_N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

0x078B5314 BLSP1_BLSP_QUP0_SPI_MASTER_LOCAL_ID**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_SPI_MASTER_LOCAL_ID**

Bits	Name	Description
15:8	EXTENDED_ID	SW may use this field to specify the current sub-transfer ID to be read when TRANSFER_CANCEL_ID_MATCH is asserted. This value has no impact on HW.
7:0	LOCAL_ID	SW specifies the current transfer ID. HW will use this value to match with TRANSFER_CANCEL_ID.

0x078B5318 BLSP1_BLSP_QUP0_SPI_MASTER_COMMAND**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_SPI_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command.

0x078B531C BLSP1_BLSP_QUP0_SPI_MASTER_STATUS**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_SPI_MASTER_STATUS**

Bits	Name	Description
2:0	CANCEL_FSM_STATE	This 3-bit field informs the microprocessor of the state of the SPI cancel logic. Internal use only

0x078B5400 BLSP1_BLSP_QUP0_I2C_MASTER_CLK_CTL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The I2C_CLK_CTL register is a read/write register that controls clock divider values.

BLSP1_BLSP_QUP0_I2C_MASTER_CLK_CTL

Bits	Name	Description
28	SCL_EXT_FORCE_LOW	When set to 0, SCL generation maintains legacy behavior. When set to 1, SCL state machine will go to the FORCED_LOW_STATE if force_low is asserted near (within 5 i2c_clk cycles = 5 * 52ns = 260ns $\approx$ MAX(Tsu;DAT)) the clock edge.
27:26	SDA_NOISE_REJECTION	Allows adding extra sampling levels on SDA to reject short low pulses. This value specifies how many TCXO cycles of logic low on SDA would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
25:24	SCL_NOISE_REJECTION	Allows adding extra sampling levels on SCL to reject short low pulses. This value specifies how many TCXO cycles of logic low on SCL would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
23:16	HIGH_TIME_DIVIDER_VALUE	Allows setting SCL duty cycle to non 50%. If this value is zero then legacy mode is used. If this value is non-zero then it will be used as the SCL high time counter and FS_DIVIDER_VALUE will be used as the low time counter. Minimum value is 0x7.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. Minimum value is 0x3. $I2C_HS_CLK = I2C_CLK / (3 * (HS_DIVIDER_VALUE + 1) + 2)$

BLSP1_BLSP_QUP0_I2C_MASTER_CLK_CTL (cont.)

Bits	Name	Description
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. Minimum value is 0x7. When HIGH_TIME_DIVIDER_VALUE=0: $I2C_FS_CLK = I2C_CLK / (2 * (FS_DIVIDER_VALUE + 3))$ When HIGH_TIME_DIVIDER_VALUE!=0: $I2C_FS_CLK = I2C_CLK / (FS_DIVIDER_VALUE + HIGH_TIME_DIVIDER_VALUE + 6)$

0x078B5404 BLSP1_BLSP_QUP0_I2C_MASTER_STATUS**Type:** RW**Clock:** crif_clk**Reset State:** 0x0C000000

The I2C_STATUS is a status register. Writing any value clears the status bits.

BLSP1_BLSP_QUP0_I2C_MASTER_STATUS

Bits	Name	Type	Description
30:28	CANCEL_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C cancel logic. Internal use only 0x0: IDLE_STATE (IDLE_STATE) 0x1: CANCEL_PENDING_STATE (CANCEL_PENDING_STATE) 0x2: PAUSE_STATE (PAUSE_STATE) 0x3: PAUSE_WAIT_STATE (PAUSE_WAIT_STATE) 0x4: SEND_STOP_STATE (SEND_STOP_STATE) 0x5: FLUSH_STATE (FLUSH_STATE) 0x6: SEND_IRQ_STATE (SEND_IRQ_STATE)
27	I2C_SCL	R	Logic state of I2C bus serial clock wire.
26	I2C_SDA	R	Logic state of I2C bus serial data wire.
25	INVALID_READ_SEQ	RW	Interrupt source. This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	RW	Interrupt source. In version 1 tags this bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address). In version 2 tags this bit is set (1) when the I2C controller is trying to access a non-existent I2C slave (address).
23	INVALID_TAG	RW	Interrupt source. This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.

BLSP1_BLSP_QUP0_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
22:20	INPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_READ_LAST_BYTE_STATE (READ_LAST_BYTE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_DEC_STATE (DEC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_STORE_STATE (STORE_STATE value. Applies for both version 1 and version 2 tags) 0x6: V2_WR_TAG_STATE (WR_TAG_STATE value. Only applicable in version 2 tags) 0x7: V2_WAIT_TAG_STATE (WAIT_TAG_STATE value. Only applicable in version 2 tags)

BLSP1_BLSP_QUP0_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
19:16	OUTPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_DECODE_STATE (DECODE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_SEND_STATE (SEND_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_NOP_STATE (NOP_STATE value. Applies for both version 1 and version 2 tags) 0x6: V1_V2_INVALID_STATE (INVALID_STATE value. Applies for both version 1 and version 2 tags) 0x7: V1_PEEK_STATE (PEEK_STATE value. Only applicable in version 1 tags) 0x8: V1_SEND_R_STATE (SEND_R_STATE value. Only applicable in version 1 tags) 0xB: V2_GET_BYTE_STATE (GET_BYTE_STATE value. Only applicable in version 2 tags) 0xC: V2_GET_WRITE_BYTE_STATE (GET_WRITE_BYTE_STATE value. Only applicable in version 2 tags) 0xD: V2_SPECIALITY_STATE (SPECIALITY_STATE value. Only applicable in version 2 tags) 0xE: V2_WAIT_FLUSH_STOP_STATE (WAIT_FLUSH_STOP_STATE value. Only applicable in version 2 tags) 0xF: V2_STOP_STATE (STOP_STATE value. Only applicable in version 2 tags)
15:13	CLK_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Internal use only 0x0: RESET_BUSIDLE_STATE (RESET_BUSIDLE_STATE) 0x1: NOT_MASTER_STATE (NOT_MASTER_STATE) 0x2: HIGH_STATE (HIGH_STATE) 0x3: LOW_STATE (LOW_STATE) 0x4: HIGH_WAIT_STATE (HIGH_WAIT_STATE) 0x5: FORCED_LOW_STATE (FORCED_LOW_STATE) 0x6: HS_ADDR_LOW_STATE (HS_ADDR_LOW_STATE) 0x7: DOUBLE_BUFFER_WAIT_STATE (DOUBLE_BUFFER_WAIT_STATE)

BLSP1_BLSP_QUP0_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
12:10	DATA_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Internal use only 0x0: RESET_WAIT_STATE (RESET_WAIT_STATE) 0x1: TX_ADDR_STATE (TX_ADDR_STATE) 0x2: TX_DATA_STATE (TX_DATA_STATE) 0x3: TX_HS_ADDR_STATE (TX_HS_ADDR_STATE) 0x4: TX_10_BIT_ADDR_STATE (TX_10_BIT_ADDR_STATE) 0x5: TX_2ND_BYTE_STATE (TX_2ND_BYTE_STATE) 0x6: RX_DATA_STATE (RX_DATA_STATE) 0x7: RX_NACK_HOLD_STATE (RX_NACK_HOLD_STATE)
9	BUS_MASTER	R	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	R	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	RW	Interrupt source. This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	RW	Interrupt source. This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.
4	ARB_LOST	RW	Interrupt source. This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.

BLSP1_BLSP_QUP0_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
3	PACKET_NACKED	RW	Interrupt source. This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	RW	Interrupt source. This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1	TRANSFER_CANCEL_DONE	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
0	TRANSFER_CANCEL_ID_MATCH	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.

0x078B5408 BLSP1_BLSP_QUP0_I2C_MASTER_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_I2C_MASTER_CONFIG**

Bits	Name	Description
0	EN_VERSION_TWO_TAG	When set, version 2 of the mini-core is enabled.

0x078B540C BLSP1_BLSP_QUP0_I2C_MASTER_BUS_CLEAR**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP0_I2C_MASTER_BUS_CLEAR

Bits	Name	Description
0	CLEAR	This command should be given only when the i2c mincore is idle. When in doubt SW can use SW_RESET to reset the minicore. When set, an I2C 'Bus Clear' executed per the I2C standard. A bus clear consists of nine I2C clock ticks with data wire left not-driven. Has the effect of clearing any slave which has lost read sync. After the clear is complete, the hardware sets the CLEAR bit to zero. The bit can not be cleared by software. After a bus clear, both clock and data lines should be high. If not, an external slave has hung the bus by holding down one or both lines. Reset the slave to clear if possible. Any slave reset mechanism is beyond the scope of the I2C mini core.

0x078B5410 BLSP1_BLSP_QUP0_I2C_MASTER_LOCAL_ID**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_I2C_MASTER_LOCAL_ID**

Bits	Name	Description
7:0	LOCAL_ID	Read only value capturing the ID byte of the last NOP LOCAL tag. Only applicable when using V2 tags

0x078B5414 BLSP1_BLSP_QUP0_I2C_MASTER_COMMAND**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP0_I2C_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command in case the transfer was flushed (QUP_STATE[I2C_FLUSH] was set) due to I2C NACK.

20.5 BLSP1_BLSP_QUP1_QUP

0x078B6000 BLSP1_BLSP_QUP1_QUP_CONFIG

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

o N equals 8 or less - shift 24

o N equals 16 to 9 - shift 16

o N equals 24 to 17 - shift 8

o N equals 32 to 25 - no shift

BLSP1_BLSP_QUP1_QUP_CONFIG

Bits	Name	Description
16	EN_EXT_OUT_FLAG	Enable Extended OUTPUT/INPUT_SERVICE_FLAG interrupt generation. When this bit is set, the behavior of the *_SERVICE_FLAG and MAX_OUTPUT_DONE_FLAG changes. Service flag and the done flag are not set till the last SPI or I2C transfer has completed. a) For SPI: 1. The shifting needs to complete 2. Clock stopped if CLK_ALWAYS_ON=0, 3. CS, if used, de-asserted b) For I2C, 1. The ACK needs to complete 2. STOP condition done generated (Attention need to be put in synchronizing the last transaction with STOP tag) 3. clock and data wires return to high condition When this bit is clear, the legacy behavior is applicable. Under legacy, the DONE_FLAG is set when: 1. MX_*_COUNT is reached 2. The output FIFO is empty 3. Last bit was sent on the link Under legacy, the flag interrupt is generated before the last transfer is complete on the external interface.
15	CORE_EXTRA_CLK_ON_EN	Enable additional transfer based qup_core_clk gating for power save. When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on.

BLSP1_BLSP_QUP1_QUP_CONFIG (cont.)

Bits	Name	Description
14	FIFO_CLK_GATE_EN	When set to 0, fifo clock is mostly on - legacy mode. When set to 1, fifo clock is turned off dynamically.
13	CORE_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
12	APP_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
11:8	MINI_CORE	value: 0000 null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 reserved value: 0100 reserved value: 0101 reserved value: 0110 reserved value: 0111 reserved See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a 'don't care'. The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS#_N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	QUP_HREADY_CTRL	When set to 0, qup wil not stall the AHB bus (legacy mode). When set to 1, qup may stall the AHB bus until register access is done.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x078B6004 BLSP1_BLSP_QUP1_QUP_STATE**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000001C

BLSP1_BLSP_QUP1_QUP_STATE

Bits	Name	Type	Description
6	I2C_FLUSH	RW	Flushing an i2c transfer requires using version 2 tags. FLUSH should be used in BAM mode only. Setting this bit to 1 will flush all tags and tag related data besides EOT until FLUSH STOP tag is encountered. Setting this bit to 0 has no impact. Reading this bit returns the flush operation status - 0 = ongoing, 1 = done.
5	WAIT_FOR_EOT	RW	Only applicable when moving to RUN_STATE using command descriptor in SPI mode with NO_OUTPUT. Setting this bit to 1 will stall the done_toggle_com indication until basi_trans_end_pro is asserted. This will prevent the next command descriptor to start prematurely.
4	I2C_MAST_GEN	R	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	R	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	R	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.
1:0	STATE	RW	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to '01', the mini-core and related logic is released from reset and enters the RUN_STATE. When set to '11', the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete.

0x078B6008 BLSP1_BLSP_QUP1_QUP_IO_MODES**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000A5

Unless otherwise stated, register bits written return the value when read.

Notes:

a. 'Packing' occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. 'Un-Packing' occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

c. INPUT_MODE and OUTPUT_MODE should be both in BAM_Mode or both in non BAM_Mode.

BLSP1_BLSP_QUP1_QUP_IO_MODES

Bits	Name	Type	Description
16	OUTPUT_BIT_SHIFT_EN	RW	If set, enables the QUP output FIFO block to do bit shifting on the output data.
15	PACK_EN	RW	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	RW	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	R	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE

BLSP1_BLSP_QUP1_QUP_IO_MODES (cont.)

Bits	Name	Type	Description
1:0	OUTPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x078B600C BLSP1_BLSP_QUP1_QUP_SW_RESET**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero. The AHB clock domain reset will stay asserted until either the spi_clk or i2c_clk domains are reset. It is prohibited to write to any QUP register during this period and failing to do so will cause an ERROR response on the AHB bus. In order to avoid this SW should poll the QUP_STATE[STATE_VALID] bit until it is asserted.

BLSP1_BLSP_QUP1_QUP_SW_RESET

Bits	Name	Description
31:0	QUP_SW_RESET	

0x078B6014 BLSP1_BLSP_QUP1_QUP_TRANSFER_CANCEL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_QUP_TRANSFER_CANCEL**

Bits	Name	Type	Description
15:8	TRANSFER_CANCEL_ID	RW	This field include the id of the transfer that is scheduled for cancellation. This field is valid when asserting TRANSFER_CANCEL bit. A value of 0xFF will cancel the current transfer regardless of its LOCAL_ID. Canceling an i2c transfer requires using version 2 tags.
7	TRANSFER_CANCEL	W	Setting this bit to 1 will cause the HW to go to pause_state when the LOCAL_ID = TRANSFER_CANCEL_ID. This would allow flushing the rest of the transfer in order to implement cancel API. Canceling an i2c transfer requires using version 2 tags.

0x078B6018 BLSP1_BLSP_QUP1_QUP_OPERATIONAL**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000C0

Refer to the chapter on 'QUP Software Considerations' regarding the correct interpretation of the various service interrupts generated by QUP and their relation to these register bits.

BLSP1_BLSP_QUP1_QUP_OPERATIONAL

Bits	Name	Description
15	NWD	Notify When Done (NWD). Read only status bit which when set indicates a NWD acknowledgement is outstanding. This bit is set by QUP hardware when NWD is signaled from BAM. This bit is cleared by QUP hardware when the NWD request is acknowledged by assertion of done_toggle. This bit is always unconditionally cleared in RESET_STATE.
14	DONE_TOGGLE	Read only status bit which provides the current state of the side-band done_toggle signal sent to BAM. At each NWD acknowledgement, this bit toggles.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Bam_Mode (for debug only).
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Bam_Mode (for debug only).
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.

BLSP1_BLSP_QUP1_QUP_OPERATIONAL (cont.)

Bits	Name	Description
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.

0x078B601C BLSP1_BLSP_QUP1_QUP_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP1_QUP_ERROR_FLAGS

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ERR	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.

0x078B6020 BLSP1_BLSP_QUP1_QUP_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000003C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP1_QUP_ERROR_FLAGS_EN

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR_EN	If set, enables output over run error generation.
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.

0x078B6028 BLSP1_BLSP_QUP1_QUP_OPERATIONAL_MASK**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register masks several QUP_OPERATIONAL flags from creating an interrupt .

BLSP1_BLSP_QUP1_QUP_OPERATIONAL_MASK

Bits	Name	Description
9	INPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.
8	OUTPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.

0x078B6100 BLSP1_BLSP_QUP1_QUP_MX_OUTPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not effect the count.

Notes:

- a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

BLSP1_BLSP_QUP1_QUP_MX_OUTPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_OUTPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_OUTPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_OUTPUT_COUNT	RW	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x078B6104 BLSP1_BLSP_QUP1_QUP_MX_OUTPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_QUP_MX_OUTPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x078B610C BLSP1_BLSP_QUP1_QUP_OUTPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP1_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	OUTPUT_FIFO_WORD_COUNT	Number of words in the output FIFO.

**0x078B6110+ BLSP1_BLSP_QUP1_QUP_OUTPUT_FIFOc, c=[0..15]
0x4*c****Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

BLSP1_BLSP_QUP1_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x078B6150 BLSP1_BLSP_QUP1_QUP_MX_WRITE_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

BLSP1_BLSP_QUP1_QUP_MX_WRITE_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_WRITE_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_WRITE_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_WRITE_COUNT	RW	The number of 'writes' of size N. This is used only if the core is in FIFO_Mode.

0x078B6154 BLSP1_BLSP_QUP1_QUP_MX_WRITE_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_QUP_MX_WRITE_CNT_CURRENT**

Bits	Name	Description
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

0x078B6200 BLSP1_BLSP_QUP1_QUP_MX_INPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Bam_Mode (for non-balanced SPI). The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

BLSP1_BLSP_QUP1_QUP_MX_INPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_INPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_INPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_INPUT_COUNT	RW	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x078B6204 BLSP1_BLSP_QUP1_QUP_MX_INPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_QUP_MX_INPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x078B6208 BLSP1_BLSP_QUP1_QUP_MX_READ_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

BLSP1_BLSP_QUP1_QUP_MX_READ_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_READ_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_READ_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_READ_COUNT	RW	The number of 'reads' of size N. This is used only if the core is in FIFO_Mode.

0x078B620C BLSP1_BLSP_QUP1_QUP_MX_READ_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP1_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x078B6214 BLSP1_BLSP_QUP1_QUP_INPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated. Hence, when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP1_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

**0x078B6218+ BLSP1_BLSP_QUP1_QUP_INPUT_FIFOc, c=[0..15]
0x4*c****Type:** R**Clock:** crif_clk**Reset State:** Undefined

Consecutive reads to this address reads the input FIFO contents on a FIFO basis. The max address to read the input FIFO is 0x254.

BLSP1_BLSP_QUP1_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

0x078B6300 BLSP1_BLSP_QUP1_SPI_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

BLSP1_BLSP_QUP1_SPI_CONFIG

Bits	Name	Type	Description
10	HS_MODE	RW	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	RW	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	RW	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
5	SLAVE_OPERATION	R	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.

0x078B6304 BLSP1_BLSP_QUP1_SPI_IO_CONTROL

Type: RW

Clock: crif_clk

Reset State: 0x00000000

The contents of this register should only be changed when in the RESET_STATE.

Unless otherwise stated, register bits written return the value when read.

BLSP1_BLSP_QUP1_SPI_IO_CONTROL

Bits	Name	Description
11	FORCE_CS	When this bit is set, the chip select is asserted unconditionally with no relationship to QUP_STATE or transaction state.
10	CLK_IDLE_HIGH	When set to 1, spi_clk will be high when spi is idle (spi_cs is not asserted). When cleared to 0, spi_clk will be low when spi is idle (spi_cs is not asserted).
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS#_N respectively. Setting any of this bit to '1', makes the associated SPI_CS#_N active HIGH. This field is a 'don't care' in SLAVE operation.

BLSP1_BLSP_QUP1_SPI_IO_CONTROL (cont.)

Bits	Name	Description
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_#N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a 'don't care' in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS#_N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS#_N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x078B6308 BLSP1_BLSP_QUP1_SPI_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP1_SPI_ERROR_FLAGS

Bits	Name	Description
3	TRANSFER_CANCEL_DONE	This bit is set (1) when the SPI controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
2	TRANSFER_CANCEL_ID_MATCH	This bit is set (1) when the SPI controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x078B630C BLSP1_BLSP_QUP1_SPI_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000000C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP1_SPI_ERROR_FLAGS_EN

Bits	Name	Description
3	TRANSFER_CANCEL_DONE_EN	If set, enables generating the transfer cancel done indication.
2	TRANSFER_CANCEL_ID_MATCH_EN	If set, enables generating the transfer cancel ID match indication.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x078B6310 BLSP1_BLSP_QUP1_SPI_DEASSERT_WAIT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the de-assertion wait time of SPI_CS#_N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

BLSP1_BLSP_QUP1_SPI_DEASSERT_WAIT

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the deasserted time of SPI_CS#_N. Only applies to MASTER operation. For SLAVE operation, this field is a 'don't care'. A value of zero indicates SPI_CS#_N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

0x078B6314 BLSP1_BLSP_QUP1_SPI_MASTER_LOCAL_ID**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_SPI_MASTER_LOCAL_ID**

Bits	Name	Description
15:8	EXTENDED_ID	SW may use this field to specify the current sub-transfer ID to be read when TRANSFER_CANCEL_ID_MATCH is asserted. This value has no impact on HW.
7:0	LOCAL_ID	SW specifies the current transfer ID. HW will use this value to match with TRANSFER_CANCEL_ID.

0x078B6318 BLSP1_BLSP_QUP1_SPI_MASTER_COMMAND**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_SPI_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command.

0x078B631C BLSP1_BLSP_QUP1_SPI_MASTER_STATUS**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_SPI_MASTER_STATUS**

Bits	Name	Description
2:0	CANCEL_FSM_STATE	This 3-bit field informs the microprocessor of the state of the SPI cancel logic. Internal use only

0x078B6400 BLSP1_BLSP_QUP1_I2C_MASTER_CLK_CTL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The I2C_CLK_CTL register is a read/write register that controls clock divider values.

BLSP1_BLSP_QUP1_I2C_MASTER_CLK_CTL

Bits	Name	Description
28	SCL_EXT_FORCE_LOW	When set to 0, SCL generation maintains legacy behavior. When set to 1, SCL state machine will go to the FORCED_LOW_STATE if force_low is asserted near (within 5 SCL cycles = $5 * 52\text{ns} = 260\text{ns} \approx \text{MAX}(\text{Tsu}, \text{DAT})$) the clock edge.
27:26	SDA_NOISE_REJECTION	Allows adding extra sampling levels on SDA to reject short low pulses. This value specifies how many TCXO cycles of logic low on SDA would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
25:24	SCL_NOISE_REJECTION	Allows adding extra sampling levels on SCL to reject short low pulses. This value specifies how many TCXO cycles of logic low on SCL would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
23:16	HIGH_TIME_DIVIDER_VALUE	Allows setting SCL duty cycle to non 50%. If this value is zero then legacy mode is used. If this value is non-zero then it will be used as the SCL high time counter and FS_DIVIDER_VALUE will be used as the low time counter. Minimum value is 0x7.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. Minimum value is 0x3. $\text{I2C_HS_CLK} = \text{I2C_CLK} / (3 * (\text{HS_DIVIDER_VALUE} + 1) + 2)$
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. Minimum value is 0x7. When HIGH_TIME_DIVIDER_VALUE=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (2 * (\text{FS_DIVIDER_VALUE} + 3))$ When HIGH_TIME_DIVIDER_VALUE!=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (\text{FS_DIVIDER_VALUE} + \text{HIGH_TIME_DIVIDER_VALUE} + 6)$

0x078B6404 BLSP1_BLSP_QUP1_I2C_MASTER_STATUS**Type:** RW**Clock:** crif_clk**Reset State:** 0x0C000000

The I2C_STATUS is a status register. Writing any value clears the status bits.

BLSP1_BLSP_QUP1_I2C_MASTER_STATUS

Bits	Name	Type	Description
30:28	CANCEL_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C cancel logic. Internal use only 0x0: IDLE_STATE (IDLE_STATE) 0x1: CANCEL_PENDING_STATE (CANCEL_PENDING_STATE) 0x2: PAUSE_STATE (PAUSE_STATE) 0x3: PAUSE_WAIT_STATE (PAUSE_WAIT_STATE) 0x4: SEND_STOP_STATE (SEND_STOP_STATE) 0x5: FLUSH_STATE (FLUSH_STATE) 0x6: SEND_IRQ_STATE (SEND_IRQ_STATE)
27	I2C_SCL	R	Logic state of I2C bus serial clock wire.
26	I2C_SDA	R	Logic state of I2C bus serial data wire.
25	INVALID_READ_SEQ	RW	Interrupt source. This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	RW	Interrupt source. In version 1 tags this bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address). In version 2 tags this bit is set (1) when the I2C controller is trying to access a non-existent I2C slave (address).
23	INVALID_TAG	RW	Interrupt source. This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_READ_LAST_BYTE_STATE (READ_LAST_BYTE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_DEC_STATE (DEC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_STORE_STATE (STORE_STATE value. Applies for both version 1 and version 2 tags) 0x6: V2_WR_TAG_STATE (WR_TAG_STATE value. Only applicable in version 2 tags) 0x7: V2_WAIT_TAG_STATE (WAIT_TAG_STATE value. Only applicable in version 2 tags)

BLSP1_BLSP_QUP1_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
19:16	OUTPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_DECODE_STATE (DECODE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_SEND_STATE (SEND_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_NOP_STATE (NOP_STATE value. Applies for both version 1 and version 2 tags) 0x6: V1_V2_INVALID_STATE (INVALID_STATE value. Applies for both version 1 and version 2 tags) 0x7: V1_PEEK_STATE (PEEK_STATE value. Only applicable in version 1 tags) 0x8: V1_SEND_R_STATE (SEND_R_STATE value. Only applicable in version 1 tags) 0xB: V2_GET_BYTE_STATE (GET_BYTE_STATE value. Only applicable in version 2 tags) 0xC: V2_GET_WRITE_BYTE_STATE (GET_WRITE_BYTE_STATE value. Only applicable in version 2 tags) 0xD: V2_SPECIALITY_STATE (SPECIALITY_STATE value. Only applicable in version 2 tags) 0xE: V2_WAIT_FLUSH_STOP_STATE (WAIT_FLUSH_STOP_STATE value. Only applicable in version 2 tags) 0xF: V2_STOP_STATE (STOP_STATE value. Only applicable in version 2 tags)
15:13	CLK_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Internal use only 0x0: RESET_BUSIDLE_STATE (RESET_BUSIDLE_STATE) 0x1: NOT_MASTER_STATE (NOT_MASTER_STATE) 0x2: HIGH_STATE (HIGH_STATE) 0x3: LOW_STATE (LOW_STATE) 0x4: HIGH_WAIT_STATE (HIGH_WAIT_STATE) 0x5: FORCED_LOW_STATE (FORCED_LOW_STATE) 0x6: HS_ADDR_LOW_STATE (HS_ADDR_LOW_STATE) 0x7: DOUBLE_BUFFER_WAIT_STATE (DOUBLE_BUFFER_WAIT_STATE)

BLSP1_BLSP_QUP1_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
12:10	DATA_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Internal use only 0x0: RESET_WAIT_STATE (RESET_WAIT_STATE) 0x1: TX_ADDR_STATE (TX_ADDR_STATE) 0x2: TX_DATA_STATE (TX_DATA_STATE) 0x3: TX_HS_ADDR_STATE (TX_HS_ADDR_STATE) 0x4: TX_10_BIT_ADDR_STATE (TX_10_BIT_ADDR_STATE) 0x5: TX_2ND_BYTE_STATE (TX_2ND_BYTE_STATE) 0x6: RX_DATA_STATE (RX_DATA_STATE) 0x7: RX_NACK_HOLD_STATE (RX_NACK_HOLD_STATE)
9	BUS_MASTER	R	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	R	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	RW	Interrupt source. This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	RW	Interrupt source. This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.
4	ARB_LOST	RW	Interrupt source. This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.

BLSP1_BLSP_QUP1_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
3	PACKET_NACKED	RW	Interrupt source. This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	RW	Interrupt source. This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1	TRANSFER_CANCEL_DONE	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
0	TRANSFER_CANCEL_ID_MATCH	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.

0x078B6408 BLSP1_BLSP_QUP1_I2C_MASTER_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_I2C_MASTER_CONFIG**

Bits	Name	Description
0	EN_VERSION_TWO_TAG	When set, version 2 of the mini-core is enabled.

0x078B640C BLSP1_BLSP_QUP1_I2C_MASTER_BUS_CLEAR**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP1_I2C_MASTER_BUS_CLEAR

Bits	Name	Description
0	CLEAR	This command should be given only when the i2c mincore is idle. When in doubt SW can use SW_RESET to reset the minicore. When set, an I2C 'Bus Clear' executed per the I2C standard. A bus clear consists of nine I2C clock ticks with data wire left not-driven. Has the effect of clearing any slave which has lost read sync. After the clear is complete, the hardware sets the CLEAR bit to zero. The bit can not be cleared by software. After a bus clear, both clock and data lines should be high. If not, an external slave has hung the bus by holding down one or both lines. Reset the slave to clear if possible. Any slave reset mechanism is beyond the scope of the I2C mini core.

0x078B6410 BLSP1_BLSP_QUP1_I2C_MASTER_LOCAL_ID**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_I2C_MASTER_LOCAL_ID**

Bits	Name	Description
7:0	LOCAL_ID	Read only value capturing the ID byte of the last NOP LOCAL tag. Only applicable when using V2 tags

0x078B6414 BLSP1_BLSP_QUP1_I2C_MASTER_COMMAND**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP1_I2C_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command in case the transfer was flushed (QUP_STATE[I2C_FLUSH] was set) due to I2C NACK.

20.6 BLSP1_BLSP_QUP2_QUP

0x078B7000 BLSP1_BLSP_QUP2_QUP_CONFIG

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read.

a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).

b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:

o N equals 8 or less - shift 24

o N equals 16 to 9 - shift 16

o N equals 24 to 17 - shift 8

o N equals 32 to 25 - no shift

BLSP1_BLSP_QUP2_QUP_CONFIG

Bits	Name	Description
16	EN_EXT_OUT_FLAG	Enable Extended OUTPUT/INPUT_SERVICE_FLAG interrupt generation. When this bit is set, the behavior of the *_SERVICE_FLAG and MAX_OUTPUT_DONE_FLAG changes. Service flag and the done flag are not set till the last SPI or I2C transfer has completed. a) For SPI: 1. The shifting needs to complete 2. Clock stopped if CLK_ALWAYS_ON=0, 3. CS, if used, de-asserted b) For I2C, 1. The ACK needs to complete 2. STOP condition done generated (Attention need to be put in synchronizing the last transaction with STOP tag) 3. clock and data wires return to high condition When this bit is clear, the legacy behavior is applicable. Under legacy, the DONE_FLAG is set when: 1. MX_*_COUNT is reached 2. The output FIFO is empty 3. Last bit was sent on the link Under legacy, the flag interrupt is generated before the last transfer is complete on the external interface.
15	CORE_EXTRA_CLK_ON_EN	Enable additional transfer based qup_core_clk gating for power save. When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on.

BLSP1_BLSP_QUP2_QUP_CONFIG (cont.)

Bits	Name	Description
14	FIFO_CLK_GATE_EN	When set to 0, fifo clock is mostly on - legacy mode. When set to 1, fifo clock is turned off dynamically.
13	CORE_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
12	APP_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
11:8	MINI_CORE	value: 0000 null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 reserved value: 0100 reserved value: 0101 reserved value: 0110 reserved value: 0111 reserved See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a 'don't care'. The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS#_N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	QUP_HREADY_CTRL	When set to 0, qup wil not stall the AHB bus (legacy mode). When set to 1, qup may stall the AHB bus until register access is done.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x078B7004 BLSP1_BLSP_QUP2_QUP_STATE**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000001C

BLSP1_BLSP_QUP2_QUP_STATE

Bits	Name	Type	Description
6	I2C_FLUSH	RW	Flushing an i2c transfer requires using version 2 tags. FLUSH should be used in BAM mode only. Setting this bit to 1 will flush all tags and tag related data besides EOT until FLUSH STOP tag is encountered. Setting this bit to 0 has no impact. Reading this bit returns the flush operation status - 0 = ongoing, 1 = done.
5	WAIT_FOR_EOT	RW	Only applicable when moving to RUN_STATE using command descriptor in SPI mode with NO_OUTPUT. Setting this bit to 1 will stall the done_toggle_com indication until basi_trans_end_pro is asserted. This will prevent the next command descriptor to start prematurely.
4	I2C_MAST_GEN	R	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	R	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	R	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.
1:0	STATE	RW	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to '01', the mini-core and related logic is released from reset and enters the RUN_STATE. When set to '11', the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete.

0x078B7008 BLSP1_BLSP_QUP2_QUP_IO_MODES**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000A5

Unless otherwise stated, register bits written return the value when read.

Notes:

a. 'Packing' occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. 'Un-Packing' occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

c. INPUT_MODE and OUTPUT_MODE should be both in BAM_Mode or both in non BAM_Mode.

BLSP1_BLSP_QUP2_QUP_IO_MODES

Bits	Name	Type	Description
16	OUTPUT_BIT_SHIFT_EN	RW	If set, enables the QUP output FIFO block to do bit shifting on the output data.
15	PACK_EN	RW	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	RW	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	R	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE

BLSP1_BLSP_QUP2_QUP_IO_MODES (cont.)

Bits	Name	Type	Description
1:0	OUTPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x078B700C BLSP1_BLSP_QUP2_QUP_SW_RESET**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero. The AHB clock domain reset will stay asserted until either the spi_clk or i2c_clk domains are reset. It is prohibited to write to any QUP register during this period and failing to do so will cause an ERROR response on the AHB bus. In order to avoid this SW should poll the QUP_STATE[STATE_VALID] bit until it is asserted.

BLSP1_BLSP_QUP2_QUP_SW_RESET

Bits	Name	Description
31:0	QUP_SW_RESET	

0x078B7014 BLSP1_BLSP_QUP2_QUP_TRANSFER_CANCEL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_QUP_TRANSFER_CANCEL**

Bits	Name	Type	Description
15:8	TRANSFER_CANCEL_ID	RW	This field include the id of the transfer that is scheduled for cancellation. This field is valid when asserting TRANSFER_CANCEL bit. A value of 0xFF will cancel the current transfer regardless of its LOCAL_ID. Canceling an i2c transfer requires using version 2 tags.
7	TRANSFER_CANCEL	W	Setting this bit to 1 will cause the HW to go to pause_state when the LOCAL_ID = TRANSFER_CANCEL_ID. This would allow flushing the rest of the transfer in order to implement cancel API. Canceling an i2c transfer requires using version 2 tags.

0x078B7018 BLSP1_BLSP_QUP2_QUP_OPERATIONAL**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000C0

Refer to the chapter on 'QUP Software Considerations' regarding the correct interpretation of the various service interrupts generated by QUP and their relation to these register bits.

BLSP1_BLSP_QUP2_QUP_OPERATIONAL

Bits	Name	Description
15	NWD	Notify When Done (NWD). Read only status bit which when set indicates a NWD acknowledgement is outstanding. This bit is set by QUP hardware when NWD is signaled from BAM. This bit is cleared by QUP hardware when the NWD request is acknowledged by assertion of done_toggle. This bit is always unconditionally cleared in RESET_STATE.
14	DONE_TOGGLE	Read only status bit which provides the current state of the side-band done_toggle signal sent to BAM. At each NWD acknowledgement, this bit toggles.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Bam_Mode (for debug only).
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Bam_Mode (for debug only).
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.

BLSP1_BLSP_QUP2_QUP_OPERATIONAL (cont.)

Bits	Name	Description
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.

0x078B701C BLSP1_BLSP_QUP2_QUP_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP2_QUP_ERROR_FLAGS

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ERR	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.

0x078B7020 BLSP1_BLSP_QUP2_QUP_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000003C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP2_QUP_ERROR_FLAGS_EN

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR_EN	If set, enables output over run error generation.
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.

0x078B7028 BLSP1_BLSP_QUP2_QUP_OPERATIONAL_MASK**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register masks several QUP_OPERATIONAL flags from creating an interrupt .

BLSP1_BLSP_QUP2_QUP_OPERATIONAL_MASK

Bits	Name	Description
9	INPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.
8	OUTPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.

0x078B7100 BLSP1_BLSP_QUP2_QUP_MX_OUTPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not effect the count.

Notes:

- a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

BLSP1_BLSP_QUP2_QUP_MX_OUTPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_OUTPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_OUTPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_OUTPUT_COUNT	RW	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x078B7104 BLSP1_BLSP_QUP2_QUP_MX_OUTPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_QUP_MX_OUTPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x078B710C BLSP1_BLSP_QUP2_QUP_OUTPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP2_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	OUTPUT_FIFO_WORD_COUNT	Number of words in the output FIFO.

**0x078B7110+ BLSP1_BLSP_QUP2_QUP_OUTPUT_FIFOc, c=[0..15]
0x4*c****Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

BLSP1_BLSP_QUP2_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x078B7150 BLSP1_BLSP_QUP2_QUP_MX_WRITE_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

BLSP1_BLSP_QUP2_QUP_MX_WRITE_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_WRITE_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_WRITE_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_WRITE_COUNT	RW	The number of 'writes' of size N. This is used only if the core is in FIFO_Mode.

0x078B7154 BLSP1_BLSP_QUP2_QUP_MX_WRITE_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_QUP_MX_WRITE_CNT_CURRENT**

Bits	Name	Description
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

0x078B7200 BLSP1_BLSP_QUP2_QUP_MX_INPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Bam_Mode (for non-balanced SPI). The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE do not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

BLSP1_BLSP_QUP2_QUP_MX_INPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_INPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_INPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_INPUT_COUNT	RW	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x078B7204 BLSP1_BLSP_QUP2_QUP_MX_INPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_QUP_MX_INPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x078B7208 BLSP1_BLSP_QUP2_QUP_MX_READ_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

BLSP1_BLSP_QUP2_QUP_MX_READ_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_READ_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_READ_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_READ_COUNT	RW	The number of 'reads' of size N. This is used only if the core is in FIFO_Mode.

0x078B720C BLSP1_BLSP_QUP2_QUP_MX_READ_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP2_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x078B7214 BLSP1_BLSP_QUP2_QUP_INPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated. Hence, when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP2_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

**0x078B7218+ BLSP1_BLSP_QUP2_QUP_INPUT_FIFOc, c=[0..15]
0x4*c****Type:** R**Clock:** crif_clk**Reset State:** Undefined

Consecutive reads to this address reads the input FIFO contents on a FIFO basis. The max address to read the input FIFO is 0x254.

BLSP1_BLSP_QUP2_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

0x078B7300 BLSP1_BLSP_QUP2_SPI_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

BLSP1_BLSP_QUP2_SPI_CONFIG

Bits	Name	Type	Description
10	HS_MODE	RW	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	RW	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	RW	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
5	SLAVE_OPERATION	R	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.

0x078B7304 BLSP1_BLSP_QUP2_SPI_IO_CONTROL

Type: RW

Clock: crif_clk

Reset State: 0x00000000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

BLSP1_BLSP_QUP2_SPI_IO_CONTROL

Bits	Name	Description
11	FORCE_CS	When this bit is set, the chip select is asserted unconditionally with no relationship to QUP_STATE or transaction state.
10	CLK_IDLE_HIGH	When set to 1, spi_clk will be high when spi is idle (spi_cs is not asserted). When cleared to 0, spi_clk will be low when spi is idle (spi_cs is not asserted).
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.

BLSP1_BLSP_QUP2_SPI_IO_CONTROL (cont.)

Bits	Name	Description
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS#_N respectively. Setting any of this bit to '1', makes the associated SPI_CS#_N active HIGH. This field is a 'don't care' in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_#N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a 'don't care' in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS#_N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS#_N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x078B7308 BLSP1_BLSP_QUP2_SPI_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP2_SPI_ERROR_FLAGS

Bits	Name	Description
3	TRANSFER_CANCEL_DONE	This bit is set (1) when the SPI controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
2	TRANSFER_CANCEL_ID_MATCH	This bit is set (1) when the SPI controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x078B730C BLSP1_BLSP_QUP2_SPI_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000000C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP2_SPI_ERROR_FLAGS_EN

Bits	Name	Description
3	TRANSFER_CANCEL_DONE_EN	If set, enables generating the transfer cancel done indication.
2	TRANSFER_CANCEL_ID_MATCH_EN	If set, enables generating the transfer cancel ID match indication.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x078B7310 BLSP1_BLSP_QUP2_SPI_DEASSERT_WAIT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the de-assertion wait time of SPI_CS#_N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

BLSP1_BLSP_QUP2_SPI_DEASSERT_WAIT

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the deasserted time of SPI_CS#_N. Only applies to MASTER operation. For SLAVE operation, this field is a 'don't care'. A value of zero indicates SPI_CS#_N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

0x078B7314 BLSP1_BLSP_QUP2_SPI_MASTER_LOCAL_ID**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_SPI_MASTER_LOCAL_ID**

Bits	Name	Description
15:8	EXTENDED_ID	SW may use this field to specify the current sub-transfer ID to be read when TRANSFER_CANCEL_ID_MATCH is asserted. This value has no impact on HW.
7:0	LOCAL_ID	SW specifies the current transfer ID. HW will use this value to match with TRANSFER_CANCEL_ID.

0x078B7318 BLSP1_BLSP_QUP2_SPI_MASTER_COMMAND**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_SPI_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command.

0x078B731C BLSP1_BLSP_QUP2_SPI_MASTER_STATUS**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_SPI_MASTER_STATUS**

Bits	Name	Description
2:0	CANCEL_FSM_STATE	This 3-bit field informs the microprocessor of the state of the SPI cancel logic. Internal use only

0x078B7400 BLSP1_BLSP_QUP2_I2C_MASTER_CLK_CTL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The I2C_CLK_CTL register is a read/write register that controls clock divider values.

BLSP1_BLSP_QUP2_I2C_MASTER_CLK_CTL

Bits	Name	Description
28	SCL_EXT_FORCE_LOW	When set to 0, SCL generation maintains legacy behavior. When set to 1, SCL state machine will go to the FORCED_LOW_STATE if force_low is asserted near (within 5 SCL clock cycles = $5 * 52\text{ns} = 260\text{ns} \approx \text{MAX}(\text{Tsu}, \text{DAT})$) the clock edge.
27:26	SDA_NOISE_REJECTION	Allows adding extra sampling levels on SDA to reject short low pulses. This value specifies how many TCXO cycles of logic low on SDA would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
25:24	SCL_NOISE_REJECTION	Allows adding extra sampling levels on SCL to reject short low pulses. This value specifies how many TCXO cycles of logic low on SCL would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
23:16	HIGH_TIME_DIVIDER_VALUE	Allows setting SCL duty cycle to non 50%. If this value is zero then legacy mode is used. If this value is non-zero then it will be used as the SCL high time counter and FS_DIVIDER_VALUE will be used as the low time counter. Minimum value is 0x7.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. Minimum value is 0x3. $\text{I2C_HS_CLK} = \text{I2C_CLK} / (3 * (\text{HS_DIVIDER_VALUE} + 1) + 2)$
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. Minimum value is 0x7. When HIGH_TIME_DIVIDER_VALUE=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (2 * (\text{FS_DIVIDER_VALUE} + 3))$ When HIGH_TIME_DIVIDER_VALUE!=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (\text{FS_DIVIDER_VALUE} + \text{HIGH_TIME_DIVIDER_VALUE} + 6)$

0x078B7404 BLSP1_BLSP_QUP2_I2C_MASTER_STATUS**Type:** RW**Clock:** crif_clk**Reset State:** 0x0C000000

The I2C_STATUS is a status register. Writing any value clears the status bits.

BLSP1_BLSP_QUP2_I2C_MASTER_STATUS

Bits	Name	Type	Description
30:28	CANCEL_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C cancel logic. Internal use only 0x0: IDLE_STATE (IDLE_STATE) 0x1: CANCEL_PENDING_STATE (CANCEL_PENDING_STATE) 0x2: PAUSE_STATE (PAUSE_STATE) 0x3: PAUSE_WAIT_STATE (PAUSE_WAIT_STATE) 0x4: SEND_STOP_STATE (SEND_STOP_STATE) 0x5: FLUSH_STATE (FLUSH_STATE) 0x6: SEND_IRQ_STATE (SEND_IRQ_STATE)
27	I2C_SCL	R	Logic state of I2C bus serial clock wire.
26	I2C_SDA	R	Logic state of I2C bus serial data wire.
25	INVALID_READ_SEQ	RW	Interrupt source. This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	RW	Interrupt source. In version 1 tags this bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address). In version 2 tags this bit is set (1) when the I2C controller is trying to access a non-existent I2C slave (address).
23	INVALID_TAG	RW	Interrupt source. This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_READ_LAST_BYTE_STATE (READ_LAST_BYTE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_DEC_STATE (DEC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_STORE_STATE (STORE_STATE value. Applies for both version 1 and version 2 tags) 0x6: V2_WR_TAG_STATE (WR_TAG_STATE value. Only applicable in version 2 tags) 0x7: V2_WAIT_TAG_STATE (WAIT_TAG_STATE value. Only applicable in version 2 tags)

BLSP1_BLSP_QUP2_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
19:16	OUTPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_DECODE_STATE (DECODE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_SEND_STATE (SEND_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_NOP_STATE (NOP_STATE value. Applies for both version 1 and version 2 tags) 0x6: V1_V2_INVALID_STATE (INVALID_STATE value. Applies for both version 1 and version 2 tags) 0x7: V1_PEEK_STATE (PEEK_STATE value. Only applicable in version 1 tags) 0x8: V1_SEND_R_STATE (SEND_R_STATE value. Only applicable in version 1 tags) 0xB: V2_GET_BYTE_STATE (GET_BYTE_STATE value. Only applicable in version 2 tags) 0xC: V2_GET_WRITE_BYTE_STATE (GET_WRITE_BYTE_STATE value. Only applicable in version 2 tags) 0xD: V2_SPECIALITY_STATE (SPECIALITY_STATE value. Only applicable in version 2 tags) 0xE: V2_WAIT_FLUSH_STOP_STATE (WAIT_FLUSH_STOP_STATE value. Only applicable in version 2 tags) 0xF: V2_STOP_STATE (STOP_STATE value. Only applicable in version 2 tags)
15:13	CLK_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Internal use only 0x0: RESET_BUSIDLE_STATE (RESET_BUSIDLE_STATE) 0x1: NOT_MASTER_STATE (NOT_MASTER_STATE) 0x2: HIGH_STATE (HIGH_STATE) 0x3: LOW_STATE (LOW_STATE) 0x4: HIGH_WAIT_STATE (HIGH_WAIT_STATE) 0x5: FORCED_LOW_STATE (FORCED_LOW_STATE) 0x6: HS_ADDR_LOW_STATE (HS_ADDR_LOW_STATE) 0x7: DOUBLE_BUFFER_WAIT_STATE (DOUBLE_BUFFER_WAIT_STATE)

BLSP1_BLSP_QUP2_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
12:10	DATA_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Internal use only 0x0: RESET_WAIT_STATE (RESET_WAIT_STATE) 0x1: TX_ADDR_STATE (TX_ADDR_STATE) 0x2: TX_DATA_STATE (TX_DATA_STATE) 0x3: TX_HS_ADDR_STATE (TX_HS_ADDR_STATE) 0x4: TX_10_BIT_ADDR_STATE (TX_10_BIT_ADDR_STATE) 0x5: TX_2ND_BYTE_STATE (TX_2ND_BYTE_STATE) 0x6: RX_DATA_STATE (RX_DATA_STATE) 0x7: RX_NACK_HOLD_STATE (RX_NACK_HOLD_STATE)
9	BUS_MASTER	R	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	R	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	RW	Interrupt source. This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	RW	Interrupt source. This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.
4	ARB_LOST	RW	Interrupt source. This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.

BLSP1_BLSP_QUP2_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
3	PACKET_NACKED	RW	Interrupt source. This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	RW	Interrupt source. This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1	TRANSFER_CANCEL_DONE	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
0	TRANSFER_CANCEL_ID_MATCH	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.

0x078B7408 BLSP1_BLSP_QUP2_I2C_MASTER_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_I2C_MASTER_CONFIG**

Bits	Name	Description
0	EN_VERSION_TWO_TAG	When set, version 2 of the mini-core is enabled.

0x078B740C BLSP1_BLSP_QUP2_I2C_MASTER_BUS_CLEAR**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP2_I2C_MASTER_BUS_CLEAR

Bits	Name	Description
0	CLEAR	This command should be given only when the i2c mincore is idle. When in doubt SW can use SW_RESET to reset the minicore. When set, an I2C 'Bus Clear' executed per the I2C standard. A bus clear consists of nine I2C clock ticks with data wire left not-driven. Has the effect of clearing any slave which has lost read sync. After the clear is complete, the hardware sets the CLEAR bit to zero. The bit can not be cleared by software. After a bus clear, both clock and data lines should be high. If not, an external slave has hung the bus by holding down one or both lines. Reset the slave to clear if possible. Any slave reset mechanism is beyond the scope of the I2C mini core.

0x078B7410 BLSP1_BLSP_QUP2_I2C_MASTER_LOCAL_ID**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_I2C_MASTER_LOCAL_ID**

Bits	Name	Description
7:0	LOCAL_ID	Read only value capturing the ID byte of the last NOP LOCAL tag. Only applicable when using V2 tags

0x078B7414 BLSP1_BLSP_QUP2_I2C_MASTER_COMMAND**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP2_I2C_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command in case the transfer was flushed (QUP_STATE[I2C_FLUSH] was set) due to I2C NACK.

20.7 BLSP1_BLSP_QUP3_QUP

0x078B8000 BLSP1_BLSP_QUP3_QUP_CONFIG

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read.

- a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).
- b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:
 - o N equals 8 or less - shift 24
 - o N equals 16 to 9 - shift 16
 - o N equals 24 to 17 - shift 8
 - o N equals 32 to 25 - no shift

BLSP1_BLSP_QUP3_QUP_CONFIG

Bits	Name	Description
16	EN_EXT_OUT_FLAG	Enable Extended OUTPUT/INPUT_SERVICE_FLAG interrupt generation. When this bit is set, the behavior of the *_SERVICE_FLAG and MAX_OUTPUT_DONE_FLAG changes. Service flag and the done flag are not set till the last SPI or I2C transfer has completed. a) For SPI: 1. The shifting needs to complete 2. Clock stopped if CLK_ALWAYS_ON=0, 3. CS, if used, de-asserted b) For I2C, 1. The ACK needs to complete 2. STOP condition done generated (Attention need to be put in synchronizing the last transaction with STOP tag) 3. clock and data wires return to high condition When this bit is clear, the legacy behavior is applicable. Under legacy, the DONE_FLAG is set when: 1. MX_*_COUNT is reached 2. The output FIFO is empty 3. Last bit was sent on the link Under legacy, the flag interrupt is generated before the last transfer is complete on the external interface.
15	CORE_EXTRA_CLK_ON_EN	Enable additional transfer based qup_core_clk gating for power save. When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on.

BLSP1_BLSP_QUP3_QUP_CONFIG (cont.)

Bits	Name	Description
14	FIFO_CLK_GATE_EN	When set to 0, fifo clock is mostly on - legacy mode. When set to 1, fifo clock is turned off dynamically.
13	CORE_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
12	APP_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
11:8	MINI_CORE	value: 0000 null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 reserved value: 0100 reserved value: 0101 reserved value: 0110 reserved value: 0111 reserved See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a 'don't care'. The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS#_N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	QUP_HREADY_CTRL	When set to 0, qup wil not stall the AHB bus (legacy mode). When set to 1, qup may stall the AHB bus until register access is done.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x078B8004 BLSP1_BLSP_QUP3_QUP_STATE**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000001C

BLSP1_BLSP_QUP3_QUP_STATE

Bits	Name	Type	Description
6	I2C_FLUSH	RW	Flushing an i2c transfer requires using version 2 tags. FLUSH should be used in BAM mode only. Setting this bit to 1 will flush all tags and tag related data besides EOT until FLUSH STOP tag is encountered. Setting this bit to 0 has no impact. Reading this bit returns the flush operation status - 0 = ongoing, 1 = done.
5	WAIT_FOR_EOT	RW	Only applicable when moving to RUN_STATE using command descriptor in SPI mode with NO_OUTPUT. Setting this bit to 1 will stall the done_toggle_com indication until basi_trans_end_pro is asserted. This will prevent the next command descriptor to start prematurely.
4	I2C_MAST_GEN	R	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	R	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	R	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.
1:0	STATE	RW	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to '01', the mini-core and related logic is released from reset and enters the RUN_STATE. When set to '11', the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete.

0x078B8008 BLSP1_BLSP_QUP3_QUP_IO_MODES**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000A5

Unless otherwise stated, register bits written return the value when read.

Notes:

a. 'Packing' occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. 'Un-Packing' occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

c. INPUT_MODE and OUTPUT_MODE should be both in BAM_Mode or both in non BAM_Mode.

BLSP1_BLSP_QUP3_QUP_IO_MODES

Bits	Name	Type	Description
16	OUTPUT_BIT_SHIFT_EN	RW	If set, enables the QUP output FIFO block to do bit shifting on the output data.
15	PACK_EN	RW	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	RW	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	R	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE

BLSP1_BLSP_QUP3_QUP_IO_MODES (cont.)

Bits	Name	Type	Description
1:0	OUTPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x078B800C BLSP1_BLSP_QUP3_QUP_SW_RESET**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero. The AHB clock domain reset will stay asserted until either the spi_clk or i2c_clk domains are reset. It is prohibited to write to any QUP register during this period and failing to do so will cause an ERROR response on the AHB bus. In order to avoid this SW should poll the QUP_STATE[STATE_VALID] bit until it is asserted.

BLSP1_BLSP_QUP3_QUP_SW_RESET

Bits	Name	Description
31:0	QUP_SW_RESET	

0x078B8014 BLSP1_BLSP_QUP3_QUP_TRANSFER_CANCEL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_QUP_TRANSFER_CANCEL**

Bits	Name	Type	Description
15:8	TRANSFER_CANCEL_ID	RW	This field include the id of the transfer that is scheduled for cancellation. This field is valid when asserting TRANSFER_CANCEL bit. A value of 0xFF will cancel the current transfer regardless of its LOCAL_ID. Canceling an i2c transfer requires using version 2 tags.
7	TRANSFER_CANCEL	W	Setting this bit to 1 will cause the HW to go to pause_state when the LOCAL_ID = TRANSFER_CANCEL_ID. This would allow flushing the rest of the transfer in order to implement cancel API. Canceling an i2c transfer requires using version 2 tags.

0x078B8018 BLSP1_BLSP_QUP3_QUP_OPERATIONAL**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000C0

Refer to the chapter on 'QUP Software Considerations' regarding the correct interpretation of the various service interrupts generated by QUP and their relation to these register bits.

BLSP1_BLSP_QUP3_QUP_OPERATIONAL

Bits	Name	Description
15	NWD	Notify When Done (NWD). Read only status bit which when set indicates a NWD acknowledgement is outstanding. This bit is set by QUP hardware when NWD is signaled from BAM. This bit is cleared by QUP hardware when the NWD request is acknowledged by assertion of done_toggle. This bit is always unconditionally cleared in RESET_STATE.
14	DONE_TOGGLE	Read only status bit which provides the current state of the side-band done_toggle signal sent to BAM. At each NWD acknowledgement, this bit toggles.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Bam_Mode (for debug only).
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Bam_Mode (for debug only).
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.

BLSP1_BLSP_QUP3_QUP_OPERATIONAL (cont.)

Bits	Name	Description
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.

0x078B801C BLSP1_BLSP_QUP3_QUP_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP3_QUP_ERROR_FLAGS

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ERR	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.

0x078B8020 BLSP1_BLSP_QUP3_QUP_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000003C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP3_QUP_ERROR_FLAGS_EN

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR_EN	If set, enables output over run error generation.
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.

0x078B8028 BLSP1_BLSP_QUP3_QUP_OPERATIONAL_MASK**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register masks several QUP_OPERATIONAL flags from creating an interrupt .

BLSP1_BLSP_QUP3_QUP_OPERATIONAL_MASK

Bits	Name	Description
9	INPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.
8	OUTPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.

0x078B8100 BLSP1_BLSP_QUP3_QUP_MX_OUTPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not effect the count.

Notes:

- a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

BLSP1_BLSP_QUP3_QUP_MX_OUTPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_OUTPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_OUTPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_OUTPUT_COUNT	RW	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x078B8104 BLSP1_BLSP_QUP3_QUP_MX_OUTPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_QUP_MX_OUTPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x078B810C BLSP1_BLSP_QUP3_QUP_OUTPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP3_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	OUTPUT_FIFO_WORD_COUNT	Number of words in the output FIFO.

**0x078B8110+ BLSP1_BLSP_QUP3_QUP_OUTPUT_FIFOc, c=[0..15]
0x4*c****Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

BLSP1_BLSP_QUP3_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x078B8150 BLSP1_BLSP_QUP3_QUP_MX_WRITE_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

BLSP1_BLSP_QUP3_QUP_MX_WRITE_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_WRITE_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_WRITE_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_WRITE_COUNT	RW	The number of 'writes' of size N. This is used only if the core is in FIFO_Mode.

0x078B8154 BLSP1_BLSP_QUP3_QUP_MX_WRITE_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_QUP_MX_WRITE_CNT_CURRENT**

Bits	Name	Description
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

0x078B8200 BLSP1_BLSP_QUP3_QUP_MX_INPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Bam_Mode (for non-balanced SPI). The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

BLSP1_BLSP_QUP3_QUP_MX_INPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_INPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_INPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_INPUT_COUNT	RW	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x078B8204 BLSP1_BLSP_QUP3_QUP_MX_INPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_QUP_MX_INPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x078B8208 BLSP1_BLSP_QUP3_QUP_MX_READ_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

BLSP1_BLSP_QUP3_QUP_MX_READ_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_READ_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_READ_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_READ_COUNT	RW	The number of 'reads' of size N. This is used only if the core is in FIFO_Mode.

0x078B820C BLSP1_BLSP_QUP3_QUP_MX_READ_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP3_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x078B8214 BLSP1_BLSP_QUP3_QUP_INPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated. Hence, when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP3_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

**0x078B8218+ BLSP1_BLSP_QUP3_QUP_INPUT_FIFOc, c=[0..15]
0x4*c****Type:** R**Clock:** crif_clk**Reset State:** Undefined

Consecutive reads to this address reads the input FIFO contents on a FIFO basis. The max address to read the input FIFO is 0x254.

BLSP1_BLSP_QUP3_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

0x078B8300 BLSP1_BLSP_QUP3_SPI_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

BLSP1_BLSP_QUP3_SPI_CONFIG

Bits	Name	Type	Description
10	HS_MODE	RW	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	RW	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	RW	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
5	SLAVE_OPERATION	R	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.

0x078B8304 BLSP1_BLSP_QUP3_SPI_IO_CONTROL

Type: RW

Clock: crif_clk

Reset State: 0x00000000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

BLSP1_BLSP_QUP3_SPI_IO_CONTROL

Bits	Name	Description
11	FORCE_CS	When this bit is set, the chip select is asserted unconditionally with no relationship to QUP_STATE or transaction state.
10	CLK_IDLE_HIGH	When set to 1, spi_clk will be high when spi is idle (spi_cs is not asserted). When cleared to 0, spi_clk will be low when spi is idle (spi_cs is not asserted).
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.

BLSP1_BLSP_QUP3_SPI_IO_CONTROL (cont.)

Bits	Name	Description
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS#_N respectively. Setting any of this bit to '1', makes the associated SPI_CS#_N active HIGH. This field is a 'don't care' in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_#N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a 'don't care' in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS#_N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS#_N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x078B8308 BLSP1_BLSP_QUP3_SPI_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP3_SPI_ERROR_FLAGS

Bits	Name	Description
3	TRANSFER_CANCEL_DONE	This bit is set (1) when the SPI controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
2	TRANSFER_CANCEL_ID_MATCH	This bit is set (1) when the SPI controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x078B830C BLSP1_BLSP_QUP3_SPI_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000000C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP3_SPI_ERROR_FLAGS_EN

Bits	Name	Description
3	TRANSFER_CANCEL_DONE_EN	If set, enables generating the transfer cancel done indication.
2	TRANSFER_CANCEL_ID_MATCH_EN	If set, enables generating the transfer cancel ID match indication.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x078B8310 BLSP1_BLSP_QUP3_SPI_DEASSERT_WAIT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the de-assertion wait time of SPI_CS#_N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

BLSP1_BLSP_QUP3_SPI_DEASSERT_WAIT

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the deasserted time of SPI_CS#_N. Only applies to MASTER operation. For SLAVE operation, this field is a 'don't care'. A value of zero indicates SPI_CS#_N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

0x078B8314 BLSP1_BLSP_QUP3_SPI_MASTER_LOCAL_ID**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_SPI_MASTER_LOCAL_ID**

Bits	Name	Description
15:8	EXTENDED_ID	SW may use this field to specify the current sub-transfer ID to be read when TRANSFER_CANCEL_ID_MATCH is asserted. This value has no impact on HW.
7:0	LOCAL_ID	SW specifies the current transfer ID. HW will use this value to match with TRANSFER_CANCEL_ID.

0x078B8318 BLSP1_BLSP_QUP3_SPI_MASTER_COMMAND**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_SPI_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command.

0x078B831C BLSP1_BLSP_QUP3_SPI_MASTER_STATUS**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_SPI_MASTER_STATUS**

Bits	Name	Description
2:0	CANCEL_FSM_STATE	This 3-bit field informs the microprocessor of the state of the SPI cancel logic. Internal use only

0x078B8400 BLSP1_BLSP_QUP3_I2C_MASTER_CLK_CTL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The I2C_CLK_CTL register is a read/write register that controls clock divider values.

BLSP1_BLSP_QUP3_I2C_MASTER_CLK_CTL

Bits	Name	Description
28	SCL_EXT_FORCE_LOW	When set to 0, SCL generation maintains legacy behavior. When set to 1, SCL state machine will go to the FORCED_LOW_STATE if force_low is asserted near (within 5 SCL clock cycles = $5 * 52\text{ns} = 260\text{ns} \approx \text{MAX}(\text{Tsu}, \text{DAT})$) the clock edge.
27:26	SDA_NOISE_REJECTION	Allows adding extra sampling levels on SDA to reject short low pulses. This value specifies how many TCXO cycles of logic low on SDA would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
25:24	SCL_NOISE_REJECTION	Allows adding extra sampling levels on SCL to reject short low pulses. This value specifies how many TCXO cycles of logic low on SCL would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
23:16	HIGH_TIME_DIVIDER_VALUE	Allows setting SCL duty cycle to non 50%. If this value is zero then legacy mode is used. If this value is non-zero then it will be used as the SCL high time counter and FS_DIVIDER_VALUE will be used as the low time counter. Minimum value is 0x7.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. Minimum value is 0x3. $\text{I2C_HS_CLK} = \text{I2C_CLK} / (3 * (\text{HS_DIVIDER_VALUE} + 1) + 2)$
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. Minimum value is 0x7. When HIGH_TIME_DIVIDER_VALUE=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (2 * (\text{FS_DIVIDER_VALUE} + 3))$ When HIGH_TIME_DIVIDER_VALUE!=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (\text{FS_DIVIDER_VALUE} + \text{HIGH_TIME_DIVIDER_VALUE} + 6)$

0x078B8404 BLSP1_BLSP_QUP3_I2C_MASTER_STATUS**Type:** RW**Clock:** crif_clk**Reset State:** 0x0C000000

The I2C_STATUS is a status register. Writing any value clears the status bits.

BLSP1_BLSP_QUP3_I2C_MASTER_STATUS

Bits	Name	Type	Description
30:28	CANCEL_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C cancel logic. Internal use only 0x0: IDLE_STATE (IDLE_STATE) 0x1: CANCEL_PENDING_STATE (CANCEL_PENDING_STATE) 0x2: PAUSE_STATE (PAUSE_STATE) 0x3: PAUSE_WAIT_STATE (PAUSE_WAIT_STATE) 0x4: SEND_STOP_STATE (SEND_STOP_STATE) 0x5: FLUSH_STATE (FLUSH_STATE) 0x6: SEND_IRQ_STATE (SEND_IRQ_STATE)
27	I2C_SCL	R	Logic state of I2C bus serial clock wire.
26	I2C_SDA	R	Logic state of I2C bus serial data wire.
25	INVALID_READ_SEQ	RW	Interrupt source. This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	RW	Interrupt source. In version 1 tags this bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address). In version 2 tags this bit is set (1) when the I2C controller is trying to access a non-existent I2C slave (address).
23	INVALID_TAG	RW	Interrupt source. This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_READ_LAST_BYTE_STATE (READ_LAST_BYTE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_DEC_STATE (DEC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_STORE_STATE (STORE_STATE value. Applies for both version 1 and version 2 tags) 0x6: V2_WR_TAG_STATE (WR_TAG_STATE value. Only applicable in version 2 tags) 0x7: V2_WAIT_TAG_STATE (WAIT_TAG_STATE value. Only applicable in version 2 tags)

BLSP1_BLSP_QUP3_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
19:16	OUTPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_DECODE_STATE (DECODE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_SEND_STATE (SEND_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_NOP_STATE (NOP_STATE value. Applies for both version 1 and version 2 tags) 0x6: V1_V2_INVALID_STATE (INVALID_STATE value. Applies for both version 1 and version 2 tags) 0x7: V1_PEEK_STATE (PEEK_STATE value. Only applicable in version 1 tags) 0x8: V1_SEND_R_STATE (SEND_R_STATE value. Only applicable in version 1 tags) 0xB: V2_GET_BYTE_STATE (GET_BYTE_STATE value. Only applicable in version 2 tags) 0xC: V2_GET_WRITE_BYTE_STATE (GET_WRITE_BYTE_STATE value. Only applicable in version 2 tags) 0xD: V2_SPECIALITY_STATE (SPECIALITY_STATE value. Only applicable in version 2 tags) 0xE: V2_WAIT_FLUSH_STOP_STATE (WAIT_FLUSH_STOP_STATE value. Only applicable in version 2 tags) 0xF: V2_STOP_STATE (STOP_STATE value. Only applicable in version 2 tags)
15:13	CLK_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Internal use only 0x0: RESET_BUSIDLE_STATE (RESET_BUSIDLE_STATE) 0x1: NOT_MASTER_STATE (NOT_MASTER_STATE) 0x2: HIGH_STATE (HIGH_STATE) 0x3: LOW_STATE (LOW_STATE) 0x4: HIGH_WAIT_STATE (HIGH_WAIT_STATE) 0x5: FORCED_LOW_STATE (FORCED_LOW_STATE) 0x6: HS_ADDR_LOW_STATE (HS_ADDR_LOW_STATE) 0x7: DOUBLE_BUFFER_WAIT_STATE (DOUBLE_BUFFER_WAIT_STATE)

BLSP1_BLSP_QUP3_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
12:10	DATA_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Internal use only 0x0: RESET_WAIT_STATE (RESET_WAIT_STATE) 0x1: TX_ADDR_STATE (TX_ADDR_STATE) 0x2: TX_DATA_STATE (TX_DATA_STATE) 0x3: TX_HS_ADDR_STATE (TX_HS_ADDR_STATE) 0x4: TX_10_BIT_ADDR_STATE (TX_10_BIT_ADDR_STATE) 0x5: TX_2ND_BYTE_STATE (TX_2ND_BYTE_STATE) 0x6: RX_DATA_STATE (RX_DATA_STATE) 0x7: RX_NACK_HOLD_STATE (RX_NACK_HOLD_STATE)
9	BUS_MASTER	R	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	R	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	RW	Interrupt source. This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	RW	Interrupt source. This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.
4	ARB_LOST	RW	Interrupt source. This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.

BLSP1_BLSP_QUP3_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
3	PACKET_NACKED	RW	Interrupt source. This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	RW	Interrupt source. This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1	TRANSFER_CANCEL_DONE	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
0	TRANSFER_CANCEL_ID_MATCH	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.

0x078B8408 BLSP1_BLSP_QUP3_I2C_MASTER_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_I2C_MASTER_CONFIG**

Bits	Name	Description
0	EN_VERSION_TWO_TAG	When set, version 2 of the mini-core is enabled.

0x078B840C BLSP1_BLSP_QUP3_I2C_MASTER_BUS_CLEAR**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP3_I2C_MASTER_BUS_CLEAR

Bits	Name	Description
0	CLEAR	This command should be given only when the i2c mincore is idle. When in doubt SW can use SW_RESET to reset the minicore. When set, an I2C 'Bus Clear' executed per the I2C standard. A bus clear consists of nine I2C clock ticks with data wire left not-driven. Has the effect of clearing any slave which has lost read sync. After the clear is complete, the hardware sets the CLEAR bit to zero. The bit can not be cleared by software. After a bus clear, both clock and data lines should be high. If not, an external slave has hung the bus by holding down one or both lines. Reset the slave to clear if possible. Any slave reset mechanism is beyond the scope of the I2C mini core.

0x078B8410 BLSP1_BLSP_QUP3_I2C_MASTER_LOCAL_ID**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_I2C_MASTER_LOCAL_ID**

Bits	Name	Description
7:0	LOCAL_ID	Read only value capturing the ID byte of the last NOP LOCAL tag. Only applicable when using V2 tags

0x078B8414 BLSP1_BLSP_QUP3_I2C_MASTER_COMMAND**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP3_I2C_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command in case the transfer was flushed (QUP_STATE[I2C_FLUSH] was set) due to I2C NACK.

20.8 BLSP1_BLSP_QUP4_QUP

0x078B9000 BLSP1_BLSP_QUP4_QUP_CONFIG

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read.

- a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).
- b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:
 - o N equals 8 or less - shift 24
 - o N equals 16 to 9 - shift 16
 - o N equals 24 to 17 - shift 8
 - o N equals 32 to 25 - no shift

BLSP1_BLSP_QUP4_QUP_CONFIG

Bits	Name	Description
16	EN_EXT_OUT_FLAG	Enable Extended OUTPUT/INPUT_SERVICE_FLAG interrupt generation. When this bit is set, the behavior of the *_SERVICE_FLAG and MAX_OUTPUT_DONE_FLAG changes. Service flag and the done flag are not set till the last SPI or I2C transfer has completed. a) For SPI: 1. The shifting needs to complete 2. Clock stopped if CLK_ALWAYS_ON=0, 3. CS, if used, de-asserted b) For I2C, 1. The ACK needs to complete 2. STOP condition done generated (Attention need to be put in synchronizing the last transaction with STOP tag) 3. clock and data wires return to high condition When this bit is clear, the legacy behavior is applicable. Under legacy, the DONE_FLAG is set when: 1. MX_*_COUNT is reached 2. The output FIFO is empty 3. Last bit was sent on the link Under legacy, the flag interrupt is generated before the last transfer is complete on the external interface.
15	CORE_EXTRA_CLK_ON_EN	Enable additional transfer based qup_core_clk gating for power save. When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on.

BLSP1_BLSP_QUP4_QUP_CONFIG (cont.)

Bits	Name	Description
14	FIFO_CLK_GATE_EN	When set to 0, fifo clock is mostly on - legacy mode. When set to 1, fifo clock is turned off dynamically.
13	CORE_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
12	APP_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
11:8	MINI_CORE	value: 0000 null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 reserved value: 0100 reserved value: 0101 reserved value: 0110 reserved value: 0111 reserved See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a 'don't care'. The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS#_N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	QUP_HREADY_CTRL	When set to 0, qup wil not stall the AHB bus (legacy mode). When set to 1, qup may stall the AHB bus until register access is done.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x078B9004 BLSP1_BLSP_QUP4_QUP_STATE**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000001C

BLSP1_BLSP_QUP4_QUP_STATE

Bits	Name	Type	Description
6	I2C_FLUSH	RW	Flushing an i2c transfer requires using version 2 tags. FLUSH should be used in BAM mode only. Setting this bit to 1 will flush all tags and tag related data besides EOT until FLUSH STOP tag is encountered. Setting this bit to 0 has no impact. Reading this bit returns the flush operation status - 0 = ongoing, 1 = done.
5	WAIT_FOR_EOT	RW	Only applicable when moving to RUN_STATE using command descriptor in SPI mode with NO_OUTPUT. Setting this bit to 1 will stall the done_toggle_com indication until basi_trans_end_pro is asserted. This will prevent the next command descriptor to start prematurely.
4	I2C_MAST_GEN	R	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	R	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	R	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.
1:0	STATE	RW	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to '01', the mini-core and related logic is released from reset and enters the RUN_STATE. When set to '11', the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete.

0x078B9008 BLSP1_BLSP_QUP4_QUP_IO_MODES**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000A5

Unless otherwise stated, register bits written return the value when read.

Notes:

a. 'Packing' occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. 'Un-Packing' occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

c. INPUT_MODE and OUTPUT_MODE should be both in BAM_Mode or both in non BAM_Mode.

BLSP1_BLSP_QUP4_QUP_IO_MODES

Bits	Name	Type	Description
16	OUTPUT_BIT_SHIFT_EN	RW	If set, enables the QUP output FIFO block to do bit shifting on the output data.
15	PACK_EN	RW	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	RW	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	R	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE

BLSP1_BLSP_QUP4_QUP_IO_MODES (cont.)

Bits	Name	Type	Description
1:0	OUTPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x078B900C BLSP1_BLSP_QUP4_QUP_SW_RESET**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero. The AHB clock domain reset will stay asserted until either the spi_clk or i2c_clk domains are reset. It is prohibited to write to any QUP register during this period and failing to do so will cause an ERROR response on the AHB bus. In order to avoid this SW should poll the QUP_STATE[STATE_VALID] bit until it is asserted.

BLSP1_BLSP_QUP4_QUP_SW_RESET

Bits	Name	Description
31:0	QUP_SW_RESET	

0x078B9014 BLSP1_BLSP_QUP4_QUP_TRANSFER_CANCEL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_QUP_TRANSFER_CANCEL**

Bits	Name	Type	Description
15:8	TRANSFER_CANCEL_ID	RW	This field include the id of the transfer that is scheduled for cancellation. This field is valid when asserting TRANSFER_CANCEL bit. A value of 0xFF will cancel the current transfer regardless of its LOCAL_ID. Canceling an i2c transfer requires using version 2 tags.
7	TRANSFER_CANCEL	W	Setting this bit to 1 will cause the HW to go to pause_state when the LOCAL_ID = TRANSFER_CANCEL_ID. This would allow flushing the rest of the transfer in order to implement cancel API. Canceling an i2c transfer requires using version 2 tags.

0x078B9018 BLSP1_BLSP_QUP4_QUP_OPERATIONAL**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000C0

Refer to the chapter on 'QUP Software Considerations' regarding the correct interpretation of the various service interrupts generated by QUP and their relation to these register bits.

BLSP1_BLSP_QUP4_QUP_OPERATIONAL

Bits	Name	Description
15	NWD	Notify When Done (NWD). Read only status bit which when set indicates a NWD acknowledgement is outstanding. This bit is set by QUP hardware when NWD is signaled from BAM. This bit is cleared by QUP hardware when the NWD request is acknowledged by assertion of done_toggle. This bit is always unconditionally cleared in RESET_STATE.
14	DONE_TOGGLE	Read only status bit which provides the current state of the side-band done_toggle signal sent to BAM. At each NWD acknowledgement, this bit toggles.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Bam_Mode (for debug only).
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Bam_Mode (for debug only).
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.

BLSP1_BLSP_QUP4_QUP_OPERATIONAL (cont.)

Bits	Name	Description
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.

0x078B901C BLSP1_BLSP_QUP4_QUP_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP4_QUP_ERROR_FLAGS

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ERR	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.

0x078B9020 BLSP1_BLSP_QUP4_QUP_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000003C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP4_QUP_ERROR_FLAGS_EN

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR_EN	If set, enables output over run error generation.
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.

0x078B9028 BLSP1_BLSP_QUP4_QUP_OPERATIONAL_MASK**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register masks several QUP_OPERATIONAL flags from creating an interrupt .

BLSP1_BLSP_QUP4_QUP_OPERATIONAL_MASK

Bits	Name	Description
9	INPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.
8	OUTPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.

0x078B9100 BLSP1_BLSP_QUP4_QUP_MX_OUTPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not effect the count.

Notes:

- a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

BLSP1_BLSP_QUP4_QUP_MX_OUTPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_OUTPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_OUTPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_OUTPUT_COUNT	RW	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x078B9104 BLSP1_BLSP_QUP4_QUP_MX_OUTPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_QUP_MX_OUTPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x078B910C BLSP1_BLSP_QUP4_QUP_OUTPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP4_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	OUTPUT_FIFO_WORD_COUNT	Number of words in the output FIFO.

**0x078B9110+ BLSP1_BLSP_QUP4_QUP_OUTPUT_FIFOc, c=[0..15]
0x4*c****Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

BLSP1_BLSP_QUP4_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x078B9150 BLSP1_BLSP_QUP4_QUP_MX_WRITE_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

BLSP1_BLSP_QUP4_QUP_MX_WRITE_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_WRITE_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_WRITE_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_WRITE_COUNT	RW	The number of 'writes' of size N. This is used only if the core is in FIFO_Mode.

0x078B9154 BLSP1_BLSP_QUP4_QUP_MX_WRITE_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_QUP_MX_WRITE_CNT_CURRENT**

Bits	Name	Description
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

0x078B9200 BLSP1_BLSP_QUP4_QUP_MX_INPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Bam_Mode (for non-balanced SPI). The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE do not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

BLSP1_BLSP_QUP4_QUP_MX_INPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_INPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_INPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_INPUT_COUNT	RW	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x078B9204 BLSP1_BLSP_QUP4_QUP_MX_INPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_QUP_MX_INPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x078B9208 BLSP1_BLSP_QUP4_QUP_MX_READ_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

BLSP1_BLSP_QUP4_QUP_MX_READ_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_READ_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_READ_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_READ_COUNT	RW	The number of 'reads' of size N. This is used only if the core is in FIFO_Mode.

0x078B920C BLSP1_BLSP_QUP4_QUP_MX_READ_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP4_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x078B9214 BLSP1_BLSP_QUP4_QUP_INPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated. Hence, when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP4_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

**0x078B9218+ BLSP1_BLSP_QUP4_QUP_INPUT_FIFOc, c=[0..15]
0x4*c****Type:** R**Clock:** crif_clk**Reset State:** Undefined

Consecutive reads to this address reads the input FIFO contents on a FIFO basis. The max address to read the input FIFO is 0x254.

BLSP1_BLSP_QUP4_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

0x078B9300 BLSP1_BLSP_QUP4_SPI_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

BLSP1_BLSP_QUP4_SPI_CONFIG

Bits	Name	Type	Description
10	HS_MODE	RW	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	RW	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	RW	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
5	SLAVE_OPERATION	R	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.

0x078B9304 BLSP1_BLSP_QUP4_SPI_IO_CONTROL

Type: RW

Clock: crif_clk

Reset State: 0x00000000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

BLSP1_BLSP_QUP4_SPI_IO_CONTROL

Bits	Name	Description
11	FORCE_CS	When this bit is set, the chip select is asserted unconditionally with no relationship to QUP_STATE or transaction state.
10	CLK_IDLE_HIGH	When set to 1, spi_clk will be high when spi is idle (spi_cs is not asserted). When cleared to 0, spi_clk will be low when spi is idle (spi_cs is not asserted).
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.

BLSP1_BLSP_QUP4_SPI_IO_CONTROL (cont.)

Bits	Name	Description
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS#_N respectively. Setting any of this bit to '1', makes the associated SPI_CS#_N active HIGH. This field is a 'don't care' in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_#N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a 'don't care' in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS#_N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS#_N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x078B9308 BLSP1_BLSP_QUP4_SPI_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP4_SPI_ERROR_FLAGS

Bits	Name	Description
3	TRANSFER_CANCEL_DONE	This bit is set (1) when the SPI controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
2	TRANSFER_CANCEL_ID_MATCH	This bit is set (1) when the SPI controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x078B930C BLSP1_BLSP_QUP4_SPI_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000000C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP4_SPI_ERROR_FLAGS_EN

Bits	Name	Description
3	TRANSFER_CANCEL_DONE_EN	If set, enables generating the transfer cancel done indication.
2	TRANSFER_CANCEL_ID_MATCH_EN	If set, enables generating the transfer cancel ID match indication.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x078B9310 BLSP1_BLSP_QUP4_SPI_DEASSERT_WAIT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the de-assertion wait time of SPI_CS#_N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

BLSP1_BLSP_QUP4_SPI_DEASSERT_WAIT

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the deasserted time of SPI_CS#_N. Only applies to MASTER operation. For SLAVE operation, this field is a 'don't care'. A value of zero indicates SPI_CS#_N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

0x078B9314 BLSP1_BLSP_QUP4_SPI_MASTER_LOCAL_ID**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_SPI_MASTER_LOCAL_ID**

Bits	Name	Description
15:8	EXTENDED_ID	SW may use this field to specify the current sub-transfer ID to be read when TRANSFER_CANCEL_ID_MATCH is asserted. This value has no impact on HW.
7:0	LOCAL_ID	SW specifies the current transfer ID. HW will use this value to match with TRANSFER_CANCEL_ID.

0x078B9318 BLSP1_BLSP_QUP4_SPI_MASTER_COMMAND**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_SPI_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command.

0x078B931C BLSP1_BLSP_QUP4_SPI_MASTER_STATUS**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_SPI_MASTER_STATUS**

Bits	Name	Description
2:0	CANCEL_FSM_STATE	This 3-bit field informs the microprocessor of the state of the SPI cancel logic. Internal use only

0x078B9400 BLSP1_BLSP_QUP4_I2C_MASTER_CLK_CTL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The I2C_CLK_CTL register is a read/write register that controls clock divider values.

BLSP1_BLSP_QUP4_I2C_MASTER_CLK_CTL

Bits	Name	Description
28	SCL_EXT_FORCE_LOW	When set to 0, SCL generation maintains legacy behavior. When set to 1, SCL state machine will go to the FORCED_LOW_STATE if force_low is asserted near (within 5 i2c_clk cycles = $5 * 52\text{ns} = 260\text{ns} \approx \text{MAX}(\text{Tsu}, \text{DAT})$) the clock edge.
27:26	SDA_NOISE_REJECTION	Allows adding extra sampling levels on SDA to reject short low pulses. This value specifies how many TCXO cycles of logic low on SDA would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
25:24	SCL_NOISE_REJECTION	Allows adding extra sampling levels on SCL to reject short low pulses. This value specifies how many TCXO cycles of logic low on SCL would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
23:16	HIGH_TIME_DIVIDER_VALUE	Allows setting SCL duty cycle to non 50%. If this value is zero then legacy mode is used. If this value is non-zero then it will be used as the SCL high time counter and FS_DIVIDER_VALUE will be used as the low time counter. Minimum value is 0x7.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. Minimum value is 0x3. $\text{I2C_HS_CLK} = \text{I2C_CLK} / (3 * (\text{HS_DIVIDER_VALUE} + 1) + 2)$
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. Minimum value is 0x7. When HIGH_TIME_DIVIDER_VALUE=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (2 * (\text{FS_DIVIDER_VALUE} + 3))$ When HIGH_TIME_DIVIDER_VALUE!=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (\text{FS_DIVIDER_VALUE} + \text{HIGH_TIME_DIVIDER_VALUE} + 6)$

0x078B9404 BLSP1_BLSP_QUP4_I2C_MASTER_STATUS**Type:** RW**Clock:** crif_clk**Reset State:** 0x0C000000

The I2C_STATUS is a status register. Writing any value clears the status bits.

BLSP1_BLSP_QUP4_I2C_MASTER_STATUS

Bits	Name	Type	Description
30:28	CANCEL_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C cancel logic. Internal use only 0x0: IDLE_STATE (IDLE_STATE) 0x1: CANCEL_PENDING_STATE (CANCEL_PENDING_STATE) 0x2: PAUSE_STATE (PAUSE_STATE) 0x3: PAUSE_WAIT_STATE (PAUSE_WAIT_STATE) 0x4: SEND_STOP_STATE (SEND_STOP_STATE) 0x5: FLUSH_STATE (FLUSH_STATE) 0x6: SEND_IRQ_STATE (SEND_IRQ_STATE)
27	I2C_SCL	R	Logic state of I2C bus serial clock wire.
26	I2C_SDA	R	Logic state of I2C bus serial data wire.
25	INVALID_READ_SEQ	RW	Interrupt source. This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	RW	Interrupt source. In version 1 tags this bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address). In version 2 tags this bit is set (1) when the I2C controller is trying to access a non-existent I2C slave (address).
23	INVALID_TAG	RW	Interrupt source. This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_READ_LAST_BYTE_STATE (READ_LAST_BYTE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_DEC_STATE (DEC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_STORE_STATE (STORE_STATE value. Applies for both version 1 and version 2 tags) 0x6: V2_WR_TAG_STATE (WR_TAG_STATE value. Only applicable in version 2 tags) 0x7: V2_WAIT_TAG_STATE (WAIT_TAG_STATE value. Only applicable in version 2 tags)

BLSP1_BLSP_QUP4_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
19:16	OUTPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_DECODE_STATE (DECODE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_SEND_STATE (SEND_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_NOP_STATE (NOP_STATE value. Applies for both version 1 and version 2 tags) 0x6: V1_V2_INVALID_STATE (INVALID_STATE value. Applies for both version 1 and version 2 tags) 0x7: V1_PEEK_STATE (PEEK_STATE value. Only applicable in version 1 tags) 0x8: V1_SEND_R_STATE (SEND_R_STATE value. Only applicable in version 1 tags) 0xB: V2_GET_BYTE_STATE (GET_BYTE_STATE value. Only applicable in version 2 tags) 0xC: V2_GET_WRITE_BYTE_STATE (GET_WRITE_BYTE_STATE value. Only applicable in version 2 tags) 0xD: V2_SPECIALITY_STATE (SPECIALITY_STATE value. Only applicable in version 2 tags) 0xE: V2_WAIT_FLUSH_STOP_STATE (WAIT_FLUSH_STOP_STATE value. Only applicable in version 2 tags) 0xF: V2_STOP_STATE (STOP_STATE value. Only applicable in version 2 tags)
15:13	CLK_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Internal use only 0x0: RESET_BUSIDLE_STATE (RESET_BUSIDLE_STATE) 0x1: NOT_MASTER_STATE (NOT_MASTER_STATE) 0x2: HIGH_STATE (HIGH_STATE) 0x3: LOW_STATE (LOW_STATE) 0x4: HIGH_WAIT_STATE (HIGH_WAIT_STATE) 0x5: FORCED_LOW_STATE (FORCED_LOW_STATE) 0x6: HS_ADDR_LOW_STATE (HS_ADDR_LOW_STATE) 0x7: DOUBLE_BUFFER_WAIT_STATE (DOUBLE_BUFFER_WAIT_STATE)

BLSP1_BLSP_QUP4_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
12:10	DATA_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Internal use only 0x0: RESET_WAIT_STATE (RESET_WAIT_STATE) 0x1: TX_ADDR_STATE (TX_ADDR_STATE) 0x2: TX_DATA_STATE (TX_DATA_STATE) 0x3: TX_HS_ADDR_STATE (TX_HS_ADDR_STATE) 0x4: TX_10_BIT_ADDR_STATE (TX_10_BIT_ADDR_STATE) 0x5: TX_2ND_BYTE_STATE (TX_2ND_BYTE_STATE) 0x6: RX_DATA_STATE (RX_DATA_STATE) 0x7: RX_NACK_HOLD_STATE (RX_NACK_HOLD_STATE)
9	BUS_MASTER	R	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	R	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	RW	Interrupt source. This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	RW	Interrupt source. This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.
4	ARB_LOST	RW	Interrupt source. This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.

BLSP1_BLSP_QUP4_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
3	PACKET_NACKED	RW	Interrupt source. This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	RW	Interrupt source. This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1	TRANSFER_CANCEL_DONE	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
0	TRANSFER_CANCEL_ID_MATCH	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.

0x078B9408 BLSP1_BLSP_QUP4_I2C_MASTER_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_I2C_MASTER_CONFIG**

Bits	Name	Description
0	EN_VERSION_TWO_TAG	When set, version 2 of the mini-core is enabled.

0x078B940C BLSP1_BLSP_QUP4_I2C_MASTER_BUS_CLEAR**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP4_I2C_MASTER_BUS_CLEAR

Bits	Name	Description
0	CLEAR	This command should be given only when the i2c mincore is idle. When in doubt SW can use SW_RESET to reset the minicore. When set, an I2C 'Bus Clear' executed per the I2C standard. A bus clear consists of nine I2C clock ticks with data wire left not-driven. Has the effect of clearing any slave which has lost read sync. After the clear is complete, the hardware sets the CLEAR bit to zero. The bit can not be cleared by software. After a bus clear, both clock and data lines should be high. If not, an external slave has hung the bus by holding down one or both lines. Reset the slave to clear if possible. Any slave reset mechanism is beyond the scope of the I2C mini core.

0x078B9410 BLSP1_BLSP_QUP4_I2C_MASTER_LOCAL_ID**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_I2C_MASTER_LOCAL_ID**

Bits	Name	Description
7:0	LOCAL_ID	Read only value capturing the ID byte of the last NOP LOCAL tag. Only applicable when using V2 tags

0x078B9414 BLSP1_BLSP_QUP4_I2C_MASTER_COMMAND**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP4_I2C_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command in case the transfer was flushed (QUP_STATE[I2C_FLUSH] was set) due to I2C NACK.

20.9 BLSP1_BLSP_QUP5_QUP

0x078BA000 BLSP1_BLSP_QUP5_QUP_CONFIG

Type: RW

Clock: crif_clk

Reset State: 0x00000000

Unless otherwise stated, register bits written return the value when read.

- a. The contents of this register should only be changed when in the RESET_STATE (see the QUP_STATE register).
- b. The value written to the QUP output FIFO, is shifted left toward the MSB before passing it to the mini-core as follows:
 - o N equals 8 or less - shift 24
 - o N equals 16 to 9 - shift 16
 - o N equals 24 to 17 - shift 8
 - o N equals 32 to 25 - no shift

BLSP1_BLSP_QUP5_QUP_CONFIG

Bits	Name	Description
16	EN_EXT_OUT_FLAG	Enable Extended OUTPUT/INPUT_SERVICE_FLAG interrupt generation. When this bit is set, the behavior of the *_SERVICE_FLAG and MAX_OUTPUT_DONE_FLAG changes. Service flag and the done flag are not set till the last SPI or I2C transfer has completed. a) For SPI: 1. The shifting needs to complete 2. Clock stopped if CLK_ALWAYS_ON=0, 3. CS, if used, de-asserted b) For I2C, 1. The ACK needs to complete 2. STOP condition done generated (Attention need to be put in synchronizing the last transaction with STOP tag) 3. clock and data wires return to high condition When this bit is clear, the legacy behavior is applicable. Under legacy, the DONE_FLAG is set when: 1. MX_*_COUNT is reached 2. The output FIFO is empty 3. Last bit was sent on the link Under legacy, the flag interrupt is generated before the last transfer is complete on the external interface.
15	CORE_EXTRA_CLK_ON_EN	Enable additional transfer based qup_core_clk gating for power save. When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on.

BLSP1_BLSP_QUP5_QUP_CONFIG (cont.)

Bits	Name	Description
14	FIFO_CLK_GATE_EN	When set to 0, fifo clock is mostly on - legacy mode. When set to 1, fifo clock is turned off dynamically.
13	CORE_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
12	APP_CLK_ON_EN	When set to 0, clock on is turned on unconditionally. When set to 1, dynamic clock on is turned on and driven high conditionally.
11:8	MINI_CORE	value: 0000 null core value: 0001 SPI core value: 0010 I2C master controller value: 0011 reserved value: 0100 reserved value: 0101 reserved value: 0110 reserved value: 0111 reserved See Note 1.
7	NO_INPUT	qup_data_in is not used and the value is a 'don't care'. The QUP input FIFO is always empty. The input service interrupt and INPUT_SERVICE_FLAG bit are never set. See notes (a) and (b) above.
6	NO_OUTPUT	qup_data_out is not used and is held at the value zero. The QUP output FIFO is always empty. The output service flag and OUTPUT_SERVICE_FLAG bit are never set. qup_data_out is still driven when SPI_CS#_N is asserted. The setting for NO_TRI_STATE still applies. See notes (a) and (b) above.
5	QUP_HREADY_CTRL	When set to 0, qup wil not stall the AHB bus (legacy mode). When set to 1, qup may stall the AHB bus until register access is done.
4:0	N	Number of logical bits N in the mini-core that constitutes a single transfer. The value zero indicates N equals one. The value of all ones indicates N equals 32. The value in this register must be 3 (i.e., N is 4 or higher in order for the STATE field to be set to RUN_STATE). See note (a) above.

0x078BA004 BLSP1_BLSP_QUP5_QUP_STATE**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000001C

BLSP1_BLSP_QUP5_QUP_STATE

Bits	Name	Type	Description
6	I2C_FLUSH	RW	Flushing an i2c transfer requires using version 2 tags. FLUSH should be used in BAM mode only. Setting this bit to 1 will flush all tags and tag related data besides EOT until FLUSH STOP tag is encountered. Setting this bit to 0 has no impact. Reading this bit returns the flush operation status - 0 = ongoing, 1 = done.
5	WAIT_FOR_EOT	RW	Only applicable when moving to RUN_STATE using command descriptor in SPI mode with NO_OUTPUT. Setting this bit to 1 will stall the done_toggle_com indication until basi_trans_end_pro is asserted. This will prevent the next command descriptor to start prematurely.
4	I2C_MAST_GEN	R	Read only. Reflects the RTL generic setting for GEN_I2C_MASTER_MINI_CORE.
3	SPI_GEN	R	Read only. Reflects the RTL generic setting for GEN_SPI_MINI_CORE.
2	STATE_VALID	R	Read only. If and only if set to one, writes to the STATE field is allowed or reads from the STATE field is valid. Writes to this bit is ignored.
1:0	STATE	RW	When clear (00), the mini-core and related logic is held in RESET_STATE. When set to '01', the mini-core and related logic is released from reset and enters the RUN_STATE. When set to '11', the mini-core and related logic enters the PAUSE_STATE at the next appropriate point in time. Writing (10) to this field clears these two bits. For PAUSE_STATE to RESET_STATE transition, two writes of (10) are required for the transition to complete.

0x078BA008 BLSP1_BLSP_QUP5_QUP_IO_MODES**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000A5

Unless otherwise stated, register bits written return the value when read.

Notes:

a. 'Packing' occurs as follows:

- N equals 8 or less - pack four values into each QUP input FIFO word.
- N equals 16 to 9 - pack two values into each QUP input FIFO word.
- N equals 32 to 17 - no packing. Each mini-core value is moved to an QUP input FIFO word.

b. 'Un-Packing' occurs as follows:

- N equals 8 or less - un-pack four values from each QUP output FIFO word.
- N equals 16 to 9 - un-pack two values from each QUP output FIFO word.
- N equals 32 to 17 - no packing. Each QUP output FIFO value is moved to the mini-core.

c. INPUT_MODE and OUTPUT_MODE should be both in BAM_Mode or both in non BAM_Mode.

BLSP1_BLSP_QUP5_QUP_IO_MODES

Bits	Name	Type	Description
16	OUTPUT_BIT_SHIFT_EN	RW	If set, enables the QUP output FIFO block to do bit shifting on the output data.
15	PACK_EN	RW	Indicates data values from the mini-core are to be packed before placement in the QUP input FIFO. See note (a) above.
14	UNPACK_EN	RW	Indicates data values taken from the QUP output FIFO should be unpacked before passing to the mini-core. See note (b) above.
13:12	INPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_INPUT = 0, then only FIFO_Mode is available)
11:10	OUTPUT_MODE	RW	Value 00: FIFO_Mode Value 01: Block_Mode Value 10: Reserved Value 11: BAM_Mode (note if the RTL generic BLOCK_SIZE_OUTPUT = 0, then only FIFO_Mode is available)
9:7	INPUT_FIFO_SIZE	R	Read only, actual value set by RTL generic. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE
6:5	INPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL generic. Indicates the block size associated with Block_Mode for input. Value 00: 4 Bytes (FIFO_Mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved
4:2	OUTPUT_FIFO_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 000: 2X BLOCK_SIZE Value 001: 4X BLOCK_SIZE Value 010: 8X BLOCK_SIZE Value 011: 16X BLOCK_SIZE

BLSP1_BLSP_QUP5_QUP_IO_MODES (cont.)

Bits	Name	Type	Description
1:0	OUTPUT_BLOCK_SIZE	R	Read only. Actual value set by RTL GENERIC. Value 00: 04 Bytes (FIFO mode only) Value 01: 16 Bytes Value 10: 32 Bytes Value 11: Reserved

0x078BA00C BLSP1_BLSP_QUP5_QUP_SW_RESET**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

A write to this register resets the entire QUP core and all mini-cores. The internal registers are brought back to their reset values. Reading of this register returns zero. The AHB clock domain reset will stay asserted until either the spi_clk or i2c_clk domains are reset. It is prohibited to write to any QUP register during this period and failing to do so will cause an ERROR response on the AHB bus. In order to avoid this SW should poll the QUP_STATE[STATE_VALID] bit until it is asserted.

BLSP1_BLSP_QUP5_QUP_SW_RESET

Bits	Name	Description
31:0	QUP_SW_RESET	

0x078BA014 BLSP1_BLSP_QUP5_QUP_TRANSFER_CANCEL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_QUP_TRANSFER_CANCEL**

Bits	Name	Type	Description
15:8	TRANSFER_CANCEL_ID	RW	This field include the id of the transfer that is scheduled for cancellation. This field is valid when asserting TRANSFER_CANCEL bit. A value of 0xFF will cancel the current transfer regardless of its LOCAL_ID. Canceling an i2c transfer requires using version 2 tags.
7	TRANSFER_CANCEL	W	Setting this bit to 1 will cause the HW to go to pause_state when the LOCAL_ID = TRANSFER_CANCEL_ID. This would allow flushing the rest of the transfer in order to implement cancel API. Canceling an i2c transfer requires using version 2 tags.

0x078BA018 BLSP1_BLSP_QUP5_QUP_OPERATIONAL**Type:** RW**Clock:** crif_clk**Reset State:** 0x000000C0

Refer to the chapter on 'QUP Software Considerations' regarding the correct interpretation of the various service interrupts generated by QUP and their relation to these register bits.

BLSP1_BLSP_QUP5_QUP_OPERATIONAL

Bits	Name	Description
15	NWD	Notify When Done (NWD). Read only status bit which when set indicates a NWD acknowledgement is outstanding. This bit is set by QUP hardware when NWD is signaled from BAM. This bit is cleared by QUP hardware when the NWD request is acknowledged by assertion of done_toggle. This bit is always unconditionally cleared in RESET_STATE.
14	DONE_TOGGLE	Read only status bit which provides the current state of the side-band done_toggle signal sent to BAM. At each NWD acknowledgement, this bit toggles.
13	IN_BLOCK_READ_REQ	Read only. When set by hardware, indicates QUP input FIFO has BLOCK_SIZE_INPUT amount of data ready for reading. Valid only in Block_Mode.
12	OUT_BLOCK_WRITE_REQ	Read only. When set by hardware, indicates QUP output FIFO needs BLOCK_SIZE_OUTPUT amount of data to be written. Valid only in Block_Mode.
11	MAX_INPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP input FIFO has reached the programmed QUP_MX_INPUT_COUNT value. Valid in FIFO_Mode (only if MX_READ_COUNT is non-zero), Block_Mode and Bam_Mode (for debug only).
10	MAX_OUTPUT_DONE_FLAG	Read only. When set by hardware, indicates QUP output FIFO has reached the programmed QUP_MX_OUTPUT_COUNT value. Valid in Block_Mode and Bam_Mode (for debug only).
9	INPUT_SERVICE_FLAG	When set by hardware, indicates QUP input FIFO has an outstanding input service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
8	OUTPUT_SERVICE_FLAG	When set by hardware, indicates QUP output FIFO has an outstanding output service request. At the point in time this bit is set, the hardware also asserts qup_irq. Writing a 'zero' to this bit does nothing. Writing a 'one' to this bit clears it and acknowledges software has or will read the data. Valid in all modes , recommended to be masked in BAM mode
7	INPUT_FIFO_FULL	Read only. When set, indicates the input FIFO is full and can accept no more data from the QUP mini-core.

BLSP1_BLSP_QUP5_QUP_OPERATIONAL (cont.)

Bits	Name	Description
6	OUTPUT_FIFO_FULL	Read only. When set, indicates the output FIFO is full and can accept no more CRIF writes.
5	INPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the input FIFO has at least one value in it to be read. When clear, indicates the input FIFO is empty.
4	OUTPUT_FIFO_NOT_EMPTY	Read only. When set, indicates the output FIFO has at least one value in it to be shifted out. When clear, indicates the output FIFO is empty.

0x078BA01C BLSP1_BLSP_QUP5_QUP_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP5_QUP_ERROR_FLAGS

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR	Indicates the output FIFO was full when a CRIF write was attempted to the FIFO. The write is discarded.
4	INPUT_UNDER_RUN_ERR	Indicates the input FIFO was empty when a CRIF read was attempted to the FIFO. The read value returns is indeterminate.
3	OUTPUT_UNDER_RUN_ERR	Indicates the output FIFO was empty when an output shift operation required a value.
2	INPUT_OVER_RUN_ERR	Indicates the input FIFO was full when an input shift operation provided a new value. When this happens, the new value is discarded.

0x078BA020 BLSP1_BLSP_QUP5_QUP_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000003C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of qup_irq and the setting of the corresponding error flag in the QUP_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP5_QUP_ERROR_FLAGS_EN

Bits	Name	Description
5	OUTPUT_OVER_RUN_ERR_EN	If set, enables output over run error generation.
4	INPUT_UNDER_RUN_ERR_EN	If set, enables input under run error generation.
3	OUTPUT_UNDER_RUN_ERR_EN	If set, enables output under run error generation.
2	INPUT_OVER_RUN_ERR_EN	If set, enables input over run error generation.

0x078BA028 BLSP1_BLSP_QUP5_QUP_OPERATIONAL_MASK**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register masks several QUP_OPERATIONAL flags from creating an interrupt .

BLSP1_BLSP_QUP5_QUP_OPERATIONAL_MASK

Bits	Name	Description
9	INPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.
8	OUTPUT_SERVICE_MASK	If set, this flag in QUP_OPERATIONAL does not cause an interrupt but provides status only.

0x078BA100 BLSP1_BLSP_QUP5_QUP_MX_OUTPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode. The counter decrements for each output transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE does not effect the count.

Notes:

- a. Allows the total number of Mini Core transfers to be less than an exact multiple of OUTPUT_BLOCK_SIZE. Any additional outputs are discarded.

BLSP1_BLSP_QUP5_QUP_MX_OUTPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_OUTPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_OUTPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_OUTPUT_COUNT	RW	Number of writes of size N to the mini-core per RUN_STATE. A value of zero indicates the output count function is not enabled for use. See note (a) above.

0x078BA104 BLSP1_BLSP_QUP5_QUP_MX_OUTPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_QUP_MX_OUTPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_OUTPUT_CNT_CURRENT	Current value of QUP_MX_OUTPUT_COUNT.

0x078BA10C BLSP1_BLSP_QUP5_QUP_OUTPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the output FIFO at a given time. Note the fields in this register are dynamically updated hence when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP5_QUP_OUTPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	OUTPUT_FIFO_WORD_COUNT	Number of words in the output FIFO.

**0x078BA110+ BLSP1_BLSP_QUP5_QUP_OUTPUT_FIFOc, c=[0..15]
0x4*c****Type:** W**Clock:** crif_clk**Reset State:** 0x00000000

Note that consecutive writes to this address keeps filling up the output FIFO. The max address to address the output FIFO is 0x14C.

BLSP1_BLSP_QUP5_QUP_OUTPUT_FIFOc

Bits	Name	Description
31:0	OUTPUT	Value to be shifted out.

0x078BA150 BLSP1_BLSP_QUP5_QUP_MX_WRITE_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_OUTPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_OUTPUT_COUNT register case, the SW should not program the QUP_MX_WRITE_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_OUTPUT * FIFO_SIZE_OUTPUT).

BLSP1_BLSP_QUP5_QUP_MX_WRITE_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_WRITE_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_WRITE_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_OUTPUT_DONE_FLAG was asserted)
15:0	MX_WRITE_COUNT	RW	The number of 'writes' of size N. This is used only if the core is in FIFO_Mode.

0x078BA154 BLSP1_BLSP_QUP5_QUP_MX_WRITE_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_QUP_MX_WRITE_CNT_CURRENT**

Bits	Name	Description
15:0	MX_WRITE_CNT_CURRENT	Current value of QUP_MX_WRITE_COUNT counter.

0x078BA200 BLSP1_BLSP_QUP5_QUP_MX_INPUT_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read. This register only applies to Block_Mode and Bam_Mode (for non-balanced SPI). The counter decrements for each input transfer when the STATE field (see QUP_STATE register) is moved from the RESET_STATE to the RUN_STATE. The PAUSE_STATE do not affect the count.

Notes:

a. Allows the number of shift register transfers to be less than an exact multiple of INPUT_BLOCK_SIZE. When count reached, remainder of INPUT_BLOCK_SIZE is filled with zeroes.

BLSP1_BLSP_QUP5_QUP_MX_INPUT_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_INPUT_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_INPUT_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_INPUT_COUNT	RW	Number of reads of size N from the mini-core per RUN_STATE. A value of zero indicates the input count function is not enabled for use. See note (a) above.

0x078BA204 BLSP1_BLSP_QUP5_QUP_MX_INPUT_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_QUP_MX_INPUT_CNT_CURRENT**

Bits	Name	Description
15:0	MX_INPUT_CNT_CURRENT	Current value of QUP_MX_INPUT_COUNT.

0x078BA208 BLSP1_BLSP_QUP5_QUP_MX_READ_COUNT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

What the QUP_MX_INPUT_COUNT register means to Block_Mode and Bam_Mode, this register means the same to FIFO_mode. If this register is non-zero, then the qup_input_service_irq is asserted after shifting in the number of shifts specified by this register.

Unlike the QUP_MX_INPUT_COUNT register case, the SW should not program the QUP_MX_READ_COUNT value to be more than the 'actual depth' of the FIFO (BLOCK_SIZE_INPUT * FIFO_SIZE_INPUT). If the SPI mini-core and slave operation is enabled, then an InputOverRun error will result.

BLSP1_BLSP_QUP5_QUP_MX_READ_COUNT

Bits	Name	Type	Description
31	MX_CONFIG_DURING_RUN	W	Write only value. When reset to zero the MX_READ_COUNT value only applies in reset_state (legacy behavior). When set to one the MX_READ_COUNT value will also apply in run_state and allow writing the transaction data in a few portions when not knowing the transaction size in advance. Reconfiguration during run is only allowed after the last portion has ended (i.e. MAX_INPUT_DONE_FLAG was asserted)
15:0	MX_READ_COUNT	RW	The number of 'reads' of size N. This is used only if the core is in FIFO_Mode.

0x078BA20C BLSP1_BLSP_QUP5_QUP_MX_READ_CNT_CURRENT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP5_QUP_MX_READ_CNT_CURRENT

Bits	Name	Description
15:0	MX_READ_CNT_CURRENT	Current value of QUP_MX_READ_COUNT counter.

0x078BA214 BLSP1_BLSP_QUP5_QUP_INPUT_FIFO_WORD_CNT**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the number of words in the input FIFO at a given time. Note the fields in this register are dynamically updated. Hence, when this register is read during a FIFO operation, the value of this register could have been altered by the time SW gets the read value. Recommended for debug purposes.

BLSP1_BLSP_QUP5_QUP_INPUT_FIFO_WORD_CNT

Bits	Name	Description
8:0	INPUT_FIFO_WORD_CNT	Number of words in the input FIFO.

**0x078BA218+BLSP1_BLSP_QUP5_QUP_INPUT_FIFOc, c=[0..15]
0x4*c****Type:** R**Clock:** crif_clk**Reset State:** Undefined

Consecutive reads to this address reads the input FIFO contents on a FIFO basis. The max address to read the input FIFO is 0x254.

BLSP1_BLSP_QUP5_QUP_INPUT_FIFOc

Bits	Name	Description
31:0	INPUT	Value shifted in.

0x078BA300 BLSP1_BLSP_QUP5_SPI_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

Unless otherwise stated, register bits written return the value when read.

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register. Both NO_OUTPUT and NO_INPUT set to zero provides default full duplex operation. Setting both these bits to one is not a legal operational state.

BLSP1_BLSP_QUP5_SPI_CONFIG

Bits	Name	Type	Description
10	HS_MODE	RW	When set, SPI HS_MODE is enabled. When clear, SPI HS_MODE is disabled.
9	INPUT_FIRST	RW	When set, INPUT FIRST SPI protocol is used. When clear, OUTPUT FIRST SPI protocol is used.
8	LOOP_BACK	RW	Loopback is only valid in non-HS mode. Always clear for normal operation. If set, loop back on SPI_DATA_MO_SI under MASTER operation or SPI_DATA_MI_SO under SLAVE operation.
5	SLAVE_OPERATION	R	This register is writable only when the hardware signal spi_slave_en is asserted. When set, the SPI is configured for SLAVE operation. Zero indicates MASTER operation.

0x078BA304 BLSP1_BLSP_QUP5_SPI_IO_CONTROL

Type: RW

Clock: crif_clk

Reset State: 0x00000000

The contents of this register should only be changed when in the RESET_STATE. See the QUP_STATE register.

Unless otherwise stated, register bits written return the value when read.

BLSP1_BLSP_QUP5_SPI_IO_CONTROL

Bits	Name	Description
11	FORCE_CS	When this bit is set, the chip select is asserted unconditionally with no relationship to QUP_STATE or transaction state.
10	CLK_IDLE_HIGH	When set to 1, spi_clk will be high when spi is idle (spi_cs is not asserted). When cleared to 0, spi_clk will be low when spi is idle (spi_cs is not asserted).
9	CLK_ALWAYS_ON	When MASTER operation is used, run SPI_CLK during IDLE.
8	MX_CS_MODE	If this bit is set, then for a given RUN state, the associated chip select will be asserted for the first N-bit transfer and will be kept asserted till the last programmed transfer. Applies only in MASTER mode. The number of transfers is determined by SPI_MX_OUTPUT_COUNT and/or SPI_MX_INPUT_COUNT registers.

BLSP1_BLSP_QUP5_SPI_IO_CONTROL (cont.)

Bits	Name	Description
7:4	CS_N_POLARITY	These four bits control the polarity of four SPI_CS#_N respectively. Setting any of this bit to '1', makes the associated SPI_CS#_N active HIGH. This field is a 'don't care' in SLAVE operation.
3:2	CS_SELECT	When MASTER operation is used, controls the assertion of SPI_CS_#N pins. Selects SPI_CS_N if 00, SPI_CS1_N if 01, SPI_CS2_N if 10, or SPI_CS3_N if 11. The deselected ChipSelects will be driven to inactive state dictated by the field CS_N_POLARITY. This field is a 'don't care' in SLAVE operation.
1	TRISTATE_CS	When set, drives Z on all SPI_CS#_N lines. When clear, enables normal functionality on these lines. This bit can be used to support deployment of the core as one of the masters in a multi-master configuration.
0	NO_TRI_STATE	When set, spi_data_out is not taken tri-state when SPI_CS#_N is de-asserted. This bit is normally set for MASTER operation but may be optionally left cleared.

0x078BA308 BLSP1_BLSP_QUP5_SPI_ERROR_FLAGS**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

All bits in this register are set by hardware and remain set until cleared by software. Writing a 'one' to a bit clears it while writing a 'zero' leaves the bit unchanged.

BLSP1_BLSP_QUP5_SPI_ERROR_FLAGS

Bits	Name	Description
3	TRANSFER_CANCEL_DONE	This bit is set (1) when the SPI controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
2	TRANSFER_CANCEL_ID_MATCH	This bit is set (1) when the SPI controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.
1	SPI_SLV_CLK_OVER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was greater than the programmed value of N. When this happens, only the first N bits are passed to the SPI input FIFO and the output shift value is held at zero.
0	SPI_SLV_CLK_UNDER_RUN_ERR	Number of SPI_CLK ticks which occurred while SPI_CS#_N was asserted was less than the programmed value of N. When this occurs, the bits which were received are passed to the SPI input FIFO and the CURRENT output bit is forced to zero.

0x078BA30C BLSP1_BLSP_QUP5_SPI_ERROR_FLAGS_EN**Type:** RW**Clock:** crif_clk**Reset State:** 0x0000000C

Each bit in this register controls the setting of a corresponding error flag. If set, each bit enables generation of spi_error_irq and the setting of the corresponding error flag in the SPI_ERROR_FLAGS register for the specified error case. At reset, all error enable bits are set to '1'.

BLSP1_BLSP_QUP5_SPI_ERROR_FLAGS_EN

Bits	Name	Description
3	TRANSFER_CANCEL_DONE_EN	If set, enables generating the transfer cancel done indication.
2	TRANSFER_CANCEL_ID_MATCH_EN	If set, enables generating the transfer cancel ID match indication.
1	SPI_SLV_CLK_OVER_RUN_ERR_EN	If set, enables clock over run error generation.
0	SPI_SLV_CLK_UNDER_RUN_ERR_EN	If set, enables clock under run error generation.

0x078BA310 BLSP1_BLSP_QUP5_SPI_DEASSERT_WAIT**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

This register holds the de-assertion wait time of SPI_CS#_N between consecutive N-bit transfers in MASTER operation. The wait time is specified in number of cycles of cc_spi_master_clk.

BLSP1_BLSP_QUP5_SPI_DEASSERT_WAIT

Bits	Name	Description
5:0	DEASSERT_WAIT	Number cc_spi_master_clk ticks associated with the deasserted time of SPI_CS#_N. Only applies to MASTER operation. For SLAVE operation, this field is a 'don't care'. A value of zero indicates SPI_CS#_N remains de-asserted for exactly one clock tick. A value of one, indicates two ticks, etc. All ones indicates 64 ticks.

0x078BA314 BLSP1_BLSP_QUP5_SPI_MASTER_LOCAL_ID**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_SPI_MASTER_LOCAL_ID**

Bits	Name	Description
15:8	EXTENDED_ID	SW may use this field to specify the current sub-transfer ID to be read when TRANSFER_CANCEL_ID_MATCH is asserted. This value has no impact on HW.
7:0	LOCAL_ID	SW specifies the current transfer ID. HW will use this value to match with TRANSFER_CANCEL_ID.

0x078BA318 BLSP1_BLSP_QUP5_SPI_MASTER_COMMAND**Type:** W**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_SPI_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command.

0x078BA31C BLSP1_BLSP_QUP5_SPI_MASTER_STATUS**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_SPI_MASTER_STATUS**

Bits	Name	Description
2:0	CANCEL_FSM_STATE	This 3-bit field informs the microprocessor of the state of the SPI cancel logic. Internal use only

0x078BA400 BLSP1_BLSP_QUP5_I2C_MASTER_CLK_CTL**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

The I2C_CLK_CTL register is a read/write register that controls clock divider values.

BLSP1_BLSP_QUP5_I2C_MASTER_CLK_CTL

Bits	Name	Description
28	SCL_EXT_FORCE_LOW	When set to 0, SCL generation maintains legacy behavior. When set to 1, SCL state machine will go to the FORCED_LOW_STATE if force_low is asserted near (within 5 SCL clock cycles = $5 * 52\text{ns} = 260\text{ns} \approx \text{MAX}(\text{Tsu}, \text{DAT})$) the clock edge.
27:26	SDA_NOISE_REJECTION	Allows adding extra sampling levels on SDA to reject short low pulses. This value specifies how many TCXO cycles of logic low on SDA would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
25:24	SCL_NOISE_REJECTION	Allows adding extra sampling levels on SCL to reject short low pulses. This value specifies how many TCXO cycles of logic low on SCL would be considered as valid logic low. 0x0 - legacy mode, 0x01 - one cycle wide low pulse is rejected, 0x2 - two cycles wide low pulse is rejected, 0x3 - three cycles wide low pulse is rejected
23:16	HIGH_TIME_DIVIDER_VALUE	Allows setting SCL duty cycle to non 50%. If this value is zero then legacy mode is used. If this value is non-zero then it will be used as the SCL high time counter and FS_DIVIDER_VALUE will be used as the low time counter. Minimum value is 0x7.
10:8	HS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in high-speed (HS) mode. Minimum value is 0x3. $\text{I2C_HS_CLK} = \text{I2C_CLK} / (3 * (\text{HS_DIVIDER_VALUE} + 1) + 2)$
7:0	FS_DIVIDER_VALUE	The value in this register represents the clock period multiplier in fast/standard (FS) mode. Minimum value is 0x7. When HIGH_TIME_DIVIDER_VALUE=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (2 * (\text{FS_DIVIDER_VALUE} + 3))$ When HIGH_TIME_DIVIDER_VALUE!=0: $\text{I2C_FS_CLK} = \text{I2C_CLK} / (\text{FS_DIVIDER_VALUE} + \text{HIGH_TIME_DIVIDER_VALUE} + 6)$

0x078BA404 BLSP1_BLSP_QUP5_I2C_MASTER_STATUS**Type:** RW**Clock:** crif_clk**Reset State:** 0x0C000000

The I2C_STATUS is a status register. Writing any value clears the status bits.

BLSP1_BLSP_QUP5_I2C_MASTER_STATUS

Bits	Name	Type	Description
30:28	CANCEL_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C cancel logic. Internal use only 0x0: IDLE_STATE (IDLE_STATE) 0x1: CANCEL_PENDING_STATE (CANCEL_PENDING_STATE) 0x2: PAUSE_STATE (PAUSE_STATE) 0x3: PAUSE_WAIT_STATE (PAUSE_WAIT_STATE) 0x4: SEND_STOP_STATE (SEND_STOP_STATE) 0x5: FLUSH_STATE (FLUSH_STATE) 0x6: SEND_IRQ_STATE (SEND_IRQ_STATE)
27	I2C_SCL	R	Logic state of I2C bus serial clock wire.
26	I2C_SDA	R	Logic state of I2C bus serial data wire.
25	INVALID_READ_SEQ	RW	Interrupt source. This bit is set (1) when a MI_REC tag does not follow a START tag for an I2C READ. Not applicable for Halcyon.
24	INVALID_READ_ADDR	RW	Interrupt source. In version 1 tags this bit is set (1) when the I2C controller is trying to receive data from a non-existent I2C slave (address). In version 2 tags this bit is set (1) when the I2C controller is trying to access a non-existent I2C slave (address).
23	INVALID_TAG	RW	Interrupt source. This bit is set (1) when the I2C controller is trying to process data from the output FIFO that is improperly tagged.
22:20	INPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER INPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_READ_LAST_BYTE_STATE (READ_LAST_BYTE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_DEC_STATE (DEC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_STORE_STATE (STORE_STATE value. Applies for both version 1 and version 2 tags) 0x6: V2_WR_TAG_STATE (WR_TAG_STATE value. Only applicable in version 2 tags) 0x7: V2_WAIT_TAG_STATE (WAIT_TAG_STATE value. Only applicable in version 2 tags)

BLSP1_BLSP_QUP5_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
19:16	OUTPUT_FSM_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C MASTER OUTPUT FSM block. Internal use only 0x0: V1_V2_RESET_STATE (RESET_STATE value. Applies for both version 1 and version 2 tags) 0x1: V1_V2_IDLE_STATE (IDLE_STATE value. Applies for both version 1 and version 2 tags) 0x2: V1_V2_DECODE_STATE (DECODE_STATE value. Applies for both version 1 and version 2 tags) 0x3: V1_V2_SEND_STATE (SEND_STATE value. Applies for both version 1 and version 2 tags) 0x4: V1_V2_MI_REC_STATE (MI_REC_STATE value. Applies for both version 1 and version 2 tags) 0x5: V1_V2_NOP_STATE (NOP_STATE value. Applies for both version 1 and version 2 tags) 0x6: V1_V2_INVALID_STATE (INVALID_STATE value. Applies for both version 1 and version 2 tags) 0x7: V1_PEEK_STATE (PEEK_STATE value. Only applicable in version 1 tags) 0x8: V1_SEND_R_STATE (SEND_R_STATE value. Only applicable in version 1 tags) 0xB: V2_GET_BYTE_STATE (GET_BYTE_STATE value. Only applicable in version 2 tags) 0xC: V2_GET_WRITE_BYTE_STATE (GET_WRITE_BYTE_STATE value. Only applicable in version 2 tags) 0xD: V2_SPECIALITY_STATE (SPECIALITY_STATE value. Only applicable in version 2 tags) 0xE: V2_WAIT_FLUSH_STOP_STATE (WAIT_FLUSH_STOP_STATE value. Only applicable in version 2 tags) 0xF: V2_STOP_STATE (STOP_STATE value. Only applicable in version 2 tags)
15:13	CLK_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C clk_control block. Internal use only 0x0: RESET_BUSIDLE_STATE (RESET_BUSIDLE_STATE) 0x1: NOT_MASTER_STATE (NOT_MASTER_STATE) 0x2: HIGH_STATE (HIGH_STATE) 0x3: LOW_STATE (LOW_STATE) 0x4: HIGH_WAIT_STATE (HIGH_WAIT_STATE) 0x5: FORCED_LOW_STATE (FORCED_LOW_STATE) 0x6: HS_ADDR_LOW_STATE (HS_ADDR_LOW_STATE) 0x7: DOUBLE_BUFFER_WAIT_STATE (DOUBLE_BUFFER_WAIT_STATE)

BLSP1_BLSP_QUP5_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
12:10	DATA_STATE	R	This 3-bit field informs the microprocessor of the state of the I2C data_control block. Internal use only 0x0: RESET_WAIT_STATE (RESET_WAIT_STATE) 0x1: TX_ADDR_STATE (TX_ADDR_STATE) 0x2: TX_DATA_STATE (TX_DATA_STATE) 0x3: TX_HS_ADDR_STATE (TX_HS_ADDR_STATE) 0x4: TX_10_BIT_ADDR_STATE (TX_10_BIT_ADDR_STATE) 0x5: TX_2ND_BYTE_STATE (TX_2ND_BYTE_STATE) 0x6: RX_DATA_STATE (RX_DATA_STATE) 0x7: RX_NACK_HOLD_STATE (RX_NACK_HOLD_STATE)
9	BUS_MASTER	R	This bit is set (1) when the I2C controller is the present bus master.
8	BUS_ACTIVE	R	This bit is set (1) when the bus is in use by this, or any other controller.
7:6	FAILED	RW	Interrupt source. This 2-bit field contains the failure information of the present I2C transfers. If transmitting, failed[1] contains the information regarding the byte that has been transmitted. Failed[0] contains the information of the byte awaiting transmission if there is a byte pipelined. If no byte is pipelined, ignore this bit. If receiving, failed[1] contains the information of the byte received and stored in the buffer, and failed[0] should be ignored. For example: Value 00: Byte n transmitted successfully, byte n+1 to begin transmission Value 01: Byte n transmitted successfully, byte n+1 errored: type of error indicated in other STATUS bits. (queued invalid write, for example) Value 10: Byte n errored: type of error indicated in other STATUS bits, byte n+1 to begin transmission (byte n+1 would have to be a valid address byte for this condition to occur) Value 11: Byte n errored: type of error indicated in other STATUS bits, byte n+1 discarded as well (if the byte was a data byte destined for a NACKed address, data is useless, therefore discarded)
5	INVALID_WRITE	RW	Interrupt source. This bit is set (1) when software writes data to the I2C_DATA register that should be flagged as an address but is not.
4	ARB_LOST	RW	Interrupt source. This bit is set (1) when the controller loses arbitration for the bus. If this bit gets set (1) during the transmission, all data has been lost, and the microprocessor must re-request its transmission.

BLSP1_BLSP_QUP5_I2C_MASTER_STATUS (cont.)

Bits	Name	Type	Description
3	PACKET_NACKED	RW	Interrupt source. This bit is set high when a NACK is received from a slave. If a high speed master code is sent and there is an ACK from a slave, then this bit is set (1) to indicate that the high speed mode can not be entered. If the high speed mode is accepted by the slave, then a NACK is performed and this bit is not set (1).
2	BUS_ERROR	RW	Interrupt source. This bit is set (1) when an unexpected START or STOP condition is detected. This returns the controller to its reset state.
1	TRANSFER_CANCEL_DONE	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller has completed canceling the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID).
0	TRANSFER_CANCEL_ID_MATCH	RW	Only applicable when using version 2 tags. Interrupt source. This bit is set (1) when the I2C controller is ready for cancel operation: it has found the transfer that was scheduled for cancellation (LOCAL_ID = TRANSFER_CANCEL_ID) and the logic is done with previous activity.

0x078BA408 BLSP1_BLSP_QUP5_I2C_MASTER_CONFIG**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_I2C_MASTER_CONFIG**

Bits	Name	Description
0	EN_VERSION_TWO_TAG	When set, version 2 of the mini-core is enabled.

0x078BA40C BLSP1_BLSP_QUP5_I2C_MASTER_BUS_CLEAR**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000

BLSP1_BLSP_QUP5_I2C_MASTER_BUS_CLEAR

Bits	Name	Description
0	CLEAR	This command should be given only when the i2c mincore is idle. When in doubt SW can use SW_RESET to reset the minicore. When set, an I2C 'Bus Clear' executed per the I2C standard. A bus clear consists of nine I2C clock ticks with data wire left not-driven. Has the effect of clearing any slave which has lost read sync. After the clear is complete, the hardware sets the CLEAR bit to zero. The bit can not be cleared by software. After a bus clear, both clock and data lines should be high. If not, an external slave has hung the bus by holding down one or both lines. Reset the slave to clear if possible. Any slave reset mechanism is beyond the scope of the I2C mini core.

0x078BA410 BLSP1_BLSP_QUP5_I2C_MASTER_LOCAL_ID**Type:** R**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_I2C_MASTER_LOCAL_ID**

Bits	Name	Description
7:0	LOCAL_ID	Read only value capturing the ID byte of the last NOP LOCAL tag. Only applicable when using V2 tags

0x078BA414 BLSP1_BLSP_QUP5_I2C_MASTER_COMMAND**Type:** RW**Clock:** crif_clk**Reset State:** 0x00000000**BLSP1_BLSP_QUP5_I2C_MASTER_COMMAND**

Bits	Name	Description
0	RESET_CANCEL_FSM	This command should be given only when the CANCEL_FSM_STATE is in CANCEL_PENDING_STATE or PAUSE_WAIT_STATE and when the core is in PAUSE. The main use case for this bit is to allow withdrawing a cancel command in case the transfer was flushed (QUP_STATE[I2C_FLUSH] was set) due to I2C NACK.

21 USB2

21.1 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS

0x078D9000 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ID

Type: R

Clock: CC_USB_OTG_HS_CLK

Reset State: 0x0042FA05

The USB_OTG_HS_ID register is the identification register. It provides a simple way to determine if the USB-HS USB 2.0 core is provided in the system. The ID register identifies the USB-HS USB 2.0 core and its revision.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ID

Bits	Name	Description
31:24	RESERVED_BITS31_24	These bits are reserved and should be set to zero.
23:16	REVISION	This field contains the revision number of the core - 0x42.
15:8	NID	This field contains the complement version of ID[7:0] - 0xFA.
7:0	ID	This field is the configuration number. This number is set to 0x05 and indicates that the peripheral is the USB-HS USB 2.0 core.

0x078D9004 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HWGENERAL

Type: R

Clock: CC_USB_OTG_HS_CLK

Reset State: 0x000005C2

The USB_OTG_HS_HWGENERAL register contains the general hardware parameters.

The USB_OTG_HS_HWTXBUF register contains the Tx buffer hardware parameters.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HWTXBUF

Bits	Name	Description
31	TXLCR	This bit is fixed to 1'b1 so that the local context register's are included in the design. This means that the DMA context is implemented in FlipFlops.
30:24	RESERVED_BITS30_24	Clear (0) these bits.
23:16	TXCHANADD	VUSB_HS_TX_CHAN_ADD - Defines the number of address lines needed per Endpoint per the TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
15:8	TXADD	VUSB_HS_TX_ADD - Defines the number of address lines needed per the entire TX latency buffer. It's reset value is taken from a GENERIC value passed to the core.
7:0	TXBURST	VUSB_HS_TX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the TX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst lengths will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

0x078D9014 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HWRXBUF**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000808

The USB_OTG_HS_HWRXBUF register contains the Rx buffer hardware parameters.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HWRXBUF

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits).
15:8	RX_ADD	VUSB_HS_RX_ADD - Defines the number of address lines needed per the entire RX latency buffer. It's reset value is taken from a GENERIC value passed to the core.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HWRXBUF (cont.)

Bits	Name	Description
7:0	RX_BURST	VUSB_HS_RX_BURST - Defines the data burst length of the AHB master interface in Quad-words (4-byte increments) of the RX data. It's reset value is taken from a GENERIC value passed to the core. Note that the actual burst lengths will depend on the settings of USB_OTG_HS_AHB_MODE and USB_OTG_HS_AHB_BURST registers.

**0x078D9040+ USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_SCRATCH_RAMn, n=[0..15]
0x4*n****Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

USB_OTG_HS_SCRATCH_RAMn registers are 16 32bit scratch registers. Required for passing USB software information between different images.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_SCRATCH_RAMn

Bits	Name	Description
31:0	SCRATCH_REGISTER	32 bit scratch register

0x078D9080 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER0LD**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_GPTIMER0LD register is the general purpose timer #0 load register. This register contains the timer duration or load value. See the GPTIMER0CTRL register for a description of the timer functions.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER0LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFF or 16.777215 seconds

0x078D9084 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER0CTRL**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_GPTIMER0CTRL register is the general purpose timer #0 control register. This register contains the control for the timer and a data field can be queried to determine the running count value. This timer has a granularity of 1 ms and can be programmed to a little over 16 seconds. There are two modes supported by this timer: the first is a one-shot and the second is a looped count, which is described in the register table below. When the timer counter value transitions to zero, an interrupt can be generated though the use of the timer interrupts in the USBTS and USBINTR registers.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER0CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x078D9088 USB_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER1LD**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_GPTIMER1LD register is the general purpose timer #1 control register. This register contains the timer duration or load value. See the GPTIMER0LD register for a description of the timer functions.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER1LD

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23:0	GPTLD	General purpose timer load value. This field is the value to be loaded into the GPTCNT countdown timer on a reset action. This value in this register represents the time in microseconds minus 1 for the timer duration. Example: for a one millisecond timer, load 1000-1=999 or 0x0003E7. Note: Max value is 0xFFFFF or 16.777215 seconds.

0x078D908C USB_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER1CTRL**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_GPTIMER1CTRL register is the general purpose timer #1 control register. See the description of the USB_OTG_HS_GPTIMER0CTRL register for details about this register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER1CTRL

Bits	Name	Description
31	GTPRUN	General purpose timer run Read/write value 0 = Timer stop value 1 = Timer run This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT.
30	GPTRST	General purpose timer reset Write-only value 0 = No action value 1 = Load counter value Writing a one to this bit will reload the GPTCNT with the value in GPTLD.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GPTIMER1CTRL (cont.)

Bits	Name	Description
29:25	RESERVED_BITS29_25	Clear (0) these bits.
24	GPTMODE	General purpose timer mode Read/write value 0 = One shot value 1 = Repeat This bit selects between a single timer countdown and a looped count down. In the one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by the software. In the repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	GPTCNT	General purpose timer counter Read-only This field is the value of the running timer.

0x078D9090 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_AHB_BURST**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_AHB_BURST register determines the AHB master mode of the USB HS Core.

NOTE If the USB_OTG_HS_AHB_MODE is configured to be 0x0 (the AHB Transactor is used), this register must be 0x0 as well, otherwise the AHB Master bus behavior is undefined. Use values other than 0x0 only if setting USB_OTG_HS_AHB_MODE to 0x1.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_AHB_BURST

Bits	Name	Description
31:3	RESERVED_BITS31_3	Should be set to zero.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_AHB_BURST (cont.)

Bits	Name	Description
2:0	AHB_BURST	AMBA AHB BURST. This is a r/w field that selects the following options for the m_hburst signal of the AMBA master interface: - 3'b000: INCR burst of unspecified length - 3'b001: INCR4, non-multiple transfers of INCR4 will be decomposed into singles - 3'b010: INCR8, non-multiple transfers of INCR8, will be decomposed into INCR4 or singles - 3'b011: INCR16, non-multiple transfers of INCR16, will be decomposed into INCR8, INCR4 or singles - 3'b100: This value is reserved and should not be used - 3'b101: INCR4, non-multiple transfers of INCR4 will be decomposed into smaller unspecified length bursts - 3'b110: INCR8, non-multiple transfers of INCR8 will be decomposed into smaller unspecified length bursts - 3'b111: INCR16, non-multiple transfers of INCR16 will be decomposed into smaller unspecified length bursts In all cases where the unspecified length burst is allowed, singles access may also occur, this is mostly true when the transaction is not 32-bit aligned. Two consecutive single accesses should not happen. When a INCRx burst size is selected and the transfer is not multiple of the INCRx burst, the burst is decomposed in the different ways. With AHBBRST[2] = 1, the smaller bursts will be unspecified length. with AHBBRST[2] = 0, the smaller bursts will be smaller INCRx or singles. For example, lets say that it's required at a given time, to transfer 22 words of information, for the following values of AHBBRST the master sequence will be: - 3'b101: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+ INCR4 unspec. length - 3'b110: INCR8+INCR8+INCR4+ INCR4 unspec. length - 3'b111: INCR16+INCR4+ INCR4 unspec. length - 3'b001: INCR4+ INCR4 +INCR4+ INCR4 +INCR4+SINGLE+SINGLE - 3'b010: INCR8+INCR8+INCR4+SINGLE+SINGLE - 3'b011: INCR16+INCR4+SINGLE+SINGLE This field after reset is set to a default value that can be configured in the file vusb_hs_cfg.vhd.
		The AHBBRST field is only used if the AMBA-AHB system interface has been selected. It has no effect for cores featuring BVCI interface. In the later case the read will return zeros. When this field is different from zero, the value of the fields TXBURST /RXBURST in register BURSTSIZE 160h, will be ignored by the controller. Internally the BURSTSIZE will be set to the value of the INCRx AMBA burst. Since this has a direct relation with the burst sizes you must be careful with AHB burst selected. Although the TXBURST / RXBURST are bypassed, this register can still be written / read with no effect, while the AHBBRST field is non-zero.

0x078D9094 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_XTOR_STS**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_XTOR_STS register is currently a placeholder for future status bits from the AHB2AHB Transactor.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_XTOR_STS

Bits	Name	Description
31:2	RESERVED_BITS31_2	Not used currently.
1	GRANT_STOLEN	Reports whether the arbiter removed the hgrant signal prior to completing a transaction. This is currently supported in WRITES ONLY. This bit can be cleared by writing a '1' to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register. To enable this bit again, write a '0' to the GRANT_STOLEN_CLEAR bit in the USB_OTG_HS_AHB_MODE register.
0	RESERVED_BIT0	Not used currently.

0x078D9098 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_AHB_MODE**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000008**USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_AHB_MODE**

Bits	Name	Description
31	ASYNC_BRIDGES_BYPASS	Default is '0'. When '0' the asynchronous bridge on the master AHB interface is used. When '1', it is bypassed. The bridge on the slave AHB is always used.
30:5	RESERVED_BITS30_5	Not used currently.
4	INCR_OVERRIDE	Valid only if the Transactor is bypassed: When '1', all INCR bursts from the USB Core will be internally transformed into SINGLE transfers. When '0', if the USB Core issues an INCR burst, it will propagate to the external master AHB port.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_AHB_MODE (cont.)

Bits	Name	Description
3:2	HPROT_MODE	When '00' the HPROT signal out of the USB Wrapper is '0001', and all transactions are non-posted. When '01' the HPROT signal out of the USB Wrapper is '0101', and all transactions are posted. When '10' the HPROT signal out of the USB Wrapper alternates according to the context of the AHB bus access. Control structures are non-posted while data transfer is posted. When '11', reserved value, but currently maps to non-posted (same as '00'). Default value is '10'
1	GRANT_STOLEN_CLEAR	Clears the grant stolen field of the USB_OTG_HS_XTOR_STS register. To enable this bit again, write '0' after clearing the GRANT_STOLEN ('1').
0	XTOR_BYPASS	When this bit is set (1), the AHB Transactor is bypassed, and the USB HS Core's AHB Master interface is directly connected to the Qualcomm AHB system. In this case, the USB_OTG_HS_AHB_BURST register value will determine the bus characteristics. When this bit is reset (0), the AHB Transactor is used to connect the USB HS Core to the Qualcomm AHB system. Default value is '0'

0x078D909C USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000830

The USB_OTG_HS_GEN_CONFIG register is used to configure various features that have been added to the HS USB Core.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG

Bits	Name	Description
31:16	RESERVED	Reserved
15	SYS_CLK_SW_EN	This bit is applicable only in SPS Device mode. When this bit is set then USB core always voting for USB_SYSTEM_CLK. Default value is 0 - USB core doesn't request USB_SYSTEM_CLK when in Low Power Mode.
14	TESTMUX_SEL_4	see TESTMUX_SEL_3_0 the first 4 bits of this register.
13	USB_BAM_DISABLE	This bit disables the bam logic inside the USB and makes him work in Legacy mode.
12	DMA_HPROT_CTRL	When this bit is set Link Controller always does non-posted dQH writes.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
11	ISO_FIX_EN	This bit enables fix for Isochronous bug in CI core (CR--0000135251).
10	DSC_PE_RST_EN	This bit enables an automatic reset of Device PE State Machine on disconnection event when operating as device. This reset is a HW fix for CR-000940.
9	HOST_SIM_TIMERS_EN_S USP	When this bit is set (1), the timers used for the USB suspend process short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB suspend process are according to the USB specification.
8	HOST_SIM_TIMERS_EN_S TD	When this bit is set (1), the timers used for the USB reset on the ULPI are short for faster simulation and ATE time. When this bit is clear(0), the timers used for the USB reset on the ULPI are according to the USB specification.
7	PE_RX_BUF_PENDING_EN	This is only valid in Device Mode. Setting this bit will cause to store a Transaction Status Tag in the Pending register instead of RX Buffer if the RX Buffer is full. The Tag will move from Pending register to RX Buffer as soon as it becomes not full.
6	STREAM_RX_BYPASS_EN ABLE	This is only valid in Device Mode. If SDIS bit is set (bit #4 of USB_OTG_HS_USBMODE (0x1A8)), i.e. streaming mode is disabled, setting this bit will cause the RX traffic to override the SDIS bit, and to receive in streaming mode. TX will still be in non-streaming mode.
5	ULPI_SERIAL_EN	This bit must be set to enable operation of ULPI Serial FS/LS mode. Default state is '1' - ULPI Serial mode is supported.
4	PE_DP_TXFIFO_IDLE_FOR CE	This is only valid in Device Mode. Setting this bit to '1' forces the dp_tx_fifo_cmd_dev to be equal to PE_DP_TXFIFO_IDLE when Device PE state machine in REPORT_NAK state and the RX Buffer is full. This bit is used to enable fix of CR-001612. Reset value is '1'.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG (cont.)

Bits	Name	Description
3:0	TESTMUX_SEL_3_0	With TESTMUX_SEL_4 select one of the following test buses: Value 00001 Key state machines 00010 dma_eng_0 dma_dev_sm_1 00011 dma_eng_1 dma_context 00100 dma_eng_2 dma_mem_arb 00101 prot_eng_0 00110 prot_eng_1 00111 prot_eng_2 01000 port_ctrl_0 01001 port_ctrl_1 01010 tx_buffer 01011 rx_buffer 01100 otg 01101 hsic_test_bus1 01110 hsic_test_bus2 10000 dma_eng_3 dma_dev_sm_2 10001 dma_eng_4 dma_traf others zeros

0x078D90A0 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG_2**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x003AFF60

Register for the chicken bits. The USB_OTG_HS_GEN_CONFIG_2 register is used to configure various features that have been added to the HS USB Core. By default, all chicken bits are off and the fix is applicable.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG_2

Bits	Name	Type	Description
31:26	RESERVED_BITS31_26	R	Clear (0) these bits.

20	IDDIG_SW	RW	HOST = 0, DEVICE = 1, default value 1 - Device
19	ULPI_TX_PKT_EN_CLR_FI X	RW	fix to QCTDD00284866 - Race between Port Reset start and SOF transmission in HSIC Host, default value 1 - enable
18	TRANSACTOR_NONPOST_WRITE_DIS	RW	chicken bit for QCTDD00257652 - This feature make the usb state machines to wait till the transactor finishes to process the transfers of specific descriptors. When bit is 1 this feature is disabled, default value 0 - enable
17	FPR_CTRL	RW	chicken bit that enables SW to clear the FPR bit in PORTSC register in Host mode instead of fixed Host Resume duration of 21 ms. This bit should be set to 1 to enable SW control of FPR. When bit is 0 then Host Resume is fixed 21 ms. Default value is 0 for backward compatibility.
16	SW_RESET_ALT_EN	RW	
15	DPSE_DMSE_HV_INTR_EN	RW	chicken bit that enables hv dpse/dmse interrupts to use usb low power mode wakeup mechanism. Default value is 1 - enable use of hv dpse/dmse interrupts.
14	USB_HW_SW_EVENTS_TO G_EN	RW	chicken bit that enables toggling of usb_otg_hs_sw_events and usb_otg_hs_hw_events buses. Default value is 1 - toggling enabled.
13	SYS_CLK_HOST_DEV_GATE_EN	RW	Chicken bit for the internal host/device clock gating. when this bit is set when usb operates in host mode the device logic will be turned off and vice versa, when this bit is cleared it disables internal system clock gating. Default value is 1 - internal clock gating is enabled.
12	LINESTATE_DIFF_WAKEUP_EN	RW	chicken bit for CR-0000155486. when this bit is set the USB enables the HW fix for Race condition between the attempt to enter LPM and USB bus reset. Default value is 1.
11	ULPI_LPM_PEND_EN	RW	chicken bit for CR-0000153486. when this bit is set the USB enables the HW fix for Function Control and LPM race condition. Default value is 1.
10	RX_FULL_NAK_EN	RW	chicken bit for CR-0000152878. when this bit is set the USB will respond with NAK's for Host Tokens with very slow AHB and when Streaming mode is enabled. Default value is 1.
9	ENDLESS_TD_EN	RW	chicken bit for CR-0000152976. When this bit is set Performance enhancements for 'infinite' Producer pipe (out endpoint with eTD that points to itself) are enabled. Default value is 1.
8	SCRATCH_RAM_EN	RW	chicken bit for CR-0000149922. When this bit is set the use of scratch ram is enabled and the SW can read/write from addresses 0x040 - 0x07c. when this bit is clear SW can no longer access those registers. Default value is 1.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GEN_CONFIG_2 (cont.)

Bits	Name	Type	Description
7	SESS_VLD_CTRL_EN	RW	When this bit is set then bit 25 of USBCMD register controls sess_vld signal inside the Link Controller. When this bit is clear then Link Controller receives sess_vld directly from PHY. Default value is 0.
6	CI_T_WTSUSRSTHS_EN	RW	When this bit is 0 then Device Port Control State Machine waits 2.5 us from USB Reset detection until starting driving Chirp K. When this bit is 1 then Device Port Control State Machine waits 1.5 ms from USB Reset detection until starting driving Chirp K. Default value is 1 - legacy behavior.
5	CI_T_UCH_EN	RW	When this bit is 0 then Device Port Control State Machine drives Chirp K for 1 ms. When this bit is 1 then Device Port Control State Machine drives Chirp K for 2ms. Default value is 1 - legacy behavior.
4	DP_RESET	RW	chicken bit for fix CI2687: When the OTG core is acting as a Host, and VBUS is turned off, and the attached Device attempts to perform a Session Request Protocol by using Data-line Pulsing, it will not be recognized by the Host. Also, when doing HNP and becoming a Host, a SE0 is forced in the line causing the OPT TD5.4 test to fail, without the software workaround.
3	ZLP_PRIME	RW	chicken bit for fix CI2655: When using ISO IN endpoints with MULT=3 and low bandwidth system bus access, the controller may enter into a wait loop situation without warning the software. Due to the low bandwidth the last packet from a mult3 sequence may not be fetched in time before the last token IN is received (for that frame/endpoint). This will cause the controller to reply with a zero length packet (ZLP), breaking the prime sequence.
2	NO_SOF_RX_FIFO_FULL	RW	chicken bit for fix CI2581: During normal operation, if the RX Fifo becomes full and the protocol engine needs to send a command to the DMA state machine, it will wait in that state until the RX Fifo becomes not full. As the protocol state machine also handles the SOF generation, the Soft will no longer be sent. If one SOF is missed, the Host controller will issue a false babble detection. If more than 3.125ms are elapsed without Soft the peripheral will recognize the idle bus as a USB reset.
1	WRONG_OPMODE_SUSP	RW	chicken bit for fix CI1274: When the Controller enters a Suspend state it asserts pomade with the wrong value, This causes no issue in actual usage.
0	RESUME_END_INTER	RW	chicken bit for fix CI1179: Working as host, when doing resume a port change interrupt was fired at the end of resume. According to the EHCI spec no interrupt should be fired.

0x078D9100 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_CAPLENGTH**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x01000040

The USB_OTG_HS_CAPLENGTH register is the capability register length. It is used to indicate which offset to add to the register base address at the beginning of the operational register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_CAPLENGTH

Bits	Name	Description
31:16	HCIVERSION	BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
7:0	CAPLENGTH	Offset at beginning of operational register

0x078D9104 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HCSPARAMS**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00010011

The USB_OTG_HS_HCSPARAMS register contains the host control structural parameters. The port steering logic capabilities are described in this register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HCSPARAMS

Bits	Name	Description
31:28	RESERVED_BITS31_28	Clear (0) these bits.
27:24	N_TT	Number of transaction translators This field indicates the number of embedded transaction translators associated with the USB2.0 host controller. For a multi-port host, this field will always equal 0001. For all other implementations, N_TT = 0000. This in a non-EHCI field to support embedded TT.
23:20	N_PTT	Number of ports per transaction translator This field indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. For a multi-port host this field will always equal N_PORTS. For all other implementations, N_PTT = 0000. This in a non-EHCI field to support embedded TT.
19:17	RESERVED_BITS19_17	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HCSPARAMS (cont.)

Bits	Name	Description
16	PI	Port indicator This bit indicates whether the ports support port indicator control. When set (1), the port status and control registers include a read/writable field for controlling the state of the port indicator. This field will always be set (1).
15:12	N_CC	Number of companion controllers This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no internal companion controllers. Port-ownership hand-off is not supported. A value larger than zero in this field indicates that there are companion USB1.1 host controller(s). Port-ownership hand-off are supported. High-, full-, and low-speed devices are supported on the host controller root ports. In this implementation, this field will always be clear (0).
11:8	N_PCC	Number of ports per companion controller This field indicates the number of ports supported per internal companion controller. It is used to indicate the port routing configuration to the system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, and so on. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC. In this implementation, this field will always be clear (0).
7:5	RESERVED_BITS7_5	Clear (0) these bits.
4	PPC	Port power control This field indicates whether the host controller implementation includes port power control. Set (1) indicates that the ports have port power switches. Clear (0) indicates that the ports do not have port power switches. The value of this field affects the functionality of the port power field in each port status and control register. This bit will always be clear (0) for a device only implementation.
3:0	N_PORTS	Number of downstream ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the operational register. Valid values are in the range of 1h to 0h. A zero in this field is undefined. The number of ports for a host implementation is configured from 1 to 8. This field will always be set (1) for device-only implementation.

0x078D9108 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HCCPARAMS**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000006

The USB_OTG_HS_HCCPARAMS register contains the host control capability parameters. This register identifies multiple mode control (time-base bit functionality) addressing capability.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HCCPARAMS

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.
15:8	EECP	EHCI extended capabilities pointer Default = 0 This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain the consistency of the PCI header defined for this class of device. For this implementation, all of these bits are clear (0).
7:4	IST	Isochronous scheduling threshold Default = implementation dependent This field indicates, relative to the current position of the executing host controller, where the software can reliably update the isochronous schedule. When bit [7] is clear (0), the value of the least significant 3 bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set (1), then host software assumes the host controller may cache an isochronous data structure for an entire frame. All of the bits in this field will always be clear (0).
3	RESERVED_BIT3	Clear (0) this bit.
2	ASP	Asynchronous schedule park capability Default = 1 If this bit is set (1), then the host controller supports the park feature for high-speed queue heads in the asynchronous schedule. The feature can be disabled, or enabled and set to a specific level by using the (ASPE) and (ASP[1:0]) fields in the USB_OTG_HS_USBCMD register. This field will always be set (1).

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HCCPARAMS (cont.)

Bits	Name	Description
1	PFL	Programmable frame list flag If this bit is clear (0), then the system software must use a frame list length of 1024 elements with this host controller. The FS[2:0] field in the USBCMD register is read-only and must be cleared (0). If this bit is set (1), then the system software can specify and use a smaller frame list, and configure the host controller using the FS[2:0] field in the USBCMD register. The frame list must always be aligned on a 4k-page boundary. This requirement ensures that the frame list is always physically contiguous. This bit in this field will always be set (1).
0	ADC	64-bit addressing capability This field will always be clear (0). No 64-bit addressing capability is supported.

0x078D9120 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DCIVERSION**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000001

The USB_OTG_HS_DCIVERSION register contains the device interface version number. The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DCIVERSION

Bits	Name	Description
15:0	DCIVERSION	Device interface version number

0x078D9124 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DCCPARAMS**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000190

The USB_OTG_HS_DCCPARAMS register contains the device control capability parameters. These fields describe the overall host/device capability of the controller.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DCCPARAMS

Bits	Name	Description
31:9	RESERVED_BITS31_9	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DCCPARAMS (cont.)

Bits	Name	Description
8	HC	Host capable When this bit is set (1), this controller is capable of operating as an EHCI-compatible USB 2.0 host controller.
7	DC	Device capable When this bit is set (1), this controller is capable of operating as a USB 2.0 device.
6:5	RESERVED_BITS6_5	Clear (0) these bits.
4:0	DEN	Device endpoint number This field indicates the number of endpoints build into the device controller. If this controller is not device capable, then this field will be all zeroes. Valid values for this field are 0 through 16.

0x078D9140 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00080000

The USB_OTG_HS_USBCMD register is the USB command register. The serial bus host/device controller executes the command indicated in this register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD

Bits	Name	Description
31	RST_CTRL	Default value = 0. Set to 1 to block operational reset to xcvr (ser and ulpi) clock domains.
30	ULPI_STP_CTRL	Default value = 0. Set to 1 to block the ulpi_stp signal from going out to ULPI PHY
29	ASYNC_INTR_CTRL	Default value = 0. Set to 1 to allow the async interrupt out from the HS core.
28	SE0_GLITCH_FIX_CTRL	Default value = 0. Set to 1 to activate the SE0 glitch fix mechanism
27	FS_3_WIRE_2_WIRE_SELECT	Default value = 0. Set this bit for enabling the two wire interface on the fs_dat and fs_se0 pins
26	ULPI_SER3_NOT6_SEL	ULPI serial 3 bits select. Read/write Read: Current status of serial data bus wide Write: SW writes '1' to this bit to request 3 pins ULPI data wide, or '0' to request 6 bit data wide in FsLsSerial Mode.
25	SESS_VLD_CTRL	Default value = 0. Set this bit to enable Link Controller operation after switching interface from Serial to ULPI.
24	RESERVED_BIT24	Clear (0) these bit

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
23:16	ITC	Interrupt threshold control Read/write Default 08h The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. This field contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum interrupt interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames
15	FS2	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
14	ATDTW	Add dTD tripwire Read/write (Device mode only) This bit is used as a semaphore to ensure the to proper addition of a new dTD to an active (primed) endpoint's linked list. This bit is set (1) and cleared (0) by the software. This bit shall also be cleared (0) by the hardware when the state machine is a hazard region for which adding a dTD to a primed endpoint may go unrecognized. For more information on the use of this bit, see the Device Operational Model section of the USB-HS DEV reference manual.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
13	SUTW	Setup tripwire (device mode only) Read/write This bit is used as a semaphore to ensure that the setup data payload of 8 bytes is extracted from a QH by the DCD without being corrupted. If the setup lockout mode is off (see USBMODE) then there exists a hazard when new setup data arrives while the DCD is copying the setup data payload from the QH for a previous setup packet. This bit is set (1) and cleared (0) by software, and will be cleared (0) by hardware when a hazard exists. For more information on the use of this bit, see the Device Operational Model section of the USB-HS DEV reference manual.
12	RESERVED_BITS12	Clear (0) this bit
11	ASPE	Asynchronous schedule park mode enable (OPTIONAL) Read/write If the asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this bit defaults to a 1h and is R/W. Otherwise, the bit must be cleared (0) and is RO. The software uses this bit to enable or disable the park mode. value 1 = Park mode is enabled. value 0 = Park mode is disabled. This field is set (1) in this implementation.
10	RESERVED_BIT10	Clear (0) this bit.
9:8	ASP	Asynchronous schedule park mode count (OPTIONAL) Read/write If the Asynchronous park capability (ASP) bit in the HCCPARAMS register is set (1), then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. This field contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the asynchronous schedule before continuing traversal of the Asynchronous schedule. See Section 4.10.3.2 for full operational details. Valid values are 1h to 3h. The software must not clear (0) this bit when the ASPE bit in this register is set (1), as this will result in undefined behavior. This field is set to 3h in this implementation.
7	LR	Light host/device controller reset (OPTIONAL) Read only Not implemented. This bit will always be clear (0).

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
6	IAA	Interrupt on async advance doorbell Read/write This bit is used as a doorbell by the software to tell the host controller to issue an interrupt the next time it advances the asynchronous schedule. The software must set (1) this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule states, it sets (1) the interrupt on the async advance status (AAI) bit in the USBSTS register. If the interrupt on async advance enable (AAE) bit in the USBINTR register is set (1), then the host controller will assert an interrupt at the next interrupt threshold. The host controller clears (0) this bit after it has set (1) the interrupt on async advance status (AAI) bit in the USBSTS register. The software should not set (1) this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in the host mode. Setting (1) this bit when the device mode is selected will produce undefined results.
5	ASE	Asynchronous Schedule Enable Read/write Default = 0b This bit controls whether the host controller skips processing the asynchronous schedule. value 0 = Do not process the asynchronous schedule value 1 = Use the ASYNCLISTADDR register to access the asynchronous schedule. Only the host controller uses this bit.
4	PSE	Periodic schedule enable Read/write Default 0b This bit controls whether the host controller skips processing the periodic schedule. value 0 = Do not process the periodic schedule value 1 = Use the PERIODICLISTBASE register to access the periodic schedule. Only the host controller uses this bit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
3:2	FS	This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3 and 2. Values meaning 000 1024 elements (4096 bytes) Default value 001 512 elements (2048 bytes) 010 256 elements (1024 bytes) 011 128 elements (512 bytes) 100 64 elements (256 bytes) 101 32 elements (128 bytes) 110 16 elements (64 bytes) 111 8 elements (32 bytes) Only the host controller uses this field.
1	RST	Controller reset (RESET) Read/write The software uses this bit to reset the controller. This bit is cleared (0) by the host/device controller when the reset process is complete. The software cannot terminate the reset process early by clearing (0) this bit. Host controller: When the software sets (1) this bit, the host controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Any transaction currently in progress on the USB is immediately terminated. A USB reset is not driven on downstream ports. The software should not set (1) this bit when the HCHalted bit in the USBSTS register is clear (0). Attempting to reset an actively running host controller will result in undefined behavior. Device controller: When the software sets (1) this bit, the device controller resets its internal pipelines, timers, counters, state machines, and so on to their initial values. Setting this bit when the device is in the attached state is not recommended, since the effect on an attached host is undefined. In order to ensure that the device is not in an attached state before initiating a device controller reset, all primed endpoints should be flushed and the USBCMD run/stop bit should be cleared (0).

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBCMD (cont.)

Bits	Name	Description
0	RS	Run/stop Read/Write Default 0b value 1 = Run value 0 = Stop Host controller: When this bit is set (1), the host controller proceeds with the execution of the schedule. The host controller continues execution as long as this bit remains set (1). When this bit is clear (0), the host controller completes the current transaction on the USB and then halts. The HC halted bit in the status register indicates when the host controller has finished the transaction and has entered the stopped state. The software should not set (1) this bit unless the host controller is in the halted state (that is, the HCHalted bit in the USBSTS register is set (1)). Device controller: Setting (1) this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. The software should use this bit to prevent an attach event before the device controller has been properly initialized. Clearing (0) this bit will cause a detach event.

0x078D9144 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_USBSTS register is the USB status register. This register indicates various states of the host/device controller and any pending interrupts. This register does not indicate status resulting from a transaction on the serial bus. The software clears certain bits in this register by setting (1) them.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS

Bits	Name	Description
31	ULPI_INTR	Default value = 0. This bit is set when Interrupt during ULPI -Serial mode or ULPI Interrupt during LPM occurs. Writing a 1 to this bit will clear it.
30	PHY_SESS_VLD_CHG	This bit is set when PHY_SESS_VLD bit changes its value.
29	PHY_SESS_VLD	This bit presents the SESS_VLD status of PHY.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
28	PHY_ALT_INT	This bit is asserted when a non-USB interrupt from PHY is detected. This interrupt is used for procedures like Battery Charging. This bit is set when bit 7 (alt_int) of RX CMD is high. Writing a 1 to this bit will clear it.
27	ASYNC_WAKEUP_INTR	This bit is asserted when async wakeup interrupt is detected. Writing a 1 to this bit will clear it.
26	RESERVED_BIT26	Clear (0) this bit.
25	TI1	General purpose timer interrupt 1 (GPTINT1) Read/write control This bit is set (1) when the counter in the GPTIMER1CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
24	TI0	General purpose timer interrupt 0 (GPTINT0) Read/write control This bit is set (1) when the counter in the GPTIMER0CTRL (non-EHCI) register transitions to zero. Setting (1) this bit will clear it.
23:20	RESERVED_BITS23_20	Clear (0) these bits.
19	UPI	USB host periodic interrupt (USBHSTPERINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set (1) and the TD was from the periodic schedule. This bit is also set (1) by the host controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
18	UAI	USB host asynchronous interrupt (USBHSTASYNCINT) Read/write control This bit is set (1) by the host controller when the cause of an interrupt is a completion of a USB transaction, where the transfer descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set (1) by the host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be clear (0).
17	RESERVED_BIT17	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
16	NAKI	NAK interrupt bit Read only This bit is set (1) by the hardware when, for a particular endpoint, both the Tx/Rx endpoint NAK bit and the corresponding Tx/Rx endpoint NAK enable bit are set (1). This bit is automatically cleared (0) by the hardware when all of the enabled Tx/Rx endpoint NAK bits are cleared (0).
15	AS	Asynchronous schedule status Read only Default = 0 This bit reports the current real status of the asynchronous schedule. When cleared (0), the asynchronous schedule status is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the asynchronous schedule when software transitions the asynchronous schedule enable bit in the USBCMD register. When this bit and the asynchronous schedule enable bit are the same value, the asynchronous schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
14	PS	Periodic schedule status Read only Default = 0 This bit reports the current real status of the periodic schedule. When cleared (0), the periodic schedule is disabled. And, if set (1), the status is enabled. The host controller is not required to immediately disable or enable the periodic schedule when software transitions the periodic schedule enable bit in the USBCMD register. When this bit and the periodic schedule enable bit are the same value, the periodic schedule is either enabled (1) or disabled (0). This bit is only used by the host controller.
13	RCL	Reclamation Read only Default = 0 This is a read-only status bit that is used to detect an empty asynchronous schedule. This bit is only used by the host controller.
12	HCH	HC halted Read only Default = 1 This bit is a clear (0) whenever the run/stop bit is set (1). The host controller sets (1) this bit after it has stopped executing, because of the run/stop bit being cleared (0), either by the software or by the host controller hardware (for example, an internal error). This bit is only used by the host controller.
11	RESERVED_BIT11	Clear (0) this bit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
10	ULPII	ULPI interrupt Read/write control Default = 0 When the ULPI viewport is present in the design, an event completion will set (1) this interrupt. This bit is used by both the host and device controllers. It is only present in designs where the configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLI	DC suspend Read/write control Default = 0 When a device controller enters a suspend state from an active state, this bit will be set (1). The device controller clears (0) the bit upon exiting from a suspend state. This bit is only used by the device controller.
7	SRI	SOF received Read/write control Default = 0 When the device controller detects a start of (micro) frame, this bit will be set (1). When a SOF is extremely late, the device controller will automatically set (1) this bit to indicate that an SOF was expected. Therefore, this bit will be set (1) roughly every 1 ms in the device FS mode and every 125 ms in the HS mode, and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set (1) at an interval of 1 ms during the prelude to connect and chirp. In the host mode, this bit will be set (1) every 125 us and can be used by the host controller driver as a time base. The software writes a 1 to this bit to clear it. This is a non-EHCI status bit.
6	URI	USB reset received Read/write control Default = 0 When the device controller detects a USB reset and enters the default state, this bit will be set (1). The software can set (1) this bit to clear the USB reset received status bit. This bit is only used by the device controller.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
5	AAI	Interrupt on async advance Read/write control Default = 0 The system software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by setting (1) the interrupt on async advance doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. This bit is only used by the host controller.
4	SEI	System error Read/write control This interrupt is triggered when there is an AHB error (HRESP = ERROR) on the AHB Master interface.
3	FRI	Frame list rollover Read/write control The host controller sets (1) this bit when the frame list index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the frame list size field of the USBCMD register) is 1024, the frame index register rolls over every time FRINDEX [1:3] toggles. Similarly, if the size is 512, the host controller sets (1) this bit to a one every time FHINDEX [12] toggles. This bit is only used by the host controller.
2	PCI	Port change detect Read/write control The host controller sets (1) this bit when a connect status occurs on any port, a port enable/disable change occurs on any port, or the force port resume bit is set (1) as the result of a J-K transition on the suspended port. The device controller sets (1) this bit when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operation states due to reset or suspend events, the notification mechanisms are the USB reset received bit and the DC suspend bits, respectively. This bit is not EHCI compatible.
1	UEI	USB error interrupt (USBERRINT) Read/write control When completion of a USB transaction results in an error condition, this bit is set (1) by the host/device controller. This bit is set (1) along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt-on-complete (IOC) bit set (1). See Section (Reference Host Operation Model: Transfer/Transaction Based Interrupt ? i.e. 4.15.1 in EHCI [5]) for a complete list of host error interrupt conditions. See section Device Error Matrix in the USB-HS DEV reference manual. The device controller detects resume signaling only.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBSTS (cont.)

Bits	Name	Description
0	UI	USB interrupt (USBINT) Read/write control This bit is set (1) by the host/device controller when the cause of an interrupt is a completion of a USB transaction where the transfer descriptor (TD) has an interrupt-on-complete (IOC) bit set (1). This bit is also set (1) by the host/device controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes.

0x078D9148 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBINTR**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_USBINTR register is the USB interrupt enable register. The interrupts to the software are enabled with this register. An interrupt is generated when a bit is set (1) and the corresponding interrupt is active. The USB status register (USBSTS) still shows interrupt sources, even if they are disabled by the USBINTR register, which allows polling of interrupt events by the software.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBINTR

Bits	Name	Description
31	ULPI_INTR_EN	Default value =0. When this bit is a 1 and ULPI_INTR is a 1, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the ULPI_INTR bit.
30	PHY_SESS_VLD_CHG_EN	Default value =0. When this bit is set then Link Controller will issue an interrupt when PHY_SESS_VLD changes its value.
29:26	RESERVED_BITS29_26	Clear (0) these bits.
25	TIE1	General purpose timer interrupt enable 1 When this bit is set (1), and the GPTINT1 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT1 bit.
24	TIE0	General purpose timer interrupt enable 0 When this bit is set (1), and the GPTINT0 bit in the USBSTS register is set (1), the controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the GPTINT0 bit.
23:20	RESERVED_BITS23_20	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
19	UPIE	USB host periodic interrupt enable When this bit is set (1), and the USBHSTPERINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTPERINT bit.
18	UAIE	USB host asynchronous interrupt enable When this bit is set (1), and the USBHSTASYNCINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBHSTASYNCINT bit.
17	RESERVED_BIT17	Clear (0) this bit.
16	NAKE	NAK interrupt enable This bit is set (1) by the software if it wants to enable the hardware interrupt for the NAK interrupt bit. If both this bit and the corresponding NAK interrupt bit are set (1), a hardware interrupt is generated.
15:11	RESERVED_BITS15_11	Clear (0) these bits.
10	ULPIE	ULPI enable When this bit is set (1), and the ULPI Interrupt bit in the USBSTS register transitions, the controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the ULPI interrupt bit. This bit is used by both the host and device controllers. It is only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1.
9	RESERVED_BIT9	Clear (0) this bit.
8	SLE	Sleep enable When this bit is set (1) and the DC suspend bit in the USBSTS register transitions, the device controller will issue an interrupt. The interrupt is acknowledged by the software setting (1) the DC suspend bit. This bit is only used by the device controller.
7	SRE	SOF received enable When this bit is set (1) and the SOF received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the SOF received bit.
6	URE	USB reset enable When this bit is set (1) and the USB reset received bit in the USBSTS register is set (1), the device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the USB reset received bit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBINTR (cont.)

Bits	Name	Description
5	AAE	Interrupt on async advance enable When this bit is set (1) and the interrupt on async advance bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the interrupt on async advance bit. This bit is only used by the host controller.
4	SEE	System error enable When this bit is set (1) and the system error bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the system error bit.
3	FRE	Frame list rollover enable When this bit is set (1) and the frame list rollover bit in the USBSTS register is set (1), the host controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the frame list rollover bit. This bit is only used by the host controller.
2	PCE	Port change detect enable When this bit is set (1) and the port change detect bit in the USBSTS register is set (1), the host/device controller will issue an interrupt. The interrupt is acknowledged by the software clearing (0) the port change detect bit.
1	UEE	USB error interrupt enable When this bit is set (1) and the USBERRINT bit in the USBSTS register is set (1), the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBERRINT bit in the USBSTS register.
0	UE	USB interrupt enable When this bit is set (1) and the USBINT bit in the USBSTS register is set (1), the host/device controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by the software clearing (0) the USBINT bit.

0x078D914C USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_FRINDEX**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_FRINDEX register is the USB frame index register. This register is used by the host controller to index the periodic frame list. The register updates every 125 microseconds (once each micro-frame). Bits [N:3] are used to select a particular entry in the periodic frame list during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by the system software in the frame list size field in the USBCMD register.

This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the host controller is in the 'halted' state, as indicated by the HC halted bit. A write to this register while the run/stop bit is set (1) produces undefined results. Writes to this register also affect the SOF value.

In the device mode, this register is read-only and the device controller updates the FRINDEX [13:3] register from the frame number indicated by the SOF marker. Whenever a SOF is received by the USB bus, FRINDEX [13:3] will be checked against the SOF marker. If FRINDEX [13:3] is different from the SOF marker, FRINDEX [13:3] will be set to the SOF value and FRINDEX [2:0] will be cleared (0) (that is, SOF for a 1-ms frame). If FRINDEX [13:3] is equal to the SOF value, FRINDEX [2:0] will be incremented (that is, SOF for 125-ms micro-frame).

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_FRINDEX

Bits	Name	Description
31:14	RESERVED_BITS31_14	Clear (0) these bits.
13:0	FRINDEX	Frame index The value in this register increments at the end of each time frame (for example, a micro-frame). Bits [N:3] are used for the frame list current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following data shows the values of N based on the value of the frame list size field in the USBCMD register when used in host mode. USBCMD [Frame list size] number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In the device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current microframe.

0x078D9154 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PERIODICLISTBASE

Type: RW

Clock: CC_USB_OTG_HS_CLK

Reset State: 0x00000000

BANKED=host

The USB_OTG_HS_PERIODICLISTBASE register is the periodic list base address register. This 32-bit register contains the beginning address of the periodic frame list in the system memory. The HCD loads this register prior to starting the schedule execution by the host controller. The memory

structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the frame index register (FRINDEX) to enable the host controller to step through the periodic frame list in sequence.

NOTE This device is shared between the host controller and device controller operation. For host controller operation, this is the USB_OTG_HS_PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PERIODICLISTBASE

Bits	Name	Description
31:12	PERBASE	Base address (low) These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.
11:0	RESERVED_BITS11_0	This field must be written as zeros. During runtime, the values of these bits are undefined.

0x078D9154 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DEVICEADDR

Type: RW

Clock: CC_USB_OTG_HS_CLK

Reset State: 0x00000000

BANKED=device

The USB_OTG_HS_DEVICEADDR register is the USB device address register. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. The software shall reprogram the address after receiving a SET_ADDRESS descriptor.

The USBADRA is used to accelerate the SET_ADDRESS sequence by allowing the DCD to preset the USBADR register before the status phase of the SET_ADDRESS descriptor.

NOTE This device is shared between the host controller and device controller operations. For host controller operation, this is the USB_OTG_HS_PERIODICLISTBASE register. For device controller operation, this is the USB_OTG_HS_DEVICEADDR register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DEVICEADDR

Bits	Name	Description
31:25	USBADR	Device address These bits correspond to the USB device address.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_DEVICEADDR (cont.)

Bits	Name	Description
24	USBADRA	Device address advance Default = 0 When this bit is clear (0), any writes to USBADR are instantaneous. When this bit is set (1) at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. The hardware will automatically clear (0) this bit on the following conditions: 1. IN is ACKed to endpoint 0 (USBADR is updated from staging register). 2. OUT/SETUP occur to endpoint 0 (USBADR is not updated). 3. Device reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD can not write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA = 1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2-ms USB requirement.
23:0	RESERVED_BITS23_0	These bits must be written as zeros. During runtime, the values of these bits are undefined.

0x078D9158 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ASYNCLISTADDR**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

BANKED=host

The USB_OTG_HS_ASYNCLISTADDR register is the next asynchronous list address register. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Bits [4:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ASYNCLISTADDR

Bits	Name	Description
31:5	ASYBASE	Link pointer low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a queue head (QH). This field is only used by the host controller.
4:0	RESERVED_BITS4_0	The values of these bits has no effect on circuit operation.

0x078D9158 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPOINTLISTADDR**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

BANKED=device

The USB_OTG_HS_ENDPOINTLISTADDR register is the endpointlist address register. In the device mode, this register contains the address of the top of the endpoint list in system memory. Bits [10:0] of this register cannot be modified by the system software and will always return a zero when read.

NOTE The USB_OTG_HS_ASYNCLISTADDR register and the USB_OTG_HS_ENDPOINTLISTADDR register are shared between the host controller and device controller operations. For the host controller, this is the USB_OTG_HS_ASYNCLISTADDR register. For the device controller, this is the USB_OTG_HS_ENDPOINTLISTADDR register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPOINTLISTADDR

Bits	Name	Description
31:11	EPBASE	Endpoint list pointer (low) These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 queue heads (QH). That is, one queue head per endpoint & direction.
10:0	RESERVED_BITS10_0	The values of these bits has no effect on circuit operation.

0x078D915C USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_TTCTRL**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_TTCTRL register is the TT status and control register. This register contains parameters needed for internal TT operations.

NOTE This register is not used in the device controller operation.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_TTCTRL

Bits	Name	Description
31	RESERVED_BIT31	Not used.
30:24	TTHA	Not used.
23:0	RESERVED_BITS23_0	Not used.

0x078D9160 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BURSTSIZE**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00001010

The USB_OTG_HS_BURSTSIZE register is the programmable burst size register. This register is used to control dynamically change the burst size used during data movement on the initiator (master) interface.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BURSTSIZE

Bits	Name	Description
31:16	RESERVED_BITS31_16	The value of these bits has no effect on circuit operation.
15:8	TXPBURST	Programmable Tx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from system memory to the USB bus.
7:0	RXPBURST	Programmable Rx burst length This register represents the maximum length of a the burst in 32-bit words while moving data from the USB bus to system memory.

0x078D9164 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_TXFILLTUNING**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_TXFILLTUNING register is the host transmit pre-buffer packet tuning register. The fields in this register control performance tuning associated with how the host controller posts data to the Tx latency FIFO before moving the data onto the USB bus. The specific areas of performance include the how much data to post into the FIFO and an estimate for how long that operation should take in the target system.

Definitions:

T0 = Standard packet overhead

T1 = Time to send data payload

Tff = Time to fetch packet into TX FIFO up to specified level.

Ts = Total packet flight time (send-only) packet

Ts = T0 + T1

Tp = Total packet time (fetch and send) packet

Tp = Tff + T0 + T1

Upon discovery of a transmit (OUT/SETUP) packet in the data structures, the host controller checks to ensure Tp remains before the end of the [micro] frame. If so it proceeds to pre-fill the TX FIFO. If at anytime during the pre-fill operation the time remaining the [micro] frame is < Ts, then the packet attempt ceases and the packet is tried at a later time. Although this is not an error condition and the host controller will eventually recover, a mark will be made the scheduler health counter to note the occurrence of a 'back-off' event. When a back-off event is detected, the partial packet fetched may need to be discarded from the latency buffer to make room for periodic traffic that will begin after the next SOF. Too many back-off events can waste bandwidth and power on the system bus, and thus should be minimized (not necessarily eliminated). Back-offs can be minimized with use of the TSCHEALTH (Tff), as described in the register table.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_TXFILLTUNING

Bits	Name	Description
31:22	RESERVED_BITS31_22	The value of these bits has no effect on circuit operation.
21:16	TXFIFOTHRES	FIFO burst threshold Default = 2 This register controls the number of data bursts that are posted to the TX latency FIFO in the host mode before the packet begins on to the bus. The minimum value is 2 and this value should be as low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth, where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the stream disable bit in USBMODE register is set (1).
15:13	RESERVED_BITS15_13	The value of these bits has no effect on circuit operation.
12:8	TXSCHHEALTH	Scheduler health counter Read/write to clear Default = 0 This register increments when the host controller fails to fill the Tx latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next start-of-frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHHEALTH. Writing to this register will clear the counter and this counter will be at a maximum at 31.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_TXFILLTUNING (cont.)

Bits	Name	Description
7:0	TXSCHOH	Scheduler overhead Default = 0 This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly-utilized bus. Choosing a value that is too high for this register is not desired, as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 ms when a device is connected in the high-speed mode for OTG and SPH. The time unit represented in this register is 6.333 ms when a device is connected in the low/full speed mode for OTG and SPH. The time unit represented in this register is always 1.267 times the MPH product.

0x078D9170 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ULPI_VIEWPORT**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x08000000

The USB_OTG_HS_ULPI_VIEWPORT register provides indirect access to the ULPI PHY register set. Although the core performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

CAUTION Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently, no usage model has been defined where the software should need to execute writes directly to the ULPI - see the exception regarding optional features below.

Executing read operations though the ULPI viewport should have no harmful side effects to standard USB operations.

NOTE The ULPI viewport is only synthesized in the design if the constant VUSB_HS_PHY_ULPI is set (1). If the ULPI interface is not enabled, this register will always read zeros.

Two operations can be performed with the ULPI viewport: wake-up and read/write operations. The wake-up operation is used to put the ULPI interface into normal operation mode and re-enable the clock, if necessary. A wake-up operation is required before accessing the registers when the ULPI interface is operating in the low power mode, serial mode, or car kit mode.

The ULPI state can be determined by reading the sync state bit (ULPISS). If this bit is set (1), then the ULPI interface is running in the normal operation mode and can accept read/write operations. If the ULPISS is clear (0), then read/write operations will not be able to execute. Undefined behavior will result if ULPISS = 0, and a read or write operation is performed.

To execute a wake-up operation, write all 32-bits of the ULPI Viewport where ULPIPORT is constructed appropriately, and the ULPIWU bit is set (1) and the ULPIRUN bit is clear (0). Poll the ULPI viewport until ULPIWU is zero for the operation to complete.

To execute a read or write operation, write all 32-bits of the ULPI viewport where ULPIDATWR, ULPIADDR, ULPIPORT, and ULPIRW are constructed appropriately, and the ULPIRUN bit is set (1). Poll the ULPI viewport until ULPIRUN is zero for the operation to complete. Once ULPIRUN is zero, the ULPIDATRD will be valid if the operation was a read.

The polling method above could also be replaced and an interrupt driven using the ULPI interrupt defined in the USBTS and USBINTR registers. When a wake-up or read/write operation completes, the ULPI interrupt will be set (1).

Several optional features may need to be enabled or disabled by the system software as part of system configuration. These bits are contained in the interface and OTG control registers of the ULPI PHY register set. These registers also contain bits that are controlled by the link dynamically and, therefore, should only be modified by the system software using the set/clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The following bits are optional bits:

* Bits 3 through 7 in the interface control register

* Bits 6 and 7 in the OTG control register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ULPI_VIEWPORT

Bits	Name	Description
31	ULPIWU	ULPI wake-up Setting (1) this bit begins the wake-up operation. The bit will automatically transition to 0 after the wake-up is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wake-up and a read/write operation at the same time.
30	ULPIRUN	ULPI read/write run Setting (1) this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set (1), the driver can not clear it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time.
29	ULPIRW	ULPI read/write control This bit selects between running a read or write operation. value 0 = Read value 1 = Write
28	ULPIFORCE	ULPI read/write force This bit enables forcing register access during RX packet value 0 = register access is not forced during RX packet (default) value 1 = register access is forced during RX packet reception

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ULPI_VIEWPORT (cont.)

Bits	Name	Description
27	ULPISS	ULPI sync state Read Only value 1 = Normal sync state value 0 = In another state (for example, car kit, serial, low power) This bit represents the state of the ULPI interface. Before reading this bit, the ULPIPORT field should be set accordingly if used with the multi-port host. Otherwise, this field should always remain 0.
26:24	ULPIPORT	ULPI port number For the wakeup or read/write operation to be executed, this value selects the port number the ULPI PHY is attached to in the multi-port host. The valid range is 0 to 7. This field should always be written as a 0 for the non-multi port products.
23:16	ULPIADDR	ULPI data address When a read or write operation is commanded, the address of the operation is written to this field.
15:8	ULPIDATRD	ULPI data read Read only After a read operation completes, the result is placed in this field.
7:0	ULPIDATWR	ULPI data write When a write operation is commanded, the data to be sent is written to this field.

0x078D9178 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTNAK**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTNAK register is the endpoint NAK register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTNAK

Bits	Name	Description
23:16	EPTN	Tx endpoint NAK Each tx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received IN token for the corresponding endpoint. Bit 15 - Endpoint #15 Bit 1 - Endpoint #1 Bit 0 - Endpoint #0

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTNAK (cont.)

Bits	Name	Description
7:0	EPRN	Rx endpoint NAK Each rx endpoint has 1 bit in this field. The bit is set (1) when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. Bit 15 - Endpoint #15 Bit 1 - Endpoint #1 Bit 0 - Endpoint #0

0x078D917C USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTNAKEN**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTNAKEN register is the endpoint NAK enable register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTNAKEN

Bits	Name	Description
23:16	EPTNE	Tx endpoint NAK enable Each bit is an enable bit for the corresponding Tx endpoint NAK bit. If this bit is set (1) and the corresponding Tx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint #15 Bit 1 - Endpoint #1 Bit 0 - Endpoint #0
7:0	EPRNE	Rx endpoint NAK enable Each bit is an enable bit for the corresponding Rx endpoint NAK bit. If this bit is set (1) and the corresponding Rx endpoint NAK bit is set (1), the NAK Interrupt bit is set (1). Bit 15 - Endpoint #15 Bit 1 - Endpoint #1 Bit 0 - Endpoint #0

0x078D9184 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0xCC000004

This is the USB_OTG_HS_PORTSC register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC

Bits	Name	Description
31:30	PTS	Parallel transceiver select Read/write This register bit pair is used in conjunction with the configuration constant VUSB_HS_PHY_TYPE to control which parallel transceiver interface is selected. If VUSB_HS_PHY_TYPE is set for 0, 1, 2, or 3, then this bit is read only. If VUSB_HS_PHY_TYPE is 4, 5, 6, or 7, then this bit is read/write. This field is reset to the following values: 00 if VUSB_HS_PHY_TYPE = 0,4 - UTMI/UTMI+ 01 if VUSB_HS_PHY_TYPE = 1,5 - Reserved 10 if VUSB_HS_PHY_TYPE = 2,6 - ULPI 11 if VUSB_HS_PHY_TYPE = 3,7 - Serial/1.1 PHY (FS only) This bit is not defined in the EHCI specification.
29	STS	Serial transceiver select Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY_SERIAL to control whether the parallel or serial transceiver interface is selected for FS and LS operation. The serial interface engine can be used in combination with the UTMI+ or ULPI physical interface to provide FS/LS signaling instead of the parallel interface. - If VUSB_HS_PHY_SERIAL is 0 or 1, then this bit is read only. - If VUSB_HS_PHY_SERIAL is 2 or 3, then this bit is read/write. This bit has no effect unless the parallel transceiver select is set to UTMI+ or ULPI. The Serial/1.1 physical interface will use the serial interface engine for FS/LS signaling regardless of this bit value. Note: This bit was reserved for future operation, and is now adding for dynamic use of the serial engine in accord with UMTI+ and ULPI characterization logic. This bit is not defined in the EHCI specification.
28	PTW	Parallel transceiver width Read/write This register bit is used in conjunction with the configuration constant VUSB_HS_PHY16_8 to control the data bus width of the UTMI transceiver interface. - If VUSB_HS_PHY16_8 is 0 or 1, then this bit is read only. - If VUSB_HS_PHY16_8 is 2 or 3, then this bit is read/write. This bit is reset to 1 if VUSB_HS_PHY16_8 selects a default UTMI interface width of 16-bits, else it is reset to 0. - Writing this bit to 0 selects the 8-bit [60MHz] UTMI interface. - Writing this bit to 1 selects the 16-bit [30MHz] UTMI interface. This bit has no effect if the serial interface is selected. This bit is not defined in the EHCI specification.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
27:26	PSPD	Port speed Read only This register field indicates the speed at which the port is operating. For HS mode operation in the host controller and HS/FS operation in the device controller, the port routing steers data to the protocol engine. For FS and LS mode operation in the host controller, the port routing steers data to the protocol engine with the embedded transaction translator. value 00 = Full speed value 01 = Low speed value 10 = High speed This bit is not defined in the EHCI specification.
25	SPRT	Short Port Reset Time. shortens port reset time for simulation.
24	PFSC	Port force full speed connect Read/write Default = 0 Setting (1) this bit will force the port to only connect at full speed. It also disables the chirp sequence that allows the port to identify itself as high speed. This is useful for testing FS configurations with a HS host, hub or device. This bit is not defined in the EHCI specification.
23	PHCD	PHY low power suspend - clock disable (PLPSCD) Read/write Default = 0 value 1 = Disable the PHY clock. value 0 = Enable the PHY clock. Reading this bit will indicate the status of the PHY clock. Note: The PHY clock cannot be disabled if it is being used as the system clock. In the device mode, The PHY can be put into low power suspend - clock disable when the device is not running (USBCMD run/stop = 0) or the host has signaled suspend (PORTSC SUSPEND = 1). Low power suspend will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the device controller driver must clear this bit. In the host mode, the PHY can be put into low power suspend - clock disable when the downstream device has been put into the suspend mode or when no downstream device is connected. Low power suspend is completely under the control of the software. See 10 System Level Issues and Core Configuration for more discussion on clock disable and power-down issues. This bit is not defined in the EHCI specification.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
22	WKOC	Wake on over-current enable (WKOC_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to over-current conditions as wake-up events. This bit is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0). This bit is output from the controller as signal pwrctl_wake_ovrcurr_en (OTG/host core only) for use by an external power control circuit.
21	WKDS	Wake on disconnect enable (WKDSCNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device disconnects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_dscnt_en (OTG/host core only) for use by an external power control circuit.
20	WKN	Wake on connect enable (WKNNT_E) Read/write Default = 0 Setting (1) this bit enables the port to be sensitive to device connects as wake-up events. This field is clear (0) if the port power (PP) bit (bit 12) in this register is clear (0) or in the device mode. This bit is output from the controller as signal pwrctl_wake_dscnt_en (OTG/host core only) for use by an external power control circuit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
19:16	PTC	Port test control Read/write Default = 0000 Any other value than zero indicates that the port is operating in the test mode. Value Specific test 0000b TEST_MODE_DISABLE 0001b J_STATE 0010b K_STATE 0011b SE0 (host) / NAK (device) 0100b Packet 0101b FORCE_ENABLE_HS 0110b FORCE_ENABLE_FS 0111b FORCE_ENABLE_LS 1000b to 1111b Reserved The FORCE_ENABLE_FS and FORCE_ENABLE_LS tests are extensions to the test mode support, as specified in the EHCI specification. Writing the PTC field to any of the FORCE_ENABLE_{HS/FS/LS} values will force the port into the connected and enabled state at the selected speed. Writing the PTC field back to TEST_MODE_DISABLE will allow the port state machines to progress normally from that point. Note: Low speed operations are not supported as a peripheral device.
15:14	PIC	Port indicator control Read/write Default = 0 Writing to this field has no effect if the P_INDICATOR bit in the HCSPARAMS register is a zero. If the P_INDICATOR bit is set (1), then this field has the following meanings: Bit value Meaning value 00 Port indicators are off value 01 Amber value 10 Green value 11 Undefined This field is output from the controller as signals port_ind_ctl_1 and port_ind_ctl_0 for use by an external LED driving circuit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
13	PO	Port owner Read only Port owner hand-off is not implemented in this design, therefore this bit will always read back as clear (0). Default = 0 The EHCI definition is include here for reference: - This bit unconditionally goes clear (0) when the configured bit in the CONFIGFLAG register makes a 0-to-1 transition. - This bit unconditionally goes set (1) whenever the configured bit is clear (0). The system software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). The software sets (1) this bit when the attached device is not a high-speed device. When this bit is set (1), it indicates that an internal companion controller owns and controls the port.
12	PP	Port power (PP) Read/write or read-only The function of this bit depends on the value of the port power switching (PPC) field in the HCSPARAMS register. - PPC = 0: PP is read-only. A device controller with no OTG capability does not have port power control switches. - PPC = 1: PP is read/write. The host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on a port (and PP equals a 0), the port is non-functional and will not report attaches, detaches, and so on. When an over-current condition is detected on a powered port and PPC is set (1), the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero, removing power from the port. This feature is implemented in the host/OTG controller (PPC = 1). In a device-only implementation, port power control is not necessary. So, PPC and PP = 0.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
11:10	LS	Line status Read-only These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines: Value Meaning value 00 SE0 value 10 J-state value 01 K-state value 11 Undefined In the host mode, the use of linestate by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In the device mode, the use of linestate by the device controller driver is not necessary.
9	HSP	High-speed port Read-only Default = 0 When the bit is set (1), the host/device connected to the port is in the high-speed mode. When this bit is clear (0), the host/device connected to the port is not in a high-speed mode. Note: HSP is redundant with PSPD(27:26), but will remain in the design for compatibility. This bit is not defined in the EHCI specification.
8	PR	Port reset This bit is clear (0) if the port power (PP) bit (bit 12) of this register is clear (0). Host mode: - Read/write - 1 = Port is in reset - 0 = Port is not in reset - Default = 0 When the software sets (1) this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically clear (go to 0) after the reset sequence is complete. Note: This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the reset duration is timed in the driver. Device mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
7	SUSP	Suspend Host mode: - Read/write - 1 = Port in suspend state - 0 = Port not in suspend state - Default = 0 The port enabled bit and suspend bit of this register define the port states: Bit value Port state value 0x Disable value 10 Enable value 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit set (1). In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally clear (0) this bit when the software clears (0) the force port resume bit. The host controller ignores a write of zero to this bit. If the host software sets (1) this bit when the port is not enabled (port enabled bit is a zero), the results are undefined. This field is clear (0) if port power (PP) is clear (0) in the host mode. Device mode: - Read only - 1 = Port in suspend state - 0 = Port not in suspend state - Default = 0 In the device mode, this bit is a read-only status bit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
6	FPR	Force port resume - Read/write - 1 = Resume detected/driven on port - 0 = No resume (K-state) detected/driven on port - Default = 0 Host mode: The software sets (1) this bit to drive resume signaling. The host controller sets (1) this bit if a J-to-K transition is detected while the port is in the suspend state. When this bit transitions to a one because a J-to-K transition is detected, the port change detect bit in the USBSTS register is also set (1). This bit will automatically clear (go to 0) after the resume sequence is complete. This behavior is different from EHCI, where the host controller driver is required to clear (0) this bit after the resume duration is timed in the driver. Note that, when the host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (full-speed 'K') is driven on the port as long as this bit remains set (1). This bit will remain set (1) until the port has switched to the high-speed idle. Clearing (0) this bit has no affect, because the port controller will time the resume operation and clear (0) the bit when the port control state switches to HS or FS idle. This bit is clear if the port power (PP) is clear (0) in the host mode. This bit is not-EHCI compatible. Device mode: After the device has been in the suspend state for 5 ms or more, the software must set (1) this bit to drive resume signaling before clearing. The device controller will set (1) this bit if a J-to-K transition is detected while the port is in the suspend state. The bit will be cleared (0) when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition was detected, the port change detect bit in the USBSTS register is also set (1).
5	OCC	Over-current change Read/write control Default = 0 This bit gets is set (1) when there is a change to over-current active. The software clears this bit by setting (1) this bit position. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
4	OCA	Over-current active Read-only Default = 0 value 1 = This port currently has an over-current condition. value 0 = This port does not have an over-current condition. This bit will automatically transition from set (1) to clear (0) when the over current condition is removed. For host/OTG implementations, the user can provide over-current detection to the vbus_pwr_fault input for this condition. For device-only implementations, this bit shall always be clear (0).
3	PEC	Port enable/disable change Read/write control value 1 = Port enabled/disabled status has changed value 0 = No change Default = 0 Host mode: For the root hub, this bit gets set (1) only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification). The software clears this bit by writing a one to it. This field is clear (0) if the port power (PP) bit in the register is clear (0). Device mode: The device port is always enabled (this bit will be zero).
2	PE	Port enabled/disabled Read/write value 1 = Enable value 0 = Disable Default 0 Host mode: Ports can only be enabled by the host controller as a part of the reset and enable. The software cannot enable a port by setting (1) this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port, due to other host controller and bus events. When the port is disabled, (0) downstream propagation of data is blocked except for reset. This field is clear (0) if the port power (PP) bit is cleared (0) in the host mode. Device mode: The device port is always enabled (this bit will be set [1])

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PORTSC (cont.)

Bits	Name	Description
1	CSC	Connect status change Read/write control value 1 = Change in current connect status value 0 = No change Default = 0 Host mode: Indicates that a change has occurred in the port's current connect status. The host/device controller sets (1) this bit for all changes to the port device connect status, even if the system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, the hub hardware will be 'setting' an already-set bit (that is, the bit will remain set). The software clears this bit by writing a one to it. This field is zero if the port power (PP) bit in this register is zero in the host mode. Device mode: This bit is undefined in the device controller mode.
0	CCS	Current connect status Read-only Host mode: value 1 = Device is present on port value 0 = No device is present Default = 0 This value reflects the current state of the port, and may not correspond directly to the event that caused the connect status change bit (bit 1) to be set (1). This field is clear if the port power (PP) bit in this register is clear (0) in host mode. Device mode: value 1 = Attached value 0 = Not attached Default = 0 If this bit is set (1), this indicates that the device successfully attached, and is operating in either high speed or full speed, as indicated by the high speed port bit in this register. If this bit is clear (0), this indicates that the device did not attach successfully or was forcibly disconnected by the software clearing (0) the run bit in the USBCMD register. It does not state the device being disconnected or suspended.

0x078D91A4 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_OTGSC**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000E20

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_OTGSC

Bits	Name	Type	Description
31	RESERVED_BIT31	RW	Clear (0) this bit.
30	DPIE	RW	Data pulse interrupt enable
29	FIELD_1MSE	RW	1 millisecond timer interrupt enable - read/write
28	BSEIE	RW	B session end interrupt enable Read/write Setting (1) this bit enables the B session end interrupt.
27	BSVIE	RW	B session valid interrupt enable Read/write Setting (1) this bit enables the B session valid interrupt.
26	ASVIE	RW	A session valid interrupt enable Read/write Setting (1) this bit enables the A session valid interrupt.
25	AVVIE	RW	A Vbus valid interrupt enable Read/write Setting (1) this bit enables the A Vbus valid interrupt.
24	IDIE	RW	USB ID interrupt enable Read/write Setting (1) this bit enables the USB ID interrupt.
23	RESERVED_BIT23	RW	Clear (0) this bit.
22	DPIS	RW	Data pulse interrupt status Read/write to clear This bit is set (1) when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). The software must write a one to clear this bit.
21	FIELD_1MSS	RW	1 millisecond timer interrupt status Read/write to clear This bit is set (1) once every millisecond. The software must write a one to clear this bit.
20	BSEIS	RW	B session end interrupt status Read/write to clear This bit is set (1) when the Vbus has fallen below the B session end threshold. The software must write a one to clear this bit
19	BSVIS	RW	B session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the B session valid threshold (0.8 VDC). The software must write a one to clear this bit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Type	Description
18	ASVIS	RW	A session valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the A session valid threshold (0.8 VDC). The software must write a one to clear this bit.
17	AVVIS	RW	A Vbus valid interrupt status Read/write to clear This bit is set (1) when Vbus has either risen above or fallen below the Vbus valid threshold (4.4 VDC) on an A device. The software must write a one to clear this bit.
16	IDIS	RW	USB ID interrupt status Read/write This bit is set (1) when a change on the ID input has been detected. The software must write a one to clear this bit.
15	RESERVED_BIT15	RW	Clear (0) this bit.
14	DPS	RW	Data bus pulsing status Read-only If this bit is set (1), it indicates that the data bus pulsing is being detected on the port.
13	FIELD_1MST	RW	1 millisecond timer toggle Read-only This bit toggles once per millisecond.
12	BSE	R	B session end Read-only Indicates that the Vbus is below the B session end threshold.
11	BSV	RW	B session valid Read-only Indicates that the Vbus is above the B session valid threshold.
10	ASV	RW	A session valid Read-only Indicates that the Vbus is above the A session valid threshold.
9	AVV	RW	A Vbus valid Read-only Indicates that the Vbus is above the A Vbus valid threshold.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_OTGSC (cont.)

Bits	Name	Type	Description
8	ID	RW	USB ID Read-only value 0 = A device value 1 = B device
7	HABA	RW	Hardware assist B-disconnect to A-connect Read/write value 0 = Disabled value 1 = Enable automatic B-disconnect to A-connect sequence.
6	HADP	RW	Hardware assist data-pulse Write to set
5	IDPU	RW	ID pull-up Read/write This bit provides control over the ID pull-up register. value 0 = Off value 1 = On (default) When this bit is clear (0), the ID input will not be sampled.
4	DP	RW	Data pulsing Read/write Setting (1) this bit causes the pull-up on DP to be asserted for data pulsing during SRP.
3	OT	RW	OTG termination Read/write This bit must be set (1) when the OTG device is in the device mode. This controls the pull-down on DM.
2	HAAR	RW	Hardware assist auto-reset Read/write value 0 = Disabled value 1 = Enable automatic reset after connect on host port.
1	VC	RW	Vbus charge Read/write Setting (1) this bit causes the Vbus line to be charged. This is used for Vbus pulsing during SRP.
0	VD	RW	Vbus discharge Read/write Setting (1) this bit causes the Vbus to discharge through a resistor.

0x078D91A8 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBMODE**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_USBMODE register is the USB device mode register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBMODE

Bits	Name	Description
31:6	RESERVED_BITS31_6	Clear (0) these bits.
5	VBPS	Vbus power select value 0 - Output is 0 value 1 - Output is 1 This bit is connected to the vbus_pwr_select output and can be used for any generic control, but is named to be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available.
4	SDIS	Stream disable mode value 0 = Inactive (default) value 1 = Active Device mode: Setting (1) this bit disables double priming on both the Rx and Tx for low bandwidth systems. This mode ensures that, when the Rx and Tx buffers are sufficient to contain an entire packet, the standard double buffering scheme is disabled to prevent overruns/underruns in bandwidth-limited systems. Note: In the high speed mode, a NYET handshake will respond to all packets received when the stream disable is active. Host mode: Setting (1) this bit ensures that overruns/underruns of the latency FIFO are eliminated for low bandwidth systems where the Rx and Tx buffers are sufficient to contain the entire packet. Enabling the stream disable also has the effect of ensuring that the Tx latency is filled to capacity before the packet is launched onto the USB. Note: Time duration to pre-fill the FIFO becomes significant when the stream disable is active. See TXFILLTUNING and TXTTFILLTUNING [MPH only] to characterize the adjustments needed for the scheduler when using this feature. Note: The use of this feature substantially limits of the overall USB performance.
3	SLOM	Setup lockout mode. In the device mode, this bit controls the behavior of the setup lock mechanism. See Control Endpoint Operation Model. value 0 = Setup lockouts on (default) value 1 = Setup lockouts off (DCD requires use of a setup data buffer tripwire in USBCMD)

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_USBMODE (cont.)

Bits	Name	Description
2	ES	Endian select Read/write This bit can change the byte ordering of the transfer buffers to match the host microprocessor bus architecture. The bit fields in the microprocessor interface and the DMA data structures (including the setup buffer within the device QH) are unaffected by the value of this bit, because they are based upon 32-bit words. value 0 = Little endian (default) - first byte referenced in the least significant byte of a 32-bit word. value 1 = Big endian - first byte referenced in most significant byte of a 32-bit word.
1:0	CM	Controller mode Read/write once The controller mode is defaulted to the proper mode for host-only and device-only implementations. For those designs that contain both host and device capability, the controller will default to an idle state and will need to be initialized to the desired operating mode after reset. For combination host/device controllers, this register can only be written once after reset. If it is necessary to switch modes, the software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. value 00 = Idle [default for combination host/device] value 01 = Reserved value 10 = Device controller [default for device only controller] value 11 = Host controller [default for host only controller]

0x078D91AC USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTSETUPSTAT**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTSETUPSTAT register is the endpoint set-up status register.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTSETUPSTAT

Bits	Name	Description
31:16	RESERVED_BITS31_16	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTSETUPSTAT (cont.)

Bits	Name	Description
15:0	ENDPTSETUPSTAT	Set-up endpoint status For every set-up transaction that is received, a corresponding bit in this register is set (1). The software must clear or acknowledge the setup transfer by setting (1) a respective bit after it has read the setup data from the queue head. The response to a set-up packet as in the order of operations and total response time is crucial to limit bus time outs while the set-up lock-out mechanism is engaged. See Managing Endpoints in the Device Operational Model. This register is only used in the device mode.

0x078D91B0 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTPRIME**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTPRIME register is the endpoint initialization register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTPRIME

Bits	Name	Description
31:16	PETB	Prime endpoint transmit buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a transmit operation in order to respond to a USB IN/INTERRUPT transaction. The software should set (1) the corresponding bit when posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a transmit buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. PETB[15] - Endpoint #15 PETB[1] - Endpoint #1 PETB[0] - Endpoint #0

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTPRIME (cont.)

Bits	Name	Description
15:0	PERB	Prime endpoint receive buffer For each endpoint, a corresponding bit is used to request that a buffer is prepared for a receive operation for when a USB host initiates a USB OUT transaction. The software should set (1) the corresponding bit whenever posting a new transfer descriptor to an endpoint. The hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. The hardware will clear (0) this bit when the associated endpoint(s) is (are) successfully primed. Note: These bits will be momentarily set (1) by the hardware during hardware re-priming operations when a dTD is retired, and the dQH is updated. Bit 15 - Endpoint #15 Bit 1 - Endpoint #1 Bit 0 - Endpoint #0

0x078D91B4 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTFLUSH**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTFLUSH register is the endpoint de-initialize register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTFLUSH

Bits	Name	Description
31:16	FETB	Flush endpoint transmit buffer Setting (1) a bit in this register will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. FETB[15] - Endpoint #15 FETB[1] - Endpoint #1 FETB[0] - Endpoint #0
15:0	FERB	Flush endpoint receive buffer Setting a bit (1) will cause the associated endpoint to clear any primed buffers. If a packet is in progress for one of the associated endpoints, that transfer will continue until completion. The hardware will clear this register after the endpoint flush operation is successful. Bit 15 - Endpoint #15 Bit 1 - Endpoint #1 Bit 0 - Endpoint #0

0x078D91B8 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTSTAT**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTSTAT register is the endpoint status register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTSTAT

Bits	Name	Description
31:16	ETBR	Endpoint transmit buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ETBR[15] - Endpoint #15 ETBR[1] - Endpoint #1 ETBR[0] - Endpoint #0
15:0	ERBR	Endpoint receive buffer ready One bit for each endpoint indicates the status of the respective endpoint buffer. This bit is set (1) by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting (1) a bit in the ENDPTPRIME register and the endpoint indicating that it is ready. This delay time varies based upon the current USB traffic and the number of bits set (1) in the ENDPTPRIME register. The buffer ready status is cleared by a USB reset, by the USB DMA system, or through the ENDPTFLUSH register. Note: These bits will be momentarily cleared by the hardware during hardware endpoint re-priming operations when a dTD is retired, and the dQH is updated. ERBR[15] - Endpoint #15 ERBR[1] - Endpoint #1 ERBR[0] - Endpoint #0

0x078D91BC USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCOMPLETE**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The register is the endpoint complete register. This register is only used in the device mode.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCOMPLETE

Bits	Name	Description
31:16	ETCE	Endpoint transmit complete event Each bit indicates that a transmit event (IN/INTERRUPT) occurred and the software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ETCE[15] - Endpoint #15 ETCE[1] - Endpoint #1 ETCE[0] - Endpoint #0
15:0	ERCE	Endpoint receive complete event Each bit indicates that a received event (OUT/SETUP) occurred and the software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set (1) in the transfer descriptor, then this bit will be set (1) simultaneously with the USBINT. Writing a one will clear the corresponding bit in this register. ERCE[15] - Endpoint #15 ERCE[1] - Endpoint #1 ERCE[0] - Endpoint #0

0x078D91C0 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRL0**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00800080

The USB_OTG_HS_ENDPTCTRL0 register is the endpoint control 0 register. Every device will implement endpoint0 as a control endpoint.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRL0

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
23	TXE	Tx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
22:20	RESERVED_BITS22_20	Clear (0) these bits.
19:18	TXT	Tx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
17	RESERVED_BIT17	Clear (0) this bit.
16	TXS	Tx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 1 = Enabled Endpoint0 is always enabled. Read only
6:4	RESERVED_BITS6_4	Clear (0) these bits.
3:2	RXT	Rx endpoint type Read only value 00 = Control Endpoint0 is fixed as a control end point.
1	RESERVED_BIT1	Clear (0) this bit.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRL0 (cont.)

Bits	Name	Description
0	RXS	Rx endpoint stall Read/write value 0 = End point OK (default) value 1 = End point stalled The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. It will continue returning STALL until the bit is cleared (0) by the software or it will automatically be cleared (0) upon receipt of a new SETUP request. After receiving a SETUP request, this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). Note: There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

**0x078D91C0+USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRLn, n=[1..15]
0x4*n****Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_ENDPTCTRLn register is the endpoint control n register. There is an ENDPTCTRLn register for each endpoint in a device.

CAUTION If one endpoint direction is enabled and the paired endpoint of the opposite direction is disabled, then the unused direction type must be changed from the default control-type to any other type (such as bulk-type). Leaving an unconfigured endpoint control will cause undefined behavior for the data PID tracking on the active endpoint/direction.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRLn

Bits	Name	Description
31:24	RESERVED_BITS31_24	Clear (0) these bits.
23	TXE	Tx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
22	TXR	Tx data toggle reset (WS) value 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and device.
21	TXI	Tx data toggle inhibit value 0 = PID sequencing enabled (default) value 1 = PID sequencing disabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet.
20	RESERVED_BIT20	Clear (0) this bit.
19:18	TXT	Tx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
17	TXD	Tx endpoint data source value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
16	TXS	Tx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.
15:8	RESERVED_BITS15_8	Clear (0) these bits.
7	RXE	Rx endpoint enable value 0 = Disabled (default) value 1 = Enabled An endpoint should be enabled only after it has been configured.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPTCTRLn (cont.)

Bits	Name	Description
6	RXR	Rx data toggle reset (WS) Write 1 = Reset PID sequence Whenever a configuration event is received for this endpoint, the software must set (1) this bit in order to synchronize the data PIDs between the host and the device.
5	RXI	Rx data toggle inhibit value 0 = Disabled (default) value 1 = Enabled This bit is only used for testing and should always be cleared (0). Setting (1) this bit will cause this endpoint to ignore the data toggle sequence and always accept a data packet regardless of their data PID.
4	RESERVED_BIT4	Clear (0) this bit.
3:2	RXT	Rx endpoint type value 00 = Control value 01 = Isochronous value 10 = Bulk value 11 = Interrupt
1	RXD	Rx endpoint data sink value 0 = Dual port memory buffer/DMA engine (default) This bit should always be cleared (0).
0	RXS	Rx endpoint stall value 0 = End point OK value 1 = End point stalled This bit will be cleared (0) automatically upon receipt of a SETUP request if this endpoint is configured as a control endpoint, and this bit will continue to be cleared (0) by the hardware until the associated ENDPTSETUPSTAT bit is cleared (0). The software can set (1) this bit to force the endpoint to return a STALL handshake to the host. This control will continue to STALL until this bit is either cleared (0) by the software or automatically cleared (0) as described above for control endpoints. Note (control endpoint types only): There is a slight delay (50 clocks maximum) between the ENDPTSETUPSTAT being cleared (0) and the hardware continuing to clear (0) this bit. In most systems, it is unlikely that the DCD software will observe this delay. However, should the DCD observe that the stall bit is not set (1) after writing a one to it, then continually write this stall bit until it is set (1) or until a new setup has been received by checking the associated ENDPTSETUPSTAT bit.

**0x078D91FC+USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPT_PIPE_IDn, n=[1..15]
0x4*n****Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x001F001F

The USB_OTG_HS_ENDPT_PIPE_IDn register is the endpoint pipe number register. There is an USB_OTG_HS_ENDPT_PIPE_IDn register for each endpoint in a device.

Note: reset value of TX_PIPE_ID and RX_PIPE_ID is 0x1F, which means that Endpoint is not mapped to any pipe.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_ENDPT_PIPE_IDn

Bits	Name	Description
31:21	RESERVED_BITS31_21	Clear (0) these bits.
20:16	TX_PIPE_ID	This field indicate the pipe number that this tx end point (n) will use in pipe mode.
15:5	RESERVED_BITS15_5	Clear (0) these bits.
4:0	RX_PIPE_ID	This field indicate the pipe number that this rx end point (n) will use in pipe mode.

0x078D9240 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_CTRL**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x388C3C3A

The USB_OTG_HS_PHY_CTRL register is used to configure various features in the Synopsys 28nm PHY.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_CTRL

Bits	Name	Type	Description
31	RESERVED_BITS31	R	Clear (0) th bits.
30	USB2_PHY_CLK_REF_DIV 2	RW	PHY should get 19.2Mhz on the CLKCORE/XO. When the ref_clk is 38.4Mhz the clock divider in the HS PHY wrapper is enabled to divide the frequency by 2. Default value is '0' - ref_clk is not divided.
29:26	USB2_PHY_PLLPTUNE	RW	connects to port PLLPTUNE of the SYPS HS PHY- PLL Proportional path tune. Default value - 4'b1110

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Type	Description
25:24	USB2_PHY_PLLITNUE	RW	connects to port PLLITUNE of the SYPS HS PHY- PLL integral path tune. Default value - 2'b00
23	USB2_PHY_VREGBYPASS	RW	connects to port VREGBYPASS of the SYPS HS PHY- This signal controls the VReg18 bypass mode. 1: the VReg18 is bypassed. 1.8V power supply needs to be provided on VDDH0. 0: the VReg18 is not bypassed. A 3.3V supply needs to be provided on VDDH0 and the internal 1.8V supply is generated by the VREG18. Default value - 1'b1
22	USB2_PHY_PLLBTUNE	RW	connects to port PLLBTUNE of the SYPS HS PHY- PLL Bandwidth adjustment, this adjustment doubles the bandwidth of the PLL. 1: Double bandwidth mode enabled 0: Design Default If PLLBTUNE = '1' is set, then FSEL[2:0] must be set to 3'b010 and a 24MHZ reference clock must be used. Default value - 1'b0
21	USB2_PHY_CLAMP_MPM_DPSE_DMSE_EN_N	RW	Clamp enable for DPSEHV and DMSEHV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and These HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 0. SW should set this bit before Entering Retention only if there is no PHY power collapse.
20	USB2_PHY_DMSE_INTEN	RW	Enable HV DMSE pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
19	USB2_PHY_DMSEHV_CLAMP_EN	RW	Clamp enable for DMSEHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and DMSEHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
18	USB2_PHY_ULPI_CLK_EN	RW	Enables the ulpi_clk from the PHY. Default value is 1- clock is enabled
17	USB2_PHY_REFCLKOUT_EN	RW	Enables the refclock_out from the Primary PHY (the refclkock_out of the primary PHY can be used as a reference clock of the secondary PHY. Default Value is 0
16	RESERVED_BIT16	R	Clear (0) this bit

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Type	Description
15	USB2_PHY_USE_CLKCORE	RW	Configure whether the XO or the CLKCORE of the HS PHY should be used as a reference clock. When external clock (XO) is used as a ref_clk, USE_CLKCORE should be 0. When CLKCORE is used as the ref_clk, USE_CLKCORE=1. Default is '0' - using XO as ref_clk and not the CLKCORE
14	USB2_PHY_DPSE_INTEN	RW	Enable HV DPSE pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
13	USB2_PHY_DPSEHV_CLAMP_EN	RW	Clamp enable for DPSEHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and DPSEHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
12	USB2_PHY_IDHV_CLAMP_EN	RW	Clamp enable for IDHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN	RW	Clamp enable for OTGSESSVLDHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
10	PHY_MPM_HV_CLAMP_EN	RW	Clamp enable for IDHV and OTGSESSVLDHV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and These HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLDHV_INTEN	RW	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN	RW	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR	RW	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL	RW	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_CTRL (cont.)

Bits	Name	Type	Description
3	HOST_PORTCTRL_FORCE_SUSEN	RW	Chicken bit for CR-0000153908 - when this bit set the core will enter to low power mode when portctrl host sm enter to suspend mode. Default value is 1.
2	USB2_PHY_SIDDQ	RW	IDDQ Test Enable.
1	USB2_PHY_RETEN	RW	Retention mode enable/disable
0	USB2_PHY_POR	RW	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x078D9244 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GENERIC1**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_GENERIC1 register. reset is 0xFFFFFFFF for generics because the value of these registers changes per core instance. SW can read these registers to identify the real HW parameters of the core instance.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GENERIC1

Bits	Name	Description
31:16	USB_HS_TX_DEPTH	TX_DEPTH is the number of words in the TX buffer. This number is calculated by the number of bytes allocated per Endpoint divided by 4, times the number of endpoints. In HS USB this value is usually 512 bytes per EP, and for FS ONLY USB it is usually 64 Bytes per EP.
15:0	USB_HS_RX_DEPTH	RX_DEPTH is the number of words in the RX buffer. This number is usually 256, but can support powers of 2 up to 4096.

0x078D9248 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GENERIC2**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_GENERIC2 register. reset is 0xFFFFFFFF for generics because the value of these registers changes per core instance. SW can read these registers to identify the real HW parameters of the core instance.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_GENERIC2

Bits	Name	Description
31:20	RESERVED_BITS31_19	
19	USE_HBM	USE_HBM generic specifies if HBM(host bam manager) block is supported in RTL. The HBM block allow AHB transfers through the BAM in host mode. '0' - BAM isn't used in host mode. '1' - BAM can be used in host mode.
18	USE_EXT_HSIC	USE_EXT_HSIC generic specifies if the USB core can use both external HSIC and ULPI phy's. the HSIC phy will be accessed through ulpi_1 bus. '0' - Existing design (per USE_HSIC generic). '1' - Both ULPI and HSIC phy's are supported (USE_HSIC generic is redundant).
17	RESERVED	Reserved
16	USE_FS_SIE	USE_FS_SIE generic specifies if FS serial interface logic is supported in RTL. '0' - FS serial interface logic is not supported. '1' - FS serial interface logic is supported
15	USE_SPS_AHB2AHB	USE_SPS_AHB2AHB generic specifies if AHB2AHB bridge is connected between BAM and SPS Fabric AHB. only applicable when USE_SPS = 1. 1 - the core has AHB2AHB bridge between BAM and SPS Fabric AHB, 0 - the BAM connected directly to SPS Fabric AHB
14	LPM_SUPPORT	The LPM_SUPPORT generic specifies if USB support Link Power Management. 1 - the core support Link Power Management, 0 - the core doesn't support Link Power Management
13:9	USB_HS_DEV_EP	The number of USB endpoints. Valid values for the number of Endpoints are 4, 8, and 16
8:3	MAX_PIPES	The number of simultaneous parallel pipes supported by the BAM. Supported values are 2 to 30.
2	USE_SPS	The USE_SPS generic specifies if Bam is connected to USB core, 1 - Bam is connected to USB core, 0 - USB core doesn't include BAM instance
1	USE_HSIC	The USE_HSIC generic specifies if an HSIC is connected to USB core. 1 - the core is connected to HSIC phy, 0 - the core is connected to ULPI phy
0	UTMI_PHY_SW_IF_EN	The UTMI_PHY_SW_IF_EN generic specifies if UTMI phy Register Interface is enabled. 1 - UTMI phy Register Interface is enabled, 0 - UTMI phy Register Interface is disabled

0x078D9250 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_L1_EP_CTRL**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x0000FFFF

The USB_OTG_HS_L1_EP_CTRL register enables/disables transition to L1 and exit from L1 state when specific TX endpoints are primed.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_L1_EP_CTRL

Bits	Name	Description
31:16	TX_EP_PRIME_L1_EXIT	Those bit's enables Remote Wakeup in L1 state when SW starts Priming The specific Endpoint.
15:0	TX_EP_PRIME_L1_EN	Control bit's that enables/disables transition to L1 when the specific TX Endpoint is active.

0x078D9254 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_L1_CONFIG

Type: RW

Clock: CC_USB_OTG_HS_CLK

Reset State: 0x00000000

The USB_OTG_HS_L1_CONFIG register is used to configure various L1 features.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_L1_CONFIG

Bits	Name	Description
31:13	RESERVED_BITS31_13	Clear (0) these bits.
12	L1_SUSP_SLEEP_SEL	Applicable only with USB2.0 phy. control bit that selects how the phy would enter ULPI low power mode, 0 - by writing to suspendM bit in func_ctrl register, 1 - by writing to sleepM bit in func_ctrl register. default value 0 - suspendM
11	PLL_PWR_DWN_EN	Control bit that enables/disables power down of 480 MHz PLL in L1 state. default value 0 -disable
10	PHY_LPM_EN	Control bit that enable/disables entering ULPI Low Power Mode in L1 state. default value 0 -disable
9	GATE_AHB_CLK_EN	Control bit that enable/disables clock request signaling for usb_ahb_clk in L1 state, currently this clock is not gated so this bit has no effect.
8	GATE_FS_XCVR_CLK_EN	Control bit that enable/disables clock gating of usb_fs_xcvr_clk in L1 state, Applicable only with HSIC phy. default value 0 -disable
7	GATE_SYS_CLK_EN	Control bit that enable/disables clock gating of usb_system_clk in L1 state. default value 0 -disable
6	GATE_XCVR_CLK_EN	Control bit that enable/disables power-down of 480 MHz PLL in L1 state, Applicable only with HSIC phy. default value 0 -disable
5	L1_REMOTE_WAKEUP_EN	Control bit that enables/disables Remote Wakeup in L1 state. When this bit is low, then Link Controller never initiates Remote Wakeup in L1 state. When this bit is high, Link Controller can initiate Remote Wakeup.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_L1_CONFIG (cont.)

Bits	Name	Description
4	LPM_EN	Control bit that enables/disables LPM support. When this bit is zero a full backward compatibility is ensured - no LPM support and no response for LPM Extended Transaction
3:0	PLL_TURNOFF_MIN_HIRD	Specifying a minimum expected HIRD value from Host that enables HW mechanism for turning off the 480 MHz PLL. The default value is 50us. Each value adds up 10 us to the previous value. the maximum value is 200us.

0x078D9260 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_LPM_ATTRIBUTES**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_LPM_ATTRIBUTES register store the bmAttribute Field of the LPM transaction.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_LPM_ATTRIBUTES

Bits	Name	Description
31:5	RESERVED_BITS31_5	Clear (0) these bits.
4	BREMOTEWAKE	A value of one (1B) in this field enables the addressed device to wake the host upon any meaningful application-specific event (e.g. an interrupt for a device with one or more interrupt endpoints). A value of zero (0B) disables the device from initiating remote wake.
3:0	HIRD	Host Initiated Resume Duration. The HIRD value is a 4-bit encoded value. The value of 0000B is interpreted as 50 us. Each value up adds 75 us to the previous value. Based on this rule, the maximum value resume drive time is at encoding value 1111B which represents 1.2ms

0x078D9264 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_LPM_TIMERS**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000078

Register that control different times during LinkPM, NOT Applicable with HSIC phy.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_LPM_TIMERS

Bits	Name	Description
11:0	LINKPM_RESUME_TIME	How much time the device make sure that the host drives resume in multiplies of 33.33 ns.Default reset value is 12'b000001111000 which means if the device will count less than 4us of resume it will disregard the resume signal. NOT Applicable with HSIC phy.

0x078D9270 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HW_VER**Type:** R**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000000

The USB_OTG_HS_HW_VER register contains HW versioning information according to the guidelines of the IP Catalog methodology.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_HW_VER

Bits	Name	Description
31:28	MAJOR	Indicates different interface version. Major version changes are not backward compatible.
27:16	MINOR	Indicates expanded functionality. Minor version adds functionality while being backward compatibility for existing features.
15:0	STEP	Indicates a change in the HW which is not intended to impact SW compatibility.

0x078D9278 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_SEC_CTRL**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x000C3C32

The USB_OTG_HS_PHY_SEC_CTRL register is used to configure various features in the secondary Synopsys 28nm PHY.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_SEC_CTRL

Bits	Name	Type	Description
31:22	RESERVED_BITS31_22	R	Clear (0) these bits.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_SEC_CTRL (cont.)

Bits	Name	Type	Description
21	USB2_PHY_CLAMP_MPM_DPSE_DMSE_EN_N_2	RW	Clamp enable for DPSEHV and DMSEHV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and These HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 0. SW should set this bit before Entering Retention only if there is no PHY power collapse.
20	USB2_PHY_DMSE_INTEN_2	RW	Enable HV DMSE pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
19	USB2_PHY_DMSEHV_CLAMP_EN_2	RW	Clamp enable for DMSEHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and DMSEHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
18	USB2_PHY_ULPI_CLK_EN_2	RW	Enables the ulpi_clk from the PHY. Default value is 1- clock is enabled
17	RESERVED_BIT17	RW	Clear (0) this bit
16	USB2_PHY_HS2_DIG_CLAMP_N_2	RW	Clamping the Low Voltage interface between DVDD of the PHY and Vddcx (Reset value is 0 clamp)
15	USB2_PHY_USE_CLKCORE_E_2	RW	Configure whether the XO or the CLKCORE of the HS PHY should be used as a reference clock (Default Value is 0 which means Use the XO)
14	USB2_PHY_DPSE_INTEN_2	RW	Enable HV DPSE pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
13	USB2_PHY_DPSEHV_CLAMP_EN_2	RW	Clamp enable for DPSEHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and DPSEHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
12	USB2_PHY_IDHV_CLAMP_EN_2	RW	Clamp enable for IDHV interrupt level shifter from VDDPAD domain to VDDCX domain. When set (1), VLS is active and IDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped high. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_PHY_SEC_CTRL (cont.)

Bits	Name	Type	Description
11	USB2_PHY_OTGSESSVLDHV_CLAMP_EN_2	RW	Clamp enable for OTGSESSVLDHV interrupt level shifter from USB VDD180 domain to VDDCX domain. When set (1), VLS is active and OTGSESSVLDHV interrupt is translated from 1.8V domain to Vddcx domain. When clear (0), VLS is clamped to zero. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
10	PHY_MPM_HV_CLAMP_EN_2	RW	Clamp enable for IDHV and OTGSESSVLDHV interrupts level shifters from USB VDD180 domain to VDDPAD MPM in usb2 phy wrapper. When set (1), VLS is active and these HV interrupts are translated from 1.8V domain to MPM Vdd domain. When clear (0), VLS is clamped to inactive state. Default value is 1. SW should clear this bit before power collapse of 1.8V domain of PHY.
9	USB2_PHY_OTGSESSVLDHV_INTEN_2	RW	Enable HV session valid interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
8	USB2_PHY_IDHV_INTEN_2	RW	Enable HV id pin interrupt from phy. This interrupt translated with level shifter for wakeup from retention when VDDCX is nominal and TCXO is running.
7	USB2_PHY_ULPI_POR_2	RW	Reset for ULPI PHY Wrapper and ULPI clock domain logic in usb2_phy_wrapper.
6:4	USB2_PHY_FSEL_2	RW	Reference Clock Frequency Select 011 (Assumes 19.2MHz default)
3	RESERVED_BIT	R	Clear this bit
2	USB2_PHY_SIDDQ_2	RW	IDDQ Test Enable.
1	USB2_PHY_RETEN_2	RW	Retention mode enable/disable
0	USB2_PHY_POR_2	RW	Power-On-Reset (Analog configuration needs to happen before POR is set to 0)

0x078D9340 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BTO_TIME_HS**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x000B40A2

Register that controls the bus timeout value For HS Hostdevice

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BTO_TIME_HS

Bits	Name	Type	Description
31:22	RESERVED_BITS31_22	R	

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BTO_TIME_HS (cont.)

Bits	Name	Type	Description
21:11	BTO_TIME_HS_HST	RW	the bus timeout value for HS Host in multiplies of 16 ns. Default reset value is 11'b00010100010 which means 2.7 us (1296 HS bit times).
10:0	BTO_TIME_HS_DEV	RW	the bus timeout value for HS Device in multiplies of 16 ns. Default reset value is 11'b00101101000 which means 6 us (2880 HS bit times).

0x078D9344 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BTO_TIME_FS_LS**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x002B20CC

Register that controls the bus timeout value For FSS

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_BTO_TIME_FS_LS

Bits	Name	Type	Description
31:22	RESERVED_BITS31_22	R	
21:11	BTO_TIME_LS	RW	the bus timeout value for LS Device in multiplies of 16 ns. Default reset value is 11'b10101100100 which means 22.7 us (35 LS bit times).
10:0	BTO_TIME_FS	RW	the bus timeout value for FS Host/Device in multiplies of 16 ns. Default reset value is 11'b00011001100 which means 3.33 us (41 FS bit times).

0x078D9348 USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_QSB_VALUES**Type:** RW**Clock:** CC_USB_OTG_HS_CLK**Reset State:** 0x00000028

configurable QSB values

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_QSB_VALUES

Bits	Name	Description
6	MEMTYPE_VALUE_EN	Enabling the hprot values
5:4	MEMTYPE_FOR_RDATA	hprot[3:2] for read data. should be 2 by default so memtype is 2 (cachable)
3:2	MEMTYPE_FOR_WDATA	hprot[3:2] for write data during transaction or block. should be 2 by default so memtype is 2 (cachable)

USB2_HSIC_USB_OTG_HS_BASE_USB_OTG_HS_QSB_VALUES (cont.)

Bits	Name	Description
1:0	MEMTYPE_FOR_NON_BUF_ACCESS	hprot[3:2] for last write data. should be 0 by default so memtype is 0 (strongly ordered)

21.2 USB2_HSIC_USB_OTG_HS_BAM**21.2.1 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM****0x078C4000 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CTRL****Type:** RW**Clock:** bam_clk**Reset State:** 0x00020000

BAM Control register allows global controls for the BAM.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CTRL

Bits	Name	Description
20	BAM_MESS_ONLY_CANCEL_WB	When active (1) - BAM will DROP former descriptor write-backing and Interrupt firing when former descriptor has been closed (accumulated=acknowledged) and ack_on_success with EOT and size 0 arrived (messaging only). When legacy mode is used (0) - This said a case then the former descriptor has been closed (accumulated=acknowledged) and ack_on_success with EOT and size 0 arrived (messaging only). In this case the FIFO-pointer has been already advanced before the ack_on_success arrives and therefore we do write-back to former descriptor and fire interrupt. 1'b1 - Drop WB and Interrupt 1'b0 - legacy.
19	CACHE_MISS_ERR_RESP_EN	When set to '1', upon local ahb access results with cache miss, the bam_ndp will not stall the bus, and finish the access with error response. This bit is relevant for BAM_NDP only.
18:17	LOCAL_CLK_GATING	These Bits enables power saving by using a local clock gating cell. Bit 17: 1'b1 - CGC is on, so that the clock is controlled by the HW - this is the reset value. 1'b0 - CGC is off so that the clock is free running Bit 18: Reserved bit for future improvements.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CTRL (cont.)

Bits	Name	Description
16	IBC_DISABLE	This Bit enables power saving by disabling the inactivity clock timer/counter. This is useful when: 1) The BAM is Enabled but idling for long periods. 2) The BAM is Enabled and running but the inactivity timers/counters are not required by the SW for operating the BAM. When the BAM is Disabled, it automatically shuts down those timers to save power. 1'b1 - Enable Power Saving Mode 1'b0 - Disable Power Saving Mode
15	BAM_CACHED_DESC_STORE	This Bit enables storage of a cached Descriptor into RAM when doing Context Switch and loading it back when returning to this pipe. This is relevant for System Modes Only. BAM to BAM Consumer mode doesn't have this option. Enabling this makes the Context Switch process slightly longer but reduces AHB Descriptor Fetch time later on. It also reduces the number of descriptor fetches done by the BAM if BAM is treating more than 2 pipes. 1'b1 - Enabled 1'b0 - Disabled Available in BAM only
14:13	BAM_DESC_CACHE_SEL	This Selector chooses which Descriptor Caching mode will be used. This is relevant for System Producer or Consumer modes only. 2'b00 - Cache when current descriptor has less than 64 bytes left. 2'b01 - Cache when current descriptor has less than 128 bytes left. 2'b10 - Immediate Auto cache - cache will happen whenever there are no descriptors cached. This might cause unnecessary descriptors reads when switching between more than 2 pipes. It is the most effective when each pipe processes more bytes than there are in an average descriptor (small descriptors, big block size), or when working with 2 or less pipes. 2'b11 - Cache when descriptor is needed only. This results in 1 descriptor present in cache at most. Available in BAM only
11:5	RESERVED	Reserved
4	BAM_EN_ACCUM	When Enabled, BAM will accumulate data written by the peripheral in Direct Mode into INCR8 Bursts. This is an optimization feature for Producer Direct Mode cases. 1'b1 - Enabled 1'b0 - Disabled Available in BAM only

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CTRL (cont.)

Bits	Name	Description
1	BAM_EN	After reset the BAM wakes up in Disabled Mode. While Disabled, BAM operates in Legacy mode (all the transfers from the peripheral go around the BAM as if it doesn't exist) Software Enables this bit to allow BAM operation. This bit doesn't affect the PIPE enable bit in BAM_P_CTRL register. The only possibility to Disable the BAM after it has been enabled is by Hardware or Software reset. 1'b1 - Enabled 1'b0 - Disabled
0	BAM_SW_RST	This will reset the BAM & all Pipes. Software may use this to reset the BAM. As long as the bit remains high the BAM remains in reset state. Software should clear this bit 1'b1 - Reset state 1'b0 - Normal state

0x078C4040 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TIMER**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This register counts the idle time of the BAM (all the pipes are in idle state).

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TIMER

Bits	Name	Description
15:0	TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms ~ 6 seconds

0x078C4044 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TIMER_CTRL**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The register can be written and read only when INACTIVITY_TIMERS_SUPPORTED generic equals to 1.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TIMER_CTRL

Bits	Name	Description
31	TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the TIMER_THRESOLD value 1'b1 - Active 1'b0 - Reset
30	TIMER_RUN	Will be used along with TIMER_MODE Not implemented at this time. Set to zero(0)
29	TIMER_MODE	Not implemented at this time. Set to zero(0)
15:0	TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

0x078C4008 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_DESC_CNT_TRSHLD**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000001

This Register holds a threshold value for the counter summing the Size of the Descriptors Provided. This value is Global for all pipes but it is relevant for System Producer BAM mode and Both Consumer modes, where Descriptors summing takes place in order to provide the information to the peripheral via pipe bytes free (producer) or pipe bytes available interfaces.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_DESC_CNT_TRSHLD

Bits	Name	Description
15:0	CNT_TRSHLD	Threshold value. The maximum allowed value is 32kByte. The minimum allowed value is 1 (value 0 is not allowed). Available in BAM only

0x078C4014 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_STTS**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only.

Clearing the interrupt bits is done by writing to BAM_IRQ_CLR register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_STTS

Bits	Name	Description
4	BAM_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
3	BAM_EMPTY_IRQ	The interrupt indicates the BAMs buffer is empty. This bit can become high only when BAM_DATA_ERASE or BAM_DATA_FLUSH is high in BAM_TEST_BUS_SEL register.
2	BAM_ERROR_IRQ	This Indicates a Fatal Error has happened in the BAM. Currently this might happen due to an UnSuccessful Pipe Reset operation.
1	BAM_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only

0x078C4018 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_CLR**Type:** W**Clock:** bam_clk**Reset State:** 0x00000000

Writing to this register causes the interrupt to clear.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_CLR

Bits	Name	Description
4	BAM_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
3	BAM_EMPTY_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM-Lite only
2	BAM_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
1	BAM_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged Available in BAM only

0x078C401C USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_EN**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Enable bits for the Interrupts in the BAM Interrupt Status register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_EN

Bits	Name	Description
4	BAM_TIMER_EN	Enables Inactivity timer interrupt by writing this bit 1'b1 - Enable 1'b0 - Disable
3	BAM_EMPTY_EN	1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
2	BAM_ERROR_EN	1'b1 - Enable 1'b0 - Disable
1	BAM_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable Available in BAM only

0x078C407C USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CNFG_BITS**Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the BAM configuration bits for bug fixes. It is highly recommended to follow the directions for each bit and set it accordingly.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CNFG_BITS

Bits	Name	Description
31	AOS_OVERFLOW_PRVNT	This bit enables overflow prevention when Sideband block accumulates ack_on_success updates from peripherals to values higher than 0x7fff. '1' - enable ack-on_success overflow prevention. If current ack_on_success update causes overflow accept_ack_on_success_toggle will not approve the update until SB accumulator is cleared. '0' - disable ack-on_success overflow prevention. Available in BAM-NDP only. Default value is '0' (Legacy). Recommended value is '1'.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
30	MULTIPLE_EVENTS_DESC_AVAIL_EN	This is an enable bit for supporting multiple events received by a Producer BAM2BAM and makes BAM-NDP to notify a correct desc_cache_avail bus. It fixed CR: QCTDD00209370.
29	MULTIPLE_EVENTS_SIZE_EN	This is an enable bit for supporting multiple events received by a Producer BAM2BAM and makes BAM-NDP delivering correct descriptor sizes on local_ahb bit. It fixed CR: QCTDD00209379.
28	BAM_ZLT_W_CD_SUPPORT	Recommended value: 1 Enables support of ZLT (i.e. a zero-sized descriptor) before a command-descriptor. Specifically it supports a case on a pipe without any data-descriptors but with ZLT descriptors and Command-descriptors only. This allows putting NWD bit in the ZLT descriptor (instead of in the CMD) which results in better performance than using the NWD in the command-descriptor. Available in BAM-Lite Only.
27	BAM_CD_ENABLE	Recommended value: 1 Enables the command descriptor feature.
26	BAM_AU_ACCUMED	Recommended value: 1 This bit fixes a bug in the Ack Update state machine, where an overflow happened while counting descriptors and reaching more than 64kB of calculated sizes. 1'b1 - Enable Fix 1'b0 - Disable Available in BAM/BAM-NDP only
25	BAM_PSM_P_HD_DATA	Recommended value: 1 This bit allows pipe state machine to ignore retransmission requests if a pipe has just been initialized and process those as a regular fetch request. (consumer modes only). When this bit disabled, BAM could fetch descriptors for a pipe which was reset and no descriptors were added yet, if a retransmission request followed after the reset.. 1'b1 - Enable Fix 1'b0 - Disable Available in BAM only
24	BAM_REG_P_EN	Recommended value: 1 This bit fixes the pipe configuration signals mux for the current active pipe in 2 pipes BAM. When disabled, internal state machines might get into enabled states while the pipe is disabled. This would typically happen after pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM/BAM-NDP only

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
23	BAM_WB_DSC_AVL_P_RST	Recommended value: 1 This bit allows the Writeback state machine to reset the vector indicating there're available descriptors when a pipe reset occurs. If disabled, BAM might fetch descriptors after resetting and reconfiguring a pipe, even though no Event (descriptors) was provided.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
22	BAM_WB_RETR_SVPNT	Recommended value: 1 This bit fixes a bug where a pipe which was reset, still stored its retransmission save point, but into the illegal's pipe address space, thus hurting the last pipe of the BAM if the BAM had a total 4, 8 or 16 pipes. This is relevant for Producer to System modes only. (CR-0000151585) 1'b1 - Enabled 1'b0 - Disable Available in BAM/BAM-NDP only
21	BAM_WB_CSW_ACK_IDL	Recommended value: 1 This bit allows the Writeback state machine to switch into idle state prior to visiting disabled state. This is needed when context switching from mode X to another pipe of mode X is well. This is required to fix a bug in the 2 pipes BAM. 1'b1 - Enable 1'b0 - Disable Available in BAM/BAM-NDP only
20	BAM_WB_BLK_CSW	Recommended value: 1 When Enabled, this bit does not allow context switch to happen in the Writeback state machine until it has created a descriptor. This is relevant when the descriptor fifo is becoming full and there's no space to create a descriptor, while another pipe is context switching. This might result in the descriptor not to be created ever, if it was the last one for that pipe. Relevant for Producer BAM-to-BAM mode only. 1'b1 - Enable 1'b0 - Disable Available in BAM only
19	BAM_WB_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Writeback state machine when performing pipe reset. 1'b1 - 1'b0 - Disable Available in BAM only

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
18	BAM_SI_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Sideband Inform state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
17	BAM_AU_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Ack Update state machine when performing pipe reset. 1'b1 - Enable 1'b0 - Disable Available in BAM only
16	BAM_PSM_P_RES	Recommended value: 1 This bit allows to reset all internal registers of the Pipe state machine when performing pipe reset.. 1'b1 - Enable 1'b0 - Disable Available in BAM only
15	BAM_PSM_CSW_REQ	Recommended value: 1 This bit forces the context switch request from pipe state machine to RAM controller not to last longer than the slave requested. (2 Pipes BAM bug fix). 1'b1 - Enable 1'b0 - Disable Available in BAM only
14	BAM_SB_CLK_REQ	Recommended value: 1 This bit allows the clock request from the sideband block to propagate into the BAM's common clock request. 1'b1 - Propagate Sideband Clock Request 1'b0 - Disable Available in BAM only
13	BAM_IBC_DISABLE	Recommended value: 1 This bit helps to save power by allowing the BAM to keep the inactivity base counter in reset when BAM is disabled or when SW configures IBC_DISABLE bit high. Irrelevant field for BAM-NDP. 1'b1 - Enable Power Saving 1'b0 - Disable Power Saving

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_CNFG_BITS (cont.)

Bits	Name	Description
12	BAM_NO_EXT_P_RST	Recommended value: 1 This bit allows the BAM / BAM Lite to ignore the externally connected blocks (eDML) when doing pipe reset. The BAM, once instructed to pipe reset, first thing lets the externally connected block know a reset is needed. Then it waits for the externally connected block to Acknowledge it is ready for the pipe reset (meaning it doesn't push any data for the reseted pipe) and then the BAM Lite completes the pipe reset operation internally. When disabled, the BAM doesn't require any Acknowledge from the external block to perform pipe reset. 1'b1 - Enable external block pipe reset 1'b0 - Disable - ignore external block pipe reset
11	BAM_FULL_PIPE	Recommended value: 0 This enables the BAM support for a BAM to BAM Producer which insists to write to a full pipe. When 0, BAM might issue data overflow if producers write to a full pipe. When 1 BAM will not allow this and lower HReady when peripheral tries to do so. Once space is freed in the pipe, Hready will rise and the flow will continue. 1'b1 - Enable 1'b0 - Disable Available in BAM only
3	RESERVED	Reserved
2	BAM_PIPE_CNFG	Recommended value: 1 Pipe SM upgrade for writing EOT bit to the previous descriptor. It's invoked only when EOB arrives in the end of a descriptor. It is highly recommended to set this bit high. Leaving it low might cause incorrect Pipe Bytes Free value reported to peripheral in rare cases. 1'b1 - Enable 1'b0 - Disable Available in BAM only
1:0	RESERVED	Reserved

0x078C5000 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_REVISION**Type:** R**Clock:** bam_clk**Reset State:** Undefined

This Register holds a hard coded revision number of the BAM RTL. This corresponds to the BAM target number in the IMS. Also additional BAM settings are reflected here.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_REVISION

Bits	Name	Description
31:24	INACTIV_TMR_BASE	This indicates the width of the inactivity timers base counter.
23	CMD_DESC_EN	This indicates BAM has Command Descriptor feature enabled in HW.
22:21	DESC_CACHE_DEPTH	This field indicates the Per-Pipe-Descriptor-Cache. could be 1-4: 2'b00 - Descriptor Cache Depth of 1. 2'b01 - Descriptor Cache Depth of 2. 2'b10 - Descriptor Cache Depth of 3. 2'b11 - Descriptor Cache Depth of 4. Valid only for BAM_NDP.
20	NUM_INACTIV_TMRS	This bit is checked only if INACTIV_TMRS_EXST = 1. This bit indicates how many inactivity timers are implemented according to value of INACTIVITY_TIMERS_SUPPORTED generic: 1'b1 - One timer for global BAM activity (INACTIVITY_TIMERS_SUPPORTED = 1) 1'b0 - MAX_PIPES timers for each pipe activity (INACTIVITY_TIMERS_SUPPORTED = 2)
19	INACTIV_TMRS_EXST	This indicates BAM has inactivity timers. 1'b1 - Timers available (INACTIVITY_TIMERS_SUPPORTED = 1 or 2) 1'b0 - No timers available (INACTIVITY_TIMERS_SUPPORTED = 0)
18	HIGH_FREQUENCY_BAM	This indicates BAM has Double Sampling on the Ack On Success interface. 1'b1 - Ack On Success double sampled 1'b0 - No double sampling of Ack On Success
17	BAM_HAS_NO_BYPASS	This field indicates BAM has no bypass on the AHB Data bus, from the Peripheral AHB Master to the fabric. When Bypass is available, it is the default routing when BAM is disabled. 1'b1 - No Bypass 1'b0 - Bypass Exists
16	RESERVED	Reserved
15	RESERVED	Reserved
14	AXI_ACTIVE	This field indicates BAM_NDP uses internal AXI bridge on the master port.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_REVISION (cont.)

Bits	Name	Description
13:12	CE_BUFFER_SIZE	This field indicates the size (in Data words) of the buffer which stores the command elements. Each command element includes 4 words. 2'b00 - 4 Words (one command element). 2'b10 - 8 Words (2 command elements). 2'b11 - 16 Words (4 command elements). Valid Only if CMD_DESC_EN = 1'b1.
11:8	NUM_EES	This indicates the Number of Interrupt Lines (Execution Environments) supported by the BAM. When 1 EE is supported, only the BAM_IRQ_SRC*_EE0 registers exist. When 4 EEs are supported, all BAM_IRQ_SRC*_EE _n registers exist for n=[0..3].
7:0	RESERVED	Reserved

0x078C5008 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_NUM_PIPES**Type:** R**Clock:** bam_clk**Reset State:** Undefined

This Register holds a the hard coded number of pipes in the BAM. Since each BAM may have a different number of pipes instantiated in HW, this register allows the SW to know this parameter. The reset state value doesn't have any meaning in this register since it is a constant.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_NUM_PIPES

Bits	Name	Description
31:24	RESERVED	Reserved
23:16	RESERVED	Reserved
15:14	BAM_DATA_ADDR_BUS_WIDTH	This field indicates BAM data bus address width: 2'b00 - 32bit address width 2'b01 - 36bit address width 2'b1x - Reserved for future widening
7:0	BAM_NUM_PIPES	This field contains the number of pipes available in this BAM

0x078C5024 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_CTRL**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_CTRL

Bits	Name	Description
22:18	BAM_ERR_HVMID	HVMID
17	BAM_ERR_DIRECT_MODE	DIRECT MODE
16:12	BAM_ERR_HCID	HCID
11:8	BAM_ERR_HPROT	HPROT
7:5	BAM_ERR_HBURST	HBURST
4:3	BAM_ERR_HSIZE	HSIZE
2	BAM_ERR_HWRITE	HWRITE
1:0	BAM_ERR_HTRANS	HTRANS

0x078C5028 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR

Bits	Name	Description
31:0	BAM_ERR_ADDR	HADDR

0x078C502C USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_DATA**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_DATA

Bits	Name	Description
31:0	BAM_ERR_DATA	HDATA

0x078C5100 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_LSB**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

Relevant only on 36 bit address BAM.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_LSB

Bits	Name	Description
31:0	BAM_ERR_ADDR	32 LSB of HADDR

0x078C5104 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_MSB**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

Relevant only on 36 bit address BAM.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_AHB_MASTER_ERR_ADDR_MSB

Bits	Name	Description
3:0	BAM_ERR_ADDR	4 MSB of Address (bits 35 to 32) of HADDR

0x078C6000 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TRUST_REG

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This Register holds the BAM Trusted configurations.

This register cannot be reset by any SW reset. Only HW reset applies.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TRUST_REG

Bits	Name	Description
13	LOCK_EE_CTRL	This bit controls if the EE setting defined in the TRUST registers will be taken into account for the pipe lock grouping decoding. 1'b0 - Only P_LOCK_GROUP is checked for pipe locking. 1'b1 - Both BAM_P_EE and P_LOCK_GROUP are checked for pipe locking.
12:8	RESERVED	Reserved
7	BAM_RST_BLOCK	When enabled, the BAM Global SW reset will not be available for usage. This is in order to deny Global SW reset requests by the Global security group. 1'b1 - Enable 1'b0 - Disable

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_TRUST_REG (cont.)

Bits	Name	Description
2:0	BAM_EE	This Field Indicates the EE # (0-7) to which the BAM Interrupt belongs to. The pipe interrupts will fire on the EE # set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 3'b000 - EE0 3'b001 - EE1 3'b010 - EE2 3'b011 - EE3 3'b100 - EE4 3'b101 - EE5 3'b110 - EE6 3'b111 - EE7

**0x078C6020+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TRUST_REGn, n=[0..30]
0x4*n**

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register holds the BAM Trusted configurations.

This register cannot be reset by any SW reset. Only HW reset applies.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TRUST_REGn

Bits	Name	Description
12:8	RESERVED	Reserved
7:3	BAM_P_SUP_GROUP	Super-Group is the upper division of the pipes compared to the pipe-group division. When any pipe locks or unlocks the BAM, all the pipes which are in a different super-group will NOT be affected. Only the pipes within the same super-group of the locker are affected. Usually pipes which belongs to different peripherals which share the same BAM, would be in a different super-groups

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TRUST_REGn (cont.)

Bits	Name	Description
2:0	BAM_P_EE	This Field Indicates the EE # (0-7) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE # set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 3'b000 - EE0 3'b001 - EE1 3'b010 - EE2 3'b011 - EE3 3'b100 - EE4 3'b101 - EE5 3'b110 - EE6 3'b111 - EE7

**0x078C7000+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_EEn, n=[0..7]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

**0x078C7004+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_MSK_EEn, n=[0..7]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: ENABLE_BAM_INTERRUPT (Enable BAM interrupt) 0x0: DISABLE_BAM_INTERRUPT (Disable BAM interrupt)
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: ENABLE_PIPE_INTERRUPT (Enable Pipe interrupt) 0x0: DISABLE_PIPE_INTERRUPT (Disable Pipe interrupt)

0x078C7008+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_UNMASKED_EEn, 4096*n, n=[0..7]

Type: R

Clock: bam_clk

Reset State: 0x00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x078C700C+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_PIPE_ATTR_EEn, n=[0..7] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

The register shows the pipes attributed to a specific EE, and an indication if BAM is enabled.

The reset value written above is true only if EE>0. For BAM_PIPE_ATTR_EE0 the default value is: Bits [MAX_PIPES-1:0] = 1 , Bits [31: MAX_PIPES] = 0 .

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_PIPE_ATTR_EEn

Bits	Name	Description
31	BAM_ENABLED	1'b1 - BAM is Enabled. 1'b0 - BAM Disabled.
30:0	P_ATTR	If bit 'i' == 1'b1 - Pipe 'i' is attributed to this EE.

0x078C7010 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS

Type: R

Clock: bam_clk

Reset State: 0x00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking out this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register points to the physical BAM_IRQ_SRCS_EE0 register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

0x078C7014 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_MSK

Type: RW

Clock: bam_clk

Reset State: 0x00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register points to the physical BAM_IRQ_SRCS_MSK_EE0 register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_MSK

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: ENABLE_BAM_INTERRUPT (Enable BAM interrupt) 0x0: DISABLE_BAM_INTERRUPT (Disable BAM interrupt)
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: ENABLE_PIPE_INTERRUPT (Enable Pipe interrupt) 0x0: DISABLE_PIPE_INTERRUPT (Disable Pipe interrupt)

0x078C7018 USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_UNMASKED**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register points to the physical BAM_IRQ_SRCS_UNMASKED_EE0 register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_IRQ_SRCS_UNMASKED

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

**0x078D7000+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_CTRLn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Control register provides various controls for the pipe.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_CTRLn

Bits	Name	Description
20:16	P_LOCK_GROUP	Pipe's lock group. Upon a lock request on this pipe, all pipes related to different pipe group and different EE (see PIPE_TRUST_REG) will be locked.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_CTRLn (cont.)

Bits	Name	Description
11	P_WRITE_NWD	BAM-Lite feature. Applicable to BAM2BAM producer pipes only. When this bit is set for producer B2B pipe, NWD bit (bit number 28 in the second word of descriptor) will be written with EOT into the generated descriptor for the consumer usage. This bit is not applicable in pipes belong to a Peripheral which uses messaging_only (e.g. USB2).
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be prefetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_CTRLn (cont.)

Bits	Name	Description
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only. When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode. This field is NOT supported in BAM-NDP (i.e. no streaming mode in NDP).
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe

**0x078D7004+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_RSTn, n=[0..30]
4096*n****Type:** W**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

Note: Software can invoke pipe reset only after it make sure that the pipe is 'quiet'.

('quiet' - No data transaction or command-descriptor is active at the time.

BAM_P_RSTn, n=[0..30]

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_RSTn

Bits	Name	Description
0	P_SW_RST	This resets the pipe and it's registers, (Both Flip-Flops and RAM). Software can invoke pipe reset only after it make sure that the pipe is 'quiet'. 1'b1 - Reset 1'b0 - Do Nothing

**0x078D7008+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_HALTn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Halt register Enables/Disables the Halt Sequence. Refer to the Software Procedures chapter for the Halt Sequence Procedure.

This is a self-modifying register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_HALTn

Bits	Name	Description
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. See the Software Procedures chapter. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it. See the Software Procedure chapter for the detailed flow.

0x078D7010+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_STTSn, n=[0..30] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_STTSn

Bits	Name	Description
7	P_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
6	P_PIPE_RST_ERROR_IRQ	Unsuccessful Pipe Reset operation. Pipe reset timer expired.
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_STTSn (cont.)

Bits	Name	Description
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

**0x078D7014+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_CLRn, n=[0..30]
4096*n****Type:** W**Clock:** bam_clk**Reset State:** 0x00000000

Writing to this register causes the interrupt to clear.

BAM_P_IRQ_CLRn, n=[0..30]

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_CLRn

Bits	Name	Description
7	P_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged
6	P_PIPE_RST_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
5	P_TRNSFR_END_CLR	1'b1 - Clear 1'b0 - Unchanged
4	P_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1'b1 - Clear 1'b0 - Unchanged

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_CLRn (cont.)

Bits	Name	Description
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

**0x078D7018+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_ENn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_IRQ_ENn

Bits	Name	Description
7	P_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable
6	P_PIPE_RST_ERROR_EN	1'b1 - Enable 1'b0 - Disable
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

**0x078D701C+USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TIMERn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This register counts the idle time of the pipe.

BAM_P_TIMERn, n=[0..30]

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TIMERn

Bits	Name	Description
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms ~ 6 seconds

**0x078D7020+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TIMER_CTRLn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by a PARAMETER value of the BAM, and uses a separate clock, the inactivity_timers_clk. This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32kHz clock. This allows the bam_clk to be turned-off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM PARAMETER. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting.

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH parameter constant. These parameters should be taken into account when setting this register. For example: for inactivity_timer_clk period of 1us and parameter is 3 and P_TIMER_THRSHLD is 10 will indicate the $2^3 * 1\mu s * 10$ which is 80us of inactivity in a pipe before sending an interrupt.

The general formula is: $2^{\text{INACTIVITY_TIMER_WIDTH}} * \text{clock_period} * \text{P_TIMER_TRSHLD}$.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESHOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_CNMSMR_SDBNDn

Bits	Name	Description
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer. The sideband-Inform block which responsible for reading descriptor has updated the SB block (which responsible for publishing to peripheral) with all of its read descriptors.
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r. BAM is waiting for Peripheral to acknowledge the former publish.
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle. The Peripheral's acknowledgement for the publish. This is a toggling signal (each ack will be inverted to its former).
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r. The Peripheral's sampled acknowledgement for the publish. This is a toggling signal (each ack will be inverted to its former).
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value. The toggle polarity of the publishment (each publishment changes its polarity).
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value. The possible values of BAM_P_CTRL field are: 0100 - Means immediate command (could be only in bam-ndp). 0001 - Means End-Of-Transaction (EOT). 0011 - means End-Of-Transaction with Notify-When-Done (NWD). 0000 - Neither Immediate-command nor EOT nor NWD.
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value. The size of the current publish.

**0x078D7800+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_SW_OFSTSn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_SW_OFSTSn, n=[0..30]

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode. This Field is NOT available in BAM-NDP
15:0	SW_DESC_OFST	Descriptor FIFO offset.

31:16	PSM_BLOCK_BYTE_CNT	The Byte count inside the current Block.
15:0	PSM_OFST_IN_DESC	The Offset inside a register. This is used by pipe state machine to compute offset inside a register after retransmission

**0x078D7818+ USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_EVNT_REGn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will

write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

BAM_P_EVNT_REGn, n=[0..30]

USB2_HSIC_USB_OTG_HS_BAM_BAM_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

22 PDM

WEB_TCXO4 includes three PDMs and one MND_clock_devider, which are controlled using the following Regs. the are clocked with HCLK

0x00068000 PDM_WEB_TCXO4_TCXO_PDM0_TOP_CTL

Type: RW

Clock: HCLK

Reset State: 0x00000000

Top level control register of PDM0 used for OE, Output polarity ctl and clock enable of PDM0

PDM_WEB_TCXO4_TCXO_PDM0_TOP_CTL

Bits	Name	Description
2	TCXO4_CLK_DISABLE	Set (1) this bit to disable the TCXO4 clock, and Clear (0) the bit to enable the TXCO4 clock.PDM0
1	PDM0_POLARITY	This bit defines the polarity of PDM0. Set (1) this bit to invert the sense of the PDM0 output, meaning that the PDM value will indicate the number of 0's in every 2^16 cycles. Clearing (0) this bit will keep the PDM in it's native polarity, meaning that the PDM value will indicate the numbed of 1's in every 2^16 cycles.
0	PDM0_OE	

0x00068004 PDM_WEB_TCXO4_PDM0_CTL

Type: RW

Clock: HCLK

Reset State: 0x00008000

The PDM0_CTL register is the pulse density modulation register number 0. This register determines the density of pulses on the PDM0 pin.

PDM_WEB_TCXO4_PDM0_CTL

Bits	Name	Description
15:0	PDM0_DAT	the PDM0_DAT, after inverting the MSbit (1's complement), determines the number of 1's in 2^{16} TCXO4 cycles for PDM0. When the PDM0_POLARITY is set (1), the output sense is inverted

0x00069000 PDM_WEB_TCXO4_TCXO_PDM1_TOP_CTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Top level control register of PDM1 used for OE, Output polarity ctl and clock enable of PDM1

PDM_WEB_TCXO4_TCXO_PDM1_TOP_CTL

Bits	Name	Description
2	TCXO4_CLK_DISABLE1	Set (1) this bit to disable the TCXO4 clock, and Clear (0) the bit to enable the TXCO4 clock. PDM1
1	PDM1_POLARITY	This bit defines the polarity of PDM1. Set (1) this bit to invert the sense of the PDM1 output, meaning that the PDM value will indicate the number of 0's in every 2^{16} cycles. Clearing (0) this bit will keep the PDM in it's native polarity, meaning that the PDM value will indicate the numbed of 1's in every 2^{16} cycles.
0	PDM1_OE	

0x00069004 PDM_WEB_TCXO4_PDM1_CTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000080

The PDM1_CTL register is the pulse density modulation register number 1. This register determines the density of pulses on the PDM1 pin.

PDM_WEB_TCXO4_PDM1_CTL

Bits	Name	Description
7:0	PDM1_DAT	the PDM1_DAT, after inverting the MSbit (1's complement), determines the number of 1's in 2^8 TCXO4 cycles for PDM1. When the PDM1_POLARITY is set (1), the output sense is inverted

0x0006A000 PDM_WEB_TCXO4_TCXO_PDM2_TOP_CTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Top level control register of PDM2 used for OE, Output polarity ctl and clock enable of PDM2

PDM_WEB_TCXO4_TCXO_PDM2_TOP_CTL

Bits	Name	Description
2	PDM2_CLK_DISABLE	Set (1) this bit to disable the PDM2 clock, and Clear (0) the bit to enable the PDM2 clock.
1	PDM2_POLARITY	This bit defines the polarity of PDM2. Set (1) this bit to invert the sense of the PDM2 output, meaning that the PDM value will indicate the number of 0's in every 2 ¹⁶ cycles. Clearing (0) this bit will keep the PDM in it's native polarity, meaning that the PDM value will indicate the number of 1's in every 2 ¹⁶ cycles.
0	PDM2_OE	

0x0006A004 PDM_WEB_TCXO4_PDM2_CTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00008000

The PDM2_CTL register is the pulse density modulation register number 2. This register determines the density of pulses on the PDM2 pin.

PDM_WEB_TCXO4_PDM2_CTL

Bits	Name	Description
15:0	PDM2_DAT	the PDM2_DAT, after inverting the MSbit (1's complement), determines the number of 1's in 2 ¹⁶ PDM2_clk cycles for PDM2. When the PDM2_POLARITY is set (1), the output sense is inverted

0x0006B000 PDM_WEB_TCXO4_GP_MN_CLK_MDIV**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The GP_MN_CLK_MDIV register is the MDIV specification register for the GP M/N clock. For all GP_MN registers, this signal is generated by dividing the frequency of the TCXO signal by an M/N counter. M,N and D have the following specifications and constraints:

- * The maximum value of M is 511.
- * The maximum value of N is 8191.
- * $N > 2M$.
- * The value of M cannot exceed the value of N.
- * N and M cannot have any common divider else than 1.
- * D is allowed to be between M and N-M => $(M < D < N - M)$.

PDM_WEB_TCXO4_GP_MN_CLK_MDIV

Bits	Name	Description
8:0	GP_M_VALUE	This register defines the value of M for the M/N counter, which generates the GP_MN signal.

0x0006B004 PDM_WEB_TCXO4_GP_MN_CLK_NDIV

Type: RW
Clock: HCLK
Reset State: 0x00000000

The GP_MN_CLK_NDIV register is the NDIV specification register for the GP M/N clock.

PDM_WEB_TCXO4_GP_MN_CLK_NDIV

Bits	Name	Description
12:0	GP_N_VALUE	This register defines the value $-(N-M)$, using 1'Bits complement value of N minus M for the M/N counter, which generates the GP_MN signal.

0x0006B008 PDM_WEB_TCXO4_GP_MN_CLK_DUTY

Type: RW
Clock: HCLK
Reset State: 0x00000000

The GP_MN_CLK_DUTY register is the duty cycle specification register for the GP M/N clock.

PDM_WEB_TCXO4_GP_MN_CLK_DUTY

Bits	Name	Description
12:0	GP_D_VALUE	This register defines the value of D, which determines the duty cycle of the GP M/N signal. D determines the # on low(0) cycles in an N-cycles interval. The useful value of D must be in the range of M to N minus M.

23 PRNG

0x00022000 PRNG_PRNG_DATA_OUT

Type: R

Reset State: 0x00000000

PRNG_PRNG_DATA_OUT

Bits	Name	Description
31:0	PRNG_DATA_OUT	Pseudo Random Number output. If the FIFO is empty, reading this register will return 0.

0x00022004 PRNG_PRNG_STATUS

Type: R

Reset State: 0x00000000

PRNG_PRNG_STATUS

Bits	Name	Description
31:10	RESERVED	
9:8	CURRENT_OPERATION	0x0: IDLE (IDLE) 0x1: GENERATE (GENERATE) 0x2: INSTANTIATE (INSTANTIATE) 0x3: RESEED (RESEED)
7	GENERATE_REQUIRED	Indicates that a generate is, or soon will be occurring. This occurs when the generate counter != 0. This is only valid when the PRNG is enabled (PRNG_EN = 1)
6	RESEED_REQUIRED	Indicates that a reseed operation is, or soon will be occurring. This occurs when the reseed counter = reseed freq. This is only valid when the PRNG is enabled (PRNG_EN = 1)
5	INSTANTIATE_REQUIRED	Indicates that an instantiate operation or soon will be occurring. This occurs when the instantiate counter = 0. This is only valid when the PRNG is enabled (PRNG_EN = 1)

PRNG_PRNG_STATUS (cont.)

Bits	Name	Description
4	RING_OSC3_HEALTHY	Indicates that ring oscillator 3 is healthy. Only valid when RING_OSC3_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.
3	RING_OSC2_HEALTHY	Indicates that ring oscillator 2 is healthy. Only valid when RING_OSC2_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.
2	RING_OSC1_HEALTHY	Indicates that ring oscillator 1 is healthy. Only valid when RING_OSC1_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.
1	RING_OSC0_HEALTHY	Indicates that ring oscillator 0 is healthy. Only valid when RING_OSC0_CFG is set to one of the feedback settings (not valid when set to one of the FORCE inputs). When set to one of the FORCE inputs, this is reset to 0.
0	DATA_AVAIL	Indicates that data is available on the PRNG_DATA_OUT FIFO.

0x00022010 PRNG_PRNG_ENTROPY_CNTR**Type:** R**Reset State:** 0x00000000**PRNG_PRNG_ENTROPY_CNTR**

Bits	Name	Description
31:0	ENTROPY_CNTR	The current value of the entropy counter. Counts DOWN. Usually this is 0 except when actually doing an instantiate or reseed operation.

0x00022014 PRNG_PRNG_SAMPLE_CNTR**Type:** R**Reset State:** 0x00000000**PRNG_PRNG_SAMPLE_CNTR**

Bits	Name	Description
31:0	SAMPLE_CNTR	The number of clocks since the last sample of the LFSRs. Counts DOWN. Usually this is 0 except when actually doing an instantiate or reseed operation.

0x00022018 PRNG_PRNG_GEN_CNTR**Type:** R**Reset State:** 0x00000000**PRNG_PRNG_GEN_CNTR**

Bits	Name	Description
31:0	PRNG_GEN_CNTR	Current value of the generate counter

0x0002201C PRNG_PRNG_RESEED_CNTR**Type:** R**Reset State:** 0x00000000**PRNG_PRNG_RESEED_CNTR**

Bits	Name	Description
31:0	RESEED_CNTR	Current value of the reseed counter

0x00022020 PRNG_PRNG_INSTANTIATE_CNTR**Type:** R**Reset State:** 0x00000000**PRNG_PRNG_INSTANTIATE_CNTR**

Bits	Name	Description
31:0	INSTANTIATE_CNTR	The current number of reseed operations since the last reseed.

0x00022100 PRNG_PRNG_LFSR_CFG**Type:** RW**Reset State:** 0x00000000**PRNG_PRNG_LFSR_CFG**

Bits	Name	Description
31:17	RESERVED	
16	LFSR_OVRID_ON	Enables entropy collectors while FIFOFULL flag is asserted. When disabled, entropy collectors are disabled after FIFOFULL flag is on.
15	LFSR3_EN	Enables the output of LFSR3. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.

PRNG_PRNG_LFSR_CFG (cont.)

Bits	Name	Description
14:12	RING_OSC3_CFG	Configuration for Ring Oscillator 3 00X: FORCE0. This is used for testability 01X: FORCE1. This is used for testability. 0x4: FEEDBACK_POINT_0 (feedback point 0 (slowest)) 0x5: FEEDBACK_POINT_1 (feedback point 1) 0x6: FEEDBACK_POINT_2 (feedback point 2) 0x7: FEEDBACK_POINT_3 (feedback point 3 (fastest))
11	LFSR2_EN	Enables the output of LFSR2. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.
10:8	RING_OSC2_CFG	Configuration for Ring Oscillator 2 00X: FORCE0. This is used for testability 01X: FORCE1. This is used for testability. 0x4: FEEDBACK_POINT_0 (feedback point 0 (slowest)) 0x5: FEEDBACK_POINT_1 (feedback point 1) 0x6: FEEDBACK_POINT_2 (feedback point 2) 0x7: FEEDBACK_POINT_3 (feedback point 3 (fastest))
7	LFSR1_EN	Enables the output of LFSR1. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.
6:4	RING_OSC1_CFG	Configuration for Ring Oscillator 1 00X: FORCE0. This is used for testability 01X: FORCE1. This is used for testability. 0x4: FEEDBACK_POINT_0 (feedback point 0 (slowest)) 0x5: FEEDBACK_POINT_1 (feedback point 1) 0x6: FEEDBACK_POINT_2 (feedback point 2) 0x7: FEEDBACK_POINT_3 (feedback point 3 (fastest))
3	LFSR0_EN	Enables the output of LFSR0. When disabled, the LFSR is reset to 0 and disables the clock to the LFSR.
2:0	RING_OSC0_CFG	Configuration for Ring Oscillator 0 00X: FORCE0. This is used for testability 01X: FORCE1. This is used for testability. 0x4: FEEDBACK_POINT_0 (feedback point 0 (slowest)) 0x5: FEEDBACK_POINT_1 (feedback point 1) 0x6: FEEDBACK_POINT_2 (feedback point 2) 0x7: FEEDBACK_POINT_3 (feedback point 3 (fastest))

0x00022104 PRNG_PRNG_CONFIG**Type:** RW**Reset State:** 0x00000000

PRNG_PRNG_CONFIG

Bits	Name	Description
31:6	RESERVED	
5:2	TEST_OUT_SEL	Selects the appropriate test output to be put out on prng_rosc_test_out signal: 0XXX: Output 0 0x8: ROSC0_DIV_32 (rosc0_div_32) 0x9: ROSC1_DIV_32 (rosc1_div_32) 0xA: ROSC2_DIV_32 (rosc2_div_32) 0xB: ROSC3_DIV_32 (rosc3_div_32) 0xC: ROSC0_SAMP (rosc0_samp) 0xD: ROSC1_SAMP (rosc1_samp) 0xE: ROSC2_SAMP (rosc2_samp) 0xF: ROSC3_SAMP (rosc3_samp)
1	PRNG_EN	Enable signal for the PRNG indicating that all setup is complete. Ring oscillators and the LFSR will still operate as per PRNG_LFSR_CFG, however when this is 0, the PRNG when the PRNG is disabled it will return to the IDLE state once its current operation has been completed, with the current operation possibly requiring space to be created in the output fifo for data that must be generated in the completion of the current operation. This space can be created by reading from the PRNG_DATA_OUT register. 0x0: DISABLED (disabled) 0x1: ENABLED (enabled)
0	SW_RESET	Software initiated reset. Automatically cleared when the write operation is complete. Reset is internally held for 2 clock cycles after this register is written and so no operations/accesses should be attempted until after this recovery time.

0x00022108 PRNG_PRNG_PERSONALIZATION_STRING**Type:** RW**Reset State:** 0x00000000**PRNG_PRNG_PERSONALIZATION_STRING**

Bits	Name	Description
31:0	PERSONALIZATION_STRING	The personalization string. This may be all 0, but also may be obtained from other non-regular processes such as time between key presses, searcher noise (if present), or other system events.

0x00022110 PRNG_PRNG_NUM_ENTROPY**Type:** RW**Reset State:** 0x00000400**PRNG_PRNG_NUM_ENTROPY**

Bits	Name	Description
31:0	NUM_ENTROPY_BYTES	Indicates the number of entropy bytes to be used during instantiate and reseed processes. Note that the minimum value of this field should be 16 for this design, although no enforcement is done in HW. Larger values provide more randomness. NIST SP800-90 specifies the maximum value to be 235 BITS.

0x00022114 PRNG_PRNG_SAMPLE_FREQ**Type:** RW**Reset State:** 0x00000400**PRNG_PRNG_SAMPLE_FREQ**

Bits	Name	Description
31:0	SAMPLE_FREQ	The number of clocks between samples of the LFSR.

0x00022118 PRNG_PRNG_GEN_WORDS**Type:** RW**Reset State:** 0x00000008**PRNG_PRNG_GEN_WORDS**

Bits	Name	Description
31:0	REQUESTED_WORDS	The number of words per generate operation

0x0002211C PRNG_PRNG_RESEED_FREQ**Type:** RW**Reset State:** 0x00010000**PRNG_PRNG_RESEED_FREQ**

Bits	Name	Description
31:0	RESEED_FREQ	The number of generate operations before a reseed is initiated. The minimum number of generate operations before a reseed is initiated is 2.

0x00022120 PRNG_PRNG_INSTANTIATE_FREQ**Type:** RW**Reset State:** 0x00010000**PRNG_PRNG_INSTANTIATE_FREQ**

Bits	Name	Description
31:0	INSTANTIATE_FREQ	The number of reseed operations before an instantiate is initiated.

24 SMMU

24.1 SMMU_SS_LOCAL_SMMU_SS_LOCAL

0x01EF0000 SMMU_SS_LOCAL_SMMU_INTR_SEL_SEC

Type: RW

Clock: PCNOC_CLK

Reset State: 0x00000000

This register is used to steer one or multiple out of 32 context bank interrupts from App TCU to secure interrupt output

SMMU_SS_LOCAL_SMMU_INTR_SEL_SEC

Bits	Name	Description
31:0	INT_APP_CXT_EN	Setting nth bit will steer nth context bank interrupt to secure interrupt output

0x01EF0008 SMMU_SS_LOCAL_SMMU_MISC_TIE_OFF_SEC

Type: RW

Clock: PCNOC_CLK

Reset State: 0x00000000

This register is used to drive static values to APP and GFX TCUs

SMMU_SS_LOCAL_SMMU_MISC_TIE_OFF_SEC

Bits	Name	Description
3	APP_INTEG_SEC_OVRRIDE	Value of INTEG_SEC_OVRRIDE Port of APP TCU
2	GFX_INTEG_SEC_OVRRIDE	Value of INTEG_SEC_OVRRIDE Port of GFX TCU
1	APP_SPNIDEN	Value of SPNIDEN Port of APP TCU

SMMU_SS_LOCAL_SMMU_MISC_TIE_OFF_SEC (cont.)

Bits	Name	Description
0	GFX_SPNIDEN	Value of SPNIDEN Port of GFX TCU

0x01EF0010 SMMU_SS_LOCAL_SMMU_CATS_64_BIT_CTL_SEC**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to control CATS Mux for 64 bit TBUs

SMMU_SS_LOCAL_SMMU_CATS_64_BIT_CTL_SEC

Bits	Name	Description
18:9	CATS_SID	SID Value
8	CATS_SID_EN	If 1 enables CATS SID generation from Register, If 0 CATS SID generation will be generated from upper 3 bits of 512M CATS space
7:5	CATS_512M_REMAP	Upper Address Bits to remap 512M CATS space in 4G space
4:1	CATS_TBU_NUM	TBU ID for which CATS Mux is Enabled. Valid Values Are: 0 = PCNOC TBU CATS, 4 = QDSP TBU CATS, 5 = GPS TBU CATS, 6 = DIME TBU CATS, 7 = PRONTO TBU CATS
0	CATS_EN	Enable CATS Mux for One of the 64 bit TBUs

0x01EF0018 SMMU_SS_LOCAL_SMMU_CATS_128_BIT_CTL_SEC**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to control CATS Mux for 128 bit TBUs

SMMU_SS_LOCAL_SMMU_CATS_128_BIT_CTL_SEC

Bits	Name	Description
18:9	CATS_SID	SID Value
8	CATS_SID_EN	If 1 enables CATS SID generation from Register, If 0 CATS SID generation will be generated from upper 3 bits of 512M CATS space
7:5	CATS_512M_REMAP	Upper Address Bits to remap 512M CATS space in 4G space

SMMU_SS_LOCAL_SMMU_CATS_128_BIT_CTL_SEC (cont.)

Bits	Name	Description
4:1	CATS_TBU_NUM	TBU ID for which CATS Mux is Enabled Valid Values Are: 1 = VFE TBU CATS, 2 = VENUS TBU CATS, 3 = MDP TBU CATS, 8 = JPEG TBU CATS, 9 = GFX TBU CATS
0	CATS_EN	Enable CATS Mux for One of the 128 bit TBUs

0x01EF0020 SMMU_SS_LOCAL_SMMU_APP_TCU_PTW_VMID_SEC**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to provide VMID for APP TCU PTW Interface

SMMU_SS_LOCAL_SMMU_APP_TCU_PTW_VMID_SEC

Bits	Name	Description
4:0	VMID	VMID Value for APP TCU PTW AXI Interface

0x01EF0028 SMMU_SS_LOCAL_SMMU_GFX_TCU_PTW_VMID_SEC**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to provide VMID for GFX TCU PTW Interface

SMMU_SS_LOCAL_SMMU_GFX_TCU_PTW_VMID_SEC

Bits	Name	Description
4:0	VMID	VMID Value for GFX TCU PTW AXI Interface

0x01EF1000 SMMU_SS_LOCAL_SMMU_INTR_SEL_NSHYP**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to steer one or multiple out of 32 context bank interrupts from App TCU to non-secure hypervisor interrupt output

SMMU_SS_LOCAL_SMMU_INTR_SEL_NSHYP

Bits	Name	Description
31:0	INT_APP_CXT_EN	Setting nth bit will steer nth context bank interrupt to non-secure hypervisor interrupt output. If same nth bit is set in SMMU_INTR_SEL_SEC, then nth context bank interrupt won't be steered to non-secure hypervisor interrupt output

0x01EF1008 SMMU_SS_LOCAL_SMMU_GFX_AHB_4K_APERTURE_NSHYP**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to access GFX TCU registers from Private Oxili AHB port

SMMU_SS_LOCAL_SMMU_GFX_AHB_4K_APERTURE_NSHYP

Bits	Name	Description
31:0	GFX_AHB_4K_APERTURE	Aperture of 4KB to access GFX TCU registers from Oxili Private AHB port. Bits [11:0] are don't care. Bits [31:12] should be set as per the memory map

0x01EF1010 SMMU_SS_LOCAL_SMMU_MSA_BYPASS_ERR_ADDR_NSHYP**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set Modem TBU output bus address in case of VA-PA mismatch

SMMU_SS_LOCAL_SMMU_MSA_BYPASS_ERR_ADDR_NSHYP

Bits	Name	Description
31:0	MSA_BYPASS_ERR_ADDR	Bus Address for VA-PA mismatch. This address should be set to a reserved location in SNOC so that error response can be generated from SNOC

0x01EF1018 SMMU_SS_LOCAL_SMMU_MSA_BYPASS_INTR_EN_NSHYP**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable Modem TBUs VA-PA mismatch interrupts

SMMU_SS_LOCAL_SMMU_MSA_BYPASS_INTR_EN_NSHYP

Bits	Name	Description
2	QDSP_MSA_VA_MISMATCH_H_IRQ_EN	QDSP VA-PA mismatch interrupt Enable
1	GPS_MSA_VA_MISMATCH_IRQ_EN	GPS VA-PA mismatch interrupt Enable
0	DIME_MSA_VA_MISMATCH_IRQ_EN	DIME VA-PA mismatch interrupt Enable

0x01EF2000 SMMU_SS_LOCAL_SMMU_INTR_SEL_NS**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to steer one or multiple out of 32 context bank interrupts from App TCU to non-secure interrupt output

SMMU_SS_LOCAL_SMMU_INTR_SEL_NS

Bits	Name	Description
31:0	INT_APP_CXT_EN	Setting nth bit will steer nth context bank interrupt to non-secure interrupt output. If same nth bit is set in SMMU_INTR_SEL_SEC OR SMMU_INTR_SEL_NSHYP, then nth context bank interrupt won't be steered to non-secure interrupt output.

00x01EF4000 SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_JPEG_n, n=[0..1]+0x8*n**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to configure SID2VMID for JPEG TBU

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_JPEG_n

Bits	Name	Description
6	VALID	If 1: This register has valid values and will be used for matching. If 0: This register has invalid values and will not be used for matching
5:2	VMID	VMID value in case of match
1	SID_MASK	Setting nth bit will mask nth SID bit for comparison
0	SID_MATCH	Match value of SID

0x01EF4010 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_JPEG**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set VMID in case of no match

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_JPEG

Bits	Name	Description
3:0	VMID	No Match VMID

0x01EF4018 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_JPEG**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_JPEG

Bits	Name	Description
0	FAULT_INTR_EN	Setting this enables SID2VMID no match and multi match interrupt

0x01EF4020 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_JPEG**Type:** R**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used for SID2VMID Fault Interrupt Status

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_JPEG

Bits	Name	Description
2	FAULT_SID	SID which caused nomatch OR multimatch Fault
1	FAULT_NO_MATCH	No Match Interrupt
0	FAULT_MULTI_MATCH	Multi Match Interrupt

0x01EF4028 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_JPEG**Type:** W**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to clear SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_JPEG

Bits	Name	Description
0	FAULT_INTR_CLR	Writing 1 will clear SID2VMID nomatch/multimatch Interrupt

**0x01EF5000+ SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_VFE_n, n=[0..3]
0x8*n****Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to configure SID2VMID for VFE TBU

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_VFE_n

Bits	Name	Description
8	VALID	If 1: This register has valid values and will be used for matching. If 0: This register has invalid values and will not be used for matching
7:4	VMID	VMID value in case of match
3:2	SID_MASK	Setting nth bit will mask nth SID bit for comparison
1:0	SID_MATCH	Match value of SID

0x01EF5020 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_VFE**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set VMID in case of no match

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_VFE

Bits	Name	Description
3:0	VMID	No Match VMID

0x01EF5028 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_VFE**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_VFE

Bits	Name	Description
0	FAULT_INTR_EN	Setting this enables SID2VMID no match and multi match interrupt

0x01EF5030 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_VFE**Type:** R**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used for SID2VMID Fault Interrupt Status

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_VFE

Bits	Name	Description
3:2	FAULT_SID	SID which caused nomatch OR multimatch Fault
1	FAULT_NO_MATCH	No Match Interrupt
0	FAULT_MULTI_MATCH	Multi Match Interrupt

0x01EF5038 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_VFE**Type:** W**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to clear SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_VFE

Bits	Name	Description
0	FAULT_INTR_CLR	Writing 1 will clear SID2VMID nomatch/multimatch Interrupt

**0x01EF6000+ SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_MDP_n, n=[0..1]
0x8*n****Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to configure SID2VMID for MDP TBU

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_MDP_n

Bits	Name	Description
6	VALID	If 1: This register has valid values and will be used for matching. If 0: This register has invalid values and will not be used for matching
5:2	VMID	VMID value in case of match
1	SID_MASK	Setting nth bit will mask nth SID bit for comparison
0	SID_MATCH	Match value of SID

0x01EF6010 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_MDP**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set VMID in case of no match

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_MDP

Bits	Name	Description
3:0	VMID	No Match VMID

0x01EF6018 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_MDP**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_MDP

Bits	Name	Description
0	FAULT_INTR_EN	Setting this enables SID2VMID no match and multi match interrupt

0x01EF6020 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_MDP

Type: R
Clock: PCNOC_CLK
Reset State: 0x00000000

This register is used for SID2VMID Fault Interrupt Status

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_MDP

Bits	Name	Description
2	FAULT_SID	SID which caused nomatch OR multimatch Fault
1	FAULT_NO_MATCH	No Match Interrupt
0	FAULT_MULTI_MATCH	Multi Match Interrupt

0x01EF6028 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_MDP

Type: W
Clock: PCNOC_CLK
Reset State: 0x00000000

This register is used to clear SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_MDP

Bits	Name	Description
0	FAULT_INTR_CLR	Writing 1 will clear SID2VMID nomatch/multimatch Interrupt

**0x01EF7000+ SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_VENUS_n, n=[0..16]
0x8*n**

Type: RW
Clock: PCNOC_CLK
Reset State: 0x00000000

This register is used to configure SID2VMID for VENUS TBU

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_VENUS_n

Bits	Name	Description
20	VALID	If 1: This register has valid values and will be used for matching. If 0: This register has invalid values and will not be used for matching
19:16	VMID	VMID value in case of match
15:8	SID_MASK	Setting nth bit will mask nth SID bit for comparison

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_VENUS_n (cont.)

Bits	Name	Description
7:0	SID_MATCH	Match value of SID

0x01EF7088 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_VENUS**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set VMID in case of no match

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_VENUS

Bits	Name	Description
3:0	VMID	No Match VMID

0x01EF7090 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_VENUS**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_VENUS

Bits	Name	Description
0	FAULT_INTR_EN	Setting this enables SID2VMID no match and multi match interrupt

0x01EF7098 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_VENUS**Type:** R**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used for SID2VMID Fault Interrupt Status

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_VENUS

Bits	Name	Description
9:2	FAULT_SID	SID which caused nomatch OR multimatch Fault

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_VENUS (cont.)

Bits	Name	Description
1	FAULT_NO_MATCH	No Match Interrupt
0	FAULT_MULTI_MATCH	Multi Match Interrupt

0x01EF70A0 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_VENUS**Type:** W**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to clear SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_VENUS

Bits	Name	Description
0	FAULT_INTR_CLR	Writing 1 will clear SID2VMID nomatch/multimatch Interrupt

**0x01EF8000+ SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_PRONTO_n, n=[0..12]
0x8*n****Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to configure SID2VMID for PRONTO TBU

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_PRONTO_n

Bits	Name	Description
14	VALID	If 1: This register has valid values and will be used for matching. If 0: This register has invalid values and will not be used for matching
13:10	VMID	VMID value in case of match
9:5	SID_MASK	Setting nth bit will mask nth SID bit for comparison
4:0	SID_MATCH	Match value of SID

0x01EF8068 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_PRONTO**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set VMID in case of no match

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_PRONTO

Bits	Name	Description
3:0	VMID	No Match VMID

0x01EF8070 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_PRONTO**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_PRONTO

Bits	Name	Description
0	FAULT_INTR_EN	Setting this enables SID2VMID no match and multi match interrupt

0x01EF8078 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_PRONTO**Type:** R**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used for SID2VMID Fault Interrupt Status

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_PRONTO

Bits	Name	Description
6:2	FAULT_SID	SID which caused nomatch OR multimatch Fault
1	FAULT_NO_MATCH	No Match Interrupt
0	FAULT_MULTI_MATCH	Multi Match Interrupt

0x01EF8080 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_PRONTO**Type:** W**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to clear SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_PRONTO

Bits	Name	Description
0	FAULT_INTR_CLR	Writing 1 will clear SID2VMID nomatch/multimatch Interrupt

**0x01EF9000+ SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_PERIPH_n, n=[0..46]
0x8*n****Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to configure SID2VMID for PERIPH TBU

SMMU_SS_LOCAL_SMMU_SID2VMID_SMR_PERIPH_n

Bits	Name	Description
24	VALID	If 1: This register has valid values and will be used for matching. If 0: This register has invalid values and will not be used for matching
23:20	VMID	VMID value in case of match
19:10	SID_MASK	Setting nth bit will mask nth SID bit for comparison
9:0	SID_MATCH	Match value of SID

0x01EF9178 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_PERIPH**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to set VMID in case of no match

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_VMID_PERIPH

Bits	Name	Description
3:0	VMID	No Match VMID

0x01EF9180 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_PERIPH**Type:** RW**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to enable SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_EN_PERIPH

Bits	Name	Description
0	FAULT_INTR_EN	Setting this enables SID2VMID no match and multi match interrupt

0x01EF9188 SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_STTS_PERIPH**Type:** R**Clock:** PCNOC_CLK**Reset State:** 0x00000000

This register is used to clear SID2VMID Fault Interrupt

SMMU_SS_LOCAL_SMMU_SID2VMID_FAULT_INTR_CLR_GFX

Bits	Name	Description
0	FAULT_INTR_CLR	Writing 1 will clear SID2VMID nomatch/multimatch Interrupt

25 Qualcomm Debug Subsystem Wrapper

25.1 CXATBFUNNEL_32W2SP

The Funnel is used when there is more than one trace source.

25.1.1 QDSS_WRAPPER_ATB_FUN2X1_CXATBFUNNEL_32W2SP

The Funnel is used when there is more than one trace source.

0x00868000 QDSS_WRAPPER_ATB_FUN2X1_CTRL_REG

Type: RW

Reset State: 0x00000300

The Funnel Control Register enables the slave ports and defines the hold time of the slave ports. Hold time refers to the number of transactions that are output on the funnel master port from the same slave while that slave port atvalidsx is HIGH. Hold time does not refer to clock cycles in this context

QDSS_WRAPPER_ATB_FUN2X1_CTRL_REG

Bits	Name	Description
11:8	HT	The formatting scheme can easily become inefficient if fast switching occurs, so, where possible, this must be minimized. If a source has nothing to transmit, then another source is selected irrespective of the minimum number of transactions. The maximum value that can be entered is 0xE and this equates to 15 cycles. 0xF is reserved. 0x0: HOLD_TIME_1 (1 transactions hold time) 0x1: HOLD_TIME_2 (2 transactions hold time) 0x2: HOLD_TIME_3 (3 transactions hold time) 0x3: HOLD_TIME_4 (4 transactions hold time) 0x4: HOLD_TIME_5 (5 transactions hold time) 0x5: HOLD_TIME_6 (6 transactions hold time) 0x6: HOLD_TIME_7 (7 transactions hold time) 0x7: HOLD_TIME_8 (8 transactions hold time) 0x8: HOLD_TIME_9 (9 transactions hold time) 0x9: HOLD_TIME_10 (10 transactions hold time) 0xA: HOLD_TIME_11 (11 transactions hold time) 0xB: HOLD_TIME_12 (12 transactions hold time) 0xC: HOLD_TIME_13 (13 transactions hold time) 0xD: HOLD_TIME_14 (14 transactions hold time) 0xE: HOLD_TIME_15 (15 transactions hold time)
1	ENS1	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
0	ENS0	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)

0x00868004 QDSS_WRAPPER_ATB_FUN2X1_PRIORITY_CTRL_REG**Type:** RW**Reset State:** 0x00000000

The Priority Control Register defines the order in which inputs are selected. Each 3-bit field represents a priority for each particular slave interface. Location 0 has the priority value for the first slave port. Location 1 is the priority value for the second slave port, Location 2 is the third, down to location 7, which has the priority value of the eighth slave port. Values represent the priority value for each port number. If you want to give highest priority to a particular slave port,

the corresponding port must be programmed with the lowest value. Typically this is likely to be a port that has more important data or that has a small FIFO and is therefore likely to overflow.

If you want to give lowest priority to a particular slave port, the corresponding slave port must be programmed with the highest value. Typically this is likely to be a device that has a large FIFO that is less likely to overflow or a source that has information that is of lower importance.

QDSS_WRAPPER_ATB_FUN2X1_PRIORITY_CTRL_REG

Bits	Name	Description
5:3	PRIPORT1	Priority value of the 2nd port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
2:0	PRIPORT0	Priority value of the first slave port. The value written into this location is the value that you want to assign the first slave port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

00x00868F00 QDSS_WRAPPER_ATB_FUN2X1_ITCTRL

Type: RW

Reset State: 0x00000000

This register is used to enable topology detection. For more information see the CoreSight Architecture Specification. This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving

NOTE When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, you must reset the system to ensure correct behavior of CoreSight and other connected system components that are affected by the integration or topology detection.

QDSS_WRAPPER_ATB_FUN2X1_ITCTRL

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00868FA0 QDSS_WRAPPER_ATB_FUN2X1_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_WRAPPER_ATB_FUN2X1_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00868FA4 QDSS_WRAPPER_ATB_FUN2X1_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_WRAPPER_ATB_FUN2X1_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00868FB0 QDSS_WRAPPER_ATB_FUN2X1_LOCKACCESS**Type:** W**Reset State:** Undefined

This is used to enable write access to device registers.

QDSS_WRAPPER_ATB_FUN2X1_LOCKACCESS

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access) 0xDEADBEEF: LOCK (invalid write value to enable the protection register and block write access)

0x00868FB4 QDSS_WRAPPER_ATB_FUN2X1_LOCKSTATUS**Type:** R**Reset State:** 0x00000003

This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug. This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0

QDSS_WRAPPER_ATB_FUN2X1_LOCKSTATUS

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock 0x0: ACCESS_PERMITTED (Write access is allowed to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00868FB8 QDSS_WRAPPER_ATB_FUN2X1_AUTHSTATUS**Type:** R**Reset State:** 0x00000000

Reports the required **security** level and current status of those enables. Where functionality changes on a given **security** level then this change in status must be reported in this register

QDSS_WRAPPER_ATB_FUN2X1_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)

0x00868FC8 QDSS_WRAPPER_ATB_FUN2X1_DEVID**Type:** R**Reset State:** 0x00000032

This indicates the capabilities of the CoreSight Funnel.

QDSS_WRAPPER_ATB_FUN2X1_DEVID

Bits	Name	Description
7:4	SCHEME	This value indicates the priority scheme implemented within the Funnel 0x3: STATIC_PRIORITY (Slave ports may be programmed to have higher or lower priority with respect to each other)
3:0	RESERVED	Reserved

0x00868FCC QDSS_WRAPPER_ATB_FUN2X1_DEVTYPE**Type:** R**Reset State:** 0x00000012

It provides a debugger with information about the component when the Part Number field is not recognized. The debugger can then report this information.

QDSS_WRAPPER_ATB_FUN2X1_DEVTYPE

Bits	Name	Description
7:4	SUB_TYPE	sub-classification within the major category 0x1: FUNNEL_ROUTER
3:0	MAJOR_TYPE	Major classification grouping for this debug/trace component 0x2: TRACE_LINK

0x00868FE0 QDSS_WRAPPER_ATB_FUN2X1_PERIPHID0

Type: R

Reset State: 0x00000008

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_WRAPPER_ATB_FUN2X1_PERIPHID0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x8: CORESIGHT_FUNNEL_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x100))

0x00868FE4 QDSS_WRAPPER_ATB_FUN2X1_PERIPHID1

Type: R

Reset State: 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_WRAPPER_ATB_FUN2X1_PERIPHID1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code)

QDSS_WRAPPER_ATB_FUN2X1_PERIPHID1 (cont.)

Bits	Name	Description
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CORESIGHT_FUNNEL_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x100))

0x00868FE8 QDSS_WRAPPER_ATB_FUN2X1_PERIPHID2**Type:** R**Reset State:** 0x0000002B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_WRAPPER_ATB_FUN2X1_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x2: R2P0 (This device is at r2p0)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	JEP106_BITS6TO4	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00868FEC QDSS_WRAPPER_ATB_FUN2X1_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_WRAPPER_ATB_FUN2X1_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made)

0x00868FD0 QDSS_WRAPPER_ATB_FUN2X1_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_WRAPPER_ATB_FUN2X1_PERIPHID4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00868FD4 QDSS_WRAPPER_ATB_FUN2X1_PERIPHID5**Type:** RW**Reset State:** Undefined

31:0	PERIPHID7	

0x00868FF0 QDSS_WRAPPER_ATB_FUN2X1_COMPID0**Type:** R**Reset State:** 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_WRAPPER_ATB_FUN2X1_COMPID0

Bits	Name	Description
7:0	PREAMBLE	Contains bits [24:31] of the component identification 0xD: ENUM_OD (Identification value)

0x00868FF4 QDSS_WRAPPER_ATB_FUN2X1_COMPID1**Type:** R**Reset State:** 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_WRAPPER_ATB_FUN2X1_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PREAMBLE	Contains bits [19:16] of the component identification 0x0: ENUM_0 (Identification value)

0x00868FF8 QDSS_WRAPPER_ATB_FUN2X1_COMPID2**Type:** R**Reset State:** 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_WRAPPER_ATB_FUN2X1_COMPID2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification 0x5: ENUM_05 (Identification value)

0x00868FFC QDSS_WRAPPER_ATB_FUN2X1_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_WRAPPER_ATB_FUN2X1_COMPID3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification 0xB1: B1 (Identification value)

25.2 CXATBFUNNEL_32W8SP

The Funnel is used when there is more than one trace source.

25.2.1 QDSS_WRAPPER_ATB_FUN8X1_CXATBFUNNEL_32W8SP

The Funnel is used when there is more than one trace source.

0x00869000 QDSS_WRAPPER_ATB_FUN8X1_CTRL_REG

Type: RW

Reset State: 0x00000300

The Funnel Control Register enables the slave ports and defines the hold time of the slave ports. Hold time refers to the number of transactions that are output on the funnel master port from the same slave while that slave port atvalidsx is HIGH. Hold time does not refer to clock cycles in this context

QDSS_WRAPPER_ATB_FUN8X1_CTRL_REG

Bits	Name	Description
11:8	HT	The formatting scheme can easily become inefficient if fast switching occurs, so, where possible, this must be minimized. If a source has nothing to transmit, then another source is selected irrespective of the minimum number of transactions. The maximum value that can be entered is 0xE and this equates to 15 cycles. 0xF is reserved. 0x0: HOLD_TIME_1 (1 transactions hold time) 0x1: HOLD_TIME_2 (2 transactions hold time) 0x2: HOLD_TIME_3 (3 transactions hold time) 0x3: HOLD_TIME_4 (4 transactions hold time) 0x4: HOLD_TIME_5 (5 transactions hold time) 0x5: HOLD_TIME_6 (6 transactions hold time) 0x6: HOLD_TIME_7 (7 transactions hold time) 0x7: HOLD_TIME_8 (8 transactions hold time) 0x8: HOLD_TIME_9 (9 transactions hold time) 0x9: HOLD_TIME_10 (10 transactions hold time) 0xA: HOLD_TIME_11 (11 transactions hold time) 0xB: HOLD_TIME_12 (12 transactions hold time) 0xC: HOLD_TIME_13 (13 transactions hold time) 0xD: HOLD_TIME_14 (14 transactions hold time) 0xE: HOLD_TIME_15 (15 transactions hold time)

QDSS_WRAPPER_ATB_FUN8X1_CTRL_REG (cont.)

Bits	Name	Description
7	ENS7	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
6	ENS6	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
5	ENS5	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
4	ENS4	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
3	ENS3	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
2	ENS2	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
1	ENS1	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)

QDSS_WRAPPER_ATB_FUN8X1_CTRL_REG (cont.)

Bits	Name	Description
0	ENS0	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)

0x00869004 QDSS_WRAPPER_ATB_FUN8X1_PRIORITY_CTRL_REG**Type:** RW**Reset State:** 0x00000000

The Priority Control Register defines the order in which inputs are selected. Each 3-bit field represents a priority for each particular slave interface. Location 0 has the priority value for the first slave port. Location 1 is the priority value for the second slave port, Location 2 is the third, down to location 7, which has the priority value of the eighth slave port. Values represent the priority value for each port number. If you want to give highest priority to a particular slave port, the corresponding port must be programmed with the lowest value. Typically this is likely to be a port that has more important data or that has a small FIFO and is therefore likely to overflow.

If you want to give lowest priority to a particular slave port, the corresponding slave port must be programmed with the highest value. Typically this is likely to be a device that has a large FIFO that is less likely to overflow or a source that has information that is of lower importance.

QDSS_WRAPPER_ATB_FUN8X1_PRIORITY_CTRL_REG

Bits	Name	Description
23:21	PRIPORT7	Priority value of the eighth port. The value written into this location is the value that you want to assign the eighth slave port. If a priority value has been entered for multiple different slave ports then the arbitration logic selects the lowest port number of them. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

QDSS_WRAPPER_ATB_FUN8X1_PRIORITY_CTRL_REG (cont.)

Bits	Name	Description
20:18	PRIPORT6	Priority value of the 7th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
17:15	PRIPORT5	Priority value of the 6th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
14:12	PRIPORT4	Priority value of the 5th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
11:9	PRIPORT3	Priority value of the 4th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

QDSS_WRAPPER_ATB_FUN8X1_PRIORITY_CTRL_REG (cont.)

Bits	Name	Description
8:6	PRIPORT2	Priority value of the 3rd port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
5:3	PRIPORT1	Priority value of the 2nd port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
2:0	PRIPORT0	Priority value of the first slave port. The value written into this location is the value that you want to assign the first slave port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

0x00869F00 QDSS_WRAPPER_ATB_FUN8X1_ITCTRL**Type:** RW**Reset State:** 0x00000000

This register is used to enable topology detection. For more information see the CoreSight Architecture Specification. This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving

Note

When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, you must reset the system to ensure correct behavior of CoreSight and other connected system components that are affected by the integration or topology detection.

QDSS_WRAPPER_ATB_FUN8X1_ITCTRL

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00869FA0 QDSS_WRAPPER_ATB_FUN8X1_CLAIMSET

Type: RW

Reset State: 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_WRAPPER_ATB_FUN8X1_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00869FA4 QDSS_WRAPPER_ATB_FUN8X1_CLAIMCLR

Type: RW

Reset State: 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_WRAPPER_ATB_FUN8X1_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00869FB0 QDSS_WRAPPER_ATB_FUN8X1_LOCKACCESS**Type:** W**Reset State:** Undefined

This is used to enable write access to device registers.

QDSS_WRAPPER_ATB_FUN8X1_LOCKACCESS

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access) 0xDEADBEEF: LOCK (invalid write value to enable the protection register and block write access)

0x00869FB4 QDSS_WRAPPER_ATB_FUN8X1_LOCKSTATUS**Type:** R**Reset State:** 0x00000003

This indicates the status of the Lock control mechanism. This lock prevents accidental writes by code under debug. This register must always be present although there might not be any lock-access control mechanism. The lock mechanism, where present and locked, must block write accesses to any control register, except the Lock Access Register. For most components this covers all registers except for the Lock Access Register 0xFB0

QDSS_WRAPPER_ATB_FUN8X1_LOCKSTATUS

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)

QDSS_WRAPPER_ATB_FUN8X1_LOCKSTATUS (cont.)

Bits	Name	Description
1	LOCKGRANT	Returns the current status of the Lock 0x0: ACCESS_PERMITTED (Write access is allowed to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00869FB8 QDSS_WRAPPER_ATB_FUN8X1_AUTHSTATUS**Type:** R**Reset State:** 0x00000000

Reports the required security level and current status of those enables. Where functionality changes on a given security level then this change in status must be reported in this register

QDSS_WRAPPER_ATB_FUN8X1_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)

0x00869FC8 QDSS_WRAPPER_ATB_FUN8X1_DEVID**Type:** R**Reset State:** 0x00000038

This indicates the capabilities of the CoreSight Funnel.

QDSS_WRAPPER_ATB_FUN8X1_DEVID

Bits	Name	Description
7:4	SCHEME	This value indicates the priority scheme implemented within the Funnel 0x3: STATIC_PRIORITY (Slave ports may be programmed to have higher or lower priority with respect to each other)
3:0	RESERVED	Reserved

0x00869FCC QDSS_WRAPPER_ATB_FUN8X1_DEVTYPE**Type:** R**Reset State:** 0x00000012

It provides a debugger with information about the component when the Part Number field is not recognized. The debugger can then report this information.

QDSS_WRAPPER_ATB_FUN8X1_DEVTYPE

Bits	Name	Description
7:4	SUB_TYPE	sub-classification within the major category 0x1: FUNNEL_ROUTER
3:0	MAJOR_TYPE	Major classification grouping for this debug/trace component 0x2: TRACE_LINK

0x00869FE0 QDSS_WRAPPER_ATB_FUN8X1_PERIPHID0**Type:** R**Reset State:** 0x00000008

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_WRAPPER_ATB_FUN8X1_PERIPHID0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x8: CORESIGHT_FUNNEL_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x100))

0x00869FE4 QDSS_WRAPPER_ATB_FUN8X1_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_WRAPPER_ATB_FUN8X1_PERIPHID1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CORESIGHT_FUNNEL_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x100))

0x00869FE8 QDSS_WRAPPER_ATB_FUN8X1_PERIPHID2**Type:** R**Reset State:** 0x0000002B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_WRAPPER_ATB_FUN8X1_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x2: R2P0 (This device is at r2p0)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	JEP106_BITS6TO4	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00869FEC QDSS_WRAPPER_ATB_FUN8X1_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_WRAPPER_ATB_FUN8X1_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made)

0x00869FD0 QDSS_WRAPPER_ATB_FUN8X1_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_WRAPPER_ATB_FUN8X1_PERIPHID4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00869FF0 QDSS_WRAPPER_ATB_FUN8X1_COMPID0**Type:** R**Reset State:** 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_WRAPPER_ATB_FUN8X1_COMPID0

Bits	Name	Description
7:0	PREAMBLE	Contains bits [24:31] of the component identification 0xD: ENUM_0D (Identification value)

0x00869FF4 QDSS_WRAPPER_ATB_FUN8X1_COMPID1**Type:** R**Reset State:** 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_WRAPPER_ATB_FUN8X1_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PREAMBLE	Contains bits [19:16] of the component identification 0x0: ENUM_0 (Identification value)

0x00869FF8 QDSS_WRAPPER_ATB_FUN8X1_COMPID2**Type:** R**Reset State:** 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_WRAPPER_ATB_FUN8X1_COMPID2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification 0x5: ENUM_05 (Identification value)

0x00869FFC QDSS_WRAPPER_ATB_FUN8X1_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_WRAPPER_ATB_FUN8X1_COMPID3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification 0xB1: B1 (Identification value)

25.3 QDSS_WRAPPER_QDSS_WRAPPER

SPDM HWEVENT MUX Config register

QDSS_WRAPPER_HWE_SPDM_MUX_REG

Bits	Name	Description
31	HWE_SPDM_MUX_OEN	SPDM HWEVENT Enable, 1= enables the SPDM HWE MUX output, 0=disables the SPDM HWE MUX output
30:9	SPARE1	Reserved
8:0	HWE_SPDM_MUX_SEL	SPDM HWEVENT MUX selection, selects one out of 512 HWEVENTS which is routed to SPDMs spdm_cy_clk_a[15] realtime monitor

0x0086CF00 QDSS_WRAPPER_CS_HWE_EXPD_ITCTL**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperIntegration Control (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_ITCTL

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x0086CFA0 QDSS_WRAPPER_CS_HWE_EXPD_CLAIMSET**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperClaim Tag Set (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_CLAIMSET

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x0086CFA4 QDSS_WRAPPER_CS_HWE_EXPD_CLAIMCLR**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperClaim Tag Clear (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_CLAIMCLR

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x0086CFB0 QDSS_WRAPPER_CS_HWE_EXPD_LOCKACCESS**Type:** W**Clock:** PDBGCLK**Reset State:** Undefined

QDSS WrapperLock Access (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_LOCKACCESS

Bits	Name	Description
31:0	LOCKACCESS	Write access code. A write of 0xC5ACCE55 enables further writes to the QDSS Coresight CSR Slave from software.

0x0086CFB4 QDSS_WRAPPER_CS_HWE_EXPD_LOCKSTATUS**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000003

QDSS WrapperLock Status (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_LOCKSTATUS

Bits	Name	Description
31:3	RFU	Reserved for Future Use.
2	FIELD_8_BIT_LOCK	Reads as zero since this component does not implement an 8 bit lock access register.
1	ACCESS	Access permission. This bit reflects the inversion of the current state of the UNLOCK bit within this component. 0x1: HIGH (Write access blocked. Reads permitted.) 0x0: LOW (Access permitted.)
0	LOCK_CONTROL	Reads as one since lock exists for this component.

0x0086CFB8 QDSS_WRAPPER_CS_HWE_EXPD_AUTHSTATUS**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperAuthentication Status (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_AUTHSTATUS

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x0086CFC8 QDSS_WRAPPER_CS_HWE_EXPD_DEVICEID

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS WrapperDevice Identification (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_DEVICEID

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	DEVID	This register is implementation defined for each Part Number and Designer. Unused for this component so reads as zeros.

0x0086CFCC QDSS_WRAPPER_CS_HWE_EXPD_DEVICETYPE

Type: R
Clock: PDBGCLK
Reset State: 0x00000004

QDSS WrapperDevice Type (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_DEVICETYPE

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	SUBTYPE	Reads as zeros meaning Other sub type.
3:0	MAJTYPE	Reads as 0x4 meaning Debug Control major type.

0x0086CFD0 QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID4

Type: R
Clock: PDBGCLK
Reset State: 0x0000000X

QDSS WrapperPeripheral ID4 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID4

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	FIELD_4KB_COUNT	Number of 4kB blocks. Reads as zero or 4kB block size.

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID4 (cont.)

Bits	Name	Description
3:0	JEP106_CONTINUATION	JEP106 continuation code. Reads as TARGETID[11:8] from MSM JTAG ID fuses [11:8]. This field should be set to bits [10:7] of Qualcomm's JEDEC assigned JEP106 code.

0x0086CFD4 QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID5**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperPeripheral ID5 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID5

Bits	Name	Description
31:0	RFU	Reads as zero per Coresight Architecture.

0x0086CFD8 QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID6**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperPeripheral ID6 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID6

Bits	Name	Description
31:0	RFU	Reads as zero per Coresight Architecture.

0x0086CFDC QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID7**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperPeripheral ID7 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID7

Bits	Name	Description
31:0	RFU	Reads as zero per Coresight Architecture.

0x0086CFE0 QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID0**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000040

QDSS WrapperPeripheral ID0 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID0

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PARTNUM	PartNumber[7:0]. [7:6] is Subsystem/core family ID (e.g. denote QDSS family or generation). [5:4] is Subsystem/core configuration options (e.g. denote cache options, etc.). [3:2] is Subsystem/core fuse options. [1:0] is Subsystem/core future use field. Reads as 0x40.

0x0086CFE4 QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID1**Type:** R**Clock:** PDBGCLK**Reset State:** 0x000000X4

QDSS WrapperPeripheral ID1 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID1

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	JEP106_IDENTITY_3_0	JEP106 Identity Code[3:0]. Reads as TARGETID[4:1] from MSM JTAG ID fuses [4:1] which will always be 0x0 for Qualcomm.
3:0	PARTNUM	PartNumber[11:8]. [11:8] is 0x4 meaning Qualcomm designed Coresight component in QDSS. Reads as 0x4.

0x0086CFE8 QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID2**Type:** R**Clock:** PDBGCLK**Reset State:** 0b000000000000000000000000000011XXX

QDSS WrapperPeripheral ID2 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID2

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	MAJREV	Major revision number of this peripheral. Reads as 0x0 for this version of QDSS.
3	JEDEC	Reads as one which indicates that a JEDEC assigned value is used.
2:0	JEP106_IDENTITY_6_4	JEP106 Identity Code[6:4]. Reads as TARGETID[7:5] from MSM JTAG ID fuses [7:5] which will always be 3'b111 for Qualcomm.

0x0086CFEC QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID3**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS WrapperPeripheral ID3 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_PERIPHID3

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	REV_AND	This field indicates minor errata fixes specific to this design. Reads as zeros for this version of QDSS.
3:0	CUSTOMER_MODIFIED	Implementation defined. Always reads as zeros for QDSS.

0x0086CFF0 QDSS_WRAPPER_CS_HWE_EXPD_COMPID0**Type:** R**Clock:** PDBGCLK**Reset State:** 0x0000000D

QDSS WrapperComponent ID0 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_COMPID0

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PREAMBLE_7_0	Coresight mandates this read as 0x0D.

0x0086CFF4 QDSS_WRAPPER_CS_HWE_EXPD_COMPID1**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000090

QDSS WrapperComponent ID1 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_COMPID1

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	PREAMBLE_15_12	Coresight mandates this read as 0x9 or Coresight class component.
3:0	PREAMBLE_11_8	Coresight mandates this read as 0x0.

0x0086CFF8 QDSS_WRAPPER_CS_HWE_EXPD_COMPID2**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000005

QDSS WrapperComponent ID2 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_COMPID2

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PREAMBLE_23_16	Coresight mandates this read as 0x05.

0x0086CFFC QDSS_WRAPPER_CS_HWE_EXPD_COMPID3**Type:** R**Clock:** PDBGCLK**Reset State:** 0x000000B1

QDSS WrapperComponent ID3 (Coresight Programmer's Model) Register

QDSS_WRAPPER_CS_HWE_EXPD_COMPID3

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PREAMBLE_31_24	Coresight mandates this read as 0xB1.

A Exhibit 1

PLEASE READ THIS LICENSE AGREEMENT ("AGREEMENT") CAREFULLY. THIS AGREEMENT IS A BINDING LEGAL AGREEMENT ENTERED INTO BY AND BETWEEN YOU (OR IF YOU ARE ENTERING INTO THIS AGREEMENT ON BEHALF OF AN ENTITY, THEN THE ENTITY THAT YOU REPRESENT) AND QUALCOMM TECHNOLOGIES, INC. ("QTI" "WE" "OUR" OR "US"). THIS IS THE AGREEMENT THAT APPLIES TO YOUR USE OF THE DESIGNATED AND/OR ATTACHED DOCUMENTATION AND ANY UPDATES OR IMPROVEMENTS THEREOF (COLLECTIVELY, "MATERIALS"). BY USING OR COMPLETING THE INSTALLATION OF THE MATERIALS, YOU ARE ACCEPTING THIS AGREEMENT AND YOU AGREE TO BE BOUND BY ITS TERMS AND CONDITIONS. IF YOU DO NOT AGREE TO THESE TERMS, QTI IS UNWILLING TO AND DOES NOT LICENSE THE MATERIALS TO YOU. IF YOU DO NOT AGREE TO THESE TERMS YOU MUST DISCONTINUE AND YOU MAY NOT USE THE MATERIALS OR RETAIN ANY COPIES OF THE MATERIALS. ANY USE OR POSSESSION OF THE MATERIALS BY YOU IS SUBJECT TO THE TERMS AND CONDITIONS SET FORTH IN THIS AGREEMENT.

1.1 License. Subject to the terms and conditions of this Agreement, including, without limitation, the restrictions, conditions, limitations and exclusions set forth in this Agreement, Qualcomm Technologies, Inc. ("QTI") hereby grants to you a nonexclusive, limited license under QTI's copyrights to use the attached Materials; and to reproduce and redistribute a reasonable number of copies of the Materials. You may not use Qualcomm Technologies or its affiliates or subsidiaries name, logo or trademarks; and copyright, trademark, patent and any other notices that appear on the Materials may not be removed or obscured. QTI shall be free to use suggestions, feedback or other information received from You, without obligation of any kind to You. QTI may immediately terminate this Agreement upon your breach. Upon termination of this Agreement, Sections 1.2-4 shall survive.

1.2 Indemnification. You agree to indemnify and hold harmless QTI and its officers, directors, employees and successors and assigns against any and all third party claims, demands, causes of action, losses, liabilities, damages, costs and expenses, incurred by QTI (including but not limited to costs of defense, investigation and reasonable attorney's fees) arising out of, resulting from or related to: (i) any breach of this Agreement by You; and (ii) your acts, omissions, products and services. If requested by QTI, You agree to defend QTI in connection with any third party claims, demands, or causes of action resulting from, arising out of or in connection with any of the foregoing.

1.3 Ownership. QTI (or its licensors) shall retain title and all ownership rights in and to the Materials and all copies thereof, and nothing herein shall be deemed to grant any right to You under any of QTI's or its affiliates' patents. You shall not subject the Materials to any third party license terms (e.g., open source license terms). You shall not use the Materials for the purpose of identifying or providing evidence to support any potential patent infringement claim against QTI, its affiliates, or any of QTI's or QTI's affiliates' suppliers and/or direct or indirect customers. QTI hereby reserves all rights not expressly granted herein.

1.4 WARRANTY DISCLAIMER. YOU EXPRESSLY ACKNOWLEDGE AND AGREE THAT THE USE OF THE MATERIALS IS AT YOUR SOLE RISK. THE MATERIALS AND TECHNICAL SUPPORT, IF ANY, ARE PROVIDED "AS IS" AND WITHOUT WARRANTY OF ANY KIND, WHETHER EXPRESS OR IMPLIED. QTI ITS LICENSORS AND AFFILIATES MAKE NO WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THE MATERIALS OR ANY OTHER INFORMATION OR DOCUMENTATION PROVIDED UNDER THIS AGREEMENT, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR AGAINST INFRINGEMENT, OR ANY EXPRESS OR IMPLIED WARRANTY ARISING OUT OF TRADE USAGE OR OUT OF A COURSE OF DEALING OR COURSE OF PERFORMANCE. NOTHING CONTAINED IN THIS AGREEMENT SHALL BE CONSTRUED AS (I) A WARRANTY OR REPRESENTATION BY QTI, ITS LICENSORS OR AFFILIATES AS TO THE VALIDITY OR SCOPE OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT OR (II) A WARRANTY OR REPRESENTATION BY QTI THAT ANY MANUFACTURE OR USE WILL BE FREE FROM INFRINGEMENT OF PATENTS, COPYRIGHTS OR OTHER INTELLECTUAL PROPERTY RIGHTS OF OTHERS, AND IT SHALL BE THE SOLE RESPONSIBILITY OF YOU TO MAKE SUCH DETERMINATION AS IS NECESSARY WITH RESPECT TO THE ACQUISITION OF LICENSES UNDER PATENTS AND OTHER INTELLECTUAL PROPERTY OF THIRD PARTIES.

1.5 LIMITATION OF LIABILITY. IN NO EVENT SHALL QTI, QTI'S AFFILIATES OR ITS LICENSORS BE LIABLE TO YOU FOR ANY INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES, INCLUDING BUT NOT LIMITED TO ANY LOST PROFITS, LOST SAVINGS, OR OTHER INCIDENTAL DAMAGES, ARISING OUT OF THE USE OR INABILITY TO USE, OR THE DELIVERY OR FAILURE TO DELIVER, ANY OF THE MATERIALS, OR ANY BREACH OF ANY OBLIGATION UNDER THIS AGREEMENT, EVEN IF QTI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THE FOREGOING LIMITATION OF LIABILITY SHALL REMAIN IN FULL FORCE AND EFFECT REGARDLESS OF WHETHER YOUR REMEDIES HEREUNDER ARE DETERMINED TO HAVE FAILED OF THEIR ESSENTIAL PURPOSE. THE ENTIRE LIABILITY OF QTI, QTI'S AFFILIATES AND ITS LICENSORS, AND THE SOLE AND EXCLUSIVE REMEDY OF YOU, FOR ANY CLAIM OR CAUSE OF ACTION ARISING HEREUNDER (WHETHER IN CONTRACT, TORT, OR OTHERWISE) SHALL NOT EXCEED US\$10.

2. **COMPLIANCE WITH LAWS; APPLICABLE LAW.** You agree to comply with all applicable local, international and national laws and regulations and with U.S. Export Administration Regulations, as they apply to the subject matter of this Agreement. This Agreement is governed by the laws of the State of California, excluding California's choice of law rules.

3. **CONTRACTING PARTIES.** If the Materials are downloaded on any computer owned by a corporation or other legal entity, then this Agreement is formed by and between QTI and such entity. The individual accepting the terms of this Agreement represents and warrants to QTI that they have the authority to bind such entity to the terms and conditions of this Agreement.

4. **MISCELLANEOUS PROVISIONS.** This Agreement, together with all exhibits attached hereto, which are incorporated herein by this reference, constitutes the entire agreement between QTI and You and supersedes all prior negotiations, representations and agreements between the parties with respect to the subject matter hereof. No addition or modification of this Agreement shall be effective unless made in writing and signed by the respective representatives of QTI and You. The restrictions, limitations, exclusions and conditions set forth in this Agreement shall apply even if QTI or any of its affiliates becomes aware of or fails to act in a manner to address any violation or failure to comply therewith. You hereby acknowledge and agree that the restrictions, limitations, conditions and exclusions imposed in this Agreement on the rights granted in this Agreement are not a derogation of the benefits of such rights. You further acknowledges that, in the absence of such restrictions, limitations, conditions and exclusions, QTI would not have entered into this Agreement with You. Each party shall be responsible for and shall bear its own expenses in connection with this Agreement. If any of the provisions of this Agreement are determined to be invalid, illegal, or otherwise unenforceable, the remaining provisions shall remain in full force and effect. This Agreement is entered into solely in the English language, and if for any reason any other language version is prepared by any party, it shall be solely for convenience and the English version shall govern and control all aspects. If You are located in the province of Quebec, Canada, the following applies: The Parties hereby confirm they have requested this Agreement and all related documents be prepared in English.
