LM80-P0436-13 Rev. C

Revision history

Revision	Date	Description
A	June 30, 2015	Initial release
B	July 23, 2015	Updated Overview section.
C	January 22, 2016	Removed chapter: Multimedia Subsystem Oxili

Contents

1 Introduction.....	11
1.1 Overview	11
1.2 System memory map	12

1 Introduction

1.1 Overview

This hardware register description document lists the programmable registers for the APQ8016 processor chip. It is intended for embedded OEMs or developers who require information about how to program the APQ8016 hardware.

Complementary ICs within this APQ chipset include:

- Audio codec
- Power manager
- WLAN and BT connectivity

2.1 BIMC_MISC

BIMC Misc Global

2.1.1 BIMC_BIMC_MISC

BIMC Misc Global

0x00400020 BIMC_CORE_CLK_SEL

Type: RW

Clock: Config Clock

Reset State: 0x00000000

Control bit in this register enables legacy mode clocking scheme. In this scheme, BIMC block gets a 2x clock input from the clock controller. BIMC locally divides the clock extract 1x clock.

BIMC_CORE_CLK_SEL

Bits	Name	Description
1	CLK_2X_MODE	0: bmc_core_clk input is 1x when CLK_2X_MODE_CTRL_EN is 1 1: bmc_core_clk input is 2x clock when CLK_2X_MODE_CTRL_EN is 1
0	CLK_2X_MODE_CTRL_EN	0: CLK_2X_MODE select control used from BIMC interface 1: CLK_2X_MODE select control used from this register bit 1 (programmed)

0x00400024 BIMC_CORE_CLK_PERIOD

Type: RW

Clock: Config Clock

Reset State: 0x00000000

Core Clock Period Register

BIMC_CORE_CLK_PERIOD

Bits	Name	Description
28	CLK_PERIOD_RESOLUTION	1: DDR clock period defined in period field of this register is in 1ps unit. 0: DDR clock period is in 100ps unit.
16:0	PERIOD	value of core clock period defined in unit described by encoding in bit 28. When CLK_PERIOD_RESOLUTION is 100ps, maximum value that can be programmed for the PERIOD is 255

**0x00400100+ BIMC_SCMOn_LOCAL_CGC_THRESHOLD, n=[0..1]
0x4*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

used to compare with core clk period info from time based feature design for disabling specific SCMO internal core clk CGC(s).

BIMC_SCMOn_LOCAL_CGC_THRESHOLD

Bits	Name	Description
28	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.
7:0	THRESHOLD_VAL	value of core clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then SCMO internal core clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

**0x00400140+ BIMC_DPEn_LOCAL_CGC_THRESHOLD, n=[0..1]
0x4*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

used to compare with core clk period info from time based feature design for disabling DPE internal core clk CGC(s).

BIMC_DPEn_LOCAL_CGC_THRESHOLD

Bits	Name	Description
28	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.
7:0	THRESHOLD_VAL	value of core clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then DPE internal core clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

0x00400180 BIMC_MPORT_CORE_DOMAIN_LOCAL_CGC_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Frequency threshold value to disable internal clock gating of core clk domain logic of masterport sub-module.

BIMC_MPORT_CORE_DOMAIN_LOCAL_CGC_THRESHOLD

Bits	Name	Description
28	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.
7:0	THRESHOLD_VAL	value of core clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then DPE internal core clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

**0x004001C0+ BIMC_MPORTn_CLK_LOCAL_CGC_THRESHOLD, n=[0..6]
0x4*n**
Type: RW**Clock:** Config Clock**Reset State:** 0x00000000

used to compare with master clk period info from time based feature design for disabling internal clk CGC(s) for master clk domain logic in masterport submodule.

BIMC_MPORTn_CLK_LOCAL_CGC_THRESHOLD

Bits	Name	Description
28	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.
7:0	THRESHOLD_VAL	value of master clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then masterport internal master clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

0x00400200 BIMC_SWAY_LOCAL_CGC_THRESHOLD
Type: RW**Clock:** Config Clock**Reset State:** 0x00000000

Frequency threshold value to disable internal clock gating of masterport sub-module.

BIMC_SWAY_LOCAL_CGC_THRESHOLD

Bits	Name	Description
28	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.

BIMC_SWAY_LOCAL_CGC_THRESHOLD (cont.)

Bits	Name	Description
7:0	THRESHOLD_VAL	value of core clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then DPE internal core clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

0x00400240+ BIMC_SCMOn_CGC_CFG, n=[0..1]
0x4*n
Type: RW**Clock:** Config Clock**Reset State:** 0x00000000

Usage: used to compare with core clk period info from time based feature design for disabling BIMC level CGC for SCMO instance. (note: this is not for SCMO internal CGCs.)

BIMC_SCMOn_CGC_CFG

Bits	Name	Description
28	CLK_DIS	A 1 in this bit will disable SCMO core clock When THRESHOLD_ENA is 0. This is for SW to turn on/off clock.
24	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.
7:0	THRESHOLD_VAL	value of core clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then DPE internal core clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

**0x00400280+ BIMC_DPEn_CGC_CFG, n=[0..1]
0x4*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Usage: used to compare with core clk period info from time based feature design for disabling BIMC level CGC for DPE instance. (note: this is not for DPE internal CGCs.)

BIMC_DPEn_CGC_CFG

Bits	Name	Description
28	CLK_DIS	A 1 in this bit will disable DPE core clock when THRESHOLD_ENA is 0. This is for SW to turn on/off clock.
24	THRESHOLD_ENA	1: enable frequency based clock gating. 0: disable frequency based clock gating.
7:0	THRESHOLD_VAL	value of core clk period in 100ps unit. If the period info from time based module is smaller than the value from these bits, then DPE internal core clk CGCs will be disabled and clk is not gated. The following are some examples: 0x00: the minimum value of the setting and the comparator output is always low. This means clk gating will be enabled if THRESHOLD_ENA of this register is also set to 0 0x01: 100ps=10GHz 0x0c: 1200ps=833MHz 0xFF: 6553.6ns=15.25kHz (max. setting)

0x00400400 BIMC_CALIBRATION_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Calibration configuration

BIMC_CALIBRATION_CFG

Bits	Name	Description
28	RAPID_CAL_ENA	Enable/disable rapid calibration. When rapid calibration is enabled, the calibrate pulses are generated every alternate core clock cycle.
23:0	COUNT_VAL	Count value used to generate calibrate pulses periodically. The counter is based of XO clock cycles. For example when the COUNT_VAL is 1, the calibrate pulses are generated every alternate XO clock cycle. Note: When the COUNT_VAL is 0, the calibrate pulses aren't generated.

**0x00400600+ BIMC_DFIn_LP_CFG, n=[0..1]
0x4*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Used to signal DDR PHY to low power

BIMC_DFIn_LP_CFG

Bits	Name	Type	Description
15:12	RFU	RW	Spare field - reserved for future use.
8	LP_ACK	R	Indicates the acknowledge status for the low power request.
4	LP_REQ	RW	Request to PHY to go to low power mode.
3:0	LP_WAKEUP	RW	Specifies the clock cycles within which PHY has to ensure that it comes out of low power.

0x00400800 BIMC_HFSC_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Used for SW driven DDR clock frequency switch

BIMC_HFSC_CFG

Bits	Name	Description
0	DISABLE	Disable/Enable the hardware driven clock frequency switch control sequence. When disabled, the SW can control the clock frequency switch handshake sequence.

0x0040080C BIMC_HFSC_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Used for frequency switch FSM debug

BIMC_HFSC_STATUS

Bits	Name	Description
0	BUSY	Status indicating that frequency switch FSM is in non-idle state.

0x00400840 BIMC_HFSC_STAGE1_CTRL**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Used for SW driven DDR clock frequency switch

BIMC_HFSC_STAGE1_CTRL

Bits	Name	Type	Description
4	ACK	R	Status indicating that STAGE1 preparation is done for clock frequency switch.
0	REQ	RW	Sends a request to the STAGE1 components to get them prepared for clock frequency switch.

0x00400860 BIMC_HFSC_STAGE2_CTRL**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Used for SW driven DDR clock frequency switch

BIMC_HFSC_STAGE2_CTRL

Bits	Name	Type	Description
4	ACK	R	Status indicating that STAGE2 preparation is done for clock frequency switch.
0	REQ	RW	Sends a request to the STAGE2 components to get them prepared for clock frequency switch.

2.2 GLOBAL1

BRIC Global #1

2.2.1 BIMC_BRIC_GLOBAL1

BRIC Global #1

0x00401000 BIMC_BRIC_GLOBAL1_COMPONENT_INFO

Type: R

Clock: Config Clock

Reset State: 0x00000101

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_BRIC_GLOBAL1_COMPONENT_INFO

Bits	Name	Description
15:8	SUB_TYPE	Identifies this configuration space as belonging to global1 configuration registers 0x1: GLOBAL1
7:0	TYPE	Identifies this configuration space as belonging to a global/common component, that does not specifically connect to a bus master or slave. 0x1: GLOBAL

0x00401020 BIMC_BRIC_CONFIGURATION_INFO_0

Type: R

Clock: Config Clock

Reset State: 0x00000808

Configuration information registers provide information on the capability and configuration of the interconnect. See register field descriptions for more details.

BIMC_BRIC_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	ADDR_WIDTH	Indicates the width of addresses generated by masters connected to the interconnect.
23:16	BUSID	Indicates the BUSID added to all commands originating from masters that are directly connected to this interconnect. Generally assigned to be a unique value in the SoC.

BIMC_BRIC_CONFIGURATION_INFO_0 (cont.)

Bits	Name	Description
15:8	NUM_SWAYS	Indicates the number of slaveways in the interconnect. Also includes any internal slaveways that perform controller functionality to on-chip and off-chip memory, including DDR-SDRAM. Each slaveway connected to a single bus slave or another level of interconnect.
7:0	NUM_MPORTS	Indicates the number of masterports in the interconnect. Each masterport connects to a single bus master or another level of interconnect.

0x00401030 BIMC_BRIC_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of the interconnect. See register field descriptions for more details.

BIMC_BRIC_CONFIGURATION_INFO_1

Bits	Name	Description
31:16	DATA_WIDTH	Indicates the width of read and write data used in the core of the interconnect.
15:8	TID_WIDTH	Indicates the width of transfer ID in the core of the interconnect. TIDs are made as wide as necessary to accommodate TIDs from all masters and to accommodate any addition transaction tagging required by the interconnect.
7:0	MID_WIDTH	Indicates the width of master ID in the core of the interconnect, including any bus and port IDs as inserted by different levels of interconnects.

0x00401040 BIMC_BRIC_CONFIGURATION_INFO_2A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of the interconnect. See register field descriptions for more details.

BIMC_BRIC_CONFIGURATION_INFO_2A

Bits	Name	Description
31:0	CFG_ADDR_BASE_GLOBAL	In configuration space, indicates the base address of first global CSR region. Upto 8 global CSR slaves occupy 8 4KB regions.

0x00401044 BIMC_BRIC_CONFIGURATION_INFO_2B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of the interconnect. See register field descriptions for more details.

BIMC_BRIC_CONFIGURATION_INFO_2B

Bits	Name	Description
31:0	CFG_ADDR_BASE_MPORTS	In configuration space, indicates the base address of first masterport CSR region. Each masterport occupies 4 4KB regions.

0x00401048 BIMC_BRIC_CONFIGURATION_INFO_2C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of the interconnect. See register field descriptions for more details.

BIMC_BRIC_CONFIGURATION_INFO_2C

Bits	Name	Description
31:0	CFG_ADDR_BASE_SWAYS	In configuration space, indicates the base address of first slaveway CSR region. Each large slaveway occupies 12 4KB regions and each regular slaveway occupies 8 4KB regions.

0x0040104C BIMC_BRIC_CONFIGURATION_INFO_2D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000808

Configuration information registers provide information on the capability and configuration of the interconnect. See register field descriptions for more details.

BIMC_BRIC_CONFIGURATION_INFO_2D

Bits	Name	Description
23:16	CFG_NUM_SWAYS_LARGE	Indicates the number of slaweways (large) that are allocated 12 4KB regions. Remaining slaweways (regular) are allocated only 8 4KB regions.
15:8	CFG_NUM_SWAYS	Indicates the number of slaweways (large and regular) that are allocated with CSR regions. Usually always equals the number of slaweways indicated in BRIC_CONFIGURATION_INFO_0.
7:0	CFG_NUM_MPORTS	Indicates the number of masterports that are allocated with CSR regions. Usually always equals the number of slaweways indicated in BRIC_CONFIGURATION_INFO_0.

0x00401100 BIMC_BRIC_INTERRUPT_STATUS_0

Type: R

Clock: Config Clock

Reset State: 0x00000000

Interrupt status registers collect interrupts from each component and are part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_STATUS_0

Bits	Name	Description
7:0	MPORT	Indicates interrupts from each masterport. 1-bit per masterport. When set (1), indicates that the corresponding masterport has generated an interrupt that requires servicing.

0x00401108 BIMC_BRIC_INTERRUPT_CLEAR_0

Type: W

Clock: Config Clock

Reset State: 0x00000000

Interrupt clear registers provide the capability to clear an interrupt status, once an interrupt has been acknowledged or serviced. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_CLEAR_0

Bits	Name	Description
7:0	MPORT	Write '1' to specific bits to clear interrupt status. 1-bit per masterport. Only interrupt status that are set are cleared. Writes of '1' to interrupt status that are not set are ignored. Writes of '0' are ignored.

0x0040110C BIMC_BRIC_INTERRUPT_ENABLE_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are propagated to the interrupt controller. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_ENABLE_0

Bits	Name	Description
7:0	MPORT	When set (1), configures the corresponding interrupt to be propagated to the interrupt controller. 1-bit per masterport.

0x00401110 BIMC_BRIC_INTERRUPT_STATUS_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers collect interrupts from each component and are part of a unified set of interrupt status and control registers to indicate and control interrupts from which components are propagated out of the interconnect.

BIMC_BRIC_INTERRUPT_STATUS_1

Bits	Name	Description
7:0	SWAY_0	Indicates interrupt #0 from each slaveway. 1-bit per slaveway. When set (1), indicates that the corresponding slaveway has generated an interrupt that requires servicing.

0x00401118 BIMC_BRIC_INTERRUPT_CLEAR_1**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the capability to clear an interrupt status, once an interrupt has been acknowledged or serviced. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller

BIMC_BRIC_INTERRUPT_CLEAR_1

Bits	Name	Description
7:0	SWAY_0	Write '1' to specific bits to clear interrupt status. 1-bit per slaway. Only interrupt status that are set are cleared. Writes of '1' to interrupt status that are not set are ignored. Writes of '0' are ignored.

0x0040111C BIMC_BRIC_INTERRUPT_ENABLE_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are propagated to the interrupt controller. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_ENABLE_1

Bits	Name	Description
7:0	SWAY_0	When set (1), configures the corresponding interrupt to be propagated to the interrupt controller. 1-bit per slaway.

0x00401120 BIMC_BRIC_INTERRUPT_STATUS_2**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers collect interrupts from each component and are part of a unified set of interrupt status and control registers to indicate and control interrupts from which components are propagated out of the interconnect.

BIMC_BRIC_INTERRUPT_STATUS_2

Bits	Name	Description
7:0	SWAY_1	Indicates interrupt #1 from each slaveway. 1-bit per slaveway. When set (1), indicates that the corresponding slaveway has generated an interrupt that requires servicing.

0x00401128 BIMC_BRIC_INTERRUPT_CLEAR_2**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the capability to clear an interrupt status, once an interrupt has been acknowledged or serviced. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller

BIMC_BRIC_INTERRUPT_CLEAR_2

Bits	Name	Description
7:0	SWAY_1	Write '1' to specific bits to clear interrupt status. 1-bit per slaveway. Only interrupt status that are set are cleared. Writes of '1' to interrupt status that are not set are ignored. Writes of '0' are ignored.

0x0040112C BIMC_BRIC_INTERRUPT_ENABLE_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are propagated to the interrupt controller. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_ENABLE_2

Bits	Name	Description
7:0	SWAY_1	When set (1), configures the corresponding interrupt to be propagated to the interrupt controller. 1-bit per slaveway.

0x00401130 BIMC_BRIC_INTERRUPT_STATUS_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers collect interrupts from each component and are part of a unified set of interrupt status and control registers to indicate and control interrupts from which components are propagated out of the interconnect.

BIMC_BRIC_INTERRUPT_STATUS_3

Bits	Name	Description
7:0	SWAY_2	Indicates interrupt #2 from each slaveway. 1-bit per slaveway. When set (1), indicates that the corresponding slaveway has generated an interrupt that requires servicing.

0x00401138 BIMC_BRIC_INTERRUPT_CLEAR_3**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the capability to clear an interrupt status, once an interrupt has been acknowledged or serviced. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_CLEAR_3

Bits	Name	Description
7:0	SWAY_2	Write '1' to specific bits to clear interrupt status. 1-bit per slaveway. Only interrupt status that are set are cleared. Writes of '1' to interrupt status that are not set are ignored. Writes of '0' are ignored.

0x0040113C BIMC_BRIC_INTERRUPT_ENABLE_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are propagated to the interrupt controller. It is part of a central set of interrupt status and control registers to indicate and control interrupts from which components are propagated to the interrupt controller.

BIMC_BRIC_INTERRUPT_ENABLE_3

Bits	Name	Description
7:0	SWAY_2	When set (1), configures the corresponding interrupt to be propagated to the interrupt controller. 1-bit per slaveway.

0x00401200 BIMC_BRIC_REF_TIMER_INTERVAL**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_BRIC_REF_TIMER_INTERVAL**

Bits	Name	Description
15:0	INTERVAL	Configures the number of clock cycles of implementation specified reference clock to generate a reference timer tick on for use in arbitration and other functions in the interconnect. The reference timer tick defines the time units that arbitration intervals are specified in. A single interval definition allows for this reference time unit to be adjusted on any change in the frequency of the reference clock. When configured with either '0' or '1', indicates an interval of 1-cycle. When configured with values greater than '1', a timer tick is generated once every configured number of reference clock cycles.

BRIC Global #2

0x00402000 BIMC_BRIC_GLOBAL2_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000201

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_BRIC_GLOBAL2_COMPONENT_INFO

Bits	Name	Description
15:8	SUB_TYPE	Identifies this configuration space as belonging to global2 configuration registers 0x2: GLOBAL2
7:0	TYPE	Identifies this configuration space as belonging to a global/common component, that does not specifically connect to a bus master or slave. 0x1: GLOBAL

0x004021F0 BIMC_BRIC_DEFAULT_SEGMENT**Type:** RW**Clock:** Config Clock**Reset State:** 0x80060007

Default segment configuration register defines the slaveways to direct all commands that do not decode to a specific bus slave in the system and commands that request specific routing.

BIMC_BRIC_DEFAULT_SEGMENT

Bits	Name	Description
31	REDIRECT_EN	When set (1), enables redirection of commands that request cacheable/coherent redirection (AREDIRECT=1). When cleared (0), command redirection is ignored and address of command determines the slave to which the command is routed to.
19:16	REDIRECT	Configures the slaveway to send all commands that request cacheable/coherent redirection. Defaults to the slaveway interfacing to the bus slave capable of handling cachable/coherent commands.
3:0	DEFAULT	Configures the slaveway to send all commands that do not decode to one of the specified address ranges. Defaults to an internal default slave capable of generating decode error, but can be configured to be any other slaveway.

**0x00402200+ BIMC_BRIC_SEGMENTn_ADDR_BASE_A_LOWER, n=[0..7]
0x80*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Segment configuration registers define the address range in the memory map for each bus slave. Each bus slave has three sets of address ranges (A, B, C), with each address range defined with a pair of BASE and MASK registers. Each BASE/MASK pair of registers defines a power-of-2 address range that is at a minimum 1MB in size. For e.g., a BASE of 0x80000000 and MASK of

0xF0000000 defines the address range 0x80000000-0x8FFFFFFF. Each BASE and MASK register is broken into UPPER and LOWER to accommodate upto 64-bit address.

BIMC_BRIC_SEGMENTn_ADDR_BASE_A_LOWER

Bits	Name	Description
31:20	BASE_31_20	Configures ADDR_BASE[31:20] to match for in address of a command. Used in conjunction with ADDR_MASK[31:20], which controls which bits of ADDR_BASE[31:20] are matched for in address of a command.
10	BASE_10	Configures ADDR_BASE[10] to match for in address of a command. Used in conjunction with ADDR_MASK[10], which controls whether ADDR_BASE[10] is matched for in address of a command.
3:2	RFU	Reserved for future use
1	TYPE	When cleared (0), identifies BASE_A/MASK_A pair of address range registers as adding to the address space defined for bus slave 'n'. When set (1), identifies BASE_A/MASK_A pair of address range registers as subtracting from the address space defined for bus slave 'n'. For e.g., allows for the address space to be defined as 128MB - 16MB for a total of 114MB.
0	ENABLE	When set (1), enables use of BASE_A/MASK_A pair of address range registers for determining whether a command decodes to bus slave 'n' or not. When cleared (0), disables use of BASE_A/MASK_A pair of address range registers.

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x00408050 BIMC_M_APP_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

0x00408060 BIMC_M_APP_MPORT_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_4

Bits	Name	Description
15:8	REORDER_BUFFER_DEPTH	Indicates the number of read data beats that can be re-ordered in this masterport (if the masterport provides response re-ordering functionality.)
7:0	REORDER_TABLE_DEPTH	Indicates the number of read and write commands whose responses can be re-ordered in this masterport (if the masterport provides responses re-ordering functionality.)

0x00408070 BIMC_M_APP_MPORT_CONFIGURATION_INFO_5A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_5A

Bits	Name	Description
31:0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the address channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x00408074 BIMC_M_APP_MPORT_CONFIGURATION_INFO_5B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_5B

Bits	Name	Description
31:0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the write channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x00408078 BIMC_M_APP_MPORT_CONFIGURATION_INFO_5C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_5C

Bits	Name	Description
31:0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of write response channels from multiple slaveways, digit 1 identifies pipelining in the write response channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0040807C BIMC_M_APP_MPORT_CONFIGURATION_INFO_5D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_APP_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x00408100 BIMC_M_APP_MPORT_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_APP_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00408108 BIMC_M_APP_MPORT_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_APP_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0040810C BIMC_M_APP_MPORT_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_APP_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00408200 BIMC_M_APP_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_APP_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00408208 BIMC_M_APP_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_APP_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x00408210 BIMC_M_APP_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_APP_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaweway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaweway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaweway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.

BIMC_M_APP_MPORT_MODE (cont.)

Bits	Name	Description
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.
2	FIODV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIOSO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x00408220 BIMC_M_APP_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_APP_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, i.e.. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x00408230 BIMC_M_APP_MPORT_PRIORITYLVL_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_APP_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x00408240 BIMC_M_APP_MPORT_READ_COMMAND_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_APP_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATTRANSIENT	Configures the values to override ATTRANSIENT from bus master with for read commands when OVERRIDE_ATTRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for read commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATTRANSIENT	When set (1), overrides ATTRANSIENT from the bus master for read commands with values configured in ATTRANSIENT register field. When cleared (0), allows ATTRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for read commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.

BIMC_M_APP_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	VERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00408250 BIMC_M_APP_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_APP_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for write commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	VERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	VERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_APP_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00408300 BIMC_M_APP_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_APP_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x00408304 BIMC_M_APP_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_APP_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x00408308 BIMC_M_APP_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_APP_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x00408320 BIMC_M_APP_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_APP_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00408324 BIMC_M_APP_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_APP_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00408328 BIMC_M_APP_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_APP_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00408340 BIMC_M_APP_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_APP_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x00408344 BIMC_M_APP_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_APP_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x00408348 BIMC_M_APP_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_APP_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0040834C BIMC_M_APP_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_APP_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x00408420 BIMC_M_APP_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_APP_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x00408424 BIMC_M_APP_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_APP_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x00408430 BIMC_M_APP_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_APP_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_APP_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x00408434 BIMC_M_APP_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_APP_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_APP_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.5 BIMC_M_APP_PROF

BRIC Traffic Profiling

2.5.1 BIMC_M_APP_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x00409000 BIMC_M_APP_PROF_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_APP_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00409020 BIMC_M_APP_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_APP_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies that a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x00409030 BIMC_M_APP_PROF_CONFIGURATION_INFO_1

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_APP_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x00409200 BIMC_M_APP_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_APP_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00409210 BIMC_M_APP_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_APP_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x00409214 BIMC_M_APP_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00409218 BIMC_M_APP_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00409220 BIMC_M_APP_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x00409230 BIMC_M_APP_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_APP_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x00409234 BIMC_M_APP_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x00409238 BIMC_M_APP_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x00409240 BIMC_M_APP_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_APP_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x00409244 BIMC_M_APP_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00409248 BIMC_M_APP_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0040924C BIMC_M_APP_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00409250 BIMC_M_APP_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x00409260 BIMC_M_APP_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x00409264 BIMC_M_APP_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_APP_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x00409270 BIMC_M_APP_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x00409274 BIMC_M_APP_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_APP_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x00409278 BIMC_M_APP_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x00409280 BIMC_M_APP_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x00409284 BIMC_M_APP_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x00409290 BIMC_M_APP_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x00409294 BIMC_M_APP_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x00409298 BIMC_M_APP_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x004092A0 BIMC_M_APP_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_APP_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x004092A4 BIMC_M_APP_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x004092A8 BIMC_M_APP_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_APP_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x00409300 BIMC_M_APP_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x00409304 BIMC_M_APP_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x00409308 BIMC_M_APP_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_APP_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x00409340 BIMC_M_APP_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x00409344 BIMC_M_APP_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_APP_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x00409348 BIMC_M_APP_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_APP_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

**0x00409400+ BIMC_M_APP_PROF_RD_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_APP_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

**0x00409410+ BIMC_M_APP_PROF_WR_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_APP_PROF_WR_STATUS_n**

Bits	Name	Description
31	WR_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding writes crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.

BIMC_M_APP_PROF_WR_STATUS_n (cont.)

Bits	Name	Description
30	WR_OUTSTANDING_UNDE RFLOW	Indicates that the number of outstanding writes went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding writes occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	WR_OUTSTANDING_MAX	Indicates the maximum number of outstanding writes that were seen when traffic profiling was last enabled. Only writes that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.6 BIMC_M_DSP_MPORT

BRIC Masterport

2.6.1 BIMC_M_DSP_MPORT_BRIC_MASTERPORT

BRIC Masterport

0x0040C000 BIMC_M_DSP_MPORT_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000102

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_DSP_MPORT_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this masterport.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a masterport 0x1: MASTERPORT
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x0040C020 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the master side and the clock used in the core side of the masterport. When ASYNC, identifies the master clock and core clock as unrelated and asynchronous to each other. When SYNC, identifies the master clock and core clock as synchronous to each other. When ISOSYNC, identifies the master clock and core clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
15:8	CONNECTION_TYPE	Indicates the type of master connecting to this masterport. When DIRECT, indicates that a bus master is directly connected to this masterport. When CASCADE, indicates that bus masters connect to this masterport through another level of interconnect. 0x0: DIRECT 0x1: CASCADE
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this masterport. When INORDER, identifies this masterport as optimized for in-order bus traffic. When OOO_ONLY, identifies this masterport as optimized for out-of-order bus traffic, where a single master is capable of handling responses return in any order. When REORDER, identifies this masterport as having a reorder buffer for re-ordering responses to command order, while allowing bus slaves to return responses in any order they desire. When STUB, identifies this masterport has a stub. 0x0: STUB 0x1: OOO_ONLY 0x2: INORDER 0x3: REORDER

0x0040C030 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	SWAY_CONNECTIVITY	Indicates slaveways that this masterport can route commands to. 1-bit per slaveway. When a specific bit is set (1), indicates that commands can be routed to the slaveway corresponding to this bit. When a specific bit is clear (0), indicates that commands are not routed to the slaveway corresponding to this bit.

0x0040C040 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_2A

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_2A

Bits	Name	Description
31:16	M_DATA_WIDTH	Indicates the width of read and write data from the bus master.
15:8	M_TID_WIDTH	Indicates the width of transfer IDs from the bus master.
7:0	M_MID_WIDTH	Indicates the width of master ID from the bus master (includes any bus and port IDs if bus master is an interconnect.)

0x0040C044 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_2B

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x0040C050 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

0x0040C060 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_4

Bits	Name	Description
15:8	REORDER_BUFFER_DEPTH	Indicates the number of read data beats that can be re-ordered in this masterport (if the masterport provides response re-ordering functionality.)
7:0	REORDER_TABLE_DEPTH	Indicates the number of read and write commands whose responses can be re-ordered in this masterport (if the masterport provides responses re-ordering functionality.)

0x0040C070 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5A

Bits	Name	Description
31:0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the address channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x0040C074 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5B

Bits	Name	Description
31:0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the write channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x0040C078 BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5C

Type: R
Clock: Config Clock
Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5C

Bits	Name	Description
31:0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of write response channels from multiple slaveways, digit 1 identifies pipelining in the write response channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0040C07C BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5D

Type: R
Clock: Config Clock
Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_DSP_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0040C100 BIMC_M_DSP_MPORT_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_DSP_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0040C108 BIMC_M_DSP_MPORT_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_DSP_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0040C10C BIMC_M_DSP_MPORT_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_DSP_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0040C200 BIMC_M_DSP_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_DSP_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x0040C208 BIMC_M_DSP_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_DSP_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x0040C210 BIMC_M_DSP_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_DSP_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaweway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaweway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaweway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.

BIMC_M_DSP_MPORT_MODE (cont.)

Bits	Name	Description
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.
2	FIODV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIOSO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x0040C220 BIMC_M_DSP_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_DSP_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, ie. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x0040C230 BIMC_M_DSP_MPORT_PRIORITYLVL_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_DSP_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x0040C240 BIMC_M_DSP_MPORT_READ_COMMAND_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_DSP_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for read commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for read commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for read commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for read commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.

BIMC_M_DSP_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	VERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x0040C250 BIMC_M_DSP_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_DSP_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for write commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	VERRIDE_AREQPRIORIT Y	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	VERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_DSP_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x0040C300 BIMC_M_DSP_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_DSP_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x0040C304 BIMC_M_DSP_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_DSP_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x0040C308 BIMC_M_DSP_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_DSP_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x0040C320 BIMC_M_DSP_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_DSP_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0040C324 BIMC_M_DSP_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_DSP_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0040C328 BIMC_M_DSP_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_DSP_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0040C340 BIMC_M_DSP_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_DSP_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x0040C344 BIMC_M_DSP_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_DSP_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x0040C348 BIMC_M_DSP_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_DSP_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0040C34C BIMC_M_DSP_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_DSP_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x0040C420 BIMC_M_DSP_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_DSP_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x0040C424 BIMC_M_DSP_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_DSP_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x0040C430 BIMC_M_DSP_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_DSP_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_DSP_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x0040C434 BIMC_M_DSP_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_DSP_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_DSP_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.7 BIMC_M_DSP_PROF

BRIC Traffic Profiling

2.7.1 BIMC_M_DSP_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x0040D000 BIMC_M_DSP_PROF_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_DSP_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x0040D020 BIMC_M_DSP_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_DSP_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies than a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x0040D030 BIMC_M_DSP_PROF_CONFIGURATION_INFO_1

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_DSP_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x0040D200 BIMC_M_DSP_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_DSP_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x0040D210 BIMC_M_DSP_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_DSP_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x0040D214 BIMC_M_DSP_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x0040D218 BIMC_M_DSP_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x0040D220 BIMC_M_DSP_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x0040D230 BIMC_M_DSP_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x0040D234 BIMC_M_DSP_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x0040D238 BIMC_M_DSP_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x0040D240 BIMC_M_DSP_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x0040D244 BIMC_M_DSP_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x0040D248 BIMC_M_DSP_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0040D24C BIMC_M_DSP_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x0040D250 BIMC_M_DSP_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x0040D260 BIMC_M_DSP_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x0040D264 BIMC_M_DSP_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_DSP_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x0040D270 BIMC_M_DSP_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x0040D274 BIMC_M_DSP_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_DSP_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x0040D278 BIMC_M_DSP_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x0040D280 BIMC_M_DSP_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x0040D284 BIMC_M_DSP_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x0040D290 BIMC_M_DSP_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x0040D294 BIMC_M_DSP_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x0040D298 BIMC_M_DSP_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x0040D2A0 BIMC_M_DSP_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x0040D2A4 BIMC_M_DSP_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x0040D2A8 BIMC_M_DSP_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x0040D300 BIMC_M_DSP_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x0040D304 BIMC_M_DSP_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x0040D308 BIMC_M_DSP_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x0040D340 BIMC_M_DSP_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x0040D344 BIMC_M_DSP_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x0040D348 BIMC_M_DSP_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

**0x0040D400+ BIMC_M_DSP_PROF_RD_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

**0x0040D410+ BIMC_M_DSP_PROF_WR_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_DSP_PROF_WR_STATUS_n**

Bits	Name	Description
31	WR_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding writes crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.

BIMC_M_DSP_PROF_WR_STATUS_n (cont.)

Bits	Name	Description
30	WR_OUTSTANDING_UNDE RFLOW	Indicates that the number of outstanding writes went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding writes occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	WR_OUTSTANDING_MAX	Indicates the maximum number of outstanding writes that were seen when traffic profiling was last enabled. Only writes that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.8 BIMC_M_DSP_PROF

BRIC Traffic Profiling

2.8.1 BIMC_M_DSP_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x0040D000 BIMC_M_DSP_PROF_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_DSP_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x0040D020 BIMC_M_DSP_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_DSP_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies that a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x0040D030 BIMC_M_DSP_PROF_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_DSP_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.

BIMC_M_DSP_PROF_CONFIGURATION_INFO_1 (cont.)

Bits	Name	Description
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x0040D200 BIMC_M_DSP_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_DSP_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x0040D210 BIMC_M_DSP_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_DSP_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x0040D214 BIMC_M_DSP_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x0040D218 BIMC_M_DSP_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x0040D220 BIMC_M_DSP_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x0040D230 BIMC_M_DSP_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x0040D234 BIMC_M_DSP_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x0040D238 BIMC_M_DSP_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x0040D240 BIMC_M_DSP_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x0040D244 BIMC_M_DSP_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x0040D248 BIMC_M_DSP_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0040D24C BIMC_M_DSP_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x0040D250 BIMC_M_DSP_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x0040D260 BIMC_M_DSP_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x0040D264 BIMC_M_DSP_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_DSP_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x0040D270 BIMC_M_DSP_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x0040D274 BIMC_M_DSP_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_DSP_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x0040D278 BIMC_M_DSP_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x0040D280 BIMC_M_DSP_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x0040D284 BIMC_M_DSP_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x0040D290 BIMC_M_DSP_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x0040D294 BIMC_M_DSP_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x0040D298 BIMC_M_DSP_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x0040D2A0 BIMC_M_DSP_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x0040D2A4 BIMC_M_DSP_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x0040D2A8 BIMC_M_DSP_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x0040D300 BIMC_M_DSP_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x0040D304 BIMC_M_DSP_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x0040D308 BIMC_M_DSP_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x0040D340 BIMC_M_DSP_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x0040D344 BIMC_M_DSP_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x0040D348 BIMC_M_DSP_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_DSP_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

**0x0040D400+ BIMC_M_DSP_PROF_RD_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_DSP_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

**0x0040D410+ BIMC_M_DSP_PROF_WR_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_DSP_PROF_WR_STATUS_n**

Bits	Name	Description
31	WR_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding writes crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.

BIMC_M_DSP_PROF_WR_STATUS_n (cont.)

Bits	Name	Description
30	WR_OUTSTANDING_UNDE RFLOW	Indicates that the number of outstanding writes went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding writes occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	WR_OUTSTANDING_MAX	Indicates the maximum number of outstanding writes that were seen when traffic profiling was last enabled. Only writes that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.9 BIMC_M_GPU_PROF

BRIC Traffic Profiling

2.9.1 BIMC_M_GPU_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x00411000 BIMC_M_GPU_PROF_COMPONENT_INFO

Type: R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_GPU_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00411020 BIMC_M_GPU_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_GPU_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies that a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x00411030 BIMC_M_GPU_PROF_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_GPU_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.

BIMC_M_GPU_PROF_CONFIGURATION_INFO_1 (cont.)

Bits	Name	Description
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x00411200 BIMC_M_GPU_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_GPU_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00411210 BIMC_M_GPU_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_GPU_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x00411214 BIMC_M_GPU_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00411218 BIMC_M_GPU_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00411220 BIMC_M_GPU_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x00411230 BIMC_M_GPU_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_GPU_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x00411234 BIMC_M_GPU_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x00411238 BIMC_M_GPU_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x00411240 BIMC_M_GPU_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_GPU_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x00411244 BIMC_M_GPU_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00411248 BIMC_M_GPU_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0041124C BIMC_M_GPU_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00411250 BIMC_M_GPU_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x00411260 BIMC_M_GPU_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x00411264 BIMC_M_GPU_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_GPU_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x00411270 BIMC_M_GPU_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x00411274 BIMC_M_GPU_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_GPU_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x00411278 BIMC_M_GPU_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x00411280 BIMC_M_GPU_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x00411284 BIMC_M_GPU_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x00411290 BIMC_M_GPU_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x00411294 BIMC_M_GPU_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x00411298 BIMC_M_GPU_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x004112A0 BIMC_M_GPU_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_GPU_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x004112A4 BIMC_M_GPU_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x004112A8 BIMC_M_GPU_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_GPU_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x00411300 BIMC_M_GPU_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x00411304 BIMC_M_GPU_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x00411308 BIMC_M_GPU_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_GPU_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x00411340 BIMC_M_GPU_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x00411344 BIMC_M_GPU_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_GPU_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x00411348 BIMC_M_GPU_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_GPU_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

0x00411400+ BIMC_M_GPU_PROF_RD_STATUS_n, n=[0..0]
0x4*n
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_GPU_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

0x00411410+ BIMC_M_GPU_PROF_WR_STATUS_n, n=[0..0]
0x4*n
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_GPU_PROF_WR_STATUS_n**

Bits	Name	Description
31	WR_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding writes crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.

BIMC_M_GPU_PROF_WR_STATUS_n (cont.)

Bits	Name	Description
30	WR_OUTSTANDING_UNDE RFLOW	Indicates that the number of outstanding writes went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding writes occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	WR_OUTSTANDING_MAX	Indicates the maximum number of outstanding writes that were seen when traffic profiling was last enabled. Only writes that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.10 BIMC_M_GPU_MPORT

BRIC Masterport

2.10.1 BIMC_M_GPU_MPORT_BRIC_MASTERPORT

BRIC Masterport

0x00410000 BIMC_M_GPU_MPORT_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000102

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_GPU_MPORT_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this masterport.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a masterport 0x1: MASTERPORT
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00410020 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the master side and the clock used in the core side of the masterport. When ASYNC, identifies the master clock and core clock as unrelated and asynchronous to each other. When SYNC, identifies the master clock and core clock as synchronous to each other. When ISOSYNC, identifies the master clock and core clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
15:8	CONNECTION_TYPE	Indicates the type of master connecting to this masterport. When DIRECT, indicates that a bus master is directly connected to this masterport. When CASCADE, indicates that bus masters connect to this masterport through another level of interconnect. 0x0: DIRECT 0x1: CASCADE
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this masterport. When INORDER, identifies this masterport as optimized for in-order bus traffic. When OOO_ONLY, identifies this masterport as optimized for out-of-order bus traffic, where a single master is capable of handling responses return in any order. When REORDER, identifies this masterport as having a reorder buffer for re-ordering responses to command order, while allowing bus slaves to return responses in any order they desire. When STUB, identifies this masterport has a stub. 0x0: STUB 0x1: OOO_ONLY 0x2: INORDER 0x3: REORDER

0x00410030 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	SWAY_CONNECTIVITY	Indicates slaweways that this masterport can route commands to. 1-bit per slaweway. When a specific bit is set (1), indicates that commands can be routed to the slaweway corresponding to this bit. WHen a specific bit is clear (0), indicates that commands are not routed to the slaweway corresponding to this bit.

0x00410040 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_2A

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_2A

Bits	Name	Description
31:16	M_DATA_WIDTH	Indicates the width of read and write data from the bus master.
15:8	M_TID_WIDTH	Indicates the width of transfer IDs from the bus master.
7:0	M_MID_WIDTH	Indicates the width of master ID from the bus master (includes any bus and port IDs if bus master is an interconnect.)

0x00410044 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_2B

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x00410050 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

0x00410060 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_4

Bits	Name	Description
15:8	REORDER_BUFFER_DEPTH	Indicates the number of read data beats that can be re-ordered in this masterport (if the masterport provides response re-ordering functionality.)
7:0	REORDER_TABLE_DEPTH	Indicates the number of read and write commands whose responses can be re-ordered in this masterport (if the masterport provides responses re-ordering functionality.)

0x00410070 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5A

Bits	Name	Description
31:0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the address channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x00410074 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5B

Bits	Name	Description
31:0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the write channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x00410078 BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5C

Bits	Name	Description
31:0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of write response channels from multiple slaveways, digit 1 identifies pipelining in the write response channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0041007C BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_GPU_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x00410100 BIMC_M_GPU_MPORT_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_GPU_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00410108 BIMC_M_GPU_MPORT_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_GPU_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041010C BIMC_M_GPU_MPORT_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_GPU_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00410200 BIMC_M_GPU_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_GPU_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00410208 BIMC_M_GPU_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_GPU_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x00410210 BIMC_M_GPU_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_GPU_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaweway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaweway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaweway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.

BIMC_M_GPU_MPORT_MODE (cont.)

Bits	Name	Description
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.
2	FIODV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIOSO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x00410220 BIMC_M_GPU_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_GPU_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, ie. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x00410230 BIMC_M_GPU_MPORT_PRIORITYLVL_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_GPU_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x00410240 BIMC_M_GPU_MPORT_READ_COMMAND_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_GPU_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATTRANSIENT	Configures the values to override ATTRANSIENT from bus master with for read commands when OVERRIDE_ATTRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for read commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATTRANSIENT	When set (1), overrides ATTRANSIENT from the bus master for read commands with values configured in ATTRANSIENT register field. When cleared (0), allows ATTRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for read commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.

BIMC_M_GPU_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00410250 BIMC_M_GPU_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_GPU_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for write commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_GPU_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00410300 BIMC_M_GPU_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_GPU_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x00410304 BIMC_M_GPU_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_GPU_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x00410308 BIMC_M_GPU_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_GPU_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x00410320 BIMC_M_GPU_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_GPU_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00410324 BIMC_M_GPU_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_GPU_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00410328 BIMC_M_GPU_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_GPU_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00410340 BIMC_M_GPU_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_GPU_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x00410344 BIMC_M_GPU_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_GPU_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x00410348 BIMC_M_GPU_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_GPU_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0041034C BIMC_M_GPU_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_GPU_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x00410420 BIMC_M_GPU_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_GPU_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x00410424 BIMC_M_GPU_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_GPU_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x00410430 BIMC_M_GPU_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_GPU_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_GPU_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x00410434 BIMC_M_GPU_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_GPU_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_GPU_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.11 BIMC_M_SYS0_PROF

BRIC Traffic Profiling

2.11.1 BIMC_M_SYS0_PROF_BRIC_PROFILING

BRIC Traffic Profiling

**0x00415400+ BIMC_M_SYS0_PROF_RD_STATUS_n, n=[0..0]
0x4*n**

Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.12 BIMC_M_SYS0_MPORT

BRIC Masterport

2.12.1 BIMC_M_SYS0_MPORT_BRIC_MASTERPORT

BRIC Masterport

0x00414000 BIMC_M_SYS0_MPORT_COMPONENT_INFO

Type: R

Clock: Config Clock

Reset State: 0x00000102

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_SYS0_MPORT_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this masterport.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a masterport 0x1: MASTERPORT
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00414020 BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the master side and the clock used in the core side of the masterport. When ASYNC, identifies the master clock and core clock as unrelated and asynchronous to each other. When SYNC, identifies the master clock and core clock as synchronous to each other. When ISOSYNC, identifies the master clock and core clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
15:8	CONNECTION_TYPE	Indicates the type of master connecting to this masterport. When DIRECT, indicates that a bus master is directly connected to this masterport. When CASCADE, indicates that bus masters connect to this masterport through another level of interconnect. 0x0: DIRECT 0x1: CASCADE

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_0 (cont.)

Bits	Name	Description
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this masterport. When INORDER, identifies this masterport as optimized for in-order bus traffic. When OOO_ONLY, identifies this masterport as optimized for out-of-order bus traffic, where a single master is capable of handling responses return in any order. When REORDER, identifies this masterport as having a reorder buffer for re-ordering responses to command order, while allowing bus slaves to return responses in any order they desire. When STUB, identifies this masterport has a stub. 0x0: STUB 0x1: OOO_ONLY 0x2: INORDER 0x3: REORDER

0x00414030 BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	SWAY_CONNECTIVITY	Indicates slaveways that this masterport can route commands to. 1-bit per slaveway. When a specific bit is set (1), indicates that commands can be routed to the slaveway corresponding to this bit. When a specific bit is clear (0), indicates that commands are not routed to the slaveway corresponding to this bit.

0x00414040 BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_2A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_2A

Bits	Name	Description
31:16	M_DATA_WIDTH	Indicates the width of read and write data from the bus master.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_2A (cont.)

Bits	Name	Description
15:8	M_TID_WIDTH	Indicates the width of transfer IDs from the bus master.
7:0	M_MID_WIDTH	Indicates the width of master ID from the bus master (includes any bus and port IDs if bus master is an interconnect.)

0x00414044 BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_2B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x00414050 BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_3 (cont.)

Bits	Name	Description
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_SYS0_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x00414100 BIMC_M_SYS0_MPORT_INTERRUPT_STATUS

Type: R
Clock: Config Clock
Reset State: 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_SYS0_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00414108 BIMC_M_SYS0_MPORT_INTERRUPT_CLEAR

Type: W
Clock: Config Clock
Reset State: 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_SYS0_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041410C BIMC_M_SYS0_MPORT_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_SYS0_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00414200 BIMC_M_SYS0_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_SYS0_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00414208 BIMC_M_SYS0_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_SYS0_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x00414210 BIMC_M_SYS0_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_SYS0_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.

BIMC_M_SYS0_MPORT_MODE (cont.)

Bits	Name	Description
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaveway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaveway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaveway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaveway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaveway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaveway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaveway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaveway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.

BIMC_M_SYS0_MPORT_MODE (cont.)

Bits	Name	Description
2	FIO DV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIO SO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x00414220 BIMC_M_SYS0_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_SYS0_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, ie. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x00414230 BIMC_M_SYS0_MPORT_PRIORITYLVL_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_SYS0_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x00414240 BIMC_M_SYS0_MPORT_READ_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_SYS0_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATTRANSIENT	Configures the values to override ATTRANSIENT from bus master with for read commands when OVERRIDE_ATTRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for read commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATTRANSIENT	When set (1), overrides ATTRANSIENT from the bus master for read commands with values configured in ATTRANSIENT register field. When cleared (0), allows ATTRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for read commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.

BIMC_M_SYS0_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	OVERWRITE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00414250 BIMC_M_SYS0_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_SYS0_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	A000	Configures the values to override A000 from bus master with for write commands when OVERRIDE_A000 is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERWRITE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERWRITE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_SYS0_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00414300 BIMC_M_SYS0_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x00414304 BIMC_M_SYS0_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x00414308 BIMC_M_SYS0_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x00414320 BIMC_M_SYS0_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00414324 BIMC_M_SYS0_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00414328 BIMC_M_SYS0_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_SYS0_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00414340 BIMC_M_SYS0_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_SYS0_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x00414344 BIMC_M_SYS0_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_SYS0_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x00414348 BIMC_M_SYS0_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_SYS0_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0041434C BIMC_M_SYS0_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_SYS0_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x00414420 BIMC_M_SYS0_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_SYS0_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x00414424 BIMC_M_SYS0_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_SYS0_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x00414430 BIMC_M_SYS0_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_SYS0_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_SYS0_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x00414434 BIMC_M_SYS0_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_SYS0_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_SYS0_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.13 BIMC_M_TCU0_MPORT

BRIC Masterport

2.13.1 BIMC_M_TCU0_MPORT_BRIC_MASTERPORT

BRIC Masterport

0x0041C000 BIMC_M_TCU0_MPORT_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000102

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_TCU0_MPORT_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this masterport.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a masterport 0x1: MASTERPORT
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x0041C020 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the master side and the clock used in the core side of the masterport. When ASYNC, identifies the master clock and core clock as unrelated and asynchronous to each other. When SYNC, identifies the master clock and core clock as synchronous to each other. When ISOSYNC, identifies the master clock and core clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
15:8	CONNECTION_TYPE	Indicates the type of master connecting to this masterport. When DIRECT, indicates that a bus master is directly connected to this masterport. When CASCADE, indicates that bus masters connect to this masterport through another level of interconnect. 0x0: DIRECT 0x1: CASCADE
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this masterport. When INORDER, identifies this masterport as optimized for in-order bus traffic. When OOO_ONLY, identifies this masterport as optimized for out-of-order bus traffic, where a single master is capable of handling responses return in any order. When REORDER, identifies this masterport as having a reorder buffer for re-ordering responses to command order, while allowing bus slaves to return responses in any order they desire. When STUB, identifies this masterport has a stub. 0x0: STUB 0x1: OOO_ONLY 0x2: INORDER 0x3: REORDER

0x0041C030 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_1

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	SWAY_CONNECTIVITY	Indicates slaweways that this masterport can route commands to. 1-bit per slaweway. When a specific bit is set (1), indicates that commands can be routed to the slaweway corresponding to this bit. WHEN a specific bit is clear (0), indicates that commands are not routed to the slaweway corresponding to this bit.

0x0041C040 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2A

Bits	Name	Description
31:16	M_DATA_WIDTH	Indicates the width of read and write data from the bus master.
15:8	M_TID_WIDTH	Indicates the width of transfer IDs from the bus master.
7:0	M_MID_WIDTH	Indicates the width of master ID from the bus master (includes any bus and port IDs if bus master is an interconnect.)

0x0041C044 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x0041C050 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

0x0041C060 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_4

Bits	Name	Description
15:8	REORDER_BUFFER_DEPTH	Indicates the number of read data beats that can be re-ordered in this masterport (if the masterport provides response re-ordering functionality.)
7:0	REORDER_TABLE_DEPTH	Indicates the number of read and write commands whose responses can be re-ordered in this masterport (if the masterport provides responses re-ordering functionality.)

0x0041C070 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5A

Bits	Name	Description
31:0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the address channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x0041C074 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5B

Bits	Name	Description
31:0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the write channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x0041C078 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5C

Bits	Name	Description
31:0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of write response channels from multiple slaveways, digit 1 identifies pipelining in the write response channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0041C07C BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0041C100 BIMC_M_TCU0_MPORT_INTERRUPT_STATUS

Type: R
Clock: Config Clock
Reset State: 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_TCU0_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041C108 BIMC_M_TCU0_MPORT_INTERRUPT_CLEAR

Type: W
Clock: Config Clock
Reset State: 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_TCU0_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041C10C BIMC_M_TCU0_MPORT_INTERRUPT_ENABLE

Type: RW
Clock: Config Clock
Reset State: 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_TCU0_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041C200 BIMC_M_TCU0_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_TCU0_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x0041C208 BIMC_M_TCU0_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_TCU0_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x0041C210 BIMC_M_TCU0_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_TCU0_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaweway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaweway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaweway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.

BIMC_M_TCU0_MPORT_MODE (cont.)

Bits	Name	Description
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.
2	FIODV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIOSO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x0041C220 BIMC_M_TCU0_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_TCU0_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, ie. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x0041C230 BIMC_M_TCU0_MPORT_PRIORITYLVL_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU0_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x0041C240 BIMC_M_TCU0_MPORT_READ_COMMAND_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU0_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATransient	Configures the values to override ATRANSIENT from bus master with for read commands when OVERRIDE_ATransient is set (1).
11	AShared	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	A000	Configures the values to override A000 from bus master with for read commands when OVERRIDE_A000 is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATransient	When set (1), overrides ATRANSIENT from the bus master for read commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_AShared	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_A000	When set (1), overrides A000 from the bus master for read commands with values configured in A000 register field. When cleared (0), allows A000 from the bus master to be propagated downstream.

BIMC_M_TCU0_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x0041C250 BIMC_M_TCU0_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU0_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for write commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_TCU0_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	OVERWRITE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERWRITE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERWRITE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERWRITE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	OVERWRITE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x0041C300 BIMC_M_TCU0_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x0041C304 BIMC_M_TCU0_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x0041C308 BIMC_M_TCU0_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x0041C320 BIMC_M_TCU0_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0041C324 BIMC_M_TCU0_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0041C328 BIMC_M_TCU0_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0041C340 BIMC_M_TCU0_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU0_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x0041C344 BIMC_M_TCU0_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU0_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x0041C348 BIMC_M_TCU0_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU0_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0041C34C BIMC_M_TCU0_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_TCU0_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x0041C420 BIMC_M_TCU0_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU0_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x0041C424 BIMC_M_TCU0_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU0_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x0041C430 BIMC_M_TCU0_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU0_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_TCU0_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x0041C434 BIMC_M_TCU0_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_TCU0_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_TCU0_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.14 BIMC_M_SYS1_PROF

BRIC Traffic Profiling

2.14.1 BIMC_M_SYS1_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x00419000 BIMC_M_SYS1_PROF_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_SYS1_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00419020 BIMC_M_SYS1_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_SYS1_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies that a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x00419030 BIMC_M_SYS1_PROF_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_SYS1_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x00419200 BIMC_M_SYS1_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_SYS1_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00419210 BIMC_M_SYS1_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x00419214 BIMC_M_SYS1_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00419218 BIMC_M_SYS1_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00419220 BIMC_M_SYS1_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x00419230 BIMC_M_SYS1_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x00419234 BIMC_M_SYS1_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x00419238 BIMC_M_SYS1_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x00419240 BIMC_M_SYS1_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x00419244 BIMC_M_SYS1_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00419248 BIMC_M_SYS1_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0041924C BIMC_M_SYS1_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00419250 BIMC_M_SYS1_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x00419260 BIMC_M_SYS1_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x00419264 BIMC_M_SYS1_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_SYS1_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x00419270 BIMC_M_SYS1_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x00419274 BIMC_M_SYS1_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_SYS1_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x00419278 BIMC_M_SYS1_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x00419280 BIMC_M_SYS1_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x00419284 BIMC_M_SYS1_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x00419290 BIMC_M_SYS1_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x00419294 BIMC_M_SYS1_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x00419298 BIMC_M_SYS1_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x004192A0 BIMC_M_SYS1_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x004192A4 BIMC_M_SYS1_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x004192A8 BIMC_M_SYS1_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x00419300 BIMC_M_SYS1_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x00419304 BIMC_M_SYS1_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x00419308 BIMC_M_SYS1_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x00419340 BIMC_M_SYS1_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x00419344 BIMC_M_SYS1_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x00419348 BIMC_M_SYS1_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_SYS1_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

0x00419400+ BIMC_M_SYS1_PROF_RD_STATUS_n, n=[0..0]
0x4*n
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_SYS1_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDEFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

31	WR_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding writes crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.

BIMC_M_SYS1_PROF_WR_STATUS_n (cont.)

Bits	Name	Description
30	WR_OUTSTANDING_UNDE RFLOW	Indicates that the number of outstanding writes went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding writes occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	WR_OUTSTANDING_MAX	Indicates the maximum number of outstanding writes that were seen when traffic profiling was last enabled. Only writes that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.15 BIMC_M_TCU0_MPORT

BRIC Masterport

2.15.1 BIMC_M_TCU0_MPORT_BRIC_MASTERPORT

BRIC Masterport

0x0041C000 BIMC_M_TCU0_MPORT_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000102

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_TCU0_MPORT_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this masterport.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a masterport 0x1: MASTERPORT
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x0041C020 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the master side and the clock used in the core side of the masterport. When ASYNC, identifies the master clock and core clock as unrelated and asynchronous to each other. When SYNC, identifies the master clock and core clock as synchronous to each other. When ISOSYNC, identifies the master clock and core clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
15:8	CONNECTION_TYPE	Indicates the type of master connecting to this masterport. When DIRECT, indicates that a bus master is directly connected to this masterport. When CASCADE, indicates that bus masters connect to this masterport through another level of interconnect. 0x0: DIRECT 0x1: CASCADE
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this masterport. When INORDER, identifies this masterport as optimized for in-order bus traffic. When OOO_ONLY, identifies this masterport as optimized for out-of-order bus traffic, where a single master is capable of handling responses return in any order. When REORDER, identifies this masterport as having a reorder buffer for re-ordering responses to command order, while allowing bus slaves to return responses in any order they desire. When STUB, identifies this masterport has a stub. 0x0: STUB 0x1: OOO_ONLY 0x2: INORDER 0x3: REORDER

0x0041C030 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	SWAY_CONNECTIVITY	Indicates slaveways that this masterport can route commands to. 1-bit per slaveway. When a specific bit is set (1), indicates that commands can be routed to the slaveway corresponding to this bit. When a specific bit is clear (0), indicates that commands are not routed to the slaveway corresponding to this bit.

0x0041C040 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2A

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2A

Bits	Name	Description
31:16	M_DATA_WIDTH	Indicates the width of read and write data from the bus master.
15:8	M_TID_WIDTH	Indicates the width of transfer IDs from the bus master.
7:0	M_MID_WIDTH	Indicates the width of master ID from the bus master (includes any bus and port IDs if bus master is an interconnect.)

0x0041C044 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2B

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x0041C050 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

0x0041C060 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_4

Bits	Name	Description
15:8	REORDER_BUFFER_DEPTH	Indicates the number of read data beats that can be re-ordered in this masterport (if the masterport provides response re-ordering functionality.)
7:0	REORDER_TABLE_DEPTH	Indicates the number of read and write commands whose responses can be re-ordered in this masterport (if the masterport provides responses re-ordering functionality.)

0x0041C070 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5A

Bits	Name	Description
31:0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the address channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x0041C074 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5B

Bits	Name	Description
31:0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the write channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x0041C078 BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5C

Bits	Name	Description
31:0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of write response channels from multiple slaveways, digit 1 identifies pipelining in the write response channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0041C07C BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU0_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0041C100 BIMC_M_TCU0_MPORT_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_TCU0_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041C108 BIMC_M_TCU0_MPORT_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_TCU0_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041C10C BIMC_M_TCU0_MPORT_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_TCU0_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0041C200 BIMC_M_TCU0_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_TCU0_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x0041C208 BIMC_M_TCU0_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_TCU0_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x0041C210 BIMC_M_TCU0_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_TCU0_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaweway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaweway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaweway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.

BIMC_M_TCU0_MPORT_MODE (cont.)

Bits	Name	Description
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.
2	FIODV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIOSO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x0041C220 BIMC_M_TCU0_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_TCU0_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, ie. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x0041C230 BIMC_M_TCU0_MPORT_PRIORITYLVL_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU0_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x0041C240 BIMC_M_TCU0_MPORT_READ_COMMAND_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU0_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATTRANSIENT	Configures the values to override ATTRANSIENT from bus master with for read commands when OVERRIDE_ATTRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for read commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATTRANSIENT	When set (1), overrides ATTRANSIENT from the bus master for read commands with values configured in ATTRANSIENT register field. When cleared (0), allows ATTRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for read commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.

BIMC_M_TCU0_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	VERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x0041C250 BIMC_M_TCU0_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU0_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for write commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	VERRIDE_AREQPRIORIT Y	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	VERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_TCU0_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	OVERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x0041C300 BIMC_M_TCU0_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x0041C304 BIMC_M_TCU0_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x0041C308 BIMC_M_TCU0_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x0041C320 BIMC_M_TCU0_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0041C324 BIMC_M_TCU0_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0041C328 BIMC_M_TCU0_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x0041C340 BIMC_M_TCU0_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU0_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x0041C344 BIMC_M_TCU0_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU0_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x0041C348 BIMC_M_TCU0_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU0_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0041C34C BIMC_M_TCU0_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_TCU0_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x0041C420 BIMC_M_TCU0_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU0_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x0041C424 BIMC_M_TCU0_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU0_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x0041C430 BIMC_M_TCU0_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU0_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_TCU0_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x0041C434 BIMC_M_TCU0_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_TCU0_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_TCU0_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.16 BIMC_M_TCU0_PROF

BRIC Traffic Profiling

2.16.1 BIMC_M_TCU0_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x0041D000 BIMC_M_TCU0_PROF_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_TCU0_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x0041D020 BIMC_M_TCU0_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_TCU0_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies than a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x0041D030 BIMC_M_TCU0_PROF_CONFIGURATION_INFO_1

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_TCU0_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x0041D200 BIMC_M_TCU0_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_TCU0_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x0041D210 BIMC_M_TCU0_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x0041D214 BIMC_M_TCU0_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x0041D218 BIMC_M_TCU0_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x0041D220 BIMC_M_TCU0_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x0041D230 BIMC_M_TCU0_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x0041D234 BIMC_M_TCU0_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x0041D238 BIMC_M_TCU0_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x0041D240 BIMC_M_TCU0_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x0041D244 BIMC_M_TCU0_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x0041D248 BIMC_M_TCU0_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0041D24C BIMC_M_TCU0_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x0041D250 BIMC_M_TCU0_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x0041D260 BIMC_M_TCU0_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x0041D264 BIMC_M_TCU0_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_TCU0_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x0041D270 BIMC_M_TCU0_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x0041D274 BIMC_M_TCU0_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_TCU0_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x0041D278 BIMC_M_TCU0_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x0041D280 BIMC_M_TCU0_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x0041D284 BIMC_M_TCU0_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x0041D290 BIMC_M_TCU0_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x0041D294 BIMC_M_TCU0_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x0041D298 BIMC_M_TCU0_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x0041D2A0 BIMC_M_TCU0_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x0041D2A4 BIMC_M_TCU0_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x0041D2A8 BIMC_M_TCU0_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x0041D300 BIMC_M_TCU0_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x0041D304 BIMC_M_TCU0_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x0041D308 BIMC_M_TCU0_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x0041D340 BIMC_M_TCU0_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x0041D344 BIMC_M_TCU0_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x0041D348 BIMC_M_TCU0_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU0_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

**0x0041D400+ BIMC_M_TCU0_PROF_RD_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

**0x0041D410+ BIMC_M_TCU0_PROF_WR_STATUS_n, n=[0..0]
0x4*n**
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_TCU0_PROF_WR_STATUS_n**

Bits	Name	Description
31	WR_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding writes crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.

BIMC_M_TCU0_PROF_WR_STATUS_n (cont.)

Bits	Name	Description
30	WR_OUTSTANDING_UNDE RFLOW	Indicates that the number of outstanding writes went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding writes occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	WR_OUTSTANDING_MAX	Indicates the maximum number of outstanding writes that were seen when traffic profiling was last enabled. Only writes that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

2.17 BIMC_M_TCU1_MPORT

BRIC Masterport

2.17.1 BIMC_M_TCU1_MPORT_BRIC_MASTERPORT

BRIC Masterport

0x00420000 BIMC_M_TCU1_MPORT_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000102

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_TCU1_MPORT_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this masterport.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a masterport 0x1: MASTERPORT
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00420020 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the master side and the clock used in the core side of the masterport. When ASYNC, identifies the master clock and core clock as unrelated and asynchronous to each other. When SYNC, identifies the master clock and core clock as synchronous to each other. When ISOSYNC, identifies the master clock and core clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
15:8	CONNECTION_TYPE	Indicates the type of master connecting to this masterport. When DIRECT, indicates that a bus master is directly connected to this masterport. When CASCADE, indicates that bus masters connect to this masterport through another level of interconnect. 0x0: DIRECT 0x1: CASCADE
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this masterport. When INORDER, identifies this masterport as optimized for in-order bus traffic. When OOO_ONLY, identifies this masterport as optimized for out-of-order bus traffic, where a single master is capable of handling responses return in any order. When REORDER, identifies this masterport as having a reorder buffer for re-ordering responses to command order, while allowing bus slaves to return responses in any order they desire. When STUB, identifies this masterport has a stub. 0x0: STUB 0x1: OOO_ONLY 0x2: INORDER 0x3: REORDER

0x00420030 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	SWAY_CONNECTIVITY	Indicates slaveways that this masterport can route commands to. 1-bit per slaveway. When a specific bit is set (1), indicates that commands can be routed to the slaveway corresponding to this bit. When a specific bit is clear (0), indicates that commands are not routed to the slaveway corresponding to this bit.

0x00420040 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_2A

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_2A

Bits	Name	Description
31:16	M_DATA_WIDTH	Indicates the width of read and write data from the bus master.
15:8	M_TID_WIDTH	Indicates the width of transfer IDs from the bus master.
7:0	M_MID_WIDTH	Indicates the width of master ID from the bus master (includes any bus and port IDs if bus master is an interconnect.)

0x00420044 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_2B

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_2B

Bits	Name	Description
15:0	C_DATA_WIDTH	Indicates the width of read and write data used in core of this masterport.

0x00420050 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH_DEPTH	Indicates the depth of read channel buffers in this masterport. A beat of read data occupies one entry in the read channel buffer, until accepted by the bus master.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this masterport. Each write response occupies one entry in the write response channel buffer, until accepted by the bus master.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this masterport. A beat of write data occupies one entry in the write channel buffer, until accepted by the arbiter.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this masterport. Each command occupies one entry in the address channel buffer, until accepted by the arbiter.

0x00420060 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_4

Bits	Name	Description
15:8	REORDER_BUFFER_DEPTH	Indicates the number of read data beats that can be re-ordered in this masterport (if the masterport provides response re-ordering functionality.)
7:0	REORDER_TABLE_DEPTH	Indicates the number of read and write commands whose responses can be re-ordered in this masterport (if the masterport provides responses re-ordering functionality.)

0x00420070 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5A

Bits	Name	Description
31:0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the address channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x00420074 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5B

Bits	Name	Description
31:0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 3 identifies pipelining on the master to masterport interface, digit 2 identifies pipelining after address decode, digit 1 identifies pipelining in the write channel buffer and digit 0 identifies pipelining on the masterport to arbiter interface.

0x00420078 BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5C

Bits	Name	Description
31:0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of write response channels from multiple slaveways, digit 1 identifies pipelining in the write response channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x0042007C BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each masterport instance. See register field descriptions for more details.

BIMC_M_TCU1_MPORT_CONFIGURATION_INFO_5D

Bits	Name	Description
31:0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the masterport, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slaveway to masterport interface after arbitration of read channels from multiple slaveways, digit 1 identifies pipelining in the read channel buffer and digit 0 identifies pipelining on the masterport to master interface.

0x00420100 BIMC_M_TCU1_MPORT_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_M_TCU1_MPORT_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00420108 BIMC_M_TCU1_MPORT_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_M_TCU1_MPORT_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0042010C BIMC_M_TCU1_MPORT_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_M_TCU1_MPORT_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00420200 BIMC_M_TCU1_MPORT_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000003**BIMC_M_TCU1_MPORT_CLOCK_CTRL**

Bits	Name	Description
1	MASTER_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by master clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00420208 BIMC_M_TCU1_MPORT_CDC_CTRL**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_M_TCU1_MPORT_CDC_CTRL

Bits	Name	Description
1	MASTER_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to master clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x00420210 BIMC_M_TCU1_MPORT_MODE**Type:** RW**Clock:** Config, Core & Master Clocks**Reset State:** 0x00000012**BIMC_M_TCU1_MPORT_MODE**

Bits	Name	Description
31:28	WR_GATHER_BEATS	Configures the number of write data beats to gather/buffer in write channel buffer before allowing the corresponding write command to be routed to arbiters. When configured to 0, write commands are held until the first beat of write data has been buffered. When configured to 1, write commands are held until two beats of write data have been buffered and so on. When configured with values larger than the number of beats in a write command, the command is held until the last beat has been buffered. When configured with values larger than the depth of write channel buffers, the command is held until all entries in the write channel buffer have been occupied.
19:16	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to proceed to the master. When configured to 0, read data is allowed to proceed to the master as soon as the first beat is buffered in the read channel buffer. When configured to 1, read data is allowed to proceed to the master as soon as two beats of read data have been buffered and so on. When configured with values larger than the number of beats in the read burst, read data is held until the last beat has been buffered. When configured with values larger than the depth of read channel buffers, read data is held until all entries in the read channel buffer have been occupied.
15	RCSSH	Redirect Cacheable System SHareable When set (1), enables redirection of all cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.
14	RCOSH	Redirect Cacheable Outer SHareable When set (1), enables redirection of all cacheable transactions that are outer shareable to the redirect slaweway.
13	RCISH	Redirect Cacheable Inner SHareable When set (1), enables redirection of all cacheable transactions that are inner shareable to the redirect slaweway.
12	RCNSH	Redirect Cacheable Non-SHareable When set (1), enables redirection of all cacheable transactions that are non-shareable to the redirect slaweway.
11	RNCSSH	Redirect Non-Cacheable System SHareable When set (1), enables redirection of all non-cacheable transactions that are system shareable to the redirect slaweway. Note: Only masters connecting using AMBA 4 ACE protocol are able to indicate system shareability for transactions.

BIMC_M_TCU1_MPORT_MODE (cont.)

Bits	Name	Description
10	RNCOSH	Redirect Non-Cacheable Outer SHareable When set (1), enables redirection of all non-cacheable transactions that are outer shareable to the redirect slaway.
9	RNCISH	Redirect Non-Cacheable Inner SHareable When set (1), enables redirection of all non-cacheable transactions that are inner shareable to the redirect slaway.
8	RNCNSH	Redirect Non-Cacheable Non-SHareable When set (1), enables redirection of all non-cacheable transactions that are non-shareable to the redirect slaway.
4	NARROW_WRITES	When set (1), enables converting of 1-beat bus-width sized writes down to 32-bit ASIZE based on write strobes. It is recommended to be enabled for directly connected CPU masters. When cleared (0), disables conversion and all writes are forwarded downstream as generated by the master.
2	FIODV	Force In-Order Device When set (1), forces commands to device memory to be executed one at a time. In other words, commands to device memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the device command are held until the device completes (response has been received at the masterport.)
1	FIOSO	Force In-Order Strongly-Ordered When set (1), forces commands to strongly ordered memory to be executed one at a time. In other words, commands to strongly ordered memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the strongly ordered command are held until the strongly ordered completes (response has been received at the masterport.)
0	ORDERING_MODEL	Configures how commands to memories of type Strongly ordered and Device (SoDv) are handled in the masterport. When configured as STRICT, all commands to SoDv memory are held until all previous commands have completed (responses have been received at the masterport) and all commands after the SoDv command are held until the SoDv completes (i.e. response has been received at the masterport.) When configured as RELAXED, all commands to SoDv memory are treated as accessing Normal memory. 0x0: RELAXED 0x1: STRICT

0x00420220 BIMC_M_TCU1_MPORT_WR_WAY_CROSSING**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Configures the level of strictness or relaxedness of way crossing checks for writes.

BIMC_M_TCU1_MPORT_WR_WAY_CROSSING

Bits	Name	Description
7:0	REG	1-bit per slaveway. When 2 or more bits are set (1), allows the corresponding slaveways to be treated as one slaveway when write commands are considered as way crossing, i.e.. write commands to these 2 (or more) slaveways are not treated as way crossing when one write command targets one slaveway and the next write command targets the second slaveway. Not treating write commands as way crossing allows the write commands to go to the slaveway ahead of the write data for potentially better overall system performance. When all bits are set (1), disables all way crossing checks. When all bits are cleared (0), way crossing is strict with each way crossing write command held until write data for all previous writes have been routed to their corresponding slaveways.

0x00420230 BIMC_M_TCU1_MPORT_PRIORITYLVL_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU1_MPORT_PRIORITYLVL_OVERRIDE

Bits	Name	Description
9:8	PRIORITYLVL	Configures the values to override APRIORITYLVL from bus master with when OVERRIDE_PRIORITYLVL is set (1).
0	OVERRIDE_PRIORITYLVL	When set (1), overrides APRIORITYLVL from the bus master with values configured in PRIORITYLVL register field. When cleared (0), allows APRIORITYLVL from the bus master to be propagated downstream.

0x00420240 BIMC_M_TCU1_MPORT_READ_COMMAND_OVERRIDE

Type: RW

Clock: Config & Master Clocks

Reset State: 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU1_MPORT_READ_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for read commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for read commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for read commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for read commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for read commands when OVERRIDE_AREDIRECT is set (1).
9	AOOO	Configures the values to override AOOO from bus master with for read commands when OVERRIDE_AOOO is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for read commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERRIDE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for read commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERRIDE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for read commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.
4	OVERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for read commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	OVERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for read commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	OVERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for read commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	OVERRIDE_AOOO	When set (1), overrides AOOO from the bus master for read commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.

BIMC_M_TCU1_MPORT_READ_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
0	OVERWRITE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for read commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00420250 BIMC_M_TCU1_MPORT_WRITE_COMMAND_OVERRIDE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

Override registers provide the capability to override one or more bus signals to specific values.

BIMC_M_TCU1_MPORT_WRITE_COMMAND_OVERRIDE

Bits	Name	Description
25:24	AREQPRIORITY	Configures the values to override AREQPRIORITY from bus master with for write commands when OVERRIDE_AREQPRIORITY is set (1).
18:16	AMEMTYPE	Configures the values to override AMEMTYPE from bus master with for write commands when OVERRIDE_AMEMTYPE is set (1).
12	ATRANSIENT	Configures the values to override ATRANSIENT from bus master with for write commands when OVERRIDE_ATRANSIENT is set (1).
11	ASHARED	Configures the values to override ASHARED from bus master with for write commands when OVERRIDE_ASHARED is set (1).
10	AREDIRECT	Configures the values to override AREDIRECT from bus master with for write commands when OVERRIDE_AREDIRECT is set (1).
9	A000	Configures the values to override A000 from bus master with for write commands when OVERRIDE_A000 is set (1).
8	AINNERSHARED	Configures the values to override AINNERSHARED from bus master with for write commands when OVERRIDE_AINNERSHARED is set (1).
6	OVERWRITE_AREQPRIORITY	When set (1), overrides AREQPRIORITY from the bus master for write commands with values configured in AREQPRIORITY register field. When cleared (0), allows AREQPRIORITY from the bus master to be propagated downstream.
5	OVERWRITE_AMEMTYPE	When set (1), overrides AMEMTYPE from the bus master for write commands with values configured in AMEMTYPE register field. When cleared (0), allows AMEMTYPE from the bus master to be propagated downstream.

BIMC_M_TCU1_MPORT_WRITE_COMMAND_OVERRIDE (cont.)

Bits	Name	Description
4	VERRIDE_ATRANSIENT	When set (1), overrides ATRANSIENT from the bus master for write commands with values configured in ATRANSIENT register field. When cleared (0), allows ATRANSIENT from the bus master to be propagated downstream.
3	VERRIDE_ASHARED	When set (1), overrides ASHARED from the bus master for write commands with values configured in ASHARED register field. When cleared (0), allows ASHARED from the bus master to be propagated downstream.
2	VERRIDE_AREDIRECT	When set (1), overrides AREDIRECT from the bus master for write commands with values configured in AREDIRECT register field. When cleared (0), allows AREDIRECT from the bus master to be propagated downstream.
1	VERRIDE_AOOO	When set (1), overrides AOOO from the bus master for write commands with values configured in AOOO register field. When cleared (0), allows AOOO from the bus master to be propagated downstream.
0	VERRIDE_AINNERSHARE D	When set (1), overrides AINNERSHARED from the bus master for write commands with values configured in AINNERSHARED register field. When cleared (0), allows AINNERSHARED from the bus master to be propagated downstream.

0x00420300 BIMC_M_TCU1_MPORT_BKE_ENABLE**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_MPORT_BKE_ENABLE**

Bits	Name	Description
0	ENABLE	When set (1), enables the book keeping element (BKE) to determine AREQPRIORITY and APRIORITYLVL of commands from the bus master by comparing the amount of bus traffic from the bus master to a target, and determining a health level for the bus master. The health level determines the relative priority of commands from the bus master to allow the bus master to catch-up if it is not getting serviced, or slow down to allow other bus masters to get their share of system resources. When cleared (0), disables the book keeping element and AREQPRIORITY and APRIORITYLVL from the bus master are propagated downstream.

0x00420304 BIMC_M_TCU1_MPORT_BKE_GRANT_PERIOD**Type:** RW**Clock:** Config & Reference Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_MPORT_BKE_GRANT_PERIOD**

Bits	Name	Description
9:0	GRANT_PERIOD	Defines the period over which the book keeping element accumulates grants to the bus master for determining it's health level. Grant period is defined in number of reference timer ticks. Refer configuration of reference timer tick for exact time unit.

0x00420308 BIMC_M_TCU1_MPORT_BKE_GRANT_COUNT**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_MPORT_BKE_GRANT_COUNT**

Bits	Name	Description
15:0	GRANT_COUNT	Defines the target grant count for the bus master. The target grant count is the number of beats of read and write data the bus master is expected to write and read in the grant period and is used as a reference to determine if the bus master is behind or ahead of where it ought to be at any given time.

0x00420320 BIMC_M_TCU1_MPORT_BKE_THRESHOLD_HIGH**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_MPORT_BKE_THRESHOLD_HIGH**

Bits	Name	Description
15:0	THRESHOLD	Defines a high threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00420324 BIMC_M_TCU1_MPORT_BKE_THRESHOLD_MEDIUM**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_MPORT_BKE_THRESHOLD_MEDIUM**

Bits	Name	Description
15:0	THRESHOLD	Defines a medium threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00420328 BIMC_M_TCU1_MPORT_BKE_THRESHOLD_LOW**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_MPORT_BKE_THRESHOLD_LOW**

Bits	Name	Description
15:0	THRESHOLD	Defines a low threshold to determine how much behind or ahead a bus master is with reference to where it ought to be at any given time.

0x00420340 BIMC_M_TCU1_MPORT_BKE_HEALTH_0**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU1_MPORT_BKE_HEALTH_0

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 0.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 0.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 0.

0x00420344 BIMC_M_TCU1_MPORT_BKE_HEALTH_1**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU1_MPORT_BKE_HEALTH_1

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 1.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 1.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 1.

0x00420348 BIMC_M_TCU1_MPORT_BKE_HEALTH_2**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health.

BIMC_M_TCU1_MPORT_BKE_HEALTH_2

Bits	Name	Description
31	LIMIT_COMMANDS	When set (1), defines that no new commands may be accepted from the bus master as long as it is determined to be at health 2.
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 2.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 2.

0x0042034C BIMC_M_TCU1_MPORT_BKE_HEALTH_3**Type:** RW**Clock:** Config & Master Clocks**Reset State:** 0x00000000

BKE health registers configure the request priority and realtime priority level to use for commands from the bus master when it has been determined to be of a certain health. Health 3 is the default health for the bus master.

BIMC_M_TCU1_MPORT_BKE_HEALTH_3

Bits	Name	Description
9:8	AREQPRIORITY	Defines the request priority of commands from the bus master when it has been determined to be at health 3.
1:0	PRIORITYLVL	Defines the realtime priority level to use for commands from the bus master when it has been determined to be at health 3.

0x00420420 BIMC_M_TCU1_MPORT_STATUS_2A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU1_MPORT_STATUS_2A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from before address channel buffers, which interfaces to frontend of the masterport.

0x00420424 BIMC_M_TCU1_MPORT_STATUS_2B

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU1_MPORT_STATUS_2B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

0x00420430 BIMC_M_TCU1_MPORT_STATUS_3A

Type: R

Clock: Config, Master & Pipe0 Clocks

Reset State: 0x55111111

Status registers indicate the state of several elements in the masterport, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_M_TCU1_MPORT_STATUS_3A

Bits	Name	Description
31	RCB_DATA_RD_FULL	Indicates that the data part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
30	RCB_DATA_RD_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
29	RCB_CTRL_RD_FULL	Indicates that the control part of read channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
28	RCB_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
27	RCB_DATA_WR_FULL	Indicates that the data part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
26	RCB_DATA_WR_EMPTY	Indicates that the data part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.

BIMC_M_TCU1_MPORT_STATUS_3A (cont.)

Bits	Name	Description
25	RCB_CTRL_WR_FULL	Indicates that the control part of read channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
24	RCB_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaveway.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

0x00420434 BIMC_M_TCU1_MPORT_STATUS_3B**Type:** R**Clock:** Config, Master & Pipe0 Clocks**Reset State:** 0x00111111

Buffer status register indicate the state of all buffers in the masterport, whether they are empty or full on either side of the buffer. Some buffers carry information from master to core and others carry information from core to master. Both write side and read side status are indicated separately, since they would be not be similar when master clock and core clock are not synchronous to each other.

BIMC_M_TCU1_MPORT_STATUS_3B

Bits	Name	Description
21	RGB_RD_FULL	Indicates that the read gathering buffer is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB_RD_EMPTY	Indicates that the read gathering buffer is empty when seen from it's read side, which interfaces to frontend of the masterport.
17	RGB_WR_FULL	Indicates that the read gathering buffer is full when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
16	RGB_WR_EMPTY	Indicates that the read gathering buffer is empty when seen from it's write side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to core of the interconnect, i.e., arbiter and slaweway.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to frontend of the masterport.

BIMC_M_TCU1_MPORT_STATUS_3B (cont.)

Bits	Name	Description
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to frontend of the masterport.

2.18 BIMC_M_TCU1_PROF

BRIC Traffic Profiling

2.18.1 BIMC_M_TCU1_PROF_BRIC_PROFILING

BRIC Traffic Profiling

0x00421000 BIMC_M_TCU1_PROF_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000202

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_M_TCU1_PROF_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this traffic profiling.
15:8	SUB_TYPE	Identifies this configuration space as belonging to traffic profiling 0x2: PROFILING
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus master. 0x2: MASTERPORT

0x00421020 BIMC_M_TCU1_PROF_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_TCU1_PROF_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	TENURE_WIDTH	Indicates the width of tenures (latencies) measured in traffic profiling.
23:16	TRACKING_TABLE_DEPTH	Indicates the number of entries in the table that tracks outstanding commands for determining how many commands have larger turnaround latencies that a programmed threshold.
7:0	SCALING_FACTOR	Indicates how many extra scaling is performed on events generated by traffic profiling if such events have to be synchronized from the tenure clock to the event clock. Any value that is non-power-of-2 is converted to power-of-2 by hardware. When the value read from this register field is used in software, similar conversion of non-power-of-2 values to next higher power-of-2 value is necessary.

0x00421030 BIMC_M_TCU1_PROF_CONFIGURATION_INFO_1

Type: R

Clock: Config Clock

Reset State: 0x00000000

Configuration information registers provide information on the capability and configuration of each traffic profiling instance. See register field descriptions for more details.

BIMC_M_TCU1_PROF_CONFIGURATION_INFO_1

Bits	Name	Description
23:16	PIPE2_ACH_DEPTH	Indicates the depth of address channel buffer in pipe2 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
15:8	PIPE1_ACH_DEPTH	Indicates the depth of address channel buffer in pipe1 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, value contained in field does not refer to any actual address channel buffer.
7:0	PIPE0_ACH_DEPTH	Indicates the depth of address channel buffer in pipe0 of masterport in which this traffic profiling instance is paired with. Applies only to traffic profiling instances in XR type masterports, which contains three distinct paths to slaves, in pipe0, pipe1, pipe2. In non-XR type masterports, pipe0 refers to the common address channel buffer used for all slave accesses.

0x00421200 BIMC_M_TCU1_PROF_CLOCK_CTRL**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000003**BIMC_M_TCU1_PROF_CLOCK_CTRL**

Bits	Name	Description
1	TENURE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by tenure clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	EVENT_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by event clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00421210 BIMC_M_TCU1_PROF_MODE**Type:** RW**Clock:** Config, Event & Tenure Clocks**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_MODE

Bits	Name	Description
25:24	WR_TENURE_MODE	Configures the start and end events for monitoring write latencies/tenures. When configured to WR_CMD_TO_BRESP, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is first cycle of write response to bus master as seen by traffic profiling. When configured to WR_CMD_TO_BRESP_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. When configured to WR_CMD_HANDSHAKE, starting event is first cycle of write command from bus master as seen by traffic profiling and ending event is transfer handshake of the same write command with bus master as seen by traffic profiling. When configured to WR_RESP_HANDSHAKE, starting event is first cycle of write response to bus master as seen by traffic profiling and ending event is transfer handshake of write response to bus master as seen by traffic profiling. 0x0: WR_CMD_TO_BRESP 0x1: WR_CMD_TO_BRESP_HANDSHAKE 0x2: WR_CMD_HANDSHAKE 0x3: WR_RESP_HANDSHAKE
17:16	RD_TENURE_MODE	Configures the start and end events for monitoring read latencies/tenures. When configured to RD_CMD_TO_FIRST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is first cycle of first beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_TO_LAST_RDATA, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. When configured to RD_CMD_HANDSHAKE, starting event is first cycle of read command from bus master as seen by traffic profiling and ending event is transfer handshake of the same read command with bus master as seen by traffic profiling. When configured to RD_DATA_HANDSHAKE, starting event is first cycle of first beat of read data to bus master as seen by traffic profiling and ending event is transfer handshake of last beat of read data to bus master as seen by traffic profiling. 0x0: RD_CMD_TO_FIRST_RDATA 0x1: RD_CMD_TO_LAST_RDATA 0x2: RD_CMD_HANDSHAKE 0x3: RD_DATA_HANDSHAKE
0	PROFILING_EN	When set (1), enables traffic profiling to monitor bus transactions from bus master and generate events for counting in performance monitors. When cleared (0), disables traffic profiling.

0x00421214 BIMC_M_TCU1_PROF_RD_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_RD_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which read latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00421218 BIMC_M_TCU1_PROF_WR_TENURE_THRESHOLD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_WR_TENURE_THRESHOLD**

Bits	Name	Description
15:0	THRESHOLD	Configures the threshold over which write latencies/tenures need to be before an event is generated to performance monitors for counting max latencies.

0x00421220 BIMC_M_TCU1_PROF_SWAY_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_SWAY_SELECT**

Bits	Name	Description
7:0	SWAY	Selects the slaveways to which commands are routed to profile. 1-bit per slaveway.

0x00421230 BIMC_M_TCU1_PROF_MID_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_MID_MASK

Bits	Name	Description
15:0	MID_MASK	When a bit position is set (1), enables matching of that bit position in MID of command with same bit position in MID_MATCH. Commands with MIDs that do not match are not considered for profiling.

0x00421234 BIMC_M_TCU1_PROF_MID_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_MID_MATCH**

Bits	Name	Description
15:0	MID_MATCH	Configures the value to match for in AMID in commands. Used in conjunction with MID_MASK, which controls which bits of MID are compared.

0x00421238 BIMC_M_TCU1_PROF_MID_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_MID_INV_MATCH**

Bits	Name	Description
0	MID_INV_MATCH	When set (1), configures MID matching to result in an inverse match, i.e., only commands whose MIDs that do not match MID_MATCH are considered for profiling.

0x00421240 BIMC_M_TCU1_PROF_ADDR_MASK_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_ADDR_MASK_LOWER

Bits	Name	Description
31:10	ADDR_MASK_LOWER	Configures ADDR_MASK[31:0]. When a bit position is set (1), enables matching of that bit position of address of command with same bit position in ADDR_MATCH[31:0].

0x00421244 BIMC_M_TCU1_PROF_ADDR_MASK_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ADDR_MASK_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00421248 BIMC_M_TCU1_PROF_ADDR_MATCH_LOWER**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ADDR_MATCH_LOWER**

Bits	Name	Description
31:10	ADDR_MATCH_LOWER	Configures the value to match for in address of commands. Used in conjunction with ADDR_MASK[31:0], which controls which bits of address are compared.

0x0042124C BIMC_M_TCU1_PROF_ADDR_MATCH_UPPER**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ADDR_MATCH_UPPER**

Bits	Name	Description
3:0	UNUSED	

0x00421250 BIMC_M_TCU1_PROF_ADDR_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ADDR_INV_MATCH**

Bits	Name	Description
0	ADDR_INV_MATCH	When set (1), configures address matching to result in an inverse match, i.e., only commands whose addresses do not match ADDR_MATCH are considered for profiling.

0x00421260 BIMC_M_TCU1_PROF_ACH_MASK_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MASK_0**

Bits	Name	Description
24	AINNERSHARED_MASK	When set (1), enables matching of AINNERSHARED in commands with AINNERSHARED_MATCH.
16	AFULL_MASK	When set (1), enables matching of AFULL in commands with AFULL_MATCH.
8	AEXCLUSIVE_MASK	When set (1), enables matching of AEXCLUSIVE in commands with AEXCLUSIVE_MATCH.
0	ABURST_MASK	When set (1), enables matching of ABURST in commands with ABURST_MATCH.

0x00421264 BIMC_M_TCU1_PROF_ACH_MATCH_0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MATCH_0**

Bits	Name	Description
24	AINNERSHARED_MATCH	Configures the value to match for in AINNERSHARED in commands. Used in conjunction with AINNERSHARED_MASK, which controls whether AINNERSHARED in commands is compared

BIMC_M_TCU1_PROF_ACH_MATCH_0 (cont.)

Bits	Name	Description
16	AFULL_MATCH	Configures the value to match for in AFULL in commands. Used in conjunction with AFULL_MASK, which controls whether AFULL in commands is compared.
8	AEXCLUSIVE_MATCH	Configures the value to match for in AEXCLUSIVE in commands. Used in conjunction with AEXCLUSIVE_MASK, which controls whether AFULL in commands is compared.
0	ABURST_MATCH	Configures the value to match for in ABURST in commands. Used in conjunction with ABURST_MASK, which controls whether ABURST in commands is compared.

0x00421270 BIMC_M_TCU1_PROF_ACH_MASK_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MASK_1**

Bits	Name	Description
24	AMSSSELFAUTH_MASK	When set (1), enables matching of AMSSSELFAUTH in commands with AMSSSELFAUTH_MATCH.
18:16	AMEMTYPE_MASK	When a bit position is set (1), enables matching of corresponding bit position of AMEMTYPE with AMEMTYPE_MATCH.
11:8	ALEN_MASK	When a bit position is set (1), enables matching of corresponding bit position of ALEN with ALEN_MATCH.
0	AINST_MASK	When set (1), enables matching of AINST in commands with AINST_MASK.

0x00421274 BIMC_M_TCU1_PROF_ACH_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MATCH_1**

Bits	Name	Description
24	AMSSSELFAUTH_MATCH	Configures the value to match for in AMSSSELFAUTH in commands. Used in conjunction with AMSSSELFAUTH_MASK, which controls whether AMSSSELFAUTH in commands is compared.

BIMC_M_TCU1_PROF_ACH_MATCH_1 (cont.)

Bits	Name	Description
18:16	AMEMTYPE_MATCH	Configures the value to match for in AMEMTYPE in commands. Used in conjunction with AMEMTYPE_MASK, which controls which bits of AMEMTYPE in commands are compared.
11:8	ALEN_MATCH	Configures the value to match for in ALEN in commands. Used in conjunction with ALEN_MASK, which controls which bits of ALEN in commands are compared.
0	AINST_MATCH	Configures the value to match for in AINST in commands. Used in conjunction with AINST_MASK, which controls whether AINST in commands is compared.

0x00421278 BIMC_M_TCU1_PROF_ACH_INV_MATCH_1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_INV_MATCH_1**

Bits	Name	Description
16	AMEMTYPE_INV_MATCH	When set (1), configures AMEMTYPE matching to result in an inverse match, i.e., only commands whose AMEMTYPE does not match AMEMTYPE_MATCH are considered for profiling.
8	ALEN_INV_MATCH	When set (1), configures ALEN matching to result in an inverse match, i.e., only commands when ALEN does not match ALEN_MATCH are considered for profiling.

0x00421280 BIMC_M_TCU1_PROF_ACH_MASK_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MASK_2**

Bits	Name	Description
24	APROTNS_MASK	When set (1), enables matching of APROTNS in commands with APROTNS_MATCH.
16	APRIV_MASK	When set (1), enables matching of APRIV in commands with APRIV_MATCH.
8	AOOO_MASK	When set (1), enables matching of AOOO in commands with AOOO_MATCH.
0	ANOALLOCATE_MASK	When set (1), enables matching of ANOALLOCATE in commands with ANOALLOCATE_MATCH.

0x00421284 BIMC_M_TCU1_PROF_ACH_MATCH_2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MATCH_2**

Bits	Name	Description
24	APROTNS_MATCH	Configures the value to match for in APROTNS in commands. Used in conjunction with APROTNS_MASK, which controls whether APROTNS in commands is compared
16	APRIV_MATCH	Configures the value to match for in APRIV in commands. Used in conjunction with APRIV_MASK, which controls whether APRIV in commands is compared
8	AOOO_MATCH	Configures the value to match for in AOOO in commands. Used in conjunction with AOOO_MASK, which controls whether AOOO in commands is compared
0	ANOALLOCATE_MATCH	Configures the value to match for in ANOALLOCATE in commands. Used in conjunction with ANOALLOCATE_MASK, which controls whether ANOALLOCATE in commands is compared

0x00421290 BIMC_M_TCU1_PROF_ACH_MASK_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MASK_3**

Bits	Name	Description
24	ASHARED_MASK	When set (1), enables matching of ASHARED in commands with ASHARED_MATCH.
17:16	AREQPRIORITY_MASK	When a bit position is set (1), enables matching of corresponding bit position of AREQPRIORITY with AREQPRIORITY_MATCH.
8	AREDIRECT_MASK	When set (1), enables matching of AREDIRECT in commands with AREDIRECT_MATCH.
0	ARDBEATNDXEN_MASK	When set (1), enables matching of ARDBEATNDXEN in commands with ARDBEATNDXEN_MATCH.

0x00421294 BIMC_M_TCU1_PROF_ACH_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MATCH_3**

Bits	Name	Description
24	ASHARED_MATCH	Configures the value to match for in ASHARED in commands. Used in conjunction with ASHARED_MASK, which controls whether ASHARED in commands is compared
17:16	AREQPRIORITY_MATCH	Configures the value to match for in AREQPRIORITY in commands. Used in conjunction with AREQPRIORITY_MASK, which controls which bits of AREQPRIORITY in commands are compared.
8	AREDIRECT_MATCH	Configures the value to match for in AREDIRECT in commands. Used in conjunction with AREDIRECT_MASK, which controls whether AREDIRECT in commands is compared
0	ARDBEATNDXEN_MATCH	Configures the value to match for in ARDBEATNDXEN in commands. Used in conjunction with ARDBEATNDXEN_MASK, which controls whether ARDBEATNDXEN in commands is compared

0x00421298 BIMC_M_TCU1_PROF_ACH_INV_MATCH_3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_INV_MATCH_3**

Bits	Name	Description
16	AREQPRIORITY_INV_MATCH	When set (1), configures AREQPRIORITY matching to result in an inverse match, i.e., only commands whose AREQPRIORITY does not match AREQPRIORITY_MATCH are considered for profiling

0x004212A0 BIMC_M_TCU1_PROF_ACH_MASK_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_ACH_MASK_4

Bits	Name	Description
24	AWRITE_MASK	When set (1), enables matching of AWRITE in commands with AWRITE_MATCH.
20:16	AVMID_MASK	When a bit position is set (1), enables matching of corresponding bit position in AVMID with AVMID_MATCH
8	ATRANSIENT_MASK	When set (1), enables matching of ATRANSIENT in commands with ATRANSIENT_MATCH.
2:0	ASIZE_MASK	When a bit position is set (1), enables matching of corresponding bit position in ASIZE with ASIZE_MATCH.

0x004212A4 BIMC_M_TCU1_PROF_ACH_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_ACH_MATCH_4**

Bits	Name	Description
24	AWRITE_MATCH	Configures the value to match for in AWRITE in commands. Used in conjunction with AWRITE_MASK, which controls whether AWRITE in commands is compared.
20:16	AVMID_MATCH	Configures the value to match for in AVMID in commands. Used in conjunction with AVMID_MASK, which controls which bits of AVMID in commands are compared.
8	ATRANSIENT_MATCH	Configures the value to match for in ATRANSIENT in commands. Used in conjunction with ATRANSIENT_MASK, which controls whether ATRANSIENT in commands is compared.
2:0	ASIZE_MATCH	Configures the value to match for in ASIZE in commands. Used in conjunction with ASIZE_MASK, which controls which bits of ASIZE in commands are compared.

0x004212A8 BIMC_M_TCU1_PROF_ACH_INV_MATCH_4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_ACH_INV_MATCH_4

Bits	Name	Description
16	AVMID_INV_MATCH	When set (1), configures AVMID matching to result in an inverse match, i.e., only commands whose AVMID does not match AVMID_MATCH are considered for profiling.
0	ASIZE_INV_MATCH	When set (1), configures ASIZE matching to result in an inverse match, i.e., only commands whose AVMID does not match ASIZE_MATCH are considered for profiling.

0x00421300 BIMC_M_TCU1_PROF_BCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_BCH_MASK**

Bits	Name	Description
1:0	BRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in BRESP with BRESP_MATCH.

0x00421304 BIMC_M_TCU1_PROF_BCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_BCH_MATCH**

Bits	Name	Description
1:0	BRESP_MATCH	Configures the value to match for in BRESP in write responses. Used in conjunction with BRESP_MASK, which controls which bits of BRESP in writes responses are compared.

0x00421308 BIMC_M_TCU1_PROF_BCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_BCH_INV_MATCH

Bits	Name	Description
0	BRESP_INV_MATCH	When set (1), configures BRESP matching to result in an inverse match, i.e., only write responses whose BRESP does not match BRESP_MATCH are considered for profiling.

0x00421340 BIMC_M_TCU1_PROF_RCH_MASK**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_RCH_MASK**

Bits	Name	Description
8	RLAST_MASK	When set (1), enables matching of RLAST in commands with corresponding setting in RCH_MATCH register.
1:0	RRESP_MASK	When a bit position is set (1), enables matching of corresponding bit position in RRESP with RRESP_MATCH.

0x00421344 BIMC_M_TCU1_PROF_RCH_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_RCH_MATCH**

Bits	Name	Description
8	RLAST_MATCH	Configures the value to match for in RLAST in read responses. Used in conjunction with RLAST_MASK, which controls whether RLAST in read responses is compared.
1:0	RRESP_MATCH	Configures the value to match for in RRESP in read responses. Used in conjunction with RRESP_MASK, which controls which bits of RRESP in read responses are compared.

0x00421348 BIMC_M_TCU1_PROF_RCH_INV_MATCH**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

BIMC_M_TCU1_PROF_RCH_INV_MATCH

Bits	Name	Description
0	RRESP_INV_MATCH	When set (1), configures RRESP matching to result in an inverse match, i.e., only read responses whose RRESP does not match RRESP_MATCH are considered for profiling.

0x00421400+ BIMC_M_TCU1_PROF_RD_STATUS_n, n=[0..0]
0x4*n
Type: R**Clock:** Config & Tenure Clocks**Reset State:** 0x00000000**BIMC_M_TCU1_PROF_RD_STATUS_n**

Bits	Name	Description
31	RD_OUTSTANDING_OVERFLOW	Indicates that the number of outstanding reads crossed the maximum supported (255) during when traffic profiling was last enabled. It is recommended that this register be read only after traffic profiling has been disabled.
30	RD_OUTSTANDING_UNDERFLOW	Indicates that the number of outstanding reads went below 0 during when traffic profiling was last enabled. It indicates that more command completions were seen compared to commands starts. The most likely scenario is an overflow of number of outstanding reads occurred leading to some command starts not being tracked. It is recommended that this register be read only after traffic profiling has been disabled.
7:0	RD_OUTSTANDING_MAX	Indicates the maximum number of outstanding reads that were seen when traffic profiling was last enabled. Only reads that match the MID filter and slaweway select filter are accounted for. It is recommended that this register be read only after traffic profiling has been disabled.

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this slaveway.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a slaveway 0x1: SLAVEWAY
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus slave. 0x3: SLAVEWAY

0x00450020 BIMC_S_APP_SWAY_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000001

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the core side and the clock used in the slave side of the slaveway. When ASYNC, identifies the master clock and core clock as un-related and asynchronous to each other. When SYNC, identifies the core clock and slave clock as synchronous to each other. When ISOSYNC, identifies the core clock and slave clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this slaveway. When DEFAULT_SLAVE, identifies this slaveway as a default slave which responds to all commands with decode error. When SLAVEWAY, identifies this slaveway as interfacing to a bus slave. When STUB, identifies this slaveway has a stub. 0x0: STUB 0x1: SLAVEWAY

0x00450030 BIMC_S_APP_SWAY_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	MPORT_CONNECTIVITY	Indicates which masterports can route commands to this slaveway instance. 1-bit per masterport. When a specific bit is set (1), indicates that the masterport corresponding to this bit can route commands to this slaveway instance. When a specific bit is cleared (0), indicates that the masterport corresponding to this bit does not route commands to this slaveway instance.

0x00450040 BIMC_S_APP_SWAY_CONFIGURATION_INFO_2**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_2

Bits	Name	Description
31:16	S_DATA_WIDTH	Indicates the width of read and write data to the bus slave.
15:8	S_TID_WIDTH	Indicates the width of transfer IDs to the bus slave.
7:0	S_MID_WIDTH	Indicates the width of master ID to the bus slave (includes any bus and port IDs.)

0x00450050 BIMC_S_APP_SWAY_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH0_DEPTH	Indicates the depth of read channel buffers #0 in this slaveway. A beat of read data occupies one entry in the read channel buffer, until accepted by the masterport.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this slaveway. Each write response occupies one entry in the write response channel buffer, until accepted by the masterport.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this slaveway. A beat of write data occupies one entry in the write channel buffer, until accepted by the bus slave.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this slaveway. Each command occupies one entry in the address channel buffer, until accepted by the bus slave.

0x00450060 BIMC_S_APP_SWAY_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_4

Bits	Name	Description
31	DUAL_RCH_EN	Indicates that this slaveway has dual read channel buffers.
7:0	RCH1_DEPTH	Indicates the depth of read channel buffers #1 in this slaveway. A beat of read data occupies one entry in the read channel buffer, until accepted by the masterport.

0x00450070 BIMC_S_APP_SWAY_CONFIGURATION_INFO_5**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_5

Bits	Name	Description
31	QOS_EN	Indicates that this slaveway uses command request priorities to control the number of high and low priority commands forwarded to the bus slave.

0x00450080 BIMC_S_APP_SWAY_CONFIGURATION_INFO_6A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_6A

Bits	Name	Description
0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 1 identifies pipelining in the address channel buffer, digit 0 identifies pipelining on the slaveway to slave interface.

0x00450084 BIMC_S_APP_SWAY_CONFIGURATION_INFO_6B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_6B

Bits	Name	Description
0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 1 identifies pipelining in the write channel buffer, digit 0 identifies pipelining on the slaveway to slave interface.

0x00450088 BIMC_S_APP_SWAY_CONFIGURATION_INFO_6C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_6C

Bits	Name	Description
0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slave to slaveway interface, digit 1 identifies in the write response channel buffer, digit 0 identifies pipelining on the slaveway to masterport interface.

0x004500BC BIMC_S_APP_SWAY_CONFIGURATION_INFO_6D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_APP_SWAY_CONFIGURATION_INFO_6D

Bits	Name	Description
0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slave to slaveway interface, digit 1 identifies in the read channel buffer, digit 0 identifies pipelining on the slaveway to masterport interface.

0x00450100 BIMC_S_APP_SWAY_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_S_APP_SWAY_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00450108 BIMC_S_APP_SWAY_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_S_APP_SWAY_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0045010C BIMC_S_APP_SWAY_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_S_APP_SWAY_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00450200 BIMC_S_APP_SWAY_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Slave Clocks**Reset State:** 0x00000003**BIMC_S_APP_SWAY_CLOCK_CTRL**

Bits	Name	Description
1	SLAVE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by slave clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

BIMC_S_APP_SWAY_CLOCK_CTRL (cont.)

Bits	Name	Description
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00450208 BIMC_S_APP_SWAY_CDC_CTRL**Type:** RW**Clock:** Config, Core & Slave Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_S_APP_SWAY_CDC_CTRL

Bits	Name	Description
1	SLAVE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to slave clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x00450210 BIMC_S_APP_SWAY_RCH_SELECT**Type:** R**Clock:** Config & Slave Clocks**Reset State:** 0x00000000

Read channel select register controls which read channel buffer to use for buffering read data for read data destined for each masterport in the interconnect.

BIMC_S_APP_SWAY_RCH_SELECT

Bits	Name	Description
7:0	UNUSED	

0x00450220 BIMC_S_APP_SWAY_MAX_OUTSTANDING_REQUESTS**Type:** RW**Clock:** Config & Core Clocks**Reset State:** 0x0000FFFF**BIMC_S_APP_SWAY_MAX_OUTSTANDING_REQUESTS**

Bits	Name	Description
15:8	WRITE	Configures the maximum number of write commands that can be outstanding at the slaveway at any time.
7:0	READ	Configures the maximum number of read commands that can be outstanding at the slaveway at any time.

0x00450230 BIMC_S_APP_SWAY_GATHERING**Type:** RW**Clock:** Config & Slave Clocks**Reset State:** 0x00000000**BIMC_S_APP_SWAY_GATHERING**

Bits	Name	Description
3:0	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to be routed to masterports. When configured with 0, read data is allowed to proceed as soon as the first beat has been buffered. When configured with 1, read data is allowed to proceed as soon as the second beat has been buffered. When configured with values larger than the number of beats in the read burst, the read data is allowed to proceed as soon as the last beat has been buffered. When configured with values larger than the depth of read channel buffers, the read data is held until all entries in the read channel buffer have been occupied.

0x00450400 BIMC_S_APP_SWAY_STATUS_0A**Type:** R**Clock:** Config & Core Clocks**Reset State:** 0x00000000

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_0A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is before address channel buffers, which interfaces to core of the interconnect.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from PIPE0 of the masterport before address channel buffers, which interfaces to core of the interconnect.

0x00450404 BIMC_S_APP_SWAY_STATUS_0B**Type:** R**Clock:** Config & Slave Clocks**Reset State:** 0x00000000

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_0B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to the bus slave.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from PIPE0 of the masterport after address channel buffers, which interfaces to the bus slave.

0x00450408 BIMC_S_APP_SWAY_STATUS_0C**Type:** R**Clock:** Config & Core Clocks**Reset State:** 0x00000000

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_0C

Bits	Name	Description
23:16	RDQ_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that reads can no longer be accepted from the arbiter. 1-bit per masterport, bit position corresponds to masterport enumeration.
8	WRQ_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that writes can no longer be accepted from the arbiter.
3:0	CMDQ_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that commands (either reads or writes) of a certain priority can no longer be accepted from the arbiter. 1-bit per priority, bit position corresponds to request priority enumeration.

0x0045040C BIMC_S_APP_SWAY_STATUS_0D

Type: R

Clock: Config & Core Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the slaweway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_0D

Bits	Name	Description
23:16	RDQ_ALMOST_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that reads can no longer be accepted from the arbiter, after one more read. 1-bit per masterport, bit position corresponds to masterport enumeration.
8	WRQ_ALMOST_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that writes can no longer be accepted from the arbiter, after one more write.
3:0	CMDQ_ALMOST_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that commands (either reads or writes) of a certain priority can no longer be accepted from the arbiter, after one more command. 1-bit per priority, bit position corresponds to request priority enumeration.

0x00450410 BIMC_S_APP_SWAY_STATUS_1A**Type:** R**Clock:** Config, Core & Slave Clocks**Reset State:** 0x55111111

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_1A

Bits	Name	Description
31	RCB0_DATA_RD_FULL	Indicates that the data part of read channel buffer #0 is full when seen from it's read side, which interfaces to core of the interconnect.
30	RCB0_DATA_RD_EMPTY	Indicates that the data part of read channel buffer #0 is empty when seen from it's read side, which interfaces to core of the interconnect.
29	RCB0_CTRL_RD_FULL	Indicates that the control part of read channel buffer #0 is full when seen from it's read side, which interfaces to core of the interconnect.
28	RCB0_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer #0 is empty when seen from it's write side, which interfaces to core of the interconnect.
27	RCB0_DATA_WR_FULL	Indicates that the data part of read channel buffer #0 is full when seen from it's write side, which interfaces to the bus slave.
26	RCB0_DATA_WR_EMPTY	Indicates that the data part of read channel buffer #0 is empty when seen from it's write side, which interfaces to the bus slave.
25	RCB0_CTRL_WR_FULL	Indicates that the control part of read channel buffer #0 is full when seen from it's write side, which interfaces to the bus slave.
24	RCB0_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer #0 is empty when seen from it's write side, which interfaces to the bus slave.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to core of the interconnect.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to the bus slave.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to the bus slave.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to the bus slave.

BIMC_S_APP_SWAY_STATUS_1A (cont.)

Bits	Name	Description
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to the bus slave.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to core of the interconnect.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to the bus slave.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to the bus slave.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to core of the interconnect.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect.

0x00450414 BIMC_S_APP_SWAY_STATUS_1B**Type:** R**Clock:** Config, Core & Slave Clocks**Reset State:** 0x11111111

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_1B

Bits	Name	Description
29	WIB_RD_FULL	Indicates that the write channel IDs buffer is full when seen from it's read side, which interfaces to the bus slave.
28	WIB_RD_EMPTY	Indicates that the write channel IDs buffer is empty when seen from it's read side, which interfaces to the bus slave.
25	WIB_WR_FULL	Indicates that the write channel IDs buffer is full when seen from it's write side, which interfaces to core of the interconnect.
24	WIB_WR_EMPTY	Indicates that the write channel IDs buffer is empty when seen from it's write side, which interfaces to core of the interconnect.
21	RGB0_RD_FULL	Indicates that the read gathering buffer #0 is full when seen from it's read side, which interfaces to frontend of the masterport.

BIMC_S_APP_SWAY_STATUS_1B (cont.)

Bits	Name	Description
20	RGB0_RD_EMPTY	Indicates that the read gathering buffer #0 is empty when seen from it's read side, which interfaces to core of the interconnect.
17	RGB0_WR_FULL	Indicates that the read gathering buffer #0 is full when seen from it's write side, which interfaces to core of the interconnect.
16	RGB0_WR_EMPTY	Indicates that the read gathering buffer #0 is empty when seen from it's write side, which interfaces to the bus slave.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to the bus slave.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to the bus slave.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to core of the interconnect.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to core of the interconnect.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to the bus slave.
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to the bus slave.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to core of the interconnect.
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to core of the interconnect.

0x00450418 BIMC_S_APP_SWAY_STATUS_1C**Type:** R**Clock:** Config, Core & Slave Clocks**Reset State:** 0x00001155

Status registers indicate the state of several elements in the slaweway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_APP_SWAY_STATUS_1C

Bits	Name	Description
13	RGB1_RD_FULL	Indicates that the read gathering buffer #1 is full when seen from it's read side, which interfaces to frontend of the masterport.
12	RGB1_RD_EMPTY	Indicates that the read gathering buffer #1 is empty when seen from it's read side, which interfaces to core of the interconnect.
9	RGB1_WR_FULL	Indicates that the read gathering buffer #1 is full when seen from it's write side, which interfaces to core of the interconnect.
8	RGB1_WR_EMPTY	Indicates that the read gathering buffer #1 is empty when seen from it's write side, which interfaces to the bus slave.
7	RCB1_DATA_RD_FULL	Indicates that the data part of read channel buffer #1 is full when seen from it's read side, which interfaces to core of the interconnect.
6	RCB1_DATA_RD_EMPTY	Indicates that the data part of read channel buffer #1 is empty when seen from it's read side, which interfaces to core of the interconnect.
5	RCB1_CTRL_RD_FULL	Indicates that the control part of read channel buffer #1 is full when seen from it's read side, which interfaces to core of the interconnect.
4	RCB1_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer #1 is empty when seen from it's write side, which interfaces to core of the interconnect.
3	RCB1_DATA_WR_FULL	Indicates that the data part of read channel buffer #1 is full when seen from it's write side, which interfaces to the bus slave.
2	RCB1_DATA_WR_EMPTY	Indicates that the data part of read channel buffer #1 is empty when seen from it's write side, which interfaces to the bus slave.
1	RCB1_CTRL_WR_FULL	Indicates that the control part of read channel buffer #1 is full when seen from it's write side, which interfaces to the bus slave.
0	RCB1_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer #1 is empty when seen from it's write side, which interfaces to the bus slave.

2.20 BIMC_S_SYS_SWAY

BRIC Slaveway

2.20.1 BIMC_S_SYS_SWAY_BRIC_SLAVEWAY

BRIC Slaveway

0x00458000 BIMC_S_SYS_SWAY_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000103

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_S_SYS_SWAY_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this slaveway.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a slaveway 0x1: SLAVEWAY
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus slave. 0x3: SLAVEWAY

0x00458020 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x01000001

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_0

Bits	Name	Description
31:24	SYNC_MODE	Indicates the clock relationship between the clock used in the core side and the clock used in the slave side of the slaveway. When ASYNC, identifies the master clock and core clock as un-related and asynchronous to each other. When SYNC, identifies the core clock and slave clock as synchronous to each other. When ISOSYNC, identifies the core clock and slave clock as related, but of different frequencies, which are of integer ratios, i.e., they are iso-synchronous to each other. 0x0: ASYNC 0x1: SYNC 0x2: ISOSYNC

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_0 (cont.)

Bits	Name	Description
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this slaveway. When DEFAULT_SLAVE, identifies this slaveway as a default slave which responds to all commands with decode error. When SLAVEWAY, identifies this slaveway as interfacing to a bus slave. When STUB, identifies this slaveway has a stub. 0x0: STUB 0x1: SLAVEWAY

0x00458030 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	MPORT_CONNECTIVITY	Indicates which masterports can route commands to this slaveway instance. 1-bit per masterport. When a specific bit is set (1), indicates that the masterport corresponding to this bit can route commands to this slaveway instance. When a specific bit is cleared (0), indicates that the masterport corresponding to this bit does not route commands to this slaveway instance.

0x00458040 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_2**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_2

Bits	Name	Description
31:16	S_DATA_WIDTH	Indicates the width of read and write data to the bus slave.
15:8	S_TID_WIDTH	Indicates the width of transfer IDs to the bus slave.
7:0	S_MID_WIDTH	Indicates the width of master ID to the bus slave (includes any bus and port IDs.)

0x00458050 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_3**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_3

Bits	Name	Description
31:24	RCH0_DEPTH	Indicates the depth of read channel buffers #0 in this slaveway. A beat of read data occupies one entry in the read channel buffer, until accepted by the masterport.
23:16	BCH_DEPTH	Indicates the depth of write response channel buffers in this slaveway. Each write response occupies one entry in the write response channel buffer, until accepted by the masterport.
15:8	WCH_DEPTH	Indicates the depth of write channel buffers in this slaveway. A beat of write data occupies one entry in the write channel buffer, until accepted by the bus slave.
7:0	ACH_DEPTH	Indicates the depth of address channel buffers in this slaveway. Each command occupies one entry in the address channel buffer, until accepted by the bus slave.

0x00458060 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_4**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_4

Bits	Name	Description
31	DUAL_RCH_EN	Indicates that this slaveway has dual read channel buffers.
7:0	RCH1_DEPTH	Indicates the depth of read channel buffers #1 in this slaveway. A beat of read data occupies one entry in the read channel buffer, until accepted by the masterport.

0x00458070 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_5**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_5

Bits	Name	Description
31	QOS_EN	Indicates that this slaveway uses command request priorities to control the number of high and low priority commands forwarded to the bus slave.

0x00458080 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6A**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6A

Bits	Name	Description
0	ACH_PIPELINE_STAGES	Indicates pipeline stages enabled on the address channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 1 identifies pipelining in the address channel buffer, digit 0 identifies pipelining on the slaveway to slave interface.

0x00458084 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6B**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6B

Bits	Name	Description
0	WCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 1 identifies pipelining in the write channel buffer, digit 0 identifies pipelining on the slaveway to slave interface.

0x00458088 BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6C**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6C

Bits	Name	Description
0	BCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the write response channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slave to slaveway interface, digit 1 identifies in the write response channel buffer, digit 0 identifies pipelining on the slaveway to masterport interface.

0x004580BC BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6D**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaveway instance. See register field descriptions for more details.

BIMC_S_SYS_SWAY_CONFIGURATION_INFO_6D

Bits	Name	Description
0	RCH_PIPELINE_STAGES	Indicates pipeline stages enabled on the read channel. Each digit identifies a specific pipeline stage in the slaveway, where '0' indicates no pipeline stage, '1' indicates 1-deep pipeline stage where forward path is registered, return path is fed through, '2' indicates 2-deep pipeline stage where both forward and return path are pipelined. Digit 2 identifies pipelining on the slave to slaveway interface, digit 1 identifies in the read channel buffer, digit 0 identifies pipelining on the slaveway to masterport interface.

0x00458100 BIMC_S_SYS_SWAY_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_S_SYS_SWAY_INTERRUPT_STATUS

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00458108 BIMC_S_SYS_SWAY_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_S_SYS_SWAY_INTERRUPT_CLEAR

Bits	Name	Description
1:0	RFU	Reserved for future use

0x0045810C BIMC_S_SYS_SWAY_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_S_SYS_SWAY_INTERRUPT_ENABLE

Bits	Name	Description
1:0	RFU	Reserved for future use

0x00458200 BIMC_S_SYS_SWAY_CLOCK_CTRL**Type:** RW**Clock:** Config, Core & Slave Clocks**Reset State:** 0x00000003**BIMC_S_SYS_SWAY_CLOCK_CTRL**

Bits	Name	Description
1	SLAVE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by slave clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers clocked by core clock. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00458208 BIMC_S_SYS_SWAY_CDC_CTRL**Type:** RW**Clock:** Config, Core & Slave Clocks**Reset State:** 0x00000000

Clock domain crossing (CDC) control register provides configuration for clock domain crossing logic.

BIMC_S_SYS_SWAY_CDC_CTRL

Bits	Name	Description
1	SLAVE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to slave clock in all buffers.
0	CORE_CLOCK_DEMETA_SEL	When cleared (0), selects DEMETA synchronizer that requires atleast 3 clock edges (two rising and one falling). When set (1), selects DEMETA synchronizer that requires atleast 2 clock edges (one falling and one rising) to synchronize to core clock in all buffers.

0x00458210 BIMC_S_SYS_SWAY_RCH_SELECT**Type:** R**Clock:** Config & Slave Clocks**Reset State:** 0x00000000

Read channel select register controls which read channel buffer to use for buffering read data for read data destined for each masterport in the interconnect.

BIMC_S_SYS_SWAY_RCH_SELECT

Bits	Name	Description
7:0	UNUSED	

0x00458230 BIMC_S_SYS_SWAY_GATHERING**Type:** RW**Clock:** Config & Slave Clocks**Reset State:** 0x00000000

BIMC_S_SYS_SWAY_GATHERING

Bits	Name	Description
3:0	RD_GATHER_BEATS	Configures the number of read data beats to gather/buffer in read channel buffer before allowing the read data to be routed to masterports. When configured with 0, read data is allowed to proceed as soon as the first beat has been buffered. When configured with 1, read data is allowed to proceed as soon as the second beat has been buffered. When configured with values larger than the number of beats in the read burst, the read data is allowed to proceed as soon as the last beat has been buffered. When configured with values larger than the depth of read channel buffers, the read data is held until all entries in the read channel buffer have been occupied.

0x00458400 BIMC_S_SYS_SWAY_STATUS_0A**Type:** R**Clock:** Config & Core Clocks**Reset State:** 0x00000000

Status registers indicate the state of several elements in the slaweway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_0A

Bits	Name	Description
23:16	WR_PENDING_PRE_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is before address channel buffers, which interfaces to core of the interconnect.
7:0	RD_PENDING_PRE_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from PIPE0 of the masterport before address channel buffers, which interfaces to core of the interconnect.

0x00458404 BIMC_S_SYS_SWAY_STATUS_0B**Type:** R**Clock:** Config & Slave Clocks**Reset State:** 0x00000000

Status registers indicate the state of several elements in the slaweway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock

cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_0B

Bits	Name	Description
23:16	WR_PENDING_POST_BUF	Indicates the number of write transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from after address channel buffers, which interfaces to the bus slave.
7:0	RD_PENDING_POST_BUF	Indicates the number of read transactions that are outstanding/pending waiting for a response from the slave. This transaction count is from PIPE0 of the masterport after address channel buffers, which interfaces to the bus slave.

0x00458408 BIMC_S_SYS_SWAY_STATUS_0C

Type: R

Clock: Config & Core Clocks

Reset State: 0x00000000

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_0C

Bits	Name	Description
23:16	RDQ_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that reads can no longer be accepted from the arbiter. 1-bit per masterport, bit position corresponds to masterport enumeration.
8	WRQ_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that writes can no longer be accepted from the arbiter.
3:0	CMDQ_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that commands (either reads or writes) of a certain priority can no longer be accepted from the arbiter. 1-bit per priority, bit position corresponds to request priority enumeration.

0x0045840C BIMC_S_SYS_SWAY_STATUS_0D**Type:** R**Clock:** Config & Core Clocks**Reset State:** 0x00000000

Status registers indicate the state of several elements in the slaweway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_0D

Bits	Name	Description
23:16	RDQ_ALMOST_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that reads can no longer be accepted from the arbiter, after one more read. 1-bit per masterport, bit position corresponds to masterport enumeration.
8	WRQ_ALMOST_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that writes can no longer be accepted from the arbiter, after one more write.
3:0	CMDQ_ALMOST_FULL	Indicates the state of QoS feedback signalling to the arbiter. When set (1), indicates that commands (either reads or writes) of a certain priority can no longer be accepted from the arbiter, after one more command. 1-bit per priority, bit position corresponds to request priority enumeration.

0x00458410 BIMC_S_SYS_SWAY_STATUS_1A**Type:** R**Clock:** Config, Core & Slave Clocks**Reset State:** 0x55111111

Status registers indicate the state of several elements in the slaweway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_1A

Bits	Name	Description
31	RCB0_DATA_RD_FULL	Indicates that the data part of read channel buffer #0 is full when seen from it's read side, which interfaces to core of the interconnect.

BIMC_S_SYS_SWAY_STATUS_1A (cont.)

Bits	Name	Description
30	RCB0_DATA_RD_EMPTY	Indicates that the data part of read channel buffer #0 is empty when seen from it's read side, which interfaces to core of the interconnect.
29	RCB0_CTRL_RD_FULL	Indicates that the control part of read channel buffer #0 is full when seen from it's read side, which interfaces to core of the interconnect.
28	RCB0_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer #0 is empty when seen from it's write side, which interfaces to core of the interconnect.
27	RCB0_DATA_WR_FULL	Indicates that the data part of read channel buffer #0 is full when seen from it's write side, which interfaces to the bus slave.
26	RCB0_DATA_WR_EMPTY	Indicates that the data part of read channel buffer #0 is empty when seen from it's write side, which interfaces to the bus slave.
25	RCB0_CTRL_WR_FULL	Indicates that the control part of read channel buffer #0 is full when seen from it's write side, which interfaces to the bus slave.
24	RCB0_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer #0 is empty when seen from it's write side, which interfaces to the bus slave.
21	BCB_RD_FULL	Indicates that the write response channel buffer is full when seen from it's read side, which interfaces to core of the interconnect.
20	BCB_RD_EMPTY	Indicates that the write response channel buffer is empty when seen from it's read side, which interfaces to core of the interconnect.
17	BCB_WR_FULL	Indicates that the write response channel buffer is full when seen from it's write side, which interfaces to the bus slave.
16	BCB_WR_EMPTY	Indicates that the write response channel buffer is empty when seen from it's write side, which interfaces to the bus slave.
13	WCB_RD_FULL	Indicates that the write channel buffer is full when seen from it's read side, which interfaces to the bus slave.
12	WCB_RD_EMPTY	Indicates that the write channel buffer is empty when seen from it's read side, which interfaces to the bus slave.
9	WCB_WR_FULL	Indicates that the write channel buffer is full when seen from it's write side, which interfaces to core of the interconnect.
8	WCB_WR_EMPTY	Indicates that the write channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect.
5	ACB_RD_FULL	Indicates that the address channel buffer is full when seen from it's read side, which interfaces to the bus slave.
4	ACB_RD_EMPTY	Indicates that the address channel buffer is empty when seen from it's read side, which interfaces to the bus slave.
1	ACB_WR_FULL	Indicates that the address channel buffer is full when seen from it's write side, which interfaces to core of the interconnect.
0	ACB_WR_EMPTY	Indicates that the address channel buffer is empty when seen from it's write side, which interfaces to core of the interconnect.

0x00458414 BIMC_S_SYS_SWAY_STATUS_1B**Type:** R**Clock:** Config, Core & Slave Clocks**Reset State:** 0x11111111

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_1B

Bits	Name	Description
29	WIB_RD_FULL	Indicates that the write channel IDs buffer is full when seen from it's read side, which interfaces to the bus slave.
28	WIB_RD_EMPTY	Indicates that the write channel IDs buffer is empty when seen from it's read side, which interfaces to the bus slave.
25	WIB_WR_FULL	Indicates that the write channel IDs buffer is full when seen from it's write side, which interfaces to core of the interconnect.
24	WIB_WR_EMPTY	Indicates that the write channel IDs buffer is empty when seen from it's write side, which interfaces to core of the interconnect.
21	RGB0_RD_FULL	Indicates that the read gathering buffer #0 is full when seen from it's read side, which interfaces to frontend of the masterport.
20	RGB0_RD_EMPTY	Indicates that the read gathering buffer #0 is empty when seen from it's read side, which interfaces to core of the interconnect.
17	RGB0_WR_FULL	Indicates that the read gathering buffer #0 is full when seen from it's write side, which interfaces to core of the interconnect.
16	RGB0_WR_EMPTY	Indicates that the read gathering buffer #0 is empty when seen from it's write side, which interfaces to the bus slave.
13	W2AB_RD_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's read side, which interfaces to the bus slave.
12	W2AB_RD_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's read side, which interfaces to the bus slave.
9	W2AB_WR_FULL	Indicates that the write channel to address channel user signals buffer is full when seen from it's write side, which interfaces to core of the interconnect.
8	W2AB_WR_EMPTY	Indicates that the write channel to address channel user signals buffer is empty when seen from it's write side, which interfaces to core of the interconnect.
5	A2WB_RD_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's read side, which interfaces to the bus slave.

BIMC_S_SYS_SWAY_STATUS_1B (cont.)

Bits	Name	Description
4	A2WB_RD_EMPTY	Indicates that the address channel to write channel user signalsbuffer is empty when seen from it's read side, which interfaces to the bus slave.
1	A2WB_WR_FULL	Indicates that the address channel to write channel user signals buffer is full when seen from it's write side, which interfaces to core of the interconnect.
0	A2WB_WR_EMPTY	Indicates that the address channel to write channel user signals buffer is empty when seen from it's write side, which interfaces to core of the interconnect.

0x00458418 BIMC_S_SYS_SWAY_STATUS_1C**Type:** R**Clock:** Config, Core & Slave Clocks**Reset State:** 0x00001155

Status registers indicate the state of several elements in the slaveway, including the number of transactions outstanding/pending waiting for a response, emptiness, fullness of several buffers, etc. The state information is available only as a debug indication and could be delayed by a few clock cycles from when the state is reached to being reflected in the status registers. One or more of the state registers are read live and could capture intermediate values as they change.

BIMC_S_SYS_SWAY_STATUS_1C

Bits	Name	Description
13	RGB1_RD_FULL	Indicates that the read gathering buffer #1 is full when seen from it's read side, which interfaces to frontend of the masterport.
12	RGB1_RD_EMPTY	Indicates that the read gathering buffer #1 is empty when seen from it's read side, which interfaces to core of the interconnect.
9	RGB1_WR_FULL	Indicates that the read gathering buffer #1 is full when seen from it's write side, which interfaces to core of the interconnect.
8	RGB1_WR_EMPTY	Indicates that the read gathering buffer #1 is empty when seen from it's write side, which interfaces to the bus slave.
7	RCB1_DATA_RD_FULL	Indicates that the data part of read channel buffer #1 is full when seen from it's read side, which interfaces to core of the interconnect.
6	RCB1_DATA_RD_EMPTY	Indicates that the data part of read channel buffer #1 is empty when seen from it's read side, which interfaces to core of the interconnect.
5	RCB1_CTRL_RD_FULL	Indicates that the control part of read channel buffer #1 is full when seen from it's read side, which interfaces to core of the interconnect.

BIMC_S_SYS_SWAY_STATUS_1C (cont.)

Bits	Name	Description
4	RCB1_CTRL_RD_EMPTY	Indicates that the control part of read channel buffer #1 is empty when seen from it's write side, which interfaces to core of the interconnect.
3	RCB1_DATA_WR_FULL	Indicates that the data part of read channel buffer #1 is full when seen from it's write side, which interfaces to the bus slave.
2	RCB1_DATA_WR_EMPTY	Indicates that the data part of read channel buffer #1 is empty when seen from it's write side, which interfaces to the bus slave.
1	RCB1_CTRL_WR_FULL	Indicates that the control part of read channel buffer #1 is full when seen from it's write side, which interfaces to the bus slave.
0	RCB1_CTRL_WR_EMPTY	Indicates that the control part of read channel buffer #1 is empty when seen from it's write side, which interfaces to the bus slave.

2.21 BIMC_S_DEFAULT_SWAY

BRIC Default Slave

2.21.1 BIMC_S_DEFAULT_SWAY_BRIC_SLAVEWAY_DEFAULT

BRIC Default Slave

0x00460000 BIMC_S_DEFAULT_SWAY_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000103

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_S_DEFAULT_SWAY_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this slaway.
15:8	SUB_TYPE	Identifies this configuration space as belonging to a slaway 0x1: SLAVEWAY
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus slave. 0x3: SLAVEWAY

0x00460020 BIMC_S_DEFAULT_SWAY_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000002

Configuration information registers provide information on the capability and configuration of each slaway instance. See register field descriptions for more details.

BIMC_S_DEFAULT_SWAY_CONFIGURATION_INFO_0

Bits	Name	Description
7:0	FUNCTIONALITY	Indicates the functionality and type of bus traffic handled by this slaway. When DEFAULT_SLAVE, identifies this slaway as a default slave which responds to all commands with decode error. When SLAWEWAY, identifies this slaway as interfacing to a bus slave. When STUB, identifies this slaway has a stub. 0x2: DEFAULT_SLAVE

0x00460030 BIMC_S_DEFAULT_SWAY_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each slaway instance. See register field descriptions for more details.

BIMC_S_DEFAULT_SWAY_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	MPORT_CONNECTIVITY	Indicates which masterports can route commands to this slaway instance. 1-bit per masterport. When a specific bit is set (1), indicates that the masterport corresponding to this bit can route commands to this slaway instance. When a specific bit is cleared (0), indicates that the masterport corresponding to this bit does not route commands to this slaway instance.

0x00460100 BIMC_S_DEFAULT_SWAY_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status registers provide indication of which interrupts from this masterport require servicing.

BIMC_S_DEFAULT_SWAY_INTERRUPT_STATUS

Bits	Name	Description
1	RFU	Reserved for future use
0	DECODE_ERROR	When set (1), indicates that a read or write command was responded with decode error.

0x00460108 BIMC_S_DEFAULT_SWAY_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear registers provide the mechanism to turn off interrupt sources once they have been acknowledged or serviced. A write of '1' to the bits corresponding to the interrupts indicated in interrupt status is required to turn off interrupts.

BIMC_S_DEFAULT_SWAY_INTERRUPT_CLEAR

Bits	Name	Description
1	RFU	Reserved for future use
0	DECODE_ERROR	When written with '1', clears the decode error interrupt status if it is also set. If decode error interrupt status is not set, the write is ignored. All writes of '0' are ignored.

0x0046010C BIMC_S_DEFAULT_SWAY_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable registers provide control over which interrupts are allowed to be propagated to an interrupt controller for servicing.

BIMC_S_DEFAULT_SWAY_INTERRUPT_ENABLE

Bits	Name	Description
1	RFU	Reserved for future use
0	DECODE_ERROR	When set (1), indicates that any decode errors interrupts are allowed to be propagated to a system wide interrupt controller. When cleared (0), any decode error interrupt is not propagated to the system wide interrupt controller.

0x00460400 BIMC_S_DEFAULT_SWAY_DEFAULT_SLAVE_STATUS_0

Type: R
Clock: Config & Core Clocks
Reset State: 0x00000000

Default slave status registers recorded the last read or write command that was responded to with decode error.

BIMC_S_DEFAULT_SWAY_DEFAULT_SLAVE_STATUS_0

Bits	Name	Description
31:0	ADDR_LOWER	Indicates ADDR[31:0] of the last read or write command that was responded to with decode error.

0x00460410 BIMC_S_DEFAULT_SWAY_DEFAULT_SLAVE_STATUS_1

Type: R
Clock: Config & Core Clocks
Reset State: 0x00000000

Default slave status registers recorded the last read or write command that was responded to with decode error.

BIMC_S_DEFAULT_SWAY_DEFAULT_SLAVE_STATUS_1

Bits	Name	Description
31	WRITE	When set (1), indicates that the last command responded to with decode error was a write. When cleared (0), indicates that the last command responded to with decode error was a read.
3:0	ADDR_UPPER	Indicates ADDR[35:32] of the last read or write command that was responded to with decode error.

0x00460420 BIMC_S_DEFAULT_SWAY_DEFAULT_SLAVE_STATUS_2

Type: R
Clock: Config & Core Clocks
Reset State: 0x00000000

Default slave status registers recorded the last read or write command that was responded to with decode error.

BIMC_S_DEFAULT_SWAY_DEFAULT_SLAVE_STATUS_2

Bits	Name	Description
31:16	TID	Indicates the transfer ID of the last command that was responded to with decode error.
15:0	MID	Indicates the master ID of the last command that was responded to with decode error.

2.22 BIMC_S_APP_ARB

BRIC Arbiter

2.22.1 BIMC_S_APP_ARB_BRIC_ARBITER

BRIC Arbiter

0x00451000 BIMC_S_APP_ARB_COMPONENT_INFO**Type:** R**Clock:** Config Clock**Reset State:** 0x00000203

Component information registers provide discoverability information on the type of component and instance of each component. These registers are always the very first register in each component's configuration address space and allow for a software routine to walk the configuration address space in steps of 4KB to identify the location of each configuration register space and to which component each 4KB configures.

BIMC_S_APP_ARB_COMPONENT_INFO

Bits	Name	Description
23:16	INSTANCE	Indicates the instance number of this arbiter.
15:8	SUB_TYPE	Identifies this configuration space as belonging to an arbiter. 0x2: ARBITER
7:0	TYPE	Identifies this configuration space as belonging to a component that interfaces to a bus slave. 0x3: SLAVEWAY

0x00451020 BIMC_S_APP_ARB_CONFIGURATION_INFO_0**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each arbiter instance. See register field descriptions for more details.

BIMC_S_APP_ARB_CONFIGURATION_INFO_0

Bits	Name	Description
31	ARB2SW_PIPELINE_EN	When set (1), indicates that a pipeline stage is present between the arbiter and the slaveway.
15:8	WGB_DEPTH	Indicates the depth of write grants buffer, which allows for multiple write commands to be granted ahead of the corresponding write data has flowed through to the slaveway. The depth provides an indication on the range of values of WR_GRANTS_AHEAD register field that will have an effect on the performance of the arbiter.
7:0	FUNCTIONALITY	Indicates that this arbiter instance is capable of using plain or fair round-robin for arbitration of commands. 0x0: ROUND_ROBIN 0x1: FAIR_ROUND_ROBIN 0x2: PRIORITY_RR 0x3: PRIORITY_FRR 0x4: TIERED_RR

0x00451030 BIMC_S_APP_ARB_CONFIGURATION_INFO_1**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Configuration information registers provide information on the capability and configuration of each arbiter instance. See register field descriptions for more details.

BIMC_S_APP_ARB_CONFIGURATION_INFO_1

Bits	Name	Description
31:0	MPORT_CONNECTIVITY	Indicates which masterports can route commands to this arbiter instance. 1-bit per masterport. When a specific bit is set (1), indicates that the masterport corresponding to this bit can route commands to this arbiter instance. When a specific bit is cleared (0), indicates that the masterport corresponding to this bit does not route commands to this arbiter instance.

0x00451200 BIMC_S_APP_ARB_CLOCK_CTRL**Type:** RW**Clock:** Config & Core Clocks**Reset State:** 0x00000001**BIMC_S_APP_ARB_CLOCK_CTRL**

Bits	Name	Description
0	CORE_CLOCK_GATING_EN	When set (1), enables activity based clock gating of all registers in this arbiter instance. Activity based clock gating uses architectural clock gates to reduce dynamic power consumption by gating clocks during periods of in-activity. When cleared (0), disables all activity based clock gating by forcing all architectural clock gates to not gate clocks even during periods of in-activity.

0x00451210 BIMC_S_APP_ARB_MODE**Type:** RW**Clock:** Config & Core Clocks**Reset State:** 0x00000000**BIMC_S_APP_ARB_MODE**

Bits	Name	Description
31:28	WR_GRANTS_AHEAD	Number of write commands that can be granted ahead of the corresponding write data bursts. For each write command granted ahead of the corresponding write data, the source route is stored in 'Write Grants Buffer' for routing write data bursts. Range of values is supported is dependent on the depth of 'Write Grants Buffers', as indicated in WGB_DEPTH in CONFIGURATION_INFO registers. Any setting larger than WGB_DEPTH is treated similar to a setting equal to WGB_DEPTH.

2.23 BIMC_S_DDR0_ARB

Bits	Name	Description
12	WBUFC_PIPE	Write buffer coalescing logic pipe-line stage
8	RDOPT_PIPE	Read optimizer pipe-line stage
4	ACHAN_INTF_PIPE	Enabled when arbiter output is combinatorial
0	ADDR_DECODE_HT	

0x00448100 BIMC_S_DDR0_SCMO_INTERRUPT_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt status register indicating AXI bus error occurred

BIMC_S_DDR0_SCMO_INTERRUPT_STATUS

Bits	Name	Description
0	ERR_OCCURRED	Error Status flag to indicate that an error has occurred.

0x00448108 BIMC_S_DDR0_SCMO_INTERRUPT_CLEAR**Type:** W**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt clear register

BIMC_S_DDR0_SCMO_INTERRUPT_CLEAR

Bits	Name	Description
0	IRQ_CLR	Writing 1 to this register will clear the interrupt signal.

0x0044810C BIMC_S_DDR0_SCMO_INTERRUPT_ENABLE**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interrupt enable register

BIMC_S_DDR0_SCMO_INTERRUPT_ENABLE

Bits	Name	Description
0	IRQ_EN	When set, interrupt is generated to processor

0x00448120 BIMC_S_DDR0_SCMO_ESYN_ADDR

Type: R
Clock: Config Clock
Reset State: 0x00000000

Error Address Register.

This register contains the address of the request that caused the AXI bus error. The error address is locked with the first error address.

BIMC_S_DDR0_SCMO_ESYN_ADDR

Bits	Name	Description
31:0	ERR_ADDR_L	The address[31:0] of the request that caused the bus error

0x00448128 BIMC_S_DDR0_SCMO_ESYN_APACKET_0

Type: R
Clock: Config Clock
Reset State: 0x00000000

Error Command Attributes Register 0.

This register provides request ID that caused the AXI bus error. It is sticky register and holds information related to the first error.

BIMC_S_DDR0_SCMO_ESYN_APACKET_0

Bits	Name	Description
31:16	ERR_ATID	Transfer ID of the request that caused the bus error.
15:0	ERR_AMID	Master ID of the request that caused the bus error.

0x0044812C BIMC_S_DDR0_SCMO_ESYN_APACKET_1

Type: R
Clock: Config Clock
Reset State: 0x00000000

Error Command Attributes Register 1.

This register provides various information about the request that caused the AXI bus error. It is sticky register and holds information related to the first error.

BIMC_S_DDR0_SCMO_ESYN_APACKET_1

Bits	Name	Description
24	ERR_CODE	Indicates address decode error. Writes to this field are ignored. 0x0: NO_ERROR 0x1: ADDRESS_DECODE_ERROR
19:16	ERR_ALEN	The burst length of the request that caused bus error
15:13	ERR_ASIZE	The ASIZE of the request that caused the bus error 0x0: BYTE 0x1: HALF_WORD 0x2: WORD 0x3: DOUBLE_WORD
12	ERR_ABURST	The ABURST of the request that caused the bus error
8	ERR_AEXCLUSIVE	The AEXCLUSIVE of the request that caused the bus error
4	ERR_APROTNS	The APROTNS of the request that caused the bus error.
2	ERR_AOOORD	The AOOORD of the request that caused the bus error
1	ERR_AOOOWR	The AOOOWR of the request that caused the bus error
0	ERR_AWRITE	The awrite of the request that caused bus error

0x00448130 BIMC_S_DDR0_SCMO_ESYN_APACKET_2**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Error Command Attributes Register 2.

This register provides request ID that caused the AXI bus error. It is sticky register and holds information related to the first error.

BIMC_S_DDR0_SCMO_ESYN_APACKET_2

Bits	Name	Description
4:0	ERR_AVMID	AVMID of the request that caused the bus error.

0x00448200 BIMC_S_DDR0_SCMO_CLOCK_CTRL**Type:** RW**Clock:** Config Clock**Reset State:** 0x00111111

This register contains Clock-gating enable signals.

BIMC_S_DDR0_SCMO_CLOCK_CTRL

Bits	Name	Description
31:21	RFU_31_21	Reserved for future use
20	CFG_WR_CORE_CG_EN	Dynamic clock gating enable for core clock to synchronize config settings whenever Config registers get updated.
16	PEN_CMD_CG_EN	Dynamic clock gating enable for pending command flow.
12	RCH_CG_EN	Dynamic clock gating enable for read data and response flow.
8	FLUSH_CG_EN	Dynamic clock gating enable for write buffer flush flow.
4	WCH_CG_EN	Dynamic clock gating enable for Write data and response flow.
0	ACH_CG_EN	Dynamic clock gating enable for Command flow.

0x00448400 BIMC_S_DDR0_SCMO_SLV_INTERLEAVE_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Interleaved Slave Configuration Register.

BIMC_S_DDR0_SCMO_SLV_INTERLEAVE_CFG

Bits	Name	Description
9:8	RANK_INTERLEAVE	Defines whether a channel is rank interleaved or not; Rank interleaving can be selected between 1KB, 2KB, 4KB boundary. 0x0: DISABLE 0x1: RANK_INTLV_1K 0x2: RANK_INTLV_2K 0x3: RANK_INTLV_4K
7:5	RFU_7_5	Reserved for future use
4	INTERLEAVE_CS1	Defines whether Rank1 is channel interleaved or not. It defines the way that bus system slave reconstructs the system address for MPU, error capture. 0x0: DISABLED 0x1: INT_1K
3:1	RFU_3_1	Reserved for future use
0	INTERLEAVE_CS0	Defines whether Rank0 is channel interleaved or not. It defines the way that bus system slave reconstructs the system address for MPU, error capture. 0x0: DISABLED 0x1: INT_1K

**0x00448410+ BIMC_S_DDR0_SCMO_ADDR_BASE_CS_n, n=[0..1]
0x4*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Base Address Register for Rank n

This register defines the base address for the memory that associates to chip select n.

BIMC_S_DDR0_SCMO_ADDR_BASE_CS_n

Bits	Name	Description
15:10	RFU_15_10	Reserved for future use
9:2	ADDR_BASE	Defines the Base Address decode, in conjunction with the ADDR_MAP_CS _n , n = [0,1], to determine the address space of the targeted chip select. The Base Address is compared to the upper AXI address. If the portions of the two addresses match, then the particular CS is accessed.
1:0	RFU_1_0	Reserved for future use

**0x00448420+ BIMC_S_DDR0_SCMO_ADDR_MAP_CS_n, n=[0..1]
0x4*n****Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Address Mapping Register for Rank n.

This register defines the way to map AXI system address into rank/bank/row/column address to memory devices.

Once the number of bank, row size and column size are defined, the memory size of the associated rank is defined.

BIMC_S_DDR0_SCMO_ADDR_MAP_CS_n

Bits	Name	Description
15	RANK_EN	Rank has memory devices attached 0x0: RANK_NOT_PRESENT 0x1: RANK_IS_PRESENT
14:13	RFU_14_13	Reserved for future use

BIMC_S_DDR0_SCMO_ADDR_MAP_CS_n (cont.)

Bits	Name	Description
12	ADDR_MODE	Addressing Mode Configuration. Selects the Addressing Mode of the Rank and determines the mapping of the System Address to the Memory Address. Linear addressing mode is configuring as 'Rank,Bank,Row,Column'. Bank interleaved addressing mode is configuring as 'Rank,Row,Bank,Column' mode. RK = Rank, R = Row, B = Bank, C=Column. For high tier products linear addressing mode of RKBRC is not supported 0x0: RKRBC 0x1: RKBRC
11:9	RFU_11_9	Reserved for future use
8	BANK_SIZE	Specifies the number of banks in the memory device. NOTE: For high tier products only 8 banks are supported. 0x0: BANKS_4 0x1: BANKS_8
7:6	RFU_7_6	Reserved for future use
5:4	ROW_SIZE	Specifies the number of bits used for the row address of the external memory 0x0: ROWS_13 0x1: ROWS_14 0x2: ROWS_15 0x3: ROWS_16
3:2	RFU_3_2	Reserved for future use
1:0	COL_SIZE	Specifies the number of bits used for the column address of the external memory 0x0: COLS_8 0x1: COLS_9 0x2: COLS_10 0x3: COLS_11

0x00448430+ BIMC_S_DDR0_SCMO_ADDR_MASK_CS_n, n=[0..1]
0x4*n

Type: RW

Clock: Config Clock

Reset State: 0x00000000

Address Size Mask Register for Rank n

This register defines the memory capacity of memory that associates to chip select n.

BIMC_S_DDR0_SCMO_ADDR_MASK_CS_n

Bits	Name	Description
15:10	RFU_15_10	Reserved for future use
9:2	ADDR_MASK	Define the address size mask bits. Note: For high tier products 64MB and 128MB are reserved. All other values not specified are reserved. 0x0: RESERVED 0x80: DENSITY_8GB 0xC0: DENSITY_4GB 0xE0: DENSITY_2GB 0xF0: DENSITY_1GB 0xF8: DENSITY_512MB 0xFC: DENSITY_256MB 0xFE: DENSITY_128MB 0xFF: DENSITY_64MB
1:0	RFU_1_0	Reserved for future use

0x00448450 BIMC_S_DDR0_SCMO_SLV_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000031

SCMO Status Register.

BIMC_S_DDR0_SCMO_SLV_STATUS

Bits	Name	Description
15:8	GLOBAL_MONS_IN_USE	Global monitors that have been reserved for use. This is defined in one-hot encoded value.
5:4	RANK_IDLE	This indicates that there are no read and write commands existing to the corresponding rank. But there could be read and write responses pending. Bit 0 corresponds to Rank 0 and bit 1 corresponds to Rank 1
0	SLAVE_IDLE	This indicates that there are no commands existing and all read and write responses have been sent.

0x00448460 BIMC_S_DDR0_SCMO_GLOBAL_MON_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000010

SCMO GLobal Monitor Configuration Register.

BIMC_S_DDR0_SCMO_GLOBAL_MON_CFG

Bits	Name	Description
4	EXCMD_ADDR_GRAN	Defines the exclusive access's address granularity to either 128-bit or 64-bit 0x1: GRANULARITY_128_BIT 0x0: GRANULARITY_64_BIT
3:2	RFU_3_2	Reserved for future use
1	CLR_EXMON_EN	Enable/disable request generation whenever any exclusive monitor gets cleared 0x0: DISABLE 0x1: ENABLE
0	EXRD_RESP	Defines exclusive read response to be sent when there are no global monitors available. When set to 1, EXRD response shall be EXOKAY irrespective of the global monitor availability. When set to 0, EXRD response shall be OKAY if there are no global monitors available. 0x0: EXOKAY_OR_OKAY 0x1: EXOKAY_ONLY

0x00448500 BIMC_S_DDR0_SCMO_CMD_BUF_CFG

Type: RW

Clock: Config Clock

Reset State: 0x00000001

SCMO Command buffers Configuration Register.

BIMC_S_DDR0_SCMO_CMD_BUF_CFG

Bits	Name	Description
11:10	RFU_11_10	Reserved for future use
9:8	CMD_ORDERING	Defines command reordering strategy 0x0: REORDERING 0x1: IN_ORDER_PER_MASTER 0x2: IN_ORDER_GLOBALLY 0x3: RESERVED
4	HP_CMD_AREQPRIO_MAP	Defines which commands are considered as high priority based on AXI Areqpriority. These commands are allocated to command buffers reserved for high priority requests. 0x0: PRIORITY3 0x1: PRIORITY3_AND_2

BIMC_S_DDR0_SCMO_CMD_BUF_CFG (cont.)

Bits	Name	Description
3	RFU_3	Reserved for future use
2:0	HP_CMD_Q_DEPTH	Defines number of command buffer entries reserved for high priority requests. NOTE: Configuration values 3,4,5 are mainly used for profiling/debug purposes 0x0: BUFFERS_0 0x1: BUFFERS_2 0x2: BUFFERS_3 0x3: BUFFERS_4 0x4: BUFFERS_5 0x5: BUFFERS_6

0x00448520 BIMC_S_DDR0_SCMO_CMD_BUF_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000000

Command buffers status register.

BIMC_S_DDR0_SCMO_CMD_BUF_STATUS

Bits	Name	Description
7:4	HP_CMD_BUF_ENTRIES_IN_USE	The number of HP command buffer entries that have been reserved for use.
3:0	LP_CMD_BUF_ENTRIES_IN_USE	The number of LP command buffer entries that have been reserved for use.

0x00448540 BIMC_S_DDR0_SCMO_RCH_SELECT**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

AXI read channel to Master port mapping configuration register

BIMC_S_DDR0_SCMO_RCH_SELECT

Bits	Name	Description
31:16	DYNAMIC_RCH_SELECT	Enables dynamic read channel selection based on fifo occupancy per each master port. Each bit index corresponds to port ID 0x0: DISABLE 0x1: ENABLE
15:0	RCH_PORTS	Defines each master port assignment to one of the dual read Channels. Each bit index corresponds to port ID 0x0: RCH0 0x1: RCH1

0x00448544 BIMC_S_DDR0_SCMO_RCH_BKPR_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Read Channel data fifos backpressure threshold configuration register.

NOTE: RCH0/1_FIFO_BKPR_HI_TH = RCH0/1_DEPTH - Max read transfer burst length from all masters to SCMO.

Example: RCH0/1_FIFO_BKPR_HI_TH = 32 - 16 = 16.

BIMC_S_DDR0_SCMO_RCH_BKPR_CFG

Bits	Name	Description
31:24	RCH1_FIFO_BKPR_HI_TH	Back pressure assertion threshold for the read channel1 data FIFO. Back pressure is asserted if the data FIFO occupancy is greater than or equal to this value. When back pressure is asserted, no more read commands can be executed
23:16	RCH1_FIFO_BKPR_LO_TH	Back pressure de-assertion threshold for the read channel1 data FIFO. Back pressure is de-asserted if the data FIFO occupancy is lower than or equal to this value. When back pressure is de-asserted, read commands are allowed to execute. NOTE: It must be less than or equal to high threshold. Recommended setting: Same value as RCH1_FIFO_BKPR_HI_TH
15:8	RCH0_FIFO_BKPR_HI_TH	Back pressure assertion threshold for the read channel0 data FIFO. Back pressure is asserted if the data FIFO occupancy is greater than or equal to this value. When back pressure is asserted, no more read commands can be executed

BIMC_S_DDR0_SCMO_RCH_BKPR_CFG (cont.)

Bits	Name	Description
7:0	RCH0_FIFO_BKPR_LO_TH	Back pressure de-assertion threshold for the read channel0 data FIFO. Back pressure is de-asserted if the data FIFO occupancy is lower than or equal to this value. When back pressure is de-asserted, read commands are allowed to execute. NOTE: It must be less than or equal to high threshold. Recommended setting: Same value as RCH0_FIFO_BKPR_HI_TH

0x00448560 BIMC_S_DDR0_SCMO_RCH_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00011111

Read Channel status register.

BIMC_S_DDR0_SCMO_RCH_STATUS

Bits	Name	Description
17	PRQ_FIFO_FULL	Full status of the pending read command FIFO.
16	PRQ_FIFO_EMPTY	Empty status of the pending read command FIFO.
13	RCH1_QUAL_FIFO_FULL	Full status of the CH1 read resp FIFO
12	RCH1_QUAL_FIFO_EMPTY	Empty status of the CH1 read resp FIFO.
9	RCH1_DATA_FIFO_FULL	Full status of the CH1 read data FIFO
8	RCH1_DATA_FIFO_EMPTY	Empty status of the CH1 read data FIFO.
5	RCH0_QUAL_FIFO_FULL	Full status of the CH0 read resp FIFO
4	RCH0_QUAL_FIFO_EMPTY	Empty status of the CH0 read resp FIFO.
1	RCH0_DATA_FIFO_FULL	Full status of the CH0 read data FIFO
0	RCH0_DATA_FIFO_EMPTY	Empty status of the CH0 read data FIFO.

0x00448580 BIMC_S_DDR0_SCMO_WCH_BUF_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Write Buffer Configuration Register

BIMC_S_DDR0_SCMO_WCH_BUF_CFG

Bits	Name	Description
7:5	RFU_7_5	Reserved for future use
4	WRITE_BLOCK_READ	When set, no read command is allowed to execute while there is any write data in the buffer. NOTE: When WRITE_BLOCK_READ = 1, CMD_ORDERING must be 2. This must be HIGH mainly for profiling/ debug purposes only.
3:1	RFU_3_1	Reserved for future use
0	COALESCE_EN	Enable write coalescing where in data from separate AXI bursts will be coalesced. This must be LOW mainly for profiling/ debug purposes only.

0x004485A0 BIMC_S_DDR0_SCMO_WCH_STATUS**Type:** R**Clock:** Config Clock**Reset State:** 0x00000111

Write data, response and Coalescing Write Buffer Status Registers

BIMC_S_DDR0_SCMO_WCH_STATUS

Bits	Name	Description
9	BRESP_FIFO_FULL	Full status of the Write response FIFO
8	BRESP_FIFO_EMPTY	Empty status of the Write response FIFO.
5	WDATA_FIFO_FULL	Full status of the Write data FIFO
4	WDATA_FIFO_EMPTY	Empty status of the Write data FIFO.
1	WBUF_FULL	Set when all of the Write Coalescing Buffers contains valid data.
0	WBUF_EMPTY	Set when none of the Write Coalescing Buffers contains any valid data.

0x004485C0 BIMC_S_DDR0_SCMO_FLUSH_CFG**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

Write Buffer Flush Configuration Register.

BIMC_S_DDR0_SCMO_FLUSH_CFG

Bits	Name	Description
31	BL16_ALIGN_FLUSH_EN	For LPDDR4 only. When 0x1, Enables the Burst Length BL16 aligned FLUSH.
30:29	RFU_30_29	Reserved for future use
28	FLUSH_IN_ORDER	Write Coalescing Buffer lines are flushed in the order in which they were allocated. NOTE: When FLUSH_IN_ORDER = 1, COALESCE_EN must be 0. This must be HIGH mainly for profiling/debug purposes only
27:26	RFU_27_26	Reserved for future use
25:16	FLUSH_IDLE_DELAY	After the controller is idle for FLUSH_IDLE_DELAY AXI cycles, the Write Buffer will be flushed. Recommended setting: 0x7F. Min setting: 0x4
15:12	RFU_15_12	Reserved for future use
11:8	FLUSH_UPPER_LIMIT	The flush high water mark. Flushing will be given higher priority when the number of valid lines in the Write Coalescing Buffer is greater than FLUSH_UPPER_LIMIT. Recommended setting: 0xD
7:4	RFU_7_4	Reserved for future use
3:0	FLUSH_LOWER_LIMIT	The flush low water mark. Buffers are considered for flush when the number of valid lines is greater than FLUSH_LOWER_LIMIT. Once flushing has begun, lines may get flushed until the number of valid lines is less than or equal to FLUSH_LOWER_LIMIT. Recommended setting: 0x8

0x004485C4 BIMC_S_DDR0_SCMO_FLUSH_CMD**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

SW FLush All Buffer Command Register

BIMC_S_DDR0_SCMO_FLUSH_CMD

Bits	Name	Description
3:2	RFU_3_2	Reserved for future use

BIMC_S_DDR0_SCMO_FLUSH_CMD (cont.)

Bits	Name	Description
1:0	FLUSH_ALL_BUF	SW: Set, HW: Clear SW trigger to flush the Write Coalescing Buffers of selected rank when corresponding bit set. Hardware will clear this field when flush of all the buffers to corresponding rank completed. SW must flush all buffers before entering sleep/ power collapse.

0x00448700 BIMC_S_DDR0_SCMO_CMD_OPT_CFG0**Type:** RW**Clock:** Config Clock**Reset State:** 0x00010000

DDR Command Optimization Configuration register 0.

This register is used to define the page management policy, RW optimizer preferences, and output command override controls.

BIMC_S_DDR0_SCMO_CMD_OPT_CFG0

Bits	Name	Description
23:21	RFU_23_21	Reserved for future use
20	IGNORE_BANK_UNAVL	When set, command execution ignores rank/bank unavailable inputs. When cleared, commands are allowed to be executed only if the corresponding rank/bank is available
19:18	RFU_19_18	Reserved for future use
17:16	MASK_CMDOUT_PRI	When 0x1, Mask priority of commands issued to DPE completely. When 0x0, AREQ=3 as well as timeout command priority is propagated to DPE. When 0x2, Mask priority of timeout commands issued to DPE (only AREQ=3 is passed on to DPE as high priority). NOTE: When DPE_CMD_REORDERING=0, MASK_CMDOUT_PRI must be 1 0x0: NO_MASK 0x1: AREQ_AND_TIMEOUT_MASK 0x2: TIMEOUT_MASK_ONLY 0x3: RESERVED
15:13	RFU_15_13	Reserved for future use
12	DPE_CMD_REORDERING	When cleared, forces output command order. When set, output commands are allowed to be reordered by protocol engine based corresponding dependency vector.
11:9	RFU_11_9	Reserved for future use

BIMC_S_DDR0_SCMO_CMD_OPT_CFG0 (cont.)

Bits	Name	Description
8	WR_OPT_EN	Indicates whether DDR page hit optimizations enabled in the write optimizer.
7:5	RFU_7_5	Reserved for future use
4	RD_OPT_EN	Indicates whether DDR page hit optimizations enabled in the read optimizer.
3:1	RFU_3_1	Reserved for future use
0	PAGE_MGMT_POLICY	Controls how HW manages DRAM pages. 0x0: KEEP_PAGE_OPEN 0x1: CLOSE_AFTER_EACH_ACCESS

0x00448704 BIMC_S_DDR0_SCMO_CMD_OPT_CFG1**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

DDR Command Optimization Configuration register 1.

This register is used to define the read command time-out settings per priority level.

NOTE: Programmed values must be HSTP_CMD_TIMEOUT < HP_CMD_TIMEOUT < MP_CMD_TIMEOUT < LP_CMD_TIMEOUT

BIMC_S_DDR0_SCMO_CMD_OPT_CFG1

Bits	Name	Description
31:29	RFU_31_29	Reserved for future use
28:24	HSTP_CMD_TIMEOUT	Specifies the number of times highest-priority read command can be skipped for any other read command or write buffer flush. 0x0: RESERVED
23:21	RFU_23_21	Reserved for future use
20:16	HP_CMD_TIMEOUT	Specifies the number of times high-priority read command can be skipped for any other read command or write buffer flush. 0x0: RESERVED
15:13	RFU_15_13	Reserved for future use
12:8	MP_CMD_TIMEOUT	Specifies the number of times mid-priority read command can be skipped for any other read command or write buffer flush. 0x0: RESERVED
7:5	RFU_7_5	Reserved for future use

BIMC_S_DDR0_SCMO_CMD_OPT_CFG1 (cont.)

Bits	Name	Description
4:0	LP_CMD_TIMEOUT	Specifies the number of times low-priority read command can be skipped for any other read command or write buffer flush. 0x0: RESERVED

0x00448708 BIMC_S_DDR0_SCMO_CMD_OPT_CFG2**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

DDR Command Optimization Configuration register 2.

This register is used to define the read/write command time-out settings for R/W Optimizer.

BIMC_S_DDR0_SCMO_CMD_OPT_CFG2

Bits	Name	Description
15:12	RFU_15_12	Reserved for future use
11:8	RWOPT_WR_CMD_TIMEOUT	Defines number of times high threshold write buffer flush command can be skipped. 0x0: RESERVED
7:4	RFU_7_4	Reserved for future use
3:0	RWOPT_RD_CMD_TIMEOUT	Defines number of times high priority/timed-out read command can be skipped. 0x0: RESERVED

0x0044870C BIMC_S_DDR0_SCMO_CMD_OPT_CFG3**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

DDR Command Optimization Configuration register 3.

This register is used to define the flush command time-out settings for WR Optimizer.

BIMC_S_DDR0_SCMO_CMD_OPT_CFG3

Bits	Name	Description
31:21	RFU_31_21	Reserved for future use

BIMC_S_DDR0_SCMO_CMD_OPT_CFG3 (cont.)

Bits	Name	Description
20:16	WROPT_CMD_TIMEOUT	Defines number of times high threshold buffer flush not treated as high priority. 0x0: RESERVED
15:5	RFU_15_5	Reserved for future use
4:0	FLUSH_CMD_TIMEOUT	Defines number of times SW flush or flush on idle command can be skipped. 0x0: RESERVED

0x00448710 BIMC_S_DDR0_SCMO_CMD_OPT_CFG4**Type:** RW**Clock:** Config Clock**Reset State:** 0x00000000

DDR Command Optimization Configuration register 4.

This register is used to define the mask control settings for write buffer and read queues settings for Command Optimizer.

BIMC_S_DDR0_SCMO_CMD_OPT_CFG4

Bits	Name	Description
7:5	RFU_7_5	Reserved for future use
4	MASK_WRQ_FULL	When 0x1, Masks the write data buffer full, almost full or stall status (wrq_full) to the Arbiter completely. When 0x0, Allows the write data buffer status to propagate to the Arbiter. This helps to back pressure the Arbiter from not granting anymore writes.
3:1	RFU_3_1	Reserved for future use
0	MASK_RDQ_FULL	When 0x1, Masks the read channel FIFO status (rdq_full, rdq_almost_full) to the Arbiter completely. When 0x0, Allows the read channel status to propagate to the Arbiter. This helps to back pressure the Arbiter from not granting read request from those masters.

2:0	FREQ_SET_POINT_REG_I N_USE	Frequency Set Point shadow register's index. Register's value is between 0 to 7, 0 being the original registers'

2.27 BIMC_S_DDR0_DPE_ABHN_DPE**0x0044C010 BIMC_S_DDR0_DPE_CONFIG_0****Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DDR Memory Configuration Register 0.

This register is used to setup the DRAM configuration in the DDR controller.

BIMC_S_DDR0_DPE_CONFIG_0

Bits	Name	Description
29:28	CA_BUS_OE_CTRL	When enabled, the design can indicate to the PHY to tri-state the command address bus. This is required as a shunt resistance is typically used in the command address path for PCDDR3 memory boards and hence will always burn power if the command address bus is always driven. The two scenarios wherein the bus can be tri-stated are (1) when all ranks are in self refresh and the memory clocks are off or (2) when all ranks are in powerdown. 0x0: DISABLED (DISABLED (default) (dpe_phy_pad_oe_ca is always driven to 1'b1. The CA bus is always in output mode.)) 0x1: SR_ONLY (SR_ONLY (dpe_phy_pad_oe_ca is only driven to 1'b0 when both ranks are in self refresh and the clock to the memory device has been turned off.)) 0x2: SR_OR_PWR_DN (SR_OR_PWR_DN (dpe_phy_pad_oe_ca is driven to 1'b0 when both ranks are in self refresh and the clock to the memory device has been turned off or when both ranks are in powerdown)) 0x3: RESERVED (RESERVED)
24	RD_BEAT_NDX_OOO	Setting this bit will enable the DPE to return read data beats to the front end out of order. dpe_cmd_rd_reseq will indicate that a transaction will have beats out of order, and the change in order will be reflected on the dpe_rdata_ndx port. This can be enabled for LPDDR2/3. This CSR has no effect on PCDDR3, as the read beat index will return out of order based on the column address by default for that memory type. 0x0: IN_ORDER (IN_ORDER (beats for a read are always returned in incrementing order) (Example: 0, 1, 2, 3, 4, 5, 6, 7)) 0x1: OOO (OOO (beats for a read can be returned in non-incrementing order) (Example: 0, 1, 6, 7, 2, 3, 4, 5))
20	DDR_WR_MASK_POLARITY	This bit is used to set the polarity for the write byte mask. LPDDR2/3 and PCDDR3 should use the default value '0'. 0x0: ACTIVE_HIGH (ACTIVE_HIGH (a high level will mask the corresponding byte from being written - default for LPDDR2)) 0x1: ACTIVE_LOW (ACTIVE_LOW (a low level will mask the corresponding byte from being written))
17:16	DEVICE_TYPE	Type of memory device 0x0: LPDDR2 (LPDDR2 (default)) 0x1: PCDDR3 (PCDDR3) 0x2: LPDDR3 (LPDDR3) 0x3: PCDDR4 (PCDDR4)

BIMC_S_DDR0_DPE_CONFIG_0 (cont.)

Bits	Name	Description
11:10	DEVICE_CFG_RANK1	Device Configuration for Rank 1. This is required for SRR in order to update the refresh rate correctly if multiple devices are involved. If all x8 individual memory devices are used, then select '00'. If all x16 individual memory devices are used, then select '01'. If all x32 individual memory devices are used, then select '10'. If all x64 individual memory devices are used, then select '11'. 0x0: X8_X8_X8_X8 (X8_X8_X8_X8 (default)) 0x1: X16_X16 (X16_X16) 0x2: X32 (X32) 0x3: X64 (X64)
9:8	DEVICE_CFG_RANK0	Device Configuration for Rank 0. This is required for SRR in order to update the refresh rate correctly if multiple devices are involved. If all x8 individual memory devices are used, then select '00'. If all x16 individual memory devices are used, then select '01'. If all x32 individual memory devices are used, then select '10'. If all x64 individual memory devices are used, then select '11'. 0x0: X8_X8_X8_X8 (X8_X8_X8_X8 (default)) 0x1: X16_X16 (X16_X16) 0x2: X32 (X32) 0x3: X64 (X64)
4	SHARED_CLK	Rank Clock Configuration. 0x0: UNSHARED_CLK (UNSHARED_CLK (default)) 0x1: SHARED_CLK (SHARED_CLK (Rank 0 and Rank 1 have the same clock))
0	DDR_CMD	Specify if Device command bus is Double Data Rate (in addition to the data bus). This needs to be enabled (1) for LPDDR2/3 SDRAM devices and disabled for PCDDR3 SDRAM devices. 0x0: SDR_ON_CMD (SDR_ON_CMD (default)) 0x1: DDR_ON_CMD (DDR_ON_CMD)

0x0044C014 BIMC_S_DDR0_DPE_CONFIG_1**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DDR Memory Configuration Register 1.

This register is used to setup the DRAM configuration in the DDR controller.

BIMC_S_DDR0_DPE_CONFIG_1

Bits	Name	Description
31:24	PERIOD_BUS_THRESHOLD_POWER_MODE	Indicates the core clock frequency (in 100ps granularity) threshold for the controller to enable low power mode to the PHY. If the current core clock frequency is less than this threshold, then low power mode is enabled for the PHY and the corresponding pads. This value will be considered valid if CONFIG_1[PAD_POWER_MODE] is enabled and CONFIG_1[PAD_POWER_MODE_CTRL] is set to 0.
20	PAD_POWER_MODE_CTRL	Indicates if HW automatically controls the pad power mode to the PHY based on the current frequency of operation. If set to 1, then SW needs to program the values in DRAM_TIMING_16[PAD_MODE] depending on the current frequency of operation. SW would also be required to setup the new value before a frequency switch event. If set to 0, then HW automatically changes the power mode based on CONFIG_1[PERIOD_BUS_THRESHOLD_POWER_MODE] and the current frequency of operation and also would handle changes in the power mode based on frequency switch events. The value of this CSR is only valid if CONFIG_1[PAD_POWER_MODE] is enabled. If operating in cycle-based mode, the only allowed value is '1'. 0x0: HW_CTRL (HW_CTRL(default)) 0x1: SW_CTRL (SW_CTRL)
16	PAD_POWER_MODE	A value of '0' is required for chips which use Gen2 PHY whereas a value of '1' is recommended for chips which use Gen1 PHY. 0x0: DISABLED (DISABLED (default, Drive to high power mode)) 0x1: ENABLED (ENABLED (Power mode is controlled by the memory controller))
12:8	NUM_BANKS_RANK1	Number of banks for Rank 1
4:0	NUM_BANKS_RANK0	Number of banks for Rank 0

0x0044C018 BIMC_S_DDR0_DPE_CONFIG_2**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DDR Memory Configuration Register 2.

This register is used to setup the DRAM configuration in the DDR controller.

BIMC_S_DDR0_DPE_CONFIG_2

Bits	Name	Description
29:28	TIMING_MODE	Command Interface timing relative to the chip select. This is necessary to provide an option to guarantee an additional cycle for the command interface signals to propagate to the DRAM device and settle (to meet input setup requirements) before being clocked in. This must be set to 00 for LPDDR2/3 (TM_1T). 1T, 2T and 3T is supported for PCDDR3. 0x0: TM_1T (TM_1T (Default: Address and command can be driven in the same cycle as the chip select)) 0x1: TM_2T (TM_2T (Address and command must be driven at least 1 cycle before chip select is asserted)) 0x2: TM_3T (TM_3T) 0x3: RESERVED (RESERVED)
24:20	DDR_BURST_LEN	Specifies the Memory Burst Length. For LPDDR2, only 4 and 8 are valid. LPDDR3 only supports burst length of 8. PCDDR3 supports burst length of 8 only. BL of 16 is not supported. 0x4: BL_OF_4 (BL_OF_4) 0x8: BL_OF_8 (BL_OF_8) 0x10: BL_OF_16 (BL_OF_16)
16	WR_DQS_EARLY	Indicates if the DQS needs to toggle one cycle before the write data is driven. This needs to be set based on the specific SDRAM device present. This is to be enabled for LPDDR3 and PCDDR3 devices, and disabled for LPDDR2 devices. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
12	DDR_CK_ON_DBG	Debug mode in which the clock to the memory device will continuously run regardless of the state of the memory (CSPD, Self Refresh). 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED (Enable Debug Mode))
11:8	MRR_BURST_LEN	The Memory burst length of a Mode Register Read. This is used for LPDDR2/3 memory only. For LPDDR2, this is 4 beats, while for LPDDR3 this is 8 beats. 0x4: BL4 (BL4) 0x8: BL8 (BL8)
5:4	BURST_RD_START	Specifies the starting column address restrictions for a read operation. This field needs to be set depending on the specific SDRAM device. For LPDDR2/3 use '00'. For PCDDR3, use '01'. This is currently not supported. 0x0: ADDRS_0_2_4 (ADDRS_0_2_4 (default- addresses of 0,2,4,6 etc)) 0x1: ADDRS_0_4_8 (ADDRS_0_4_8 (addresses of 0,4, etc)) 0x2: ADDRS_0_ONLY (ADDRS_0_ONLY (addresses of 0 only) 11: (invalid))

BIMC_S_DDR0_DPE_CONFIG_2 (cont.)

Bits	Name	Description
1:0	BURST_WR_START	Specifies the starting column address restrictions for a write operation. This field needs to be set depending on the specific SDRAM device. For LPDDR2/3 use '00'. For PCDDR3, use '01'. This is currently not supported. 0x0: ADDRS_0_2_4 (ADDRS_0_2_4 (default- addresses of 0,2,4,6 etc)) 0x1: ADDRS_0_4_8 (ADDRS_0_4_8 (addresses of 0,4, etc)) 0x2: ADDRS_0_ONLY (ADDRS_0_ONLY (addresses of 0 only) 11: (invalid))

0x0044C01C BIMC_S_DDR0_DPE_CONFIG_3**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DDR Memory Configuration Register 3.

This register is used to setup the DRAM configuration in the DDR controller.

BIMC_S_DDR0_DPE_CONFIG_3

Bits	Name	Description
28	DIST_LOAD_CTRL	This will enable duplication of cs_n, cke and odt signals in order to ease timing for multi-t by distributing the load of these signals. This is for single rank systems only. When enabled, cs_n[1] = cs_n[0], cke[1] = cke[0] and odt[1] = odt[0]. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
26:24	REF_DEFICIT_WTRMRK	Number of refreshes to postpone. This field allows the design to postpone up to 7 refreshes to increase performance. When set to 0, all refreshes are 'urgent' and will be issued immediately. When set to a non-zero value, the controller will postpone this number of refreshes in the presence of RD/WR traffic. Once the controller has postponed REF_DEFICIT_WTRMRK refreshes, each additional outstanding refresh will be treated as 'urgent' and will be issued to the memory device immediately. The design will catch up on the postponed refreshes only when there is no RD/WR traffic in the command queue for the rank and when all the pages to the device are closed (for example due the expiration of the PG_OPEN_TIMER).

BIMC_S_DDR0_DPE_CONFIG_3 (cont.)

Bits	Name	Description
20:16	TREFBW_XO_DIV_6_CYCLES	This field is used to define the amount of time in the burst refresh window for LPDDR2 and LPDDR3. See MAX_REFRESHES_TREFBW to disable tREFBW for PCDDR devices. This value will not vary with the frequency of the DPE core clock. The value programmed for TREFBW_XO_DIV_6_CYCLES is if largest_tRFCab < 210 ns { TREFBW_XO_DIV_6_CYCLES = ROUND_UP(32x tRFCab / (Txo*6)) + 1; } else { TREFBW_XO_DIV_6_CYCLES = ROUND_UP(32 x tRFCab / (Txo*6)); } where Txo = the period of the tcxo clock. largest_tRFCab = largest of the tRFCab values on either rank as specified in ns in the specification or data sheet. e.g., largest_tRFCab = 210 ns, tcxo=19.2 MHz gives RU(6720 ns/ 312.5 ns) = 22 decimal largest_tRFCab = 130 ns, tcxo = 19.2 MHz gives RU(4160/312.5) + 1 = 15 decimal.
14:12	MAX_REFRESHES_TREFBW	This indicates the maximum number of refreshes allowed in the TREFBW rolling window. This only applies to LPDDR2 and LPDDR3 as a means to limit the maximum current consumption. Typically, for LPDDR, write 3'b001 for up to 8 all-bank refreshes to be permitted in the tREFBW rolling window. For non-LPDDR devices, this field should be disabled by writing all zeros. Supported values are: 0x0: DISABLED (Disabled (default)) 0x1: EIGHT (EIGHT) 0x2: SEVEN (SEVEN) 0x3: SIX (SIX) 0x4: FIVE (FIVE)
8	DRAIN_CQ_ON_SHKE_CMD	This enables draining of commands in the command queue when a housekeeping command is received. The commands drained are only for the destination rank/bank of the housekeeping command. This is currently not supported. 0x0: DISABLE (DISABLE (When a housekeeping command is received, read/write commands to the DDR memory are halted and the house keeping command is driven)) 0x1: ENABLE (ENABLE (Read/write commands are drained only for the destination rank/bank of the housekeeping command))

BIMC_S_DDR0_DPE_CONFIG_3 (cont.)

Bits	Name	Description
4	LOAD_TIMING_ON_FREQ_CHNG	Indicates the active DDR timing registers will be loaded upon a frequency change request. 0x0: DISABLE (DISABLE (Frequency change request will not effect active DDR timing registers) (default)) 0x1: ENABLE (ENABLE (Frequency change request will load active DDR timing registers with values stored in read/writable timing registers.))
1	HW_FREQ_SW_SR_ONLY	This bit overrides the 'HW_FREQ_SWITCH' bit and forces all frequency switches to be done with self refresh regardless of the state of memory ranks. This must be enabled for PCDDR3, as CSPD is not supported. This can be enabled for LPDDR2/3. 0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE)
0	HW_FREQ_SWITCH	This selects between the method for frequency switch, Clockstop Powerdown or Self Refresh. However, design will optimize frequency switch as follows. If any rank is already in self refresh, switch will be done with self refresh. If no rank is already in self refresh but any rank is already in clock stop power down, the switch will be done using clock stop power down. If no rank is already in self refresh or clock stop powerdown, switch will follow the setting of this bit. Note, if HW_FREQ_SW_SR_ONLY is set, the frequency switch will be done with self refresh regardless of this bit. 0x0: SELF_REFRESH (SELF REFRESH) 0x1: CSPD (CSPD)

0x0044C020 BIMC_S_DDR0_DPE_CONFIG_4**Type:** W**Clock:** ACLK**Reset State:** 0x00000000

DDR Memory Configuration Register 4.

This register is used to setup the DRAM configuration in the DDR controller.

BIMC_S_DDR0_DPE_CONFIG_4

Bits	Name	Description
4	RECALC_PS_PARAMS	Writing a 1 to this bit will cause all parameters which are programmed in 100ps units as specified by their corresponding *_IN_PS bit in CONFIG_5/6 to be recalculated by HW. They will not be loaded into the active registers by writing this bit. After writing this bit, the CYC_CALC_VALID bit in MEMC_STATUS_1 should be polled before writing a '1' to LOAD_ALL_CONFIG. Therefore, RECALC should not be written to this bit in the same write as '1' ('LOAD') is written to LOAD_ALL_CONFIG. 0x0: NOP (NOP) 0x1: RECALC (RECALC (1 will kick off calculation of fields specified in pico seconds))
0	LOAD_ALL_CONFIG	Setting this will load the DDR configuration registers for use by the controller. DPE maintains 2 sets of configuration registers: one read/write which can be set by software based on frequency requirements or for other reasons. These can be written at anytime and have no affect on current operation. Another shadow set of registers exists which is actively used by the DPE. Software must load the read/write set, then set this bit to propagate the new settings to the controller. After writing this bit, the SHADOW_REGS_STALE bit in MEMC_STATUS_2 will go to 'UP_TO_DATE' until another write is performed to the control registers. See MEMC_STATUS_2 for more details. 0x0: NOP (NOP (No change in active shadow register set) (default)) 0x1: LOAD (LOAD (1 will load the read only active shadow register set with the values in the R/W set))

0x0044C024 BIMC_S_DDR0_DPE_CONFIG_5**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DDR Memory Configuration Register 5.

If the timing parameter value is only specified in clock cycles as per the JEDEC specification, then it is recommended to set that specific timing parameter in cycle based mode in the CSR below.

If the timing parameter value is only specified in ns as per the JEDEC specification, then it is recommended to set that specific timing parameter in time based mode in the CSR below.

If the timing parameter value is specified such that it has a minimum cycle time requirement as well as a timing parameter value in ns as per the JEDEC specification, then it is recommended to set that specific timing parameter in time based mode in the CSR below.

Each bit in this register indicates if the value stored in the DRAM_TIMING register is in 100ps intervals, or in DDR clock cycles.

DDR Memory Configuration Register 6.

This register is used to setup the DRAM configuration in the DDR controller. These registers are used to enable/disable debug modes for IO stage and Calibrated Delay Circuit interfaces as well as to block activates if necessary for manual SW frequency switch.

BIMC_S_DDR0_DPE_CONFIG_6

Bits	Name	Description
12	DRAM_RD_BURST_ORDER	Some memory devices will return read data in differ net orders, based on the column address. This register is used to identify a specific order of read data. For example, LPDDR2 column read with column_address[2:1]=01 will return data in column order 2 3, 4 5, 6 7, 0 1. However, a PCDDR3 column read with column_address[2:1]=01 will return data in column order 2 3, 0 1, 6 7, 4 5. For PCDDR3, set this to '1'. For LPDDR2 and LPDDR3, set this to '0'. 0x0: INCR_ORDER (INCR_ORDER) 0x1: DECR_ORDER (DECR_ORDER)
9	RANK1_BLK_ACT	Writing a 1 to this bit will block new activates on Rank 1. Clearing allows activates to resume. 'LOAD_ALL_CONFIG' is required before changes to this bit take effect. Usage: Intended for manual SW Freq switch sequence. Set this bit after Rank 1 is in self refresh. Load_all_config. Switch frequency. Exit self refresh. Perform MRWs to update latencies. Clear this bit to allow traffic to resume. Load_all_config. 0x0: NOP (NOP) 0x1: BLOCK (BLOCK)
8	RANK0_BLK_ACT	Writing a 1 to this bit will block new activates on Rank 0. Clearing allows activates to resume. 'LOAD_ALL_CONFIG' is required before changes to this bit take effect. Usage: Intended for manual SW Freq switch sequence. Set this bit after Rank 1 is in self refresh. Load_all_config. Switch frequency. Exit self refresh. Perform MRWs to update latencies. Clear this bit to allow traffic to resume. Load_all_config. 0x0: NOP (NOP) 0x1: BLOCK (BLOCK)

0x0044C040 BIMC_S_DDR0_DPE_ODT_CONFIG_0**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

ODT Configuration Register 0.

This register is used to setup the ODT controls for PCDDR3/LPDDR3 memory devices.

BIMC_S_DDR0_DPE_ODT_CONFIG_0

Bits	Name	Description
9	RANK1_FORCE_ODT	Force Rank1 ODT to be driven high and continuously. Do not set except as part of write leveling sequence as described in the HPG. 0x0: DISABLED (DISABLED (default - normal operation)) 0x1: ENABLED (ENABLED (ODT pin at DRAM device force high continuously))
8	RANK0_FORCE_ODT	Force Rank0 ODT to be driven high and continuously. Do not set except as part of write leveling sequence as described in the HPG. 0x0: DISABLED (DISABLED (default- normal operation)) 0x1: ENABLED (ENABLED (ODT pin at DRAM device force high continuously))
6	RANK1_ODT_ON_WR_RANK1	Enable Rank1 ODT to be driven when write occurs on Rank1. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
5	RANK1_ODT_ON_WR_RANK0	Enable Rank1 ODT to be driven when write occurs on Rank0. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
4	RANK1_ODT_ON_RD_RANK0	Enable Rank1 ODT to be driven when read occurs from Rank0. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
2	RANK0_ODT_ON_WR_RANK1	Enable Rank0 ODT to be driven when write occurs on Rank1. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
1	RANK0_ODT_ON_WR_RANK0	Enable Rank0 ODT to be driven when write occurs on Rank0. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
0	RANK0_ODT_ON_RD_RANK1	Enable Rank0 ODT to be driven when read occurs from Rank1. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)

0x0044C044 BIMC_S_DDR0_DPE_ODT_CONFIG_1

Type: RW

Clock: ACLK

Reset State: 0x00000000

ODT Configuration Register 1.

This register is used to setup the ODT controls for PCDDR3/LPDDR3 memory devices.

BIMC_S_DDR0_DPE_ODT_CONFIG_1

Bits	Name	Description
30:28	ODTH8	Specifies the timing parameter ODTH8 (for PCDDR3) in core clock cycles.
24	SYNC_ODT_DLY_MODE	Specifies whether the synchronous ODT delays specified in this register below are in actual cycles or in terms of the write latency offset (negative offset). For LPDDR3, this needs to be set in cycles whereas for PCDDR3, this needs to be set as write latency offset. 0x0: IN_CYCLES (IN_CYCLES(default)) 0x1: WL_OFFSET (WL_OFFSET)
22:20	SYNC_ODT_ON_DLY	Specifies the synchronous ODT on delay in either clock cycles or write latency offset (negative offset) depending on the value specified in field - SYNC_ODT_DLY_MODE. For LPDDR3, the ODT on delay is specified in ns, hence the value programmed here should be 0. For PCDDR3, this should be set to 2 cycles.
18:16	SYNC_ODT_OFF_DLY	Specifies the synchronous ODT off delay in either clock cycles or write latency offset (negative offset) depending on the value specified in field - SYNC_ODT_DLY_MODE. For LPDDR3, the ODT off delay is specified in ns, hence the value programmed here should be 0. For PCDDR3, this should be set to 2 cycles.
9:8	ODT_OFF_BEFORE_RD	The number of cycles ODT must be disabled before the DRAM returns read data for a read command to that rank. This CSR is specified in read latency offset. This should be set to '1' for LPDDR3, and '2' for PCDDR3.
4	ODT_ON_MIN_POS	Indicates whether the ODT on min delay specified in DRAM_TIMING_23 is positive or negative. For LPDDR3, this needs to be set to POSITIVE whereas for PCDDR3, this needs to be set to NEGATIVE. 0x0: POSITIVE (POSITIVE (default)) 0x1: NEGATIVE (NEGATIVE)
0	ODT_OFF_MIN_POS	Indicates whether the ODT off min delay specified in DRAM_TIMING_23 is positive or negative. For LPDDR3 and PCDDR3, this needs to be set to POSITIVE. 0x0: POSITIVE (POSITIVE (default)) 0x1: NEGATIVE (NEGATIVE)

0x0044C050 BIMC_S_DDR0_DPE_CA_TRAIN_PRE_CS**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE CA Training sequence register 0.

This register is define the first 2 of 6 values driven onto the CA bus during the CA Training session. These two values are driven onto the CA bus before CS goes low (PRE CS). LPDDR3 only.

BIMC_S_DDR0_DPE_CA_TRAIN_PRE_CS

Bits	Name	Description
25:16	CA_BUS_2	This is the 2nd value driven onto the CA bus during the CA training session. LPDDR3 only.
9:0	CA_BUS_1	This is the 1st value driven onto the CA bus during the CA training session. LPDDR3 only.

0x0044C054 BIMC_S_DDR0_DPE_CA_TRAIN_CS**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE CA Training sequence register 1.

This register is define the 3rd and 4th of 6 values driven onto the CA bus during the CA Training session. These two values are driven onto the CA bus while CS is low (During CS). These values should be captured into the DQ bus. LPDDR3 only.

BIMC_S_DDR0_DPE_CA_TRAIN_CS

Bits	Name	Description
25:16	CA_BUS_4	This is the 4th value driven onto the CA bus during the CA training session. LPDDR3 only.
9:0	CA_BUS_3	This is the 3rd value driven onto the CA bus during the CA training session. LPDDR3 only.

0x0044C058 BIMC_S_DDR0_DPE_CA_TRAIN_POST_CS**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE CA Training sequence register 2.

This register is define the 5th and 6th of 6 values driven onto the CA bus during the CA Training session. These two values are driven onto the CA bus after CS went low (POST CS). LPDDR3 only.

BIMC_S_DDR0_DPE_CA_TRAIN_POST_CS

Bits	Name	Description
25:16	CA_BUS_6	This is the 6th value driven onto the CA bus during the CA training session. LPDDR3 only.

BIMC_S_DDR0_DPE_CA_TRAIN_POST_CS (cont.)

Bits	Name	Description
9:0	CA_BUS_5	This is the 5th value driven onto the CA bus during the CA training session. LPDDR3 only.

0x0044C060 BIMC_S_DDR0_DPE_RCW_CTRL**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Read Capture Window Control CSR.

This register controls the async reset for the read enable circuitry in the PHY for DQS qualification. It also includes a global disable control which results in the external read enable signal being always driven to 1'b1.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_RCW_CTRL

Bits	Name	Description
31	RCW_ASYNC_RESET_BYT E7	This field is only valid for x64 DRAM devices. SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte7. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
30	RCW_ASYNC_RESET_BYT E6	This field is only valid for x64 DRAM devices. SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte6. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
29	RCW_ASYNC_RESET_BYT E5	This field is only valid for x64 DRAM devices. SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte5. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)

BIMC_S_DDR0_DPE_RCW_CTRL (cont.)

Bits	Name	Description
28	RCW_ASYNC_RESET_BYTE4	This field is only valid for x64 DRAM devices. SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte4. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
27	RCW_ASYNC_RESET_BYTE3	SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte3. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
26	RCW_ASYNC_RESET_BYTE2	SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte2. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
25	RCW_ASYNC_RESET_BYTE1	SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte1. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
24	RCW_ASYNC_RESET_BYTE0	SW control for the async reset for the flops in the RCW generation circuit for PHYdata byte0. SW writes this field to 1'b1 if the flops in the PHY are required to be reset. SW is then required to write this field to 1'b0 to deassert the reset. 0x0: RESET_OFF (RESET_OFF) 0x1: RESET_ON (RESET_ON)
20	RCW_ENABLE	When set to disable, the external read enable for precise DQS qualification is always driven to 1'b1 for all data bytes. When enabled (required if ODT is being used for LPDDR3 or PCDDR3), the design will send out a read enable pulse equal to the memory BL/2 - 1 cycles to the PHY data bytes. 0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE)
7:0	EXP_PATTERN	This is the read data pattern from the memory device for LPDDR3/PCDDR3. Some of the example patterns could be '10101010', '00110011' (for LPDDR3) or '01010101' (for PCDDR3). These represent memory burst length of 8.

0x0044C068 BIMC_S_DDR0_DPE_PWR_CTRL_0**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Power Control Register 0.

This register is used to setup and activate the power controls of the DPE and memory.

BIMC_S_DDR0_DPE_PWR_CTRL_0

Bits	Name	Description
28	PWR_DN_MODE	Indicates that each rank will not power down until all ranks are capable of powerdown. If this bit is not set, each rank powers down on an individual basis. Concurrent Mode is currently not supported. 0x0: INDIVIDUAL (INDIVIDUAL (Each rank can power down individually when ready, default)) 0x1: CONCURRENT (CONCURRENT (All ranks power down together only when all ranks are ready for power down.) (This is currently not supported))
24	PWR_DN_EN	Enable power down mode for the memory devices. When this mode is enabled, the controller will power down the memory device when the proper conditions are met. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED (Enable power down mode))
20	CLK_STOP_PWR_DN_EN	Enable clock stop power down mode for the memory devices. When this mode is enabled, the controller will put the memory device into CSPD when conditions are met. CSPD is supported for LPDDR2/3 only. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED (Enable clock stop powerdown mode))
16	CLK_ON_EN	Enable clock on functionality. The controller can request that the clock remain on through the use of a clock on port. When this feature is enabled, the controller can indicate that it no longer needs a clock by de-asserting the clock on port. Certain controller idle conditions must be met. 0x0: DISABLED (DISABLED (Controller clock on port will remain high) (default)) 0x1: ENABLED (ENABLED (Controller clock on port will go low when certain idle conditions are met))
15:4	CLK_ON_IDLE_CNT	Number of clock cycles the controller must be in an idle state before the clock on port can be de-asserted. (0x0 = 0 cycles, 0x1 = cycle etc.) The minimum supported value for this register is 6 cycles.
0	PCHG_PD_DLL	Precharge Powerdown DLL setting. This is currently not supported.

0x0044C078 BIMC_S_DDR0_DPE_OPT_CTRL_0**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Optimization Control Register 0.

This register is used to setup and activate performance optimization features of the DPE.

BIMC_S_DDR0_DPE_OPT_CTRL_0

Bits	Name	Description
20	BC_OTF_EN	Enables the DPE to issue Burst Chop (On The Fly) commands to shorten the burst length of reads and writes where possible. This is for PCDDR3 memory devices only. Burst chop, on the fly, must be enabled through Mode Register 0 before enabling this feature. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
16	RD_INT_BST	Enables the DPE controller logic to drive a burst stop to reduce the length of the DDR Memory burst for a read command. This can be enabled for LPDDR2, but must be disabled for LPDDR3 and PCDDR3. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
12	WR_INT_BST	Enables the DPE controller logic to drive a burst stop to reduce the length of the DDR Memory burst for a write command. This can be enabled for LPDDR2, but must be disabled for LPDDR3 and PCDDR3. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
8	RD_INT_RD	Enables the DPE controller logic to interrupt a DDR Read command with another read command to the DDR memory when possible. This will improve the performance of the controller by removing un-needed DDR memory data beats. This can be enabled for LPDDR2, but must be disabled for LPDDR3 and PCDDR3. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)
4	WR_INT_WR	Enables the DPE controller logic to interrupt a DDR Write command with another Write command to the DDR memory when possible. This will improve the performance of the controller by removing un-needed DDR memory data beats. This can be enabled for LPDDR2, but must be disabled for LPDDR3 and PCDDR3. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)

BIMC_S_DDR0_DPE_OPT_CTRL_0 (cont.)

Bits	Name	Description
0	SPLIT_LONG_WR	Setting this to '1' will split long write transactions to allow read commands to the memory device. Long writes require multiple Write CAS commands. In some cases, long writes can dominate the usage of the memory. This control register allows the controller to stop sending write commands to allow read commands to reach the memory. This feature is currently not supported. 0x0: DISABLED (DISABLED (default)) 0x1: ENABLED (ENABLED)

0x0044C07C BIMC_S_DDR0_DPE_OPT_CTRL_1**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Optimization Control Register 1.

This register is used to setup and activate performance optimization features of the DPE.

BIMC_S_DDR0_DPE_OPT_CTRL_1

Bits	Name	Description
25:16	DDR_EFF_OPT_TIMER	DDR efficiency optimization timer. Specifies the number of cycles a higher priority non-optimally serviceable transaction may be delayed to continue with more optimal transactions. Supported values are 0-1023, with 0 disabling this feature.
12	PG_MGMT	Indicates if PAGE_OPEN_TIMER is used for managing open pages. 0x0: KEEP_OPEN (KEEP_OPEN (Keep page open unless forced to close it. e.g. forced to closed because of a refresh, different page to open in the same bank.) (default)) 0x1: TIMER (TIMER (Pages will be managed with all listed above plus PAGE_OPEN_TIMER))
11:0	PG_OPEN_TIMER	Maximum time interval in DDR cycles a page can remain open without any page hits. (0 = 0 cycles, 1 = 1 cycle etc.)

0x0044C08C BIMC_S_DDR0_DPE_DRAM_STATUS_0**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DDR Status Register 0.

This register contains information on the state of the SDRAM device.

BIMC_S_DDR0_DPE_DRAM_STATUS_0

Bits	Name	Description
25	RANK_1_SR	READ ONLY Indicates Rank 1 is in Self Refresh 0x0: NOT_IN_SR (NOT_IN_SR (default)) 0x1: IN_SR (IN_SR)
24	RANK_0_SR	READ ONLY Indicates Rank 0 is in Self Refresh 0x0: NOT_IN_SR (NOT_IN_SR (default)) 0x1: IN_SR (IN_SR)
21	RANK_1_DPD	READ ONLY Indicates Rank 1 is in Deep Power Down. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_IN_DPD (NOT_IN_DPD (default)) 0x1: IN_DPD (IN_DPD)
20	RANK_0_DPD	READ ONLY Indicates Rank 0 is in Deep Power Down. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_IN_DPD (NOT_IN_DPD (default)) 0x1: IN_DPD (IN_DPD)
17	RANK_1_DERATE	READ ONLY Indicates if Rank 1 has temperature derating applied to the timing values. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_IN_DERATE (NOT_IN_DERATE (Derate offset has not been added to timer values, default)) 0x1: IN_DERATE (IN_DERATE (Derate offset has been added to timer values))
16	RANK_0_DERATE	READ ONLY Indicates if Rank 0 has temperature derating applied to the timing values. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_IN_DERATE (NOT_IN_DERATE (Derate offset has not been added to timer values, default)) 0x1: IN_DERATE (IN_DERATE (Derate offset has been added to timer values))
13	RANK_1_TEMP_OOR	READ ONLY Indicates if RANK 1 has reached a temperature out of the range of the temperature sensor. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_OOR (NOT_OOR (default)) 0x1: OOR (OOR)

BIMC_S_DDR0_DPE_DRAM_STATUS_0 (cont.)

Bits	Name	Description
12	RANK_0_TEMP_OOR	READ ONLY Indicates if RANK 1 has reached a temperature out of the range of the temperature sensor. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_OOR (NOT_OOR (default)) 0x1: OOR (OOR)
9	RANK_1_CSPD	READ ONLY Indicates Rank 1 is in Clock Stop Power Down. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_IN_CSPD (NOT_IN_CSPD (default)) 0x1: IN_CSPD (IN_CSPD)
8	RANK_0_CSPD	READ ONLY Indicates Rank 0 is in Clock Stop Power Down. This is supported by LPDDR2/3 devices only, this register will hold a value of '0' for PCDDR3. 0x0: NOT_IN_CSPD (NOT_IN_CSPD (default)) 0x1: IN_CSPD (IN_CSPD)
5	RANK_1_PWR_DN	READ ONLY Indicates Rank 1 is in Power Down. 0x0: NOT_IN_PWR_DN (NOT_IN_PWR_DN (default)) 0x1: IN_PWR_DN (IN_PWR_DN)
4	RANK_0_PWR_DN	READ ONLY Indicates Rank 0 is in Power Down. 0x0: NOT_IN_PWR_DN (NOT_IN_PWR_DN (default)) 0x1: IN_PWR_DN (IN_PWR_DN)
1	RANK_1_BUSY	READ ONLY Indicates Rank 1 has pending commands in the command queue. 0x0: IN_IDLE (IN_IDLE (default)) 0x1: BUSY (BUSY)
0	RANK_0_BUSY	READ ONLY Indicates Rank 0 has pending commands in the command queue 0x0: IN_IDLE (IN_IDLE (default)) 0x1: BUSY (BUSY)

0x0044C09C BIMC_S_DDR0_DPE_MEMC_STATUS_0**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DPE Status Register 0.

This register contains information on the state of the memory controller.

BIMC_S_DDR0_DPE_MEMC_STATUS_0

Bits	Name	Description
15:0	RD_FIFO_BYTE_EMPTY	READ ONLY Empty Status of each byte lane in the Read Data FIFO

0x0044C0A0 BIMC_S_DDR0_DPE_MEMC_STATUS_1**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DPE Status Register 1.

This register contains information on the state of the memory controller. When the timing parameters in DRAM_TIMING registers are stored in multiples of 100ps, time is required for the calculation of DDR clock cycles. This register is the status of that calculation. The calculation is kicked off by either a req/ack interface in the DPE I/Os or writing RECALC ('1') to CONFIG_4[RECALC_PS_PARAMS]. The status bit will go to NO ('1') when the calculation has been kicked off and will go to YES ('0') when all cycle calculations for all DRAM_TIMING registers are complete.

BIMC_S_DDR0_DPE_MEMC_STATUS_1

Bits	Name	Description
0	CYC_CALC_VALID	0x0: YES (YES (The DPE logic is NOT currently calculating DRAM_TIMING values from 100ps intervals into DDR clock cycles)) 0x1: NO (NO (The DPE logic is currently calculating DRAM_TIMING values from 100ps intervals into DDR clock cycles))

0x0044C0A4 BIMC_S_DDR0_DPE_MEMC_STATUS_2**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DPE Status Register 2.

This register contains information on the state of the memory controller. This register indicates if the active shadow set of registers matches the set of Read/Write registers. Any time the Read/Write registers are written, this bit will go to '0' (STALE) to indicate the active shadow registers are stale with respect to the Read/Write registers. The bit will go back to '1' (UP_TO_DATE) once a '1' is written to the LOAD_ALL_CONFIG register in CONFIG_4 or the new values are loaded into the active shadow set due to a frequency switch. It will remain '1' (UP_TO_DATE) until the next time a Read/Write register is written by software.

BIMC_S_DDR0_DPE_MEMC_STATUS_2

Bits	Name	Description
0	SHADOW_REGS_STALE	0x0: STALE (STALE (Active shadow registers are stale)) 0x1: UP_TO_DATE (UP_TO_DATE (Active shadow registers match Read/Write registers))

0x0044C0B4 BIMC_S_DDR0_DPE_INTERRUPT_ENABLE**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register controls the conditions for the interrupt bit to assert. These registers are used for LPDDR2/3 only, and should be set to DISABLED for PCDDR3 devices.

BIMC_S_DDR0_DPE_INTERRUPT_ENABLE

Bits	Name	Description
6:4	LOW_TEMP_THRESHOLD	The external interrupt will be generated based on the following refresh rate requirements based on low temperature: 0x0: DISABLED (DISABLED (default, interrupt for low temp disabled)) 0x1: TREFI_2X_OR_4X (TREFI_2X_OR_4X (Interrupt is enabled if temp reaches 2X tREFI, 4X tREFI or LOW_LIMIT level)) 0x2: TREFI_4X (TREFI_4X (Interrupt is enabled if temp reaches 4X tREFI or LOW_LIMIT level)) 0x3: TREFI_2X (TREFI_2X (Interrupt is enabled if temp reaches 2X tREFI level)) 0x4: TREFI_1X (TREFI_1X (Interrupt is enabled if temp reaches 1X tREFI level)) 0x5: TREFI_0_5X (TREFI_0.5X (LPDDR3 only, Interrupt is enabled if temp reaches 0.5X tREFI level, 1X tREFI level, 2X tREFI level, 4X tREFI level, or LOW_LIMIT))

BIMC_S_DDR0_DPE_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
2:0	HIGH_TEMP_THRESHOLD	The external interrupt will be generated based on the following refresh rate requirements based on high temperature: 0x0: DISABLED (DISABLED (default, interrupt for high temp disabled)) 0x1: TREFI_0_25X_DERATE (TREFI_0.25X_DERATE (Interrupt is enabled if temp reaches 0.25X tREFI, DERATE, or HIGH_LIMIT level)) 0x2: DERATE (DERATE (Interrupt is enabled if temp reaches derate or HIGH_LIMIT level)) 0x3: TREFI_0_25X (TREFI_0.25X (Interrupt is enabled if temp reaches 0.25X tREFI level)) 0x4: TREFI_1X (TREFI_1X (Interrupt is enabled if temp reaches 1X tREFI level)) 0x5: TREFI_0_5X (TREFI_0.5X (LPDDR3 only, Interrupt is enabled if temp reaches 0.5X tREFI level, 0.25X tREFI level, DERATE level or HIGH_LIMIT level))

0x0044C0B8 BIMC_S_DDR0_DPE_INTERRUPT_STATUS**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

Interrupts are enabled in the INTERRUPT_ENABLE register. This register is read to determine which enabled, interrupt events have occurred and are causing an interrupt assertion. Interrupt will remain asserted until cleared via the INTERRUPT_CLR register. These registers are used for LPDDR2/3 only, and are required to remain at '0' (default value) for PCDDR3 devices.

BIMC_S_DDR0_DPE_INTERRUPT_STATUS

Bits	Name	Description
22:20	RANK1_TEMP_INFO	0x0: LOW_LIMIT (LOW_LIMIT (SDRAM Low temperature operating limit exceeded)) 0x1: TREFI_4X (TREFI_4X (4x tREFI, 4x tREFIpb, 4x tREFW)) 0x2: TREFI_2X (TREFI_2X (2x tREFI, 2x tREFIpb, 2x tREFW)) 0x3: TREFI_1X (TREFI_1X (1x tREFI, 1x tREFIpb, 1x tREFW (<=85C))) 0x4: TREFI_0_5X (TREFI_0.5X (0.5x tREFI, 0.5x tREFIpb, 0.5x tREFW, ONLY for LPDDR3)) 0x5: TREFI_0_25X (TREFI_0.25X (0.25x tREFI, 0.25x tREFIpb, 0.25x tREFW, do not de-rate SDRAM AC timing)) 0x6: TREFI_0_25X_DERATE (TREFI_0.25X_DERATE (0.25x tREFI, 0.25x tREFIpb, 0.25x tREFW, de-rate SDRAM AC timing)) 0x7: HIGH_LIMIT (HIGH_LIMIT (SDRAM HIGH temperature operating limit exceeded))

BIMC_S_DDR0_DPE_INTERRUPT_STATUS (cont.)

18:16	RANK0_TEMP_INFO	0x0: LOW_LIMIT (LOW_LIMIT (SDRAM Low temperature operating limit exceeded)) 0x1: TREFI_4X (TREFI_4X (4x tREFI, 4x tREFIpb, 4x tREFW)) 0x2: TREFI_2X (TREFI_2X (2x tREFI, 2x tREFIpb, 2x tREFW)) 0x3: TREFI_1X (TREFI_1X (1x tREFI, 1x tREFIpb, 1x tREFW (<=85C))) 0x4: TREFI_0_5X (TREFI_0.5X (0.5x tREFI, 0.5x tREFIpb, 0.5x tREFW, ONLY for LPDDR3)) 0x5: TREFI_0_25X (TREFI_0.25X (0.25x tREFI, 0.25x tREFIpb, 0.25x tREFW, do not de-rate SDRAM AC timing)) 0x6: TREFI_0_25X_DERATE (TREFI_0.25X_DERATE (0.25x tREFI, 0.25x tREFIpb, 0.25x tREFW, de-rate SDRAM AC timing)) 0x7: HIGH_LIMIT (HIGH_LIMIT (SDRAM HIGH temperature operating limit exceeded))
3	RANK1_LOW_TEMP	A '1' indicates that Rank 1's low temperature threshold was enabled and crossed. 0x0: NONE (NONE) 0x1: THRESHLD_CROSSED (THRESHLD_CROSSED (programmed threshold was crossed))
2	RANK1_HIGH_TEMP	A '1' indicates that Rank 1's high temperature threshold was enabled and crossed. 0x0: NONE (NONE) 0x1: THRESHLD_CROSSED (THRESHLD_CROSSED (programmed threshold was crossed))
1	RANK0_LOW_TEMP	A '1' indicates that Rank 0's low temperature threshold was enabled and crossed. 0x0: NONE (NONE) 0x1: THRESHLD_CROSSED (THRESHLD_CROSSED (programmed threshold was crossed))
0	RANK0_HIGH_TEMP	A '1' indicates that Rank 0's high temperature threshold was enabled and crossed. 0x0: NONE (NONE) 0x1: THRESHLD_CROSSED (THRESHLD_CROSSED (programmed threshold was crossed))

0x0044C0BC BIMC_S_DDR0_DPE_INTERRUPT_CLR**Type:** W**Clock:** ACLK**Reset State:** 0x00000000

This register allows control for SW to clear the interrupt. HW will set the interrupt based on the scenarios enabled in INTERRUPT_ENABLE register. Additional information about the interrupt is available via INTERRUPT_STATUS CSRs. The interrupt I/O will remain set (asserted) until SW writes a '1' to the corresponding field in this register. These registers are used for LPDDR2/3 only, and should not be used for PCDDR3 devices.

BIMC_S_DDR0_DPE_INTERRUPT_CLR

Bits	Name	Description
3	RANK1_LOW_TEMP	0x0: NOP (NOP) 0x1: CLR_INT (CLR_INT)
2	RANK1_HIGH_TEMP	0x0: NOP (NOP) 0x1: CLR_INT (CLR_INT)
1	RANK0_LOW_TEMP	0x0: NOP (NOP) 0x1: CLR_INT (CLR_INT)
0	RANK0_HIGH_TEMP	0x0: NOP (NOP) 0x1: CLR_INT (CLR_INT)

0x0044C0C0 BIMC_S_DDR0_DPE_INTERRUPT_SET**Type:** W**Clock:** ACLK**Reset State:** 0x00000000

This register gives SW the capability to force the interrupt to be driven. Writing a '1' to a field in this register will force the interrupt to be driven until cleared by writing the corresponding field in INTERRUPT_CTRL CSR. These registers are used for LPDDR2/3 only, and should be used for PCDDR3 devices.

BIMC_S_DDR0_DPE_INTERRUPT_SET

Bits	Name	Description
3	RANK1_LOW_TEMP	0x0: NOP (NOP) 0x1: SET_INT (SET_INT)
2	RANK1_HIGH_TEMP	0x0: NOP (NOP) 0x1: SET_INT (SET_INT)
1	RANK0_LOW_TEMP	0x0: NOP (NOP) 0x1: SET_INT (SET_INT)
0	RANK0_HIGH_TEMP	0x0: NOP (NOP) 0x1: SET_INT (SET_INT)

0x0044C0D0 BIMC_S_DDR0_DPE_ELEVATE_PRI_RD**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register indicates the number of DDR clock cycles for a read command to be elevated to priority level 1/2/3/4.

BIMC_S_DDR0_DPE_ELEVATE_PRI_RD

Bits	Name	Description
31:24	CYCLES_PRI0	DDR cycles divided by 8 after which a read with current priority level of 0 gets promoted to priority level of 1. A value of 0 indicates that the read command at current priority level 0 will never get promoted to priority level 1.
23:16	CYCLES_PRI1	DDR cycles divided by 8 after which a read with current priority level of 1 gets promoted to priority level of 2. A value of 0 indicates that the read command at current priority level 1 will never get promoted to priority level 2.
15:8	CYCLES_PRI2	DDR cycles divided by 8 after which a read with current priority level of 2 gets promoted to priority level of 3. A value of 0 indicates that the read command at current priority level 2 will never get promoted to priority level 3.
7:0	CYCLES_PRI3	DDR cycles divided by 8 after which a read with current priority level of 3 gets promoted to priority level of 4. A value of 0 indicates that the read command at current priority level 3 will never get promoted to priority level 4.

0x0044C0D4 BIMC_S_DDR0_DPE_ELEVATE_PRI_WR**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register indicates the number of DDR clock cycles for a write command to be elevated to priority level 1/2/3/4.

BIMC_S_DDR0_DPE_ELEVATE_PRI_WR

Bits	Name	Description
31:24	CYCLES_PRI0	DDR cycles divided by 8 after which a write with current priority level of 0 gets promoted to priority level of 1. A value of 0 indicates that the write command at current priority level 0 will never get promoted to priority level 1.
23:16	CYCLES_PRI1	DDR cycles divided by 8 after which a write with current priority level of 1 gets promoted to priority level of 2. A value of 0 indicates that the write command at current priority level 1 will never get promoted to priority level 2.
15:8	CYCLES_PRI2	DDR cycles divided by 8 after which a write with current priority level of 2 gets promoted to priority level of 3. A value of 0 indicates that the read command at current priority level 2 will never get promoted to priority level 3.

BIMC_S_DDR0_DPE_ELEVATE_PRI_WR (cont.)

Bits	Name	Description
7:0	CYCLES_PRI3	DDR cycles divided by 8 after which a write with current priority level of 3 gets promoted to priority level of 4. A value of 0 indicates that the write command at current priority level 3 will never get promoted to priority level 4.

0x0044C0E4 BIMC_S_DDR0_DPE_TIMER_0**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Clock cycle timer register 0.

This register contains timer values used for frequency independent timing parameters. Values are in clock cycles.

BIMC_S_DDR0_DPE_TIMER_0

Bits	Name	Description
31:28	WTR_DIFF_RANK	Additional sync time between a write to one Rank and a Read to a different Rank.
27:24	RTW_DIFF_RANK	Additional delay to add to the time interval between a Read to one Rank and a Write to a different Rank. This needs to be set to a minimum of 0010.
23:20	RTR_DIFF_RANK	Additional delay beyond DDR memory burst length/2 between a Read to one Rank and a Read to a different Rank. For LPDDR2/3 and PCDDR3 devices, this can be set to MAX(1, RU((tHZ(DQ)max - tLZ(DQ)min/tck) for optimal setting. tck here represents the time period for the fastest DDR1x clock frequency which will be used.
19:16	WTW_DIFF_RANK	Additional delay beyond DDR memory burst length/2 between a Write to one Rank and a Write to a different Rank.
15:12	RTW_SAME_RANK_ADD_DLY	Additional delay to add to the time interval of a Read then a Write to the same Rank. This needs to be set to a minimum of 0010.
11:8	WTR_SAME_RANK_ADD_DLY	Additional delay beyond DDR memory burst length/2 between a Write to one Rank and a Read to the same Rank.
7:4	RTR_SAME_RANK_ADD_DLY	Additional delay beyond DDR memory burst length/2 between a Read to one Rank and a Read to the same Rank.
3:0	WTW_SAME_RANK_ADD_DLY	Additional delay beyond DDR memory burst length/2 between a Write to one Rank and a Write to the same Rank.

0x0044C0E8 BIMC_S_DDR0_DPE_TIMER_1**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Clock cycle timer register 1.

This register contains timer values used for frequency independent timing parameters. These are to be programmed in DDR clock cycles.

BIMC_S_DDR0_DPE_TIMER_1

Bits	Name	Description
13:12	DERATE_OFFSET	Temperature Derating value for DDR memory timing parameters. TRCD, TRAS, TRP and TRRD will be derated to add DERATE_OFFSET extra clock cycles to the normal value. Not used for PCDDR, must program to 0x0. For LPDDR2/3 this must be programmed based on upcoming frequency prior to frequency switch: set to 0x2 for frequencies > 50 MHz set to 0x0 for frequencies <= 50 MHz (Below 50MHz, the min cycle fields will guarantee the derate requirements are met.)
8	TDQSS	DDR Timing parameter tDQSS. This is for LPDDR2/3 only. 0x0: ZERO (ZERO (0 cycles, default, PCDDR3)) 0x1: ONE (ONE (1 cycle, LPDDR2/3))
7:0	IDLE_PWR_DN_CNT	Minimum number of cycles a Rank must be idle before going into Power Down. If this is set to '0', the device will not wait any idle cycles before going into power down. Setting this to a value greater than zero will put the memory device into power down once a count down from the programmed value expires. (0x0 = 0 cycles, 0x1 = 1 cycle etc)

0x0044C0EC BIMC_S_DDR0_DPE_TIMER_2**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Clock cycle timer register 2.

This register contains timer values used for frequency independent timing parameters. It is to be programmed in DDR clock cycles.

BIMC_S_DDR0_DPE_TIMER_2

Bits	Name	Description
16:8	TRASMAX_XO_DIV_6_CYCLES	This field is used to define the amount of time to allow for tRASMAX for LPDDR2 and LPDDR3. tRASMAX is the maximum row active time. Generally, tRASMAX is specified as 70 usec for both LPDDR2 and LPDDR3 but refer to the device datasheet for actual requirement. The setting for this value will not vary with the frequency of the DPE core clock as the implementation actually uses the XO clock divided by 6. Set to 0x0 to disable tRASMAX. tRASMAX is enforced automatically via refreshes for PCDDR3 so this should be set to 0x0 for PCDDR3. The value programmed for TRASMAX_XO_DIV_6_CYCLES is $TRASMAX_XO_DIV_6_CYCLES = ROUND_DOWN(tRASMAX / (Txo * 6)) - 6$; where Txo = the period of the tcxo clock. $tRASMAX$ = tRAS(max) value specified in uSec in the specification or data sheet. e.g., $tRASMAX = 70 \text{ uSec}$, $tcxo = 19.2 \text{ MHz}$ gives $RD(70us / 312.5 \text{ ns}) - 6 = 218$ decimal
7:4	TMRW	Mode register write command period. For LPDDR2 devices, this should be set to tMRW. For LPDDR3 devices, this must be set to 'h15. For PCDDR3, this should be set to tMRD.
2:0	TMRR	DDR timing parameter tMRR. Mode register read command Period. This is for LPDDR2/3 only.

0x0044C0F0 BIMC_S_DDR0_DPE_TIMER_3**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Clock cycle timer register 3.

This register contains timer values used for frequency independent timing parameters. It is to be programmed in DDR clock cycles.

BIMC_S_DDR0_DPE_TIMER_3

Bits	Name	Description
11:8	BANK_AVAIL_OFFSET	Number of DDR cycles before tRFC expires that DPE will indicate bank(s) being refreshed are available by de asserting corresponding bits in bank_unavail vector.

BIMC_S_DDR0_DPE_TIMER_3 (cont.)

Bits	Name	Description
5:4	CLK_CYC_BEFORE_PD_EXIT	Number of DDR clock cycles the memory clock must toggle before exiting power down. This only applies if the clock was stopped during power down. For LPDDR2/3, set this to 2 cycles. This is for LPDDR2/3 only.
2:0	CLK_CYC_AFTER_PD_ENTRY	Number of DDR clock cycles for memory clock to toggle after power down. For LPDDR2 set this to a minimum of 1 cycle. For LPDDR3 set this to a minimum of 2 cycles. This is for LPDDR2/3 only.

0x0044C114 BIMC_S_DDR0_DPE_MRW_BEFORE_FREQ_SWITCH_0**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Mode Register Write before Frequency Switch 0.

This register contains the Mode Register Write address and data information. The MRW will be scheduled to occur before frequency switch, if the operation is valid (indicated by MRW_FREQ_SWITCH). This operation is currently not supported.

BIMC_S_DDR0_DPE_MRW_BEFORE_FREQ_SWITCH_0

Bits	Name	Description
27:20	W_ADDR	Mode Register address.
15:0	W_DATA	Mode Register Write Data.

0x0044C118 BIMC_S_DDR0_DPE_MRW_BEFORE_FREQ_SWITCH_1**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE Mode Register Write before Frequency Switch 1.

This register contains the Mode Register Write address and data information. The MRW will be scheduled to occur before frequency switch, if the operation is valid (indicated by MRW_FREQ_SWITCH). This operation is currently not supported.

BIMC_S_DDR0_DPE_MRW_BEFORE_FREQ_SWITCH_1

Clock: ACLK

Reset State: 0x00000000

DPE Mode Register Write for Frequency Switch

This register indicates which Mode Register Writes are valid to execute upon a Frequency Switch event.

BIMC_S_DDR0_DPE_MRW_FREQ_SWITCH

Bits	Name	Description
19	BEFORE_3	Setting this to '1' indicates a Mode register write stored in MRW_BEFORE_FREQ_SWITCH_3 is valid and will be carried out upon a frequency switch event. This is Currently not supported. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
18	BEFORE_2	Setting this to '1' indicates a Mode register write stored in MRW_BEFORE_FREQ_SWITCH_2 is valid and will be carried out upon a frequency switch event. This is Currently not supported. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
17	BEFORE_1	Setting this to '1' indicates a Mode register write stored in MRW_BEFORE_FREQ_SWITCH_1 is valid and will be carried out upon a frequency switch event. This is Currently not supported. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
16	BEFORE_0	Setting this to '1' indicates a Mode register write stored in MRW_BEFORE_FREQ_SWITCH_0 is valid and will be carried out upon a frequency switch event. This is Currently not supported. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
3	AFTER_3	Setting this to '1' indicates a Mode register write stored in MRW_AFTER_FREQ_SWITCH_3 is valid and will be carried out upon a frequency switch event. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
2	AFTER_2	Setting this to '1' indicates a Mode register write stored in MRW_AFTER_FREQ_SWITCH_2 is valid and will be carried out upon a frequency switch event. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
1	AFTER_1	Setting this to '1' indicates a Mode register write stored in MRW_AFTER_FREQ_SWITCH_1 is valid and will be carried out upon a frequency switch event. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))
0	AFTER_0	Setting this to '1' indicates a Mode register write stored in MRW_AFTER_FREQ_SWITCH_0 is valid and will be carried out upon a frequency switch event. 0x0: NOP (NOP (default)) 0x1: EXEC (EXEC (perform the write))

0x0044C144 BIMC_S_DDR0_DPE_DRAM_TIMING_0**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_0_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

NOTE The following applies to all DRAM_TIMING_* CSRs

If the timing parameter value is only specified in clock cycles as per the JEDEC specification, then it is recommended to set that specific timing parameter in cycle based mode in CONIFG_5 CSR and program the timing parameter field as the cycle value, while the MIN_CYC value for that parameter would be 0 (SW could also program the MIN_CYC value if the parameter has one specified in the JEDEC specification).

If the timing parameter value is only specified in ns as per the JEDEC specification, then it is recommended to set that specific timing parameter in time based mode in CONIFG_5 CSR and to program the timing parameter field in multiples of 100ps and leave the MIN_CYC field (for that timing parameter) as 0.

If the timing parameter value is specified such that it has a minimum cycle time requirement as well as a timing parameter value in ns as per the JEDEC specification, then it is recommended to set that specific timing parameter in time based mode in CONIFG_5 CSR and to program the timing parameter field in multiples of 100ps and program the MIN_CYC field to reflect the minimum cycle time requirement for that timing parameter.

BIMC_S_DDR0_DPE_DRAM_TIMING_0

Bits	Name	Description
15:12	TRASMIN_MIN_CYC	Minimum TRASMIN value in DDR clock cycles.
9:0	TRASMIN	DDR timing parameter tRASmin.

0x0044C148 BIMC_S_DDR0_DPE_DRAM_TIMING_1**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_1_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_1

Bits	Name	Description
31:28	TWR_MIN_CYC	Minimum TWR value in DDR clock cycles.
23:16	TWR	DDR timing parameter tWR, write recovery time.
15:12	TRCD_MIN_CYC	Minimum TRCD value in DDR clock cycles.
8:0	TRCD	DDR timing parameter tRCD.

0x0044C14C BIMC_S_DDR0_DPE_DRAM_TIMING_2

Type: RW

Clock: ACLK

Reset State: 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_2_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_2

Bits	Name	Description
31:28	TWTR_MIN_CYC	Minimum TWTR value in DDR clock cycles.
22:16	TWTR	DDR timing parameter tWTR.
15:12	TRRD_MIN_CYC	Minimum TRRD value in DDR clock cycles.
7:0	TRRD	DDR timing parameter tRRD. Number of DDR clock cycles between Activate to Activate (different banks on the same chip select).

0x0044C150 BIMC_S_DDR0_DPE_DRAM_TIMING_3

Type: RW

Clock: ACLK

Reset State: 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_3_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_3

Bits	Name	Description
31:28	TRFCAB_MIN_CYC	Minimum TRFCAB value in DDR clock cycles.
27:16	TRFCAB	DDR timing parameter tRFCab. Number of DDR clock cycles between auto-refresh command and the next activate command.
15:12	TRFCPB_MIN_CYC	Minimum TRFCPB value in DDR clock cycles.
11:0	TRFCPB	DDR timing parameter tRFCpb. Number of DDR clock cycles between a per-bank refresh command and the next activate command. This is currently not supported.

0x0044C154 BIMC_S_DDR0_DPE_DRAM_TIMING_4

Type: RW

Clock: ACLK

Reset State: 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_4_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_4

Bits	Name	Description
15:12	TRTP_MIN_CYC	Minimum TRTP value in DDR clock cycles. *note* Current design restriction requires the minimum value for this parameter to be 4 (0100).
6:0	TRTP	DDR timing parameter tRTP. Number of additional DDR clock cycles between a read and a precharge command to the same page with DDR BL/2 as the initial base delay.

0x0044C158 BIMC_S_DDR0_DPE_DRAM_TIMING_5**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_5_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_5

Bits	Name	Description
31:28	TRPAB_MIN_CYC	Minimum TRPAB value in DDR cycles.
24:16	TRPAB	DDR timing parameter tRPab. Duration of time from all bank Precharge to Activate command to the same bank. PCDDR3 devices do not differentiate between per-bank and all-bank precharge timing, in that case program this to TRP. For LPDDR2/3, set this timing parameter to tRPab.
15:12	TRPPB_MIN_CYC	Minimum TRPPB value in DDR cycles.
8:0	TRPPB	DDR timing parameter tRPpb. Duration of time from per bank Precharge to Activate command to the same bank. PCDDR3 devices do not differentiate between per-bank and all-bank precharge timing, in that case program this to TRP. For LPDDR2/3, set this timing parameter to tRPpb.

0x0044C15C BIMC_S_DDR0_DPE_DRAM_TIMING_6**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_6_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_6

Bits	Name	Description
31:28	TFAW_MIN_CYC	Minimum TFAW value in DDR clock cycles.
25:16	TFAW	DDR timing parameter tFAW. Programmable rolling window in time during which no more than 4 activates are allowed.
15:12	TCKE_MIN_CYC	Minimum TCKE value in DDR clock cycles.
7:0	TCKE	DDR timing parameter tCKE. Minimum CKE pulse width (High or Low).

0x0044C160 BIMC_S_DDR0_DPE_DRAM_TIMING_7**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_7_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_7

Bits	Name	Description
22:16	TZQCS_MIN_CYC	Minimum TZQCS value in DDR clock cycles.
10:0	TZQCS	Number of DDR clock cycles required for ZQ short calibration. For LPDDR2/3, this is the timing parameter tZQCS. For PCDDR3, this is the timing Parameter tZQCS.

0x0044C164 BIMC_S_DDR0_DPE_DRAM_TIMING_8**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_8_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_8

Bits	Name	Description
15:12	TMOD_MIN_CYC	Minimum TMOD value in DDR clock cycles.
10:0	TMOD	Specifies the timing parameter tMOD in DDR clock cycles for PCDDR3 devices

0x0044C168 BIMC_S_DDR0_DPE_DRAM_TIMING_9

Type: RW

Clock: ACLK

Reset State: 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_9_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_9

Bits	Name	Description
15:12	MIN_SR_DURATION_MIN_CYC	Minimum MIN_SR_DURATION value in DDR clock cycles.
7:0	MIN_SR_DURATION	Specifies the minimum time the SDRAM device must remain in self refresh mode once a self refresh command is received. For LPDDR2/3, this is specified as tCKESR. For PCDDR3, this is specified as tCKE.

0x0044C16C BIMC_S_DDR0_DPE_DRAM_TIMING_10

Type: RW

Clock: ACLK

Reset State: 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register

DRAM_TIMING_10_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_10

Bits	Name	Description
31:28	TXSRD_MIN_CYC	Minimum TXSRD value in DDR clock cycles.
27:16	TXSRD	Time between self refresh exit and next valid Read command. This needs to be set based on the specific SDRAM device and the PHY generation as follows: LPDDR2/3, Gen1 PHY (with pad power mode support required): max(175ns, tXSR) LPDDR2/3, Gen2 PHY or Gen1 PHY (with no support for pad power mode): tXSR PCDDR3: tXSDLL (which is in cycles only)
15:12	TXSNR_MIN_CYC	Minimum TXSNR value in DDR clock cycles.
11:0	TXSNR	Number of DDR clock cycles between self refresh exit and next valid Non-Read command. This needs to be set based on the specific SDRAM device. For LPDDR2/3 devices, the value programmed in TXSNR should be tXSR. For PCDDR3, this needs to be programmed with tXS timing parameter.

0x0044C170 BIMC_S_DDR0_DPE_DRAM_TIMING_11

Type: RW

Clock: ACLK

Reset State: 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_11_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_11

Bits	Name	Description
31:28	TXPNR_ACT_PWR_DN_MIN_CYC	Minimum TXPNR_ACT_PWR_DN value in DDR clock cycles.
23:16	TXPNR_ACT_PWR_DN	Number of cycles between power down exit and next valid Non-Read command. This is used only if the Power down state was active power down. This distinction is required for PCDDR devices where in a slow/fast exit option the Mode Register could potentially mean different timers for read commands (which require a DLL) vs. a non-read command. For LPDDR2/3, program this to 'txPNR' if available, else set to 'txP'. For PCDDR3, set this to 'txP'.
15:12	TXPR_ACT_PWR_DN_MIN_CYC	Minimum TXPR_ACT_PWR_DN value in DDR clock cycles.
8:0	TXPR_ACT_PWR_DN	Number of DDR clock cycles between power down exit and next read command. This value gets used only if the Power down state was active power down. For LPDDR2/3, program this to 'txPR' if available, else set to 'txP'. For PCDDR3, set this to 'txP'.

0x0044C174 BIMC_S_DDR0_DPE_DRAM_TIMING_12**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design, until they are loaded into the active register DRAM_TIMING_12_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_12

Bits	Name	Description
31:28	TXPNR_PCHG_PWR_DN_MIN_CYC	Minimum TXPNR_PCHG_PWR_DN value in DDR clock cycles.
23:16	TXPNR_PCHG_PWR_DN	Number of cycles between power down exit and next valid Non-Read command. This is used only if the Power down state was precharge power down. For LPDDR2/3, program this to 'txPNR' if available, else set to 'txP'. For PCDDR3, set this to 'txP'.
15:12	TXPR_PCHG_PWR_DN_MIN_CYC	Minimum TXPR_PCHG_PWR_DN value in DDR clock cycles.

BIMC_S_DDR0_DPE_DRAM_TIMING_12 (cont.)

Bits	Name	Description
8:0	TXPR_PCHG_PWR_DN	Number of DDR clock cycles between power down exit and next read command. This value gets used only if the Power down state was precharge power down. For LPDDR2/3, program this to 'TXPR' if available, else set to 'tXP'. For PCDDR3, if Mode register for 'DLL control for Precharge PD' is programmed to 'fast exit', set this memory timing parameter to 'tXP', else program this to 'tXPDLL'.

0x0044C178 BIMC_S_DDR0_DPE_DRAM_TIMING_13**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains the parameters which are specified by the memory vendor in ns. These values are not used by the design until they are loaded in the active register

DRAM_TIMING_13_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps, and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_13

Bits	Name	Description
31:28	CLK_AFTER_SR_ENTRY_MIN_CYC	Minimum number of DDR clock cycles for memory clock to toggle after entering self refresh. For LPDDR2 devices, this should be set to '1', and for LPDDR3 devices, this should be set to '2'. For PCDDR3, this should be set to 5 DDR clock cycles.
22:16	CLK_AFTER_SR_ENTRY	Duration of time the DDR clock must toggle after entering self refresh. For LPDDR2 devices, this should be set to '1', and for LPDDR3 devices, this should be set to '2'. For PCDDR3, this should be set to ddr timing parameter tCKSRE.
15:12	CLK_BEFORE_SR_EXIT_MIN_CYC	Minimum number of DDR clock cycles the DDR clock must toggle before exiting self refresh. For LPDDR2/3, this needs to be set to at least 2 DDR clock cycles. For PCDDR3, this needs to be set to 5 DDR clock cycles.

BIMC_S_DDR0_DPE_DRAM_TIMING_13 (cont.)

Bits	Name	Description
10:0	CLK_BEFORE_SR_EXIT	Required duration of time DDR clock must toggle before exiting self refresh. For LPDDR2/3, this needs to be set to at least 2 DDR clock cycles. For PCDDR3, this needs to be set to DDR timing parameter tCKSRX. In addition, an extra delay of 10-20ns would need to be applied to this CSR, if using the pad low power mode ie if CONFIG_1[PAD_POWER_MODE] is 1. Furthermore, if the current mode in the pads is enabled and the system is configured to dynamically turn off the current mode during self refresh, then the timer needs to be programmed such that it provides at least 100ns of pad settling time.

0x0044C17C BIMC_S_DDR0_DPE_DRAM_TIMING_14**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains timing values for the pad input enable windows for capturing read data from the DDR memory. These values are not used by the design until they are loaded in the active register DRAM_TIMING_14_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

The value of the parameter may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_14

Bits	Name	Description
31:28	IE_WINDOW_START_ADD_CYCLES	Additional clock cycles to delay the start of the pad input enable window.
25:24	IE_WINDOW_START_SUB_CYCLES	Number of clock cycles to subtract from the delay of the start of the pad input enable window. Allows the IE window to start up to 3 cycles sooner than RL cycles beyond the CAS command. For PCDDR3 devices, this is required to be set to 1 as the first DQS edge could arrive slightly before RL expires.
23:16	IE_WINDOW_START	Amount of time to delay the DQ/DQS pad input enable window beyond CAS cycle + Read Latency. The maximum value for this register is tDQSkmin + any routing delays to get to the pad + delays in the read data path from memory to the DQ pad (board/package delays) - pad IE turn on delay.
15:12	IE_WINDOW_END_ADD_CYCLES	Additional clock cycles to extend the pad input enable window.
7:0	IE_WINDOW_END	Amount of time to extend the DQ/DQS pad input enable window beyond CAS Cycle + Read Latency + burst length/2. This can be set to a minimum of tDQSKmax + delays in the read data path from memory to the DQ pad (board/package delays) + 500ps.

0x0044C180 BIMC_S_DDR0_DPE_DRAM_TIMING_15**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains timing values for the read fifo capture windows for capturing read data from the DDR memory. These values are not used by the design until they are loaded in the active register DRAM_TIMING_15_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs

The value of the parameter may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_15

Bits	Name	Description
31:28	RD_CAPTURE_START_AD D_CYCLES	Additional clock cycles to delay the start of the read capture window. Typically, this needs to be set to the number of IOSTAGE pipeline registers placed between the memory controller and the PHY.
23:16	RD_CAPTURE_START	Amount of time to delay the start of the read capture window beyond the CAS cycle + Read Latency of the memory device. This can be set to a maximum of tDQSKmin + any round trip delays.
15:12	RD_CAPTURE_END_ADD_ CYCLES	Additional clock cycles to extend the read capture window. Typically, this needs to be set to the number of IOSTAGE pipeline registers placed between the memory controller and the PHY.
7:0	RD_CAPTURE_END	Amount of time to extend the read capture window beyond the CAS cycle + Read Latency + burst length/2 + delays in the read data path from the memory to the controller (includes board/package delays + delays in the PHY). This can be set to a minimum of tDQSKmax + any round trip delays + 500ps.

0x0044C184 BIMC_S_DDR0_DPE_DRAM_TIMING_16**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains timing values required by the memory vendor in DDR clock cycles. These values are not used by the design until they are loaded in the active register DRAM_TIMING_16_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs

The value of the parameter may vary from one SDRAM vendor to another.

BIMC_S_DDR0_DPE_DRAM_TIMING_16

Bits	Name	Description
29:28	ODTON_MAX_ADD_CYCLE S	Additional clock cycles to add to the DRAM_TIMING_23[ODTON_MAX] timing parameter. ODT is supported for PCDDR3 and LPDDR3 devices only. The only supported values for this field are '0' and '1'.
25:24	ODTOFF_MIN_SUB_CYCLE S	Additional clock cycles to add to the DRAM_TIMING_23[ODTOFF_MIN] timing parameter. ODT is supported for PCDDR3 and LPDDR3 devices only. The only supported values for this field are '0' and '1'.
20	PAD_MODE	Indicates the power mode to be used for the PHY based on the frequency of operation. This value in the CSR is only valid if CONFIG_1[PAD_POWER_MODE] is enabled and CONFIG_1[PAD_POWER_MODE_CTRL] is set to SW_CTRL. 0x0: LOW_POWER_MODE (Low Power Mode (default)) 0x1: HIGH_POWER_MODE (High Power Mode)
19:16	TCCD	DDR timing parameter tCCD min, CAS to CAS delay. This is fixed at 2 for LPDDR2, 4 for LPDDR3 and PCDDR3.
13:8	RD_LATENCY	Read latency of the memory device.
5:0	WR_LATENCY	Write latency of the memory device.

0x0044C188 BIMC_S_DDR0_DPE_DRAM_TIMING_17**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains timing values required by the memory vendor in DDR clock cycles. These values are not used by the design until they are loaded in the active register DRAM_TIMING_17_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs

The value of the parameter may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_17

Bits	Name	Description
25:16	TZQCL_MIN_CYC	Minimum TZQCL value in DDR clock cycles.
11:0	TZQCL	Number of DDR clock cycles required for the ZQ long calibration sequence to execute. For LPDDR2/3, this is the timing parameter tZQCL. For PCDDR3, this is the timing parameter TZQoper.

0x0044C18C BIMC_S_DDR0_DPE_DRAM_TIMING_18**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains values for read enable control in DDR clock cycles. These values are not used by the design until they are loaded in the active register DRAM_TIMING_18_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs. The contents of this CSR is only valid for x64 DRAM devices.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_18

Bits	Name	Description
28:24	RCW_START_DLY_BYTE7	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.
20:16	RCW_START_DLY_BYTE6	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.
12:8	RCW_START_DLY_BYTE5	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.
4:0	RCW_START_DLY_BYTE4	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.

0x0044C190 BIMC_S_DDR0_DPE_DRAM_TIMING_19**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains values for read enable control in DDR clock cycles. These values are not used by the design until they are loaded in the active register DRAM_TIMING_19_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_19

Bits	Name	Description
28:24	RCW_START_DLY_BYTE3	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.
20:16	RCW_START_DLY_BYTE2	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.
12:8	RCW_START_DLY_BYTE1	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.
4:0	RCW_START_DLY_BYTE0	Enables the external read enable n cycles from the CAS cycle for the read command. The minimum value supported is 1 cycle.

0x0044C194 BIMC_S_DDR0_DPE_DRAM_TIMING_20**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains fine grain delay values for read enable control required by PHY. These values are not used by the design until they are loaded in the active register DRAM_TIMING_20_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs. The contents of this CSR is only valid for x64 DRAM devices.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_20

Bits	Name	Description
31:24	RCW_FINE_DLY_BYTE7	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
23:16	RCW_FINE_DLY_BYTE6	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
15:8	RCW_FINE_DLY_BYTE5	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
7:0	RCW_FINE_DLY_BYTE4	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.

0x0044C198 BIMC_S_DDR0_DPE_DRAM_TIMING_21**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains fine grain delay values for read enable control required by PHY. These values are not used by the design until they are loaded in the active register DRAM_TIMING_21_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_21

Bits	Name	Description
31:24	RCW_FINE_DLY_BYTE3	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
23:16	RCW_FINE_DLY_BYTE2	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
15:8	RCW_FINE_DLY_BYTE1	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
7:0	RCW_FINE_DLY_BYTE0	This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.

0x0044C19C BIMC_S_DDR0_DPE_DRAM_TIMING_22**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains coarse grain delay values for read enable control required by PHY. These values are not used by the design until they are loaded in the active register DRAM_TIMING_22_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_22

Bits	Name	Description
29:28	RCW_COARSE_DLY_BYTE 7	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)
25:24	RCW_COARSE_DLY_BYTE 6	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)
21:20	RCW_COARSE_DLY_BYTE 5	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)
17:16	RCW_COARSE_DLY_BYTE 4	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)
13:12	RCW_COARSE_DLY_BYTE 3	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)

BIMC_S_DDR0_DPE_DRAM_TIMING_22 (cont.)

Bits	Name	Description
9:8	RCW_COARSE_DLY_BYTE 2	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)
5:4	RCW_COARSE_DLY_BYTE 1	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)
1:0	RCW_COARSE_DLY_BYTE 0	This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0: NO_DELAY (No delay (default)) 0x1: MINOR_DLY (MINOR_DLY) 0x2: ENUM_1_2_CYCLE (1/2_CYCLE) 0x3: ENUM_1_2_CYCLE_PLUS_MINOR_DLY (1/2_CYCLE_PLUS_MINOR_DLY)

0x0044C1A0 BIMC_S_DDR0_DPE_DRAM_TIMING_23**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

This register contains timing values required by the memory vendor in ns. These values are not used by the design until they are loaded in the active register DRAM_TIMING_23_ACT by setting CONFIG_4[LOAD_ALL_CONFIG] to '1' or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs

The value of the parameter contained in the registers can be in DDR clock cycles or in multiples of 100ps and may vary from one SDRAM vendor to another.

Refer to the note in DRAM_TIMING_0 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_23

Bits	Name	Description
29:24	ODTON_MAX	Specifies the ODT on max delay. For PCDDR3 devices, program this to tAONmax. For LPDDR3 devices, this should be programmed to tODTonmax - tDQSCKmin. If tDQSCKmin should exceed the tODTonmax, then program this to '0'.
20:16	ODTON_MIN	Specifies the ODT on min delay for LPDDR3/PCDDR3.
13:8	ODTOFF_MAX	Specifies the ODT off max delay for LPDDR3/PCDDR3.
4:0	ODTOFF_MIN	Specifies the ODT off min delay for LPDDR3/PCDDR3.

0x0044C1A4 BIMC_S_DDR0_DPE_DRAM_TIMING_0_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_0_ACT

Bits	Name	Description
6:0	TRASMIN	READ ONLY

0x0044C1A8 BIMC_S_DDR0_DPE_DRAM_TIMING_1_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_1_ACT

Bits	Name	Description
20:16	TWR	READ ONLY
5:0	TRCD	READ ONLY

0x0044C1AC BIMC_S_DDR0_DPE_DRAM_TIMING_2_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_2_ACT

Bits	Name	Description
19:16	TWTR	READ ONLY
4:0	TRRD	READ ONLY

0x0044C1B0 BIMC_S_DDR0_DPE_DRAM_TIMING_3_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_3_ACT

Bits	Name	Description
24:16	TRFCAB	READ ONLY
8:0	TRFCPB	READ ONLY

0x0044C1B4 BIMC_S_DDR0_DPE_DRAM_TIMING_4_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_4_ACT

Bits	Name	Description
3:0	TRTP	READ ONLY

0x0044C1B8 BIMC_S_DDR0_DPE_DRAM_TIMING_5_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_5_ACT

Bits	Name	Description
21:16	TRPAB	READ ONLY
5:0	TRPPB	READ ONLY

0x0044C1BC BIMC_S_DDR0_DPE_DRAM_TIMING_6_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_6_ACT

Bits	Name	Description
22:16	TFAW	READ ONLY
4:0	TCKE	READ ONLY

0x0044C1C0 BIMC_S_DDR0_DPE_DRAM_TIMING_7_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_7_ACT

Bits	Name	Description
7:0	TZQCS	READ ONLY

0x0044C1C4 BIMC_S_DDR0_DPE_DRAM_TIMING_8_ACT

Type: R

Clock: ACLK

Reset State: 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_8_ACT

Bits	Name	Description
7:0	TMOD	READ ONLY

0x0044C1C8 BIMC_S_DDR0_DPE_DRAM_TIMING_9_ACT

Type: R

Clock: ACLK

Reset State: 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_9_ACT

Bits	Name	Description
4:0	MIN_SR_DURATION	READ ONLY

0x0044C1CC BIMC_S_DDR0_DPE_DRAM_TIMING_10_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_10_ACT

Bits	Name	Description
25:16	TXSRD	READ ONLY
8:0	TXSNR	READ ONLY

0x0044C1D0 BIMC_S_DDR0_DPE_DRAM_TIMING_11_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_11_ACT

Bits	Name	Description
20:16	TXPNR_ACT_PWR_DN	READ ONLY
5:0	TXPR_ACT_PWR_DN	READ ONLY

0x0044C1D4 BIMC_S_DDR0_DPE_DRAM_TIMING_12_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_12_ACT

Bits	Name	Description
20:16	TXPNR_PCHG_PWR_DN	READ ONLY
5:0	TXPR_PCHG_PWR_DN	READ ONLY

0x0044C1D8 BIMC_S_DDR0_DPE_DRAM_TIMING_13_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_13_ACT

Bits	Name	Description
20:16	CLK_AFTER_SR_ENTRY	READ ONLY
7:0	CLK_BEFORE_SR_EXIT	READ ONLY

0x0044C1DC BIMC_S_DDR0_DPE_DRAM_TIMING_14_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. It also reflects the value in the ADD_CYCLES field in the DRAM_TIMING_14 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_14_ACT

Bits	Name	Description
21:16	IE_WINDOW_START	READ ONLY
5:0	IE_WINDOW_END	READ ONLY

0x0044C1E0 BIMC_S_DDR0_DPE_DRAM_TIMING_15_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. It also reflects the value in the ADD_CYCLES field in the DRAM_TIMING_15 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_15_ACT

Bits	Name	Description
21:16	RD_CAPTURE_START	READ ONLY
5:0	RD_CAPTURE_END	READ ONLY

0x0044C1E4 BIMC_S_DDR0_DPE_DRAM_TIMING_16_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles.

BIMC_S_DDR0_DPE_DRAM_TIMING_16_ACT

Bits	Name	Description
20	PAD_MODE	READ ONLY
19:16	TCCD	READ ONLY
13:8	RD_LATENCY	READ ONLY
5:0	WR_LATENCY	READ ONLY

0x0044C1E8 BIMC_S_DDR0_DPE_DRAM_TIMING_17_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles and is a result of comparison to min value. However this does not include the derate offset if timing is being derated (where applicable based on memory device specification).

BIMC_S_DDR0_DPE_DRAM_TIMING_17_ACT

Bits	Name	Description
9:0	TZQCL	READ ONLY

0x0044C1EC BIMC_S_DDR0_DPE_DRAM_TIMING_18_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the following read enable control in DDR clock cycles. The contents of this register are only valid for x64 DRAM devices.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_18_ACT

Bits	Name	Description
28:24	RCW_START_DLY_BYTE7	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.
20:16	RCW_START_DLY_BYTE6	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.
12:8	RCW_START_DLY_BYTE5	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.
4:0	RCW_START_DLY_BYTE4	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.

0x0044C1F0 BIMC_S_DDR0_DPE_DRAM_TIMING_19_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the following read enable control in DDR clock cycles.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature).

BIMC_S_DDR0_DPE_DRAM_TIMING_19_ACT

Bits	Name	Description
28:24	RCW_START_DLY_BYTE3	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.
20:16	RCW_START_DLY_BYTE2	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.
12:8	RCW_START_DLY_BYTE1	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.
4:0	RCW_START_DLY_BYTE0	READ ONLY Enables the external read enable n cycles from the CAS cycle for the read command.

0x0044C1F4 BIMC_S_DDR0_DPE_DRAM_TIMING_20_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the fine grain delay values for read enable control required by PHY. The contents of this CSR is only valid for x64 DRAM devices.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_20_ACT

Bits	Name	Description
31:24	RCW_FINE_DLY_BYTE7	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
23:16	RCW_FINE_DLY_BYTE6	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
15:8	RCW_FINE_DLY_BYTE5	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.

BIMC_S_DDR0_DPE_DRAM_TIMING_20_ACT (cont.)

Bits	Name	Description
7:0	RCW_FINE_DLY_BYTE4	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.

0x0044C1F8 BIMC_S_DDR0_DPE_DRAM_TIMING_21_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the fine grain delay values for read enable control required by PH.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature).

BIMC_S_DDR0_DPE_DRAM_TIMING_21_ACT

Bits	Name	Description
31:24	RCW_FINE_DLY_BYTE3	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
23:16	RCW_FINE_DLY_BYTE2	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
15:8	RCW_FINE_DLY_BYTE1	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.
7:0	RCW_FINE_DLY_BYTE0	READ ONLY This value controls the fine-grain delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device.

0x0044C1FC BIMC_S_DDR0_DPE_DRAM_TIMING_22_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the coarse grain delay values for read enable control required by PHY.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DRAM_TIMING_22_ACT

Bits	Name	Description
29:28	RCW_COARSE_DLY_BYTE 7	READ ONLY This value controls the coarse delay which will be applied by the PHY for the external read enable signal for precise DQS capture from the PCDDR3/LPDDR3 DRAM device. 0x0044C200 BIMC_S_DDR0_DPE_DRAM_TIMING_23_ACT**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

This register contains the current value of the timing parameter in DDR clock cycles. It also reflects the value in the ADD_CYCLES field in DRAM_TIMING_16 CSR.

BIMC_S_DDR0_DPE_DRAM_TIMING_23_ACT

Bits	Name	Description
31:28	ODTON_MAX	READ ONLY Specifies the ODT on max delay for LPDDR3/PCDDR3. Not Supported.
25:24	ODTON_MIN	READ ONLY Specifies the ODT on min delay for LPDDR3/PCDDR3. Not Supported.
22:20	ODTOFF_MAX	READ ONLY Specifies the ODT off max delay for LPDDR3/PCDDR3. Not Supported.
17:16	ODTOFF_MIN	READ ONLY Specifies the ODT off min delay for LPDDR3/PCDDR3. Not Supported.

0x0044C240 BIMC_S_DDR0_DPE_DQCAL_RDATA_RANK1_U

Type: R

Clock: ACLK

Reset State: 0x00000000

DQCAL Read Data Register for Rank1 Upper.

This register contains the upper 32 bits of a x64 DRAM mode register contents for a DQ calibration command triggered via SHKE to Rank1. The contents of this register are only valid for x64 DRAM devices. This is used to capture the read data from the DRAM device's mode register for a read DQ calibration command for LPDDR3 or an MPR read command for PCDDR3. The DQS data bits 0, 8, 16, 24, 32, 40, 48 and 56 are only captured on each DQS edge. The field below will capture the data for the last 2 cycles of DQS (last 4 DQS edges). Eg. DQCAL_RDATA[7:0] will have DQS data bits 0, 8, 16, 24, 32, 40, 48 and 56 for the fifth DQS edge. Hence 32 bits for the first 4 DQS edges.

BIMC_S_DDR0_DPE_DQCAL_RDATA_RANK1_U

Bits	Name	Description
31:0	DQCAL_RDATA	READ ONLY Upper 32 bits of Data for DQ calibration read for Rank1. The data captures the lowest bit for each byte across the memory burst. For eg. each cycle of memory burst is 16 bytes of data for x64 DRAM- 1 bit for each byte is captured which is 16 bits for every cycle of DQS.

0x0044C244 BIMC_S_DDR0_DPE_DQCAL_RDATA_RANK1_L**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DQCAL Read Data Register for Rank1 Lower.

This register contains the lower 32 bits of a x64 DRAM or 32 bits of a x32 DRAM mode register contents for a DQ calibration command triggered via SHKE to Rank1. This is used to capture the read data from the DRAM device's mode register for a read DQ calibration command for LPDDR3 or an MPR read command for PCDDR3. The DQS data bits 0, 8, 16 and 24 are only captured on each DQS edge for x32 DRAM device. For x32 LPDDR3 or PCDDR3 DRAM, DQCAL_RDATA[3:0] will have DQS data bits 0, 8, 16 and 24 for the first DQS edge. Hence 32 bits for the 8 DQS edges. For x64 LPDDR3 or PCDDR3 DRAM, the DQS data bits 0, 8, 16, 24, 32, 40, 48 and 56 are only captured on each DQS edge for x64 DRAM device. For x64 LPDDR3 or PCDDR3 DRAM, DQCAL_RDATA[7:0] will have DQS data bits 0, 8, 16, 24, 32, 40, 48 and 56 for every DQS edge (in this case DQS edges 1 - 4) resulting in 32 bits of captured data.

BIMC_S_DDR0_DPE_DQCAL_RDATA_RANK1_L

Bits	Name	Description
31:0	DQCAL_RDATA	READ ONLY Lower 32 bits of Data for DQ calibration read for Rank1. The data captures the lowest bit for each byte across the memory burst. For eg. each cycle of memory burst is 8 bytes of data for x32 DRAM (or 16 bytes of data for x64 DRAM) - 1 bit for each byte is captured which is 8 bits for every cycle of DQS.

DQCAL Status0 Register for Rank1.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK1

Bits	Name	Description
7	DQCAL_COMPARE_BYTE7	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE7] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE7] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
6	DQCAL_COMPARE_BYTE6	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE6] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE6] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
5	DQCAL_COMPARE_BYTE5	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE5] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE5] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)

BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK1 (cont.)

Bits	Name	Description
4	DQCAL_COMPARE_BYTE4	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE4] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE4] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
3	DQCAL_COMPARE_BYTE3	READ ONLY Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE3] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE3] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
2	DQCAL_COMPARE_BYTE2	READ ONLY Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE2] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE2] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)

BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK1 (cont.)

Bits	Name	Description
1	DQCAL_COMPARE_BYTE1	READ ONLY Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE1] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE1] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
0	DQCAL_COMPARE_BYTE0	READ ONLY Indicates whether the DQ calibration command for LPDDR2/3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE0] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE0] are correct. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. For LPDDR3/PCDDR3, the calibration command has a memory burst length of 8. 0x0: NONE (None) 0x1: ENUM_1_POS_EDGE (1_POS_EDGE) 0x2: ENUM_2_POS_EDGES (2_POS_EDGES) 0x3: ENUM_3_POS_EDGES (3_POS_EDGES) 0x4: ENUM_4_POS_EDGES (4_POS_EDGES) 0x5: ENUM_5_POS_EDGES (5_POS_EDGES) 0x6: ENUM_6_POS_EDGES (6_POS_EDGES) 0x7: ENUM_7_OR_MORE_POS_EDGES (7_OR_MORE_POS_EDGES)

0x0044C280 BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK0**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DQCAL Status0 Register for Rank0.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK0

Bits	Name	Description
7	DQCAL_COMPARE_BYTE7	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE7] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE7] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
6	DQCAL_COMPARE_BYTE6	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE6] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE6] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
5	DQCAL_COMPARE_BYTE5	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE5] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE5] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)

BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK0 (cont.)

Bits	Name	Description
4	DQCAL_COMPARE_BYTE4	READ ONLY This field is only valid for x64 DRAM devices. Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS1_RANK1[DQS_PE_BYTE4] and DQCAL_STATUS1_RANK1[DQS_NE_BYTE4] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
3	DQCAL_COMPARE_BYTE3	READ ONLY Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE3] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE3] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
2	DQCAL_COMPARE_BYTE2	READ ONLY Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE2] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE2] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)

BIMC_S_DDR0_DPE_DQCAL_STATUS0_RANK0 (cont.)

Bits	Name	Description
1	DQCAL_COMPARE_BYTE1	READ ONLY Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE1] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE1] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)
0	DQCAL_COMPARE_BYTE0	READ ONLY Indicates whether the DQ calibration command for LPDDR3 or PCDDR3 triggered via SHKE_DRAM_MANUAL_0[RD_DQCAL] resulted in an expected pattern comparison pass/fail. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. SW also needs to ensure that the number of DQS edges received in DQCAL_STATUS2_RANK1[DQS_PE_BYTE0] and DQCAL_STATUS2_RANK1[DQS_NE_BYTE0] are correct. A valid pass is only when number of DQS edges received are correct and the PASS comparison bit is set. 0x0: FAIL (FAIL) 0x1: PASS (PASS)

0x0044C284 BIMC_S_DDR0_DPE_DQCAL_STATUS1_RANK0**Type:** R**Clock:** ACLK**Reset State:** 0x00000000

DQCAL Status1 Register for Rank0. The contents of this CSR are only valid for x64 DRAM devices.

Note that the byte numbers below may not correspond to the actual DRAM byte. This is required so as to keep the byte number reference correct between the controller and the PHY (which has no information on the byte swap feature)

BIMC_S_DDR0_DPE_DQCAL_STATUS1_RANK0

Bits	Name	Description
30:28	DQS_PE_BYTE7	READ ONLY Indicates the number of DQS PE edges received for the DQ calibration command. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. For LPDDR3/PCDDR3, the calibration command has a memory burst length of 8. 0x0: NONE (None) 0x1: ENUM_1_POS_EDGE (1_POS_EDGE) 0x2: ENUM_2_POS_EDGES (2_POS_EDGES) 0x3: ENUM_3_POS_EDGES (3_POS_EDGES) 0x4: ENUM_4_POS_EDGES (4_POS_EDGES) 0x5: ENUM_5_POS_EDGES (5_POS_EDGES) 0x6: ENUM_6_POS_EDGES (6_POS_EDGES) 0x7: ENUM_7_OR_MORE_POS_EDGES (7_OR_MORE_POS_EDGES)
26:24	DQS_NE_BYTE7	READ ONLY Indicates the number of DQS NE edges received for the DQ calibration command. The value in this CSR field is valid when HW deasserts SHKE_DRAM_MANUAL_0[RD_DQCAL] indicating that the command completed. For LPDDR3/PCDDR3, the calibration command has a memory burst length of 8. 0x0: NONE (None) 0x1: ENUM_1_POS_EDGE (1_POS_EDGE) 0x2: ENUM_2_POS_EDGES (2_POS_EDGES) 0x3: ENUM_3_POS_EDGES (3_POS_EDGES) 0x4: ENUM_4_POS_EDGES (4_POS_EDGES) 0x5: ENUM_5_POS_EDGES (5_POS_EDGES) 0x6: ENUM_6_POS_EDGES (6_POS_EDGES) 0x7: ENUM_7_OR_MORE_POS_EDGES (7_OR_MORE_POS_EDGES)

0x0044C2FC BIMC_S_DDR0_DPE_CGC_CTRL**Type:** RW**Clock:** ACLK**Reset State:** 0x00000000

DPE clock gating control register. This register is used to enable automatic, dynamic gating of clock trees within the DPE. Values written to the CSR_ACCESS and RECALC_TCYC fields take effect immediately, while changes to all other fields become active upon writing a value of '1' to CONFIG_4[LOAD_ALL_CONFIG] or when CONFIG_3[LOAD_TIMING_ON_FREQ_CHNG] is set to '1' and a frequency change occurs.

BIMC_S_DDR0_DPE_CGC_CTRL

Bits	Name	Description
16	BANKTIMERS	Bank timer clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
15	COL_TIMERS	Column timer clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
14	CQ	Command queue clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
13	CSR_ACCESS	CSR access clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
12	LOAD_TIMING	Load timing clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
11	MEMCAS_CMD	Column logic clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
10	NDX_FIFO	Read index FIFO clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
9	OPT	Open page table clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
8	PAGE_IDLE_TIMER	Page idle timer clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
7	PWR_MGMT	Power management clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
6	RANKTIMERS	Rank timer clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
5	RDATA	Read data FIFO clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)
4	RECALC_TCYC	Timing-based parameter logic clock tree dynamic gating. 0x0: DISABLE (Disable) 0x1: ENABLE (Enable)

0	CSR_ACCESS	SW: RW, HW: R CSR access clock tree dynamic gating 0x0: DISABLE (Disable (default)) 0x1: ENABLE (Enable)

0x0044D020 BIMC_S_DDR0_SHKE_DRAM_MANUAL_0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Manual Command Register 0.

This register enables the software to manually issue commands to the DDR SDRAM interface. A value of '1' should be written in the bit field of the command that the software wants to force the controller to perform. When the controller has finished executing the command, it will clear the bit. Only one bit should be active at any given time in the register below, except for the RANK_SEL field. This limits the SW to have only 1 outstanding SW command for execution by the memory controller. This CSR is typically used for initialization the memory rank along with the DRAM_MANUAL_1 register. During SDRAM device initialization, SW should also program the DRAM_MANUAL_1 register (optional) so HW can maintain timing between the memory commands else, this is SW's responsibility. Once the rank(s) are initialized, it is not typical for SW to trigger commands (except those which are required as part of sequences - eg. Deep Power down). However after rank initialization, the HW will maintain protocol legal timings for SW triggered commands.

BIMC_S_DDR0_SHKE_DRAM_MANUAL_0

Bits	Name	Description
29:28	RANK_SEL	SW: RW, HW: R Select which chip select should be targeted for the chosen manual command to be executed. 0x0: INVALID (Invalid (default)) 0x1: CS0_ONLY (CS0 only) 0x2: CS1_ONLY (CS1 only) 0x3: CS0_AND_CS1 (CS0 and CS1)
27	CK_ON	SW: RW, HW: R Turns on external clock CK, CKN. This bit is self-cleared once the command is executed. Until the rank is initialized, HW would control the clocks based on this setting. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
26	CKE_ON	SW: RW, HW: R Turns on clock enable CKE. This bit is self-cleared once the command is executed. Until the rank is initialized, HW would control the CKE based on this setting. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)

BIMC_S_DDR0_SHKE_DRAM_MANUAL_0 (cont.)

Bits	Name	Description
25	RESETN_ON	SW: RW, HW: R Turns on reset pin to PCDDR3/4 devices only. This bit is self-cleared once the command is executed. Until the rank is initialized, HW would control the SDRAM reset based on this setting. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
24	CK_OFF	SW: RW, HW: R Turns off external clock CK, CKN. This bit is self-cleared once the command is executed. Until the rank is initialized, HW would control the clocks based on this setting. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
23	CKE_OFF	SW: RW, HW: R Turns off clock enable CKE. This bit is self-cleared once the command is executed. Until the rank is initialized, HW would control the CKE based on this setting. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
22	RESETN_OFF	SW: RW, HW: R Turns off reset pin to PCDDR3/4 devices only. This bit is self-cleared once the command is executed. Until the rank is initialized, HW would control the SDRAM reset based on this setting. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
21	ENTER_DEEP_PD	SW: RW, HW: RW Issue Deep Power Down. This bit is self-cleared once the command is executed. Deep Power down feature is only available on LPDDR2/3 SDRAM devices. HW will check to ensure all commands outstanding to the rank have completed before issuing the DPD command. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)

BIMC_S_DDR0_SHKE_DRAM_MANUAL_0 (cont.)

Bits	Name	Description
20	EXIT_DEEP_PD	SW: RW, HW: RW Issue Exit Deep Power Down. This bit is self-cleared once the command is executed. Deep Power down feature is only available on LPDDR2/3 SDRAM devices. The RANK_SEL field for this command cannot be set to '11'. When exiting Deep Power Down for a given Rank, it is required to re-initialize the LPDDR2/3 SDRAM devices by repeating the initialization sequence for the associated rank before that memory can be utilized or accessed. It is SW's responsibility to ensure that the minimum duration of DPD is met. Additionally SW needs to ensure that the clocks are stable before exiting DPD. Refer to the HW programming guide for Deep Power Down sequence 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
19	ZQCAL_SHORT	SW: RW, HW: RW Issue Short ZQ-Cal Command. This bit is self-cleared once the command is executed. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
18	ZQCAL_LONG	SW: RW, HW: RW Issue Long ZQ-Cal Command. This bit is self-cleared once the command is executed. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
17	AUTO_REFRESH	SW: RW, HW: RW NOT SUPPORTED. Auto-Refresh Command. This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
16	PRECHARGE_ALL	SW: RW, HW: RW NOT SUPPORTED. Precharge All Command. This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)

BIMC_S_DDR0_SHKE_DRAM_MANUAL_0 (cont.)

Bits	Name	Description
15	ENTER_SELF_REFRESH_IDLE	SW: RW, HW: R Enter Self-Refresh when idle. This SW trigger for self refresh is only supported for all active ranks. SW needs to account for the same when setting the RANK_SEL field for this command (eg. if the other rank is uninitialized or in deep power down). This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
14	ENTER_SELF_REFRESH_ASAP	SW: RW, HW: R Enter Self-Refresh immediately. This SW trigger for self refresh is only supported for all active ranks. SW needs to account for the same when setting the RANK_SEL field for this command (eg. if the other rank is uninitialized or in deep power down). This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
13	EXIT_SELF_REFRESH	SW: RW, HW: R Exit Self-Refresh immediately. This SW trigger for self refresh is only supported for all active ranks. SW needs to account for the same when setting the RANK_SEL field for this command (eg. if the other rank is uninitialized or in deep power down). Also, this command is only supported if SW had triggered a self refresh entry event or a watchdog event occurred. The corresponding status can be observed via SHKE_DRAM_STATUS CSR. This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
12	MODE_REGISTER_READ	SW: RW, HW: RW Mode Register Read Command. This only applies to LPDDR2/3 MRR commands. The Mode Register Address information for the command is used from SHKE_MREG_ADDR_WDATA_CNTL[MREG_ADDR]. This bit is self-cleared once the command is executed. Additionally, the read data from the memory device is available in SHKE_MREG_RDATA_RANK1/0 CSR. The read status is available in SHKE_MREG_RDATA_STATUS CSR. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)

BIMC_S_DDR0_SHKE_DRAM_MANUAL_0 (cont.)

Bits	Name	Description
11	MODE_REGISTER_WRITE	SW: RW, HW: RW Mode Register Write Command. The Mode Register Address and data information for the command is used from SHKE_MREG_ADDR_WDATA_CNTL[MREG_ADDR] and SHKE_MREG_ADDR_WDATA_CNTL[MREG_WDATA] CSR fields. This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
8	STALL_CMDS	SW: RW, HW: R This allows SW to stop transactions on the DDR bus. Once the transactions are stalled, SW will be required to unstall by executing the RESUME_CMDS command. This feature has been provided for debug and the stall status is available via SHKE_DRAM_STATUS CSR. This SW trigger for stall is only supported for all active ranks. SW needs to account for the same when setting the RANK_SEL field for this command (e.g. if the other rank is uninitialized or in deep power down). This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
7	RESUME_CMDS	SW: RW, HW: R This allows SW to resume transactions on the DDR bus. This feature has been provided for debug. This SW trigger for resume is only supported for all active ranks. SW needs to account for the same when setting the RANK_SEL field for this command (eg. if the other rank is uninitialized or in deep power down). Also, this command is only supported if SW had triggered a stall. The corresponding status can be observed via SHKE_DRAM_STATUS CSR This bit is self-cleared once the command is executed. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
6	EXTND_MODE_REGISTER_WRITE	SW: RW, HW: RW Extended Mode Register Write Command. The Mode Register Address and data information for the command is used from SHKE_MREG_ADDR_WDATA_CNTL[MREG_ADDR] and SHKE_MREG_ADDR_WDATA_CNTL[MREG_WDATA] CSR fields. This bit is self-cleared once the command is executed. This bit is only to be used for Mode register writes related to the LPDDR3 CA training sequence as this allows the CA bus to be stable before and after the command to allow for sufficient setup time for the DRAM to sample the command correctly. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)

BIMC_S_DDR0_SHKE_DRAM_MANUAL_0 (cont.)

Bits	Name	Description
5	CA_TRAIN_PATTERN_CMD	SW: RW, HW: RW LPDDR3 CA Pattern Command for CA Training. The specific address pattern to be driven in needs to be programmed in DPE_CA_TRAIN_PRE_CS, DPE_CA_TRAIN_CS and DPE_CA_TRAIN_POST_CS CSRs before triggering this command. This bit is self-cleared once the command is executed. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)
4	RD_DQCAL	SW: RW, HW: RW DQ Calibration Read Command. This relates to LPDDR3 MRR command & PCDDR3 MPR command. This is used for read training and/or rank auto detect. A pre-defined read pattern is sent out by the DRAM and captured by the controller. In case of LPDDR3, this is an MRR commands with SHKE_MREG_ADDR_WDATA_CNTL[MREG_ADDR] specified correctly (valid values are 0x32 & 0x40). In case of PCDDR3 devices, this is an MPR read command and hence SHKE_MREG_ADDR_WDATA_CNTL[MREG_ADDR] is a don't care. This bit is self-cleared once the command is executed. The read data status for the calibration read command is captured in the DPE status registers. The RANK_SEL field for this command cannot be set to '11'. 0x0: NOP (Nop (default)) 0x1: EXECUTE (Execute)

0x0044D024 BIMC_S_DDR0_SHKE_DRAM_MANUAL_1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Manual Command Register 1.

This register can only be used during memory rank initialization. As part of the memory device initialization, certain delays are required between commands. This can be enforced by SW or by setting up the following register before triggering a command to be executed via DRAM_MANUAL_0 CSR. When WAIT_TIMER_BEFORE_HW_CLEAR is set to a non-zero value any SW command issued during memory device initialization will wait the programmable number of timer/xo clock cycles before indicating the command completion response.

BIMC_S_DDR0_SHKE_DRAM_MANUAL_1

Bits	Name	Description
16	WAIT_TIMER_DOMAIN	SW: RW, HW: R Indicates which clock should be used in HW for the down counter. 0x0: TIMER_CLOCK (Timer Clock (default)) 0x1: XO_CLOCK (XO Clock)
15:0	WAIT_TIMER_BEFORE_HW_CLEAR	SW: RW, HW: R This indicates the amount of time in timer/xo clock cycles required to wait after sending the SW triggered command in SHKE_DRAM_MANUAL_0 CSR before indicating the command completion response.

0x0044D030 BIMC_S_DDR0_SHKE_MREG_ADDR_WDATA_CNTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Mode Register Address and Write Data Control.

A SW triggered mode register read/write command via DRAM_MANUAL_0[MODE_REGISTER_READ/WRITE] CSR uses the mode register address and write data (if Mode Register Write) from the register below.

BIMC_S_DDR0_SHKE_MREG_ADDR_WDATA_CNTL

Bits	Name	Description
27:20	MREG_ADDR	SW: RW, HW: R Mode Register Address Information for the Mode Register Read/Write triggered via SW using SHKE_DRAM_MANUAL_0[MODE_REGISTER_READ/WRITE], SHKE_DRAM_MANUAL_0[EXTND_MODE_REGISTER_WRITE] or SHKE_DRAM_MANUAL_0[RD_DQCAL]
15:0	MREG_WDATA	SW: RW, HW: R Mode Register Write data information corresponding to the Mode Register Write command triggered via SW using SHKE_DRAM_MANUAL_0[MODE_REGISTER_WRITE/EXTND_MODE_REGISTER_WRITE] CSR.

0x0044D050 BIMC_S_DDR0_SHKE_MREG_RDATA_RANK1_U**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Mode Register Read (Upper 32 bits) from Memory Rank1. The data in this register is valid only for 64-bit memory devices. (does not apply for LPDDR2/3 devices)

BIMC_S_DDR0_SHKE_MREG_RDATA_RANK1_U

Bits	Name	Description
31:0	MREG_RDATA	This is the read data corresponding to either the Mode Register Read triggered via SW using DRAM_MANUAL_0[MODE_REGISTER_READ] CSR targeted to rank1. In case of an mode register read command, the read data represents 32 bits of the first beat of read data from the SDRAM device.

0x0044D054 BIMC_S_DDR0_SHKE_MREG_RDATA_RANK1_L

Type: R

Clock: HCLK

Reset State: 0x00000000

SHKE Mode Register Read (Lower 32 bits) from Memory Rank1. The data in this register is valid only for both 64-bit & 32-bit memory devices.

BIMC_S_DDR0_SHKE_MREG_RDATA_RANK1_L

Bits	Name	Description
31:0	MREG_RDATA	This is the read data corresponding to either the Mode Register Read triggered via SW using DRAM_MANUAL_0[MODE_REGISTER_READ] CSR targeted to rank1. In case of an mode register read command, the read data represents 32 bits of the first beat of read data from the SDRAM device.

0x0044D060 BIMC_S_DDR0_SHKE_MREG_RDATA_RANK0_U

Type: R

Clock: HCLK

Reset State: 0x00000000

SHKE Mode Register Read (Upper 32 bits) from Memory Rank0. The data in this register is valid only for 64-bit memory devices. (does not apply for LPDDR2/3 devices)

BIMC_S_DDR0_SHKE_MREG_RDATA_RANK0_U

Bits	Name	Description
31:0	MREG_RDATA	This is the read data corresponding to either the Mode Register Read triggered via SW using DRAM_MANUAL_0[MODE_REGISTER_READ] CSR targeted to rank1. In case of an mode register read command, the read data represents 32 bits of the first beat of read data from the SDRAM device.

SHKE Mode Register Read (Lower 32 bits) from Memory Rank0. The data in this register is valid only for both 64-bit & 32-bit memory devices.

BIMC_S_DDR0_SHKE_MREG_RDATA_RANK0_L

Bits	Name	Description
31:0	MREG_RDATA	This is the read data corresponding to either the Mode Register Read triggered via SW using DRAM_MANUAL_0[MODE_REGISTER_READ] CSR targeted to rank0. In case of an mode register read command, the read data represents 32 bits of the first beat of read data from the SDRAM device.

0x0044D070 BIMC_S_DDR0_SHKE_MREG_RDATA_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Mode Register Read status.

BIMC_S_DDR0_SHKE_MREG_RDATA_STATUS

Bits	Name	Description
0	MREG_TIMEOUT	This is the MRR status corresponding to the Mode Register Read triggered via SW using DRAM_MANUAL_0[MODE_REGISTER_READ] CSR. If the memory device does not respond with DQS edges (eg. if the memory device isn't present) then this bit would be set when HW clears the DRAM_MANUAL_0[MODE_REGISTER_READ] bit to indicate MRR completion. 0x0: NO_TIMEOUT (No Timeout(default)) 0x1: TIMEOUT (Timeout)

0x0044D074 BIMC_S_DDR0_SHKE_DRAM_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Dram status based on SW trigger in DRAM_MANUAL_0 CSR control.

BIMC_S_DDR0_SHKE_DRAM_STATUS

Bits	Name	Description
2	WDOG_SELF_RFSH	This is the DRAM self refresh status corresponding to the watchdog reset event received. If set, it indicates that the memory controller is currently in self refresh state due to a watchdog reset event and hence requires a DDR_MANUAL_0[EXIT_SELF_REFRESH] trigger to exit from the forced self refresh state. 0x0: NOT_IN_SELF_REFRESH (Not In Self Refresh(default)) 0x1: IN_SELF_REFRESH (In Self Refresh)
1	SW_SELF_RFSH	This is the DRAM self refresh status corresponding to the SW triggered command via DRAM_MANUAL_0[ENTER_SELF_REFRESH_IDLE/_ASAP] and DDR_MANUAL_0[EXIT_SELF_REFRESH] CSR. If set, it indicates that the memory controller is currently in SW triggered self refresh state and hence requires a DDR_MANUAL_0[EXIT_SELF_REFRESH] trigger to exit from the SW forced self refresh state. 0x0: NOT_IN_SELF_REFRESH (Not In Self Refresh(default)) 0x1: IN_SELF_REFRESH (In Self Refresh)

BIMC_S_DDR0_SHKE_DRAM_STATUS (cont.)

Bits	Name	Description
0	STALL	This is the DRAM stall status corresponding to the SW triggered command via DRAM_MANUAL_0[STALL_CMDS] and DDR_MANUAL_0[RESUME_CMDS] CSR. If set, it indicates that the memory controller is currently in SW triggered stalled state and hence requires a DDR_MANUAL_0[RESUME_CMDS] trigger to exit from the SW forced stall state. 0x0: NOT_STALLED (Not Stalled(default)) 0x1: STALLED (Stalled)

0x0044D0A0 BIMC_S_DDR0_SHKE_PERIODIC_MRR**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

SHKE Periodic MRR Command.

This is typically used to generate periodic LPDDR2/3 MRR commands to monitor the temperature of the memory device and appropriately adjust the refresh rate depending on the SDRAM device temperature.

BIMC_S_DDR0_SHKE_PERIODIC_MRR

Bits	Name	Description
27:20	MRR_ADDR	Specify which mode register to access. For LPDDR2/3 devices, this would typically be set to 0x04.
17:16	MRR_RANK_SEL	SW: RW, HW: R Specify DRAM rank to which the command goes. The HW will only send the command to a rank which is initialized. 0x0: NOT_VALID (Not valid (default)) 0x1: RANK_0_ONLY (Rank 0 only) 0x2: RANK_1_ONLY (Rank 1 only) 0x3: BOTH_RANKS_0_AND_1 (Both ranks 0 and 1)

BIMC_S_DDR0_SHKE_PERIODIC_MRR (cont.)

Bits	Name	Description
15:0	MRR_INTERVAL	SW: RW, HW: R Number of timer clock edges between periodic MRR samples. This interval is maintained by the controller on a per-rank basis. The timer clock typically runs at 32 kHz, hence providing a range of 10-2050ms periodic interval. The minimum supported value is ?d4 for 1 rank systems and ?d13 for 2 rank systems. 0x0: DISABLED (Disabled (default)) 0x100: TIME_OF_10MS (Time of 10ms) 0x200: TIME_OF_20MS (Time of 20ms) 0x400: TIME_OF_30MS (Time of 30ms) 0x800: TIME_OF_60MS (Time of 60ms) 0x1000: TIME_OF_130MS (Time of 130ms) 0x2000: TIME_OF_260MS (Time of 260ms) 0x4000: TIME_OF_510MS (Time of 510ms) 0x8000: TIME_OF_1030MS (Time of 1030ms) 0xFFFF: TIME_OF_2050MS (Time of 2050ms)

0x0044D0B0 BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK1_U**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Periodic Mode Register Read (Upper 32 bits) from Memory Rank1. The data in this register is valid only for 64-bit memory devices. (does not apply for LPDDR2/3 devices).

BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK1_U

Bits	Name	Description
31:0	MREG_DATA	This is the read data corresponding to the Mode Register Read command issued to rank1 due to periodic mode register reads enabled via PERIODIC_MRR CSR. The data captured represents the upper 32 bits for the first beat of read data for 64bit memory devices.

0x0044D0B4 BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK1_L**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Periodic Mode Register Read (Lower 32 bits) from Memory Rank1. The data in this register is valid for both 64-bit & 32-bit memory devices.

BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK1_L

Bits	Name	Description
31:0	MREG_DATA	This is the read data corresponding to the Mode Register Read command issued to rank1 due to periodic mode register reads enabled via PERIODIC_MRR CSR. The data captured represents the lower 32 bits for the first beat of read data for 64bit memory devices or the only 32 bits of data for the first beat of read data for 32 bit memory devices.

0x0044D0B8 BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK0_U**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Periodic Mode Register Read (Upper 32 bits) from Memory Rank0. The data in this register is valid only for 64-bit memory devices. (does not apply for LPDDR2/3 devices)

BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK0_U

Bits	Name	Description
31:0	MREG_DATA	This is the read data corresponding to the Mode Register Read command issued to rank0 due to periodic mode register reads enabled via PERIODIC_MRR CSR. The data captured represents the upper 32 bits for the first beat of read data for 64bit memory devices.

0x0044D0BC BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK0_L**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

SHKE Periodic Mode Register Read (Lower 32 bits) from Memory Rank0. The data in this register is valid for both 64-bit & 32-bit memory devices.

BIMC_S_DDR0_SHKE_PERIODIC_MRR_RDATA_RANK0_L

Bits	Name	Description
31:0	MREG_DATA	This is the read data corresponding to the Mode Register Read command issued to rank0 due to periodic mode register reads enabled via PERIODIC_MRR CSR. The data captured represents the lower 32 bits for the first beat of read data for 64bit memory devices or the only 32 bits of data for the first beat of read data for 32 bit memory devices.

0x0044D0D0 BIMC_S_DDR0_SHKE_PERIODIC_ZQCAL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register provides control for periodic ZQCalibration commands to be issued to the SDRAM memory device.

BIMC_S_DDR0_SHKE_PERIODIC_ZQCAL

Bits	Name	Description
29:28	RANK_SEL	SW: RW, HW: R Specify DRAM rank to which the command goes. The HW will only send the command to a rank which is initialized. 0x0: NOT_VALID (Not valid (default)) 0x1: RANK_0_ONLY (Rank 0 only) 0x2: RANK_1_ONLY (Rank 1 only) 0x3: BOTH_RANKS_0_AND_1 (Both ranks 0 and 1)
15:0	ZQCAL_INTERVAL	SW: RW, HW: R Number of timer clock edges between periodic ZQ calibrations. This interval is maintained by the controller on a per-rank basis. The timer clock typically runs at 32kHz, hence providing a range of 10-2050ms periodic interval. The minimum supported value is ?d4 for 1 rank systems and ?d13 for 2 rank systems. 0x0: DISABLED (Disabled (default)) 0x100: TIME_OF_10MS (Time of 10ms) 0x200: TIME_OF_20MS (Time of 20ms) 0x400: TIME_OF_30MS (Time of 30ms) 0x800: TIME_OF_60MS (Time of 60ms) 0x1000: TIME_OF_130MS (Time of 130ms) 0x2000: TIME_OF_260MS (Time of 260ms) 0x4000: TIME_OF_510MS (Time of 510ms) 0x8000: TIME_OF_1030MS (Time of 1030ms) 0xFFFF: TIME_OF_2050MS (Time of 2050ms)

0x0044D0F0 BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register provides the controls for auto refresh functionality for the SDRAM devices.

BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL

Bits	Name	Description
29	AUTO_RFSH_ENABLE_RANK1	SW: RW, HW: R Auto Refresh Enable for Rank1 0x0: DISABLE (Disable (default)) 0x1: ENABLE (Enable)
28	AUTO_RFSH_ENABLE_RANK0	SW: RW, HW: R Auto Refresh Enable for Rank0 0x0: DISABLE (Disable (default)) 0x1: ENABLE (Enable)
25:24	AUTO_REFRESH_MODE	SW: RW, HW: R Specifies the auto refresh mode. Per-bank refresh mode is only supported for LPDDR2/3 8-bank devices. 0x0: ALL_BANK_REFRESH (All Bank Refresh (default)) 0x1: PER_BANK_REFRESH (Per Bank Refresh)
23:22	AUTO_SWITCH_ALL_BANK_MODE	SW: RW, HW: R If configured in per-bank refresh mode, this setting controls whether HW automatically switches to all-bank refresh mode when a certain high temperature of the memory device is detected which requires a faster refresh rate. When enabled, HW automatically switches back to the configured per-bank refresh mode when the device temperature returns below the threshold specified. When set to '10', HW will automatically switch to all-bank refresh mode when a TREFI multiplier of 0.25 is received and it switches back to per-bank refresh mode when a multiplier greater than 0.25 is received (eg. 0.5 or 1). It is illegal to change this CSR setting after the rank has been initialized. 0x0: DISABLE (Disable (default)) 0x1: TREFI_0_5X_OR_TREFI_0_25X (TREFI_0.5X_OR_TREFI_0.25X) 0x2: TREFI_0_25X (TREFI_0.25X) 0x3: NOT_VALID (Not Valid)
16	DISABLE_AUTO_REFRESH_TEMP_UPDATE	SW: RW, HW: R Disables the refresh rate updates based on SRR based DRAM temperature updates. It is illegal to change this CSR setting after the rank has been initialized. 0x0: ENABLE (Enable (default)) 0x1: DISABLE (Disable)
9:0	TREFI	SW: RW, HW: R If SHKE_AUTO_RFSH_CNTL_1[TREFI] is non-zero, then this field is used as TREFI value for rank0. If SHKE_AUTO_RFSH_CNTL_1[TREFI] is zero, then this field is used as TREFI value for both ranks. Number of clock cycle delay (in t _{cxo} clock cycles) between all-bank auto-refresh commands. This is required to be set to the ?desired t _{TREFI} ? -1 t _{cxo} cycles. It is illegal to change this CSR setting after the rank has been initialized.

0x0044D0F4 BIMC_S_DDR0_SHKE_SELF_REFRESH_CNTL**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register provides the controls for HW activity based self refresh.

BIMC_S_DDR0_SHKE_SELF_REFRESH_CNTL

Bits	Name	Description
29	HW_SELF_RFSH_ENABLE_RANK1	SW: RW, HW: R Enables HW to look for no activity for rank1 and trigger an idle timer specified based on the value of HW_SELF_RFSH_TIMER. If there is no activity still and the timer expires, the HW will initiate entry to self refresh mode. 0x0: DISABLE (Disable (default)) 0x1: ENABLE (Enable)
28	HW_SELF_RFSH_ENABLE_RANK0	SW: RW, HW: R Enables HW to look for no activity for rank0 and trigger an idle timer specified based on the value of HW_SELF_RFSH_TIMER. If there is no activity still and the timer expires, the HW will initiate entry to self refresh mode. 0x0: DISABLE (Disable (default)) 0x1: ENABLE (Enable)
23:12	HW_SELF_RFSH_IDLE_TIMER	SW: RW, HW: R Count idle tctx cycles before entering self refresh. The timer is based on XO clock frequency. Valid only when HW_SELF_RFSH_ENABLE_RANK* or CONCURRENT_SELF_RFSH_EN is set. The minimum supported value is 4.

BIMC_S_DDR0_SHKE_SELF_REFRESH_CNTL (cont.)

Bits	Name	Description
8	CONCURRENT_SELF_REFRESH_EN	SW: RW, HW: R Concurrent Self Refresh Mode. This field is only valid if both the memory ranks are populated with DRAM devices and if only one or none of the individual self refresh enable bits for the ranks are set. (Currently only support this field can be set if and only if the individual self refresh enable bits for the ranks are both off) If the individual self refresh enable bits for both ranks (above) are off and this field is set (only supported mode), then self refresh is only entered when both ranks are idle and the idle timer has expired for both ranks. The above is a recommended setting for PCDDR3 (or LPDDR3) for dual rank ODT configurations wherein the inactive rank is selected to provide termination for a read/write to the other rank. If the concurrent self refresh enable bit is set and only the hardware self refresh enable bit for rank1 is set (not supported), then the controller would enter self refresh for rank1 entirely based on rank1 traffic, however the self refresh enter for rank0 would happen only if rank1 is in self refresh and rank0's idle timer has expired. Rank0 will come out of self refresh if either of the ranks go non-idle. This setting is recommended for LPDDR3 (external) dual rank devices wherein only 1 ODT pin exists. 0x0: DISABLE (Disable (default)) 0x1: ENABLE (Enable)

0x0044D100 BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL_1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register provides the controls for auto refresh functionality for Rank1 for the SDRAM devices.

BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL_1

Bits	Name	Description
9:0	TREFI	SW: RW, HW: R This field is only for Rank1 refresh rate. If the contents of this field are zero, then SHKE_AUTO_REFRESH_CNTL[TREFI] is used as the initial value for both ranks, else SHKE_AUTO_REFRESH_CNTL[TREFI] is used as the initial value for rank0 and this field is used as the initial value for rank1. Number of clock cycle delay (in t _{cxo} clock cycles) between all-bank auto-refresh commands. This is required to be set to the ?desired tREFI? -1 t _{cxo} cycles. It is illegal to change this CSR setting after the rank has been initialized.

0x0044D104 BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL_2**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register provides the programmable delay for updating the refresh rate based on SDRAM's device temperature. This register is NOT SUPPORTED if retention based power collapse is used.

BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL_2

Bits	Name	Description
31:16	RFSH_UPDATE_TIMER	SW: RW, HW: R Number of timer clock edges to wait before updating the refresh rate. This is only for the refresh rates selected in DLY_RFSH_CONDN below. Typically, SW would want to set this to the amount of time it takes to service a high temperature interrupt from DPE indicating high temperature is reached and hence the min. frequency of operation needs to be increased for the design to perform data commands in addition to keeping up with the auto refresh requirements of the device. A value of 0 indicates that the timer is disabled. The minimum supported value for this timer is ?h3. Typically, the value programmed in this timer would be far less than the value in PERIODIC_MRR[MRR_INTERVAL].

BIMC_S_DDR0_SHKE_AUTO_REFRESH_CNTL_2 (cont.)

Bits	Name	Description
0	DLY_RFSH_CONDN	SW: RW, HW: R If the timer above is valid (non-zero), then this CSR field determines at what requested refresh rates should the timer be enabled. 0x0: TREFI_0_5X_OR_LESS (TREFI_0.5X_OR_LESS) 0x1: TREFI_0_25X (TREFI_0.25X)

3 Peripheral Configuration NOC

0x00500000 PCNOC_OBS_ID_COREID

Type: R

Reset State: 0x3D716D0D

PCNOC_OBS_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00500004 PCNOC_OBS_ID_REVISIONID

Type: R

Reset State: 0x01222B00

PCNOC_OBS_ID_REVISIONID

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00500008 PCNOC_OBS_FAULTEN

Type: RW

Reset State: 0x00000000

PCNOC_QHM1_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00501228 PCNOC_QHM1_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**PCNOC_QHM1_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00501280 PCNOC_QXM_SNOC_TFILT_ID_COREID**Type:** R**Reset State:** 0x214A1A09**PCNOC_QXM_SNOC_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00501284 PCNOC_QXM_SNOC_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_QXM_SNOC_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00501288 PCNOC_QXM_SNOCTFILT_MODE**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOCTFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0050128C PCNOC_QXM_SNOCTFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOCTFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00501290 PCNOC_QXM_SNOCTFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOCTFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00501294 PCNOC_QXM_SNOCTFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOCTFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00501298 PCNOC_QXM_SNOG_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOG_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0050129C PCNOC_QXM_SNOG_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOG_TFILT_SRCIDMASK**

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x005012A0 PCNOC_QXM_SNOG_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOG_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x005012A4 PCNOC_QXM_SNOG_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000

PCNOC_QXM_SNOG_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x005012A8 PCNOC_QXM_SNOG_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**PCNOC_QXM_SNOG_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00502000 PCNOC_TPRB0_TPROF_ID_COREID**Type:** R**Reset State:** 0xD1B7540A**PCNOC_TPRB0_TPROF_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00502004 PCNOC_TPRB0_TPROF_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_TPRB0_TPROF_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00502008 PCNOC_TPRB0_TPROF_EN**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_EN**

Bits	Name	Description
0	EN	Register En is a 1-bit register that enables the transaction probe counter unit.

0x0050200C PCNOC_TPRB0_TPROF_MODE**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_MODE**

Bits	Name	Description
1:0	MODE	Register Mode sets the counting mode per observed port. Each bit per observation port defines the incrementing mode. (Mode = 0 for Delay, Mode = 1 for Pending)

0x00502010 PCNOC_TPRB0_TPROF_OBSERVEDSEL_0**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_OBSERVEDSEL_0**

Bits	Name	Description
2:0	OBSERVEDSEL_0	Register ObservedSel_i selects the port to be observed: 0.

0x00502014 PCNOC_TPRB0_TPROF_OBSERVEDSEL_1**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_OBSERVEDSEL_1**

Bits	Name	Description
2:0	OBSERVEDSEL_1	Register ObservedSel_i selects the port to be observed: 1.

0x00502020 PCNOC_TPRB0_TPROF_NTENURELINES_0**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_NTENURELINES_0**

Bits	Name	Description
2:0	NTENURELINES_0	Register nTenureLine_i indicates the number of transaction probe lines allocated to each observed port: 0.

0x0050202C PCNOC_TPRB0_TPROF_THRESHOLDS_0_0**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_THRESHOLDS_0_0**

Bits	Name	Description
3:0	THRESHOLDS_0_0	Register Threshold_i_j contains the threshold index '0' that allows computation of threshold values.

0x00502030 PCNOC_TPRB0_TPROF_THRESHOLDS_0_1**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_THRESHOLDS_0_1**

Bits	Name	Description
3:0	THRESHOLDS_0_1	Register Threshold_i_j contains the threshold index '1' that allows computation of threshold values.

0x00502034 PCNOC_TPRB0_TPROF_THRESHOLDS_0_2**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_THRESHOLDS_0_2**

Bits	Name	Description
3:0	THRESHOLDS_0_2	Register Threshold_i_j contains the threshold index '2' that allows computation of threshold values.

0x0050203C PCNOC_TPRB0_TPROF_THRESHOLDS_1_0**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_THRESHOLDS_1_0**

Bits	Name	Description
3:0	THRESHOLDS_1_0	Register Threshold_i_j contains the threshold index '0' that allows computation of threshold values.

0x00502040 PCNOC_TPRB0_TPROF_THRESHOLDS_1_1**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_THRESHOLDS_1_1**

Bits	Name	Description
3:0	THRESHOLDS_1_1	Register Threshold_i_j contains the threshold index '1' that allows computation of threshold values.

0x00502044 PCNOC_TPRB0_TPROF_THRESHOLDS_1_2**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_THRESHOLDS_1_2**

Bits	Name	Description
3:0	THRESHOLDS_1_2	Register Threshold_i_j contains the threshold index '2' that allows computation of threshold values.

0x0050206C PCNOC_TPRB0_TPROF_OVERFLOWSTATUS**Type:** R**Reset State:** Undefined**PCNOC_TPRB0_TPROF_OVERFLOWSTATUS**

Bits	Name	Description
1:0	OVERFLOWSTATUS	Register OverflowStatus is a status register that handles the overflow status on each observed port. OverflowStatus = nObservable. Bit 0 gives the status of observed port 0.

0x00502070 PCNOC_TPRB0_TPROF_OVERFLOWRESET**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_OVERFLOWRESET**

Bits	Name	Description
1:0	OVERFLOWRESET	Register OverflowReset is a pulse register that clears overflow status bits per observed port on each write access. OverflowReset = nObservable. Writing 0x2 clears the overflow status of observed port 1.

0x00502074 PCNOC_TPRB0_TPROF_PENDINGEVENTMODE**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_PENDINGEVENTMODE**

Bits	Name	Description
0	PENDINGEVENTMODE	Register pendingEventMode is a 1-bit register that configures the pending event mode. When set to 0 (CYCLE), and when register mode is set to PENDING, the pending event is generated on each cycle when the counter is greater than zero. When set to 1 (STOP) the pending event is generated on each stop event.

0x00502078 PCNOC_TPRB0_TPROF_PRESCALER**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_TPROF_PRESCALER**

Bits	Name	Description
7:0	PRESCALER	8Register Prescaler is an-bit pre-scaling register that accepts any pre-scaling value between 1 (default) and 256. If set to 0, pre-scaling is disabled. If set to any other supported value 'n', the threshold counter value is divided by (n + 1).

0x00503000 PCNOC_EPRB0_SPROF_ID_COREID**Type:** R**Reset State:** 0x2E2A2E06

PCNOC_EPRB0_SPROF_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00503004 PCNOC_EPRB0_SPROF_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_EPRB0_SPROF_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00503008 PCNOC_EPRB0_SPROF_MAINCTL**Type:** RW**Reset State:** 0x00000000

Register MainCtl contains probe global control bits. The register has seven bit fields:

PCNOC_EPRB0_SPROF_MAINCTL

Bits	Name	Description
7	FILTBYTEALWAYSCHAINABLEEN	When set to 0, Filter Byte / ByteEn Cnt will be connected to all statistics counters where odd Stat count are not chainable. When set to 1, Filter Byte / ByteEn Cnt will be connected only to chainable stat counter (even stat counter).
6	INTRUSIVEMODE	When set to 1, register field IntrusiveMode enables trace operation in Intrusive flow-control mode. When set to 0, the register enables trace operation in Overflow flow-control mode
5	STATCONDDUMP	When set, register field StatCondDump enables the dump of a statistics frame to the range of counter values set for registers StatAlarmMin, StatAlarmMax, and AlarmMode. This field also renders register StatAlarmStatus inoperative. When parameter statisticsCounterAlarm is set to False, the StatCondDump register bit is reserved.
4	ALARMEN	When set, register field AlarmEn enables the probe to collect alarm-related information. When the register field bit is null, both TraceAlarm and StatAlarm outputs are driven to 0.

PCNOC_EPRB0_SPROF_MAINCTL (cont.)

Bits	Name	Description
3	STATEN	When set to 1, register field StatEn enables statistics profiling. The probe sendS statistics results to the output for signal ObsTx. All statistics counters are cleared when the StatEn bit goes from 0 to 1. When set to 0, counters are disabled.
2	PAYLOADEN	Register field PayloadEn, when set to 1, enables traces to contain headers and payload. When set to 0, only headers are reported.
1	TRACEEN	Register field TraceEn enables the probe to send filtered packets (Trace) on the ObsTx observation output.
0	ERREN	Register field ErrEn enables the probe to send on the ObsTx output any packet with Error status, independently of filtering mechanisms, thus constituting a simple supplementary global filter.

0x0050300C PCNOC_EPRB0_SPROF_CFGCTL**Type:** RW**Reset State:** 0b000000000000000000000000000000X0**PCNOC_EPRB0_SPROF_CFGCTL**

Bits	Name	Type	Description
1	ACTIVE	R	
0	GLOBALEN	RW	

0x00503014 PCNOC_EPRB0_SPROF_FILTERLUT**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERLUT**

Bits	Name	Description
3:0	FILTERLUT	Register FilterLut contains a look-up table that is used to combine filter outputs in order to trace packets. Packet tracing is enabled when the FilterLut bit of index (FNout ... F0out) is equal to 1. The number of bits in register FilterLut is determined by the setting for parameter nPort, calculated as 2**nPort. When parameter nFilter is set to None or 0, FilterLut is reserved.

0x00503018 PCNOC_EPRB0_SPROF_TRACEALARMEN**Type:** RW**Reset State:** 0x00000000

PCNOC_EPRB0_SPROF_TRACEALARMEN

Bits	Name	Description
2:0	TRACEALARMEN	Register TraceAlarmEn controls which lookup table or filter can set the TraceAlarm signal output once the trace alarm status is set. The number of bits in register TraceAlarmEn is determined by the value set for parameter nFilter + 1. Bit nFilter controls the lookup table output, and bits nFilter:0 control the corresponding filter output. When parameter nFilter is set to None, TraceAlarmEn is reserved.

0x0050301C PCNOC_EPRB0_SPROF_TRACEALARMSTATUS**Type:** R**Reset State:** Undefined**PCNOC_EPRB0_SPROF_TRACEALARMSTATUS**

Bits	Name	Description
2:0	TRACEALARMSTATUS	Register TraceAlarmStatus is a read-only register that indicates which lookup table or filter has been matched by a packet, independently of register TraceAlarmEn bit configuration. The number of bits in TraceAlarmStatus is determined by the value set for parameter nFilter + 1. When nFilter is set to None, TraceAlarmStatus is reserved.

0x00503020 PCNOC_EPRB0_SPROF_TRACEALARMCLR**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_TRACEALARMCLR**

Bits	Name	Description
2:0	TRACEALARMCLR	Register TraceAlarmClr is a write-only register. A write operation to this register clears the bits in register TraceAlarmStatus, which are set by this write. The number of bits in register TraceAlarmClr is determined by the value set for parameter nFilter + 1. When nFilter is set to None, TraceAlarmClr is reserved.

0x00503024 PCNOC_EPRB0_SPROF_STATPERIOD**Type:** RW**Reset State:** 0x00000000

PCNOC_EPRB0_SPROF_STATPERIOD

Bits	Name	Description
4:0	STATPERIOD	Register StatPeriod is a 5-bit register that sets a period, within a range of 2-8 megacycles, during which statistics are collected before being dumped automatically. Setting the register effectively enables automatic mode operation for statistics collection. Note: The configured period is also used for statistics alarm generation. The period is calculated with the formula: $N_Cycle = 2^{**min(23, StatPeriod)}$ When register StatPeriod is set to its default value 0, automatic dump mode is disabled, and register StatGo is activated for manual mode operation. Note: When parameter nStatisticsCounter is set to 0, statistics collection is disabled, with the consequence that all statistics collection registers, including StatPeriod, are reserved.

0x00503028 PCNOC_EPRB0_SPROF_STATGO**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_STATGO**

Bits	Name	Description
0	STATGO	Writing to 1-bit pulse register StatGo generates a statistics dump. The register is active when statistics collection operates in its manual mode, that is, when register StatPeriod is set to 0.

0x0050302C PCNOC_EPRB0_SPROF_STATALARMMIN**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_STATALARMMIN**

Bits	Name	Description
31:0	STATALARMMIN	Register StatAlarmMin contains the minimum count value used in statistics alarm comparisons. The number of bits is equal to twice the value set for parameter wStatisticsCounter. When parameter statisticsCounterAlarm is set to False, StatAlarmMin is reserved.

0x00503030 PCNOC_EPRB0_SPROF_STATALARMMAX**Type:** RW**Reset State:** 0x00000000

PCNOC_EPRB0_SPROF_STATALARMMAX

Bits	Name	Description
31:0	STATALARMMAX	Register StatAlarmMax contains the maximum count value used in statistics alarm comparisons. The number of bits is equal to twice the value set for parameter wStatisticsCounter. When parameter statisticsCounterAlarm is set to False, StatAlarmMax is reserved.

0x00503034 PCNOC_EPRB0_SPROF_STATALARMSSTATUS**Type:** R**Reset State:** Undefined**PCNOC_EPRB0_SPROF_STATALARMSSTATUS**

Bits	Name	Description
0	STATALARMSSTATUS	Register StatAlarmStatus is a read-only 1-bit register indicating that at least one statistics counter has exceeded the programmed values for registers StatAlarmMin or StatAlarmMax. Output signal StatAlarm is equal to the values stored in register MainCtl fields StatAlarmStatus and AlarmEn. When parameter statisticsCounterAlarm is set to False, StatAlarmStatus is reserved.

0x00503038 PCNOC_EPRB0_SPROF_STATALARMCCLR**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_STATALARMCCLR**

Bits	Name	Description
0	STATALARMCCLR	Register StatAlarmClr is a 1-bit write-only register. A write operation to this register clears the register StatAlarmStatus bit. When parameter statisticsCounterAlarm is set to False, StatAlarmClr is reserved.

0x00503044 PCNOC_EPRB0_SPROF_FILTERS_0_ROUTEIDBASE**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_0_ROUTEIDBASE**

Bits	Name	Description
29:0	FILTERS_0_ROUTEIDBASE	Register RouteIdBase contains the RouteId-IsbFilterRouteId bits base used to filter packets.

0x00503048 PCNOC_EPRB0_SPROF_FILTERS_0_ROUTEIDMASK**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_0_ROUTEIDMASK**

Bits	Name	Description
29:0	FILTERS_0_ROUTEIDMASK	Register RouteIdMask contains the RouteId-IsbFilterRouteId mask used to filter packets. A packet is candidate when packet.RouteId >> IsbFilterRouteId & RouteIdMask = RouteIdBase & RouteIdMask.

0x0050304C PCNOC_EPRB0_SPROF_FILTERS_0_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_0_ADDRBASE_LOW**

Bits	Name	Description
31:0	FILTERS_0_ADDRBASE_LO W	Address LSB register.

0x00503050 PCNOC_EPRB0_SPROF_FILTERS_0_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_0_ADDRBASE_HIGH**

Bits	Name	Description
0	FILTERS_0_ADDRBASE_HI GH	Address MSB register.

0x00503054 PCNOC_EPRB0_SPROF_FILTERS_0_WINDOWSIZE**Type:** RW**Reset State:** 0x00000000

PCNOC_EPRB0_SPROF_FILTERS_0_WINDOWSIZE

Bits	Name	Description
5:0	FILTERS_0_WINDOWSIZE	Register WindowSize contains the encoded address mask used to filter packets. The effective Mask value is equal to $\sim(2^{\max(\text{WindowSize}, \text{packet.Len})} - 1)$. A packet is candidate when $\text{packet.Addr} \& \text{Mask} = \text{AddrBase} \& \text{Mask}$. This allows filtering of packets having an intersection with the AddrBase/WindowSize burst aligned region, even if the region is smaller than the packet.

0x00503060 PCNOC_EPRB0_SPROF_FILTERS_0_OPCODE**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_0_OPCODE**

Bits	Name	Description
3	URGEN	Selects URG packets (urgency).
2	LOCKEN	Selects RDX-WR, RDL, WRC and Linked sequence.
1	WREN	Selects WR packets.
0	RDEN	Selects RD packets.

0x00503064 PCNOC_EPRB0_SPROF_FILTERS_0_STATUS**Type:** RW**Reset State:** 0x00000000

Register Status is 2-bit register that selects candidate packets based on packet status.

PCNOC_EPRB0_SPROF_FILTERS_0_STATUS

Bits	Name	Description
1	RSPEN	Selects RSP and FAIL-CONT status packets.
0	REQEN	Selects REQ status packets.

0x00503068 PCNOC_EPRB0_SPROF_FILTERS_0_LENGTH**Type:** RW**Reset State:** 0x00000000

PCNOC_EPRB0_SPROF_FILTERS_0_LENGTH

Bits	Name	Description
3:0	FILTERS_0_LENGTH	Register Length is 4-bit register that selects candidate packets if their number of bytes is less than or equal to 2^{Length} .

0x0050306C PCNOC_EPRB0_SPROF_FILTERS_0_URGENCY**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_0_URGENCY**

Bits	Name	Description
1:0	FILTERS_0_URGENCY	Register Urgency contains the minimum urgency level used to filter packets. A packet is a candidate when Urgency is greater than or equal to $2^{(\text{Urgency}-1)}$.

0x00503080 PCNOC_EPRB0_SPROF_FILTERS_1_ROUTEIDBASE**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_ROUTEIDBASE**

Bits	Name	Description
29:0	FILTERS_1_ROUTEIDBASE	Register RouteIdBase contains the RouteId-IsbFilterRouteId bits base used to filter packets.

0x00503084 PCNOC_EPRB0_SPROF_FILTERS_1_ROUTEIDMASK**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_ROUTEIDMASK**

Bits	Name	Description
29:0	FILTERS_1_ROUTEIDMASK	Register RouteIdMask contains the RouteId-IsbFilterRouteId mask used to filter packets. A packet is candidate when $\text{packet.RouteId} \gg \text{IsbFilterRouteId} \ \& \ \text{RouteIdMask} = \text{RouteIdBase} \ \& \ \text{RouteIdMask}$.

0x00503088 PCNOC_EPRB0_SPROF_FILTERS_1_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_ADDRBASE_LOW**

Bits	Name	Description
31:0	FILTERS_1_ADDRBASE_LO W	Address LSB register.

0x0050308C PCNOC_EPRB0_SPROF_FILTERS_1_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_ADDRBASE_HIGH**

Bits	Name	Description
0	FILTERS_1_ADDRBASE_HI GH	Address MSB register.

0x00503090 PCNOC_EPRB0_SPROF_FILTERS_1_WINDOWSIZE**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_WINDOWSIZE**

Bits	Name	Description
5:0	FILTERS_1_WINDOWSIZE	Register WindowSize contains the encoded address mask used to filter packets. The effective Mask value is equal to $\sim(2^{\max(\text{WindowSize}, \text{packet.Len})} - 1)$. A packet is candidate when $\text{packet.Addr} \& \text{Mask} = \text{AddrBase} \& \text{Mask}$. This allows filtering of packets having an intersection with the AddrBase/WindowSize burst aligned region, even if the region is smaller than the packet.

0x0050309C PCNOC_EPRB0_SPROF_FILTERS_1_OPCODE**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_OPCODE**

Bits	Name	Description
3	URGEN	Selects URG packets (urgency).

PCNOC_EPRB0_SPROF_FILTERS_1_OPCODE (cont.)

Bits	Name	Description
2	LOCKEN	Selects RDX-WR, RDL, WRC and Linked sequence.
1	WREN	Selects WR packets.
0	RDEN	Selects RD packets.

0x005030A0 PCNOC_EPRB0_SPROF_FILTERS_1_STATUS**Type:** RW**Reset State:** 0x00000000

Register Status is 2-bit register that selects candidate packets based on packet status.

PCNOC_EPRB0_SPROF_FILTERS_1_STATUS

Bits	Name	Description
1	RSPEN	Selects RSP and FAIL-CONT status packets.
0	REQEN	Selects REQ status packets.

0x005030A4 PCNOC_EPRB0_SPROF_FILTERS_1_LENGTH**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_LENGTH**

Bits	Name	Description
3:0	FILTERS_1_LENGTH	Register Length is 4-bit register that selects candidate packets if their number of bytes is less than or equal to 2^{**}Length .

0x005030A8 PCNOC_EPRB0_SPROF_FILTERS_1_URGENCY**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_FILTERS_1_URGENCY**

Bits	Name	Description
1:0	FILTERS_1_URGENCY	Register Urgency contains the minimum urgency level used to filter packets. A packet is a candidate when Urgency is greater than or equal to $2^{**}(\text{Urgency}-1)$.

0x00503138 PCNOC_EPRB0_SPROF_COUNTERS_0_SRC**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_COUNTERS_0_SRC**

Bits	Name	Description
4:0	INTEVENT	Internal packet event

0x0050313C PCNOC_EPRB0_SPROF_COUNTERS_0_ALARMMODE**Type:** RW**Reset State:** 0x00000000**PCNOC_EPRB0_SPROF_COUNTERS_0_ALARMMODE**

Bits	Name	Description

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00504008 PCNOC_TPRB0_SPROF_MAINCTL**Type:** RW**Reset State:** 0x00000000

Register MainCtl contains probe global control bits. The register has seven bit fields:

PCNOC_TPRB0_SPROF_MAINCTL

Bits	Name	Type	Description
7	FILTBYTEALWAYSCHAINABLEEN	RW	When set to 0, Filter Byte / ByteEn Cnt will be connected to all statistics counters where odd Stat count are not chainable. When set to 1, Filter Byte / ByteEn Cnt will be connected only to chainable stat counter (even stat counter).
6	INTRUSIVEMODE	R	When set to 1, register field IntrusiveMode enables trace operation in Intrusive flow-control mode. When set to 0, the register enables trace operation in Overflow flow-control mode
5	STATCONDDUMP	RW	When set, register field StatCondDump enables the dump of a statistics frame to the range of counter values set for registers StatAlarmMin, StatAlarmMax, and AlarmMode. This field also renders register StatAlarmStatus inoperative. When parameter statisticsCounterAlarm is set to False, the StatCondDump register bit is reserved.
4	ALARMEN	RW	When set, register field AlarmEn enables the probe to collect alarm-related information. When the register field bit is null, both TraceAlarm and StatAlarm outputs are driven to 0.
3	STATEN	RW	When set to 1, register field StatEn enables statistics profiling. The probe sendS statistics results to the output for signal ObsTx. All statistics counters are cleared when the StatEn bit goes from 0 to 1. When set to 0, counters are disabled.
2	PAYLOADEN	RW	Register field PayloadEn, when set to 1, enables traces to contain headers and payload. When set to 0, only headers are reported.
1	TRACEEN	RW	Register field TraceEn enables the probe to send filtered packets (Trace) on the ObsTx observation output.
0	ERREN	RW	Register field ErrEn enables the probe to send on the ObsTx output any packet with Error status, independently of filtering mechanisms, thus constituting a simple supplementary global filter.

0x0050400C PCNOC_TPRB0_SPROF_CFGCTL**Type:** RW**Reset State:** 0b000000000000000000000000000000X0**PCNOC_TPRB0_SPROF_CFGCTL**

Bits	Name	Type	Description
1	ACTIVE	R	
0	GLOBALEN	RW	

0x00504024 PCNOC_TPRB0_SPROF_STATPERIOD**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_STATPERIOD**

Bits	Name	Description
4:0	STATPERIOD	Register StatPeriod is a 5-bit register that sets a period, within a range of 2-8 megacycles, during which statistics are collected before being dumped automatically. Setting the register effectively enables automatic mode operation for statistics collection. Note: The configured period is also used for statistics alarm generation. The period is calculated with the formula: $N_Cycle = 2^{min(23, StatPeriod)}$ When register StatPeriod is set to its default value 0, automatic dump mode is disabled, and register StatGo is activated for manual mode operation. Note: When parameter nStatisticsCounter is set to 0, statistics collection is disabled, with the consequence that all statistics collection registers, including StatPeriod, are reserved.

0x00504028 PCNOC_TPRB0_SPROF_STATGO**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_STATGO**

Bits	Name	Description
0	STATGO	Writing to 1-bit pulse register StatGo generates a statistics dump. The register is active when statistics collection operates in its manual mode, that is, when register StatPeriod is set to 0.

0x0050402C PCNOC_TPRB0_SPROF_STATALARMMIN**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_STATALARMMIN**

Bits	Name	Description
31:0	STATALARMMIN	Register StatAlarmMin contains the minimum count value used in statistics alarm comparisons. The number of bits is equal to twice the value set for parameter wStatisticsCounter. When parameter statisticsCounterAlarm is set to False, StatAlarmMin is reserved.

0x00504030 PCNOC_TPRB0_SPROF_STATALARMMAX**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_STATALARMMAX**

Bits	Name	Description
31:0	STATALARMMAX	Register StatAlarmMax contains the maximum count value used in statistics alarm comparisons. The number of bits is equal to twice the value set for parameter wStatisticsCounter. When parameter statisticsCounterAlarm is set to False, StatAlarmMax is reserved.

0x00504034 PCNOC_TPRB0_SPROF_STATALARMSSTATUS**Type:** R**Reset State:** Undefined**PCNOC_TPRB0_SPROF_STATALARMSSTATUS**

Bits	Name	Description
0	STATALARMSSTATUS	Register StatAlarmStatus is a read-only 1-bit register indicating that at least one statistics counter has exceeded the programmed values for registers StatAlarmMin or StatAlarmMax. Output signal StatAlarm is equal to the values stored in register MainCtl fields StatAlarmStatus and AlarmEn. When parameter statisticsCounterAlarm is set to False, StatAlarmStatus is reserved.

0x00504038 PCNOC_TPRB0_SPROF_STATALARMCCLR**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_STATALARMCCLR**

Bits	Name	Description
0	STATALARMCCLR	Register StatAlarmClr is a 1-bit write-only register. A write operation to this register clears the register StatAlarmStatus bit. When parameter statisticsCounterAlarm is set to False, StatAlarmClr is reserved.

0x00504138 PCNOC_TPRB0_SPROF_COUNTERS_0_SRC**Type:** RW**Reset State:** 0x00000000

PCNOC_TPRB0_SPROF_COUNTERS_0_SRC

Bits	Name	Description
1:0	COUNTERS_9_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x005041F4 PCNOC_TPRB0_SPROF_COUNTERS_9_VAL**Type:** R**Reset State:** Undefined**PCNOC_TPRB0_SPROF_COUNTERS_9_VAL**

Bits	Name	Description
15:0	COUNTERS_9_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00504200 PCNOC_TPRB0_SPROF_COUNTERS_10_SRC**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_COUNTERS_10_SRC**

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00504204 PCNOC_TPRB0_SPROF_COUNTERS_10_ALARMMODE**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_COUNTERS_10_ALARMMODE**

Bits	Name	Description
1:0	COUNTERS_10_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00504208 PCNOC_TPRB0_SPROF_COUNTERS_10_VAL**Type:** R**Reset State:** Undefined**PCNOC_TPRB0_SPROF_COUNTERS_10_VAL**

Bits	Name	Description
15:0	COUNTERS_10_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00504214 PCNOC_TPRB0_SPROF_COUNTERS_11_SRC**Type:** RW**Reset State:** 0x00000000**PCNOC_TPRB0_SPROF_COUNTERS_11_SRC**

Bits	Name	Description
15:0	COUNTERS_15_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x0050C000 PCNOC_QHM1_QOS_ID_COREID**Type:** R**Reset State:** 0xB88D1704**PCNOC_QHM1_QOS_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x0050C004 PCNOC_QHM1_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00

PCNOC_QHM1_QOS_ID_REVISIONID

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0050C008 PCNOC_QHM1_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

PCNOC_QHM1_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0050C00C PCNOC_QHM1_QOS_MODE**Type:** RW**Reset State:** 0x00000000**PCNOC_QHM1_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0050C018 PCNOC_QHM1_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

PCNOC_QHM1_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0050D000 PCNOC_QHM2_QOS_ID_COREID**Type:** R**Reset State:** 0x5F073304**PCNOC_QHM2_QOS_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x0050D004 PCNOC_QHM2_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_QHM2_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0050D008 PCNOC_QHM2_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

PCNOC_QHM2_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0050D00C PCNOC_QHM2_QOS_MODE**Type:** RW**Reset State:** 0x00000000**PCNOC_QHM2_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0050D018 PCNOC_QHM2_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

PCNOC_QHM2_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0050E000 PCNOC_SDC1_QOS_ID_COREID**Type:** R**Reset State:** 0xE4C38F04**PCNOC_SDC1_QOS_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.

PCNOC_SDC1_QOS_ID_COREID (cont.)

Bits	Name	Description
7:0	CORETYPEID	Field identifying the type of IP.

0x0050E004 PCNOC_SDC1_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_SDC1_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0050E008 PCNOC_SDC1_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

PCNOC_SDC1_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0050E018 PCNOC_SDC1_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

PCNOC_SDC1_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0050F000 PCNOC_SDC2_QOS_ID_COREID**Type:** R**Reset State:** 0xBE565A04**PCNOC_SDC2_QOS_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x0050F004 PCNOC_SDC2_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_SDC2_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0050F008 PCNOC_SDC2_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

PCNOC_SDC2_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0050F00C PCNOC_SDC2_QOS_MODE

Type: RW

Reset State: 0x00000000

PCNOC_SDC2_QOS_MODE

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0050F018 PCNOC_SDC2_QOS_EXTCONTROL

Type: RW

Reset State: 0x00000000

External inputs control.

PCNOC_SDC2_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x00510000 PCNOC_SNOQ_QOS_ID_COREID

Type: R

Reset State: 0xE0779004

PCNOC_SNOC_QOS_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00510004 PCNOC_SNOC_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**PCNOC_SNOC_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00510008 PCNOC_SNOC_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

PCNOC_SNOC_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0051000C PCNOC_SNOC_QOS_MODE**Type:** RW**Reset State:** 0x00000000**PCNOC_SNOC_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x00510018 PCNOC_SNOC_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

PCNOC_SNOC_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

3.1 PCNOC_0_BUS_TIMEOUT**0x00023004 PCNOC_0_ABT_INST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_0_ABT_INST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00023008 PCNOC_0_ABT_NUM_SLAVES**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000005**PCNOC_0_ABT_NUM_SLAVES**

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002300C PCNOC_0_ABT_TIMER_LOADVAL**Type:** RW**Clock:** AHB Clock**Reset State:** 0x000000FF**PCNOC_0_ABT_TIMER_LOADVAL**

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00023010 PCNOC_0_ABT_TIMER_MODE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_0_ABT_TIMER_MODE**

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00023014 PCNOC_0_ABT_INTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_0_ABT_INTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00023018 PCNOC_0_ABT_INTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000

PCNOC_0_ABT_INTR_CLEAR

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002301C PCNOC_0_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_0_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00023020 PCNOC_0_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_0_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00023024 PCNOC_0_ABT_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_0_ABT_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x00023028 PCNOC_0_ABT_SYND_ID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_0_ABT_SYND_ID

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002302C PCNOC_0_ABT_SYND_ADDR0

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_0_ABT_SYND_ADDR0

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00023030 PCNOC_0_ABT_SYND_ADDR1

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_0_ABT_SYND_ADDR1

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00023034 PCNOC_0_ABT_SYND_HREADY

Type: R
Clock: AHB Clock
Reset State: 0xFFFFFFFF

PCNOC_0_ABT_SYND_HREADY

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.2 PCNOC_1_BUS_TIMEOUT**0x00024004 PCNOC_1_ABT_INST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_INST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00024008 PCNOC_1_ABT_NUM_SLAVES**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000005**PCNOC_1_ABT_NUM_SLAVES**

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002400C PCNOC_1_ABT_TIMER_LOADVAL**Type:** RW**Clock:** AHB Clock**Reset State:** 0x000000FF

PCNOC_1_AB_TTIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in AB_TTIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00024010 PCNOC_1_AB_TTIMER_MODE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_AB_TTIMER_MODE**

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in AB_TTIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00024014 PCNOC_1_AB_TINTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_AB_TINTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00024018 PCNOC_1_AB_TINTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_AB_TINTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002401C PCNOC_1_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00024020 PCNOC_1_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00024024 PCNOC_1_ABT_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x00024028 PCNOC_1_ABT_SYND_ID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_SYND_ID**

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.

PCNOC_1_ABT_SYND_ID (cont.)

Bits	Name	Description
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002402C PCNOC_1_ABT_SYND_ADDR0**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_SYND_ADDR0**

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00024030 PCNOC_1_ABT_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_1_ABT_SYND_ADDR1**

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00024034 PCNOC_1_ABT_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_1_ABT_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.3 PCNOC_2_BUS_TIMEOUT

0x00025004 PCNOC_2_ABT_INST_ID

Type: RW

Clock: AHB Clock

Reset State: 0x00000000

PCNOC_2_ABT_INST_ID

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00025008 PCNOC_2_ABT_NUM_SLAVES

Type: R

Clock: AHB Clock

Reset State: 0x00000005

PCNOC_2_ABT_NUM_SLAVES

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002500C PCNOC_2_ABT_TIMER_LOADVAL

Type: RW

Clock: AHB Clock

Reset State: 0x000000FF

PCNOC_2_ABT_TIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00025010 PCNOC_2_ABT_TIMER_MODE

Type: RW

Clock: AHB Clock

Reset State: 0x00000000

PCNOC_2_AB_TTIMER_MODE

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00025014 PCNOC_2_AB_TINTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_2_AB_TINTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00025018 PCNOC_2_AB_TINTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_2_AB_TINTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002501C PCNOC_2_AB_TINTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_2_AB_TINTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00025020 PCNOC_2_ABT_SYND_VALID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_2_ABT_SYND_VALID

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00025024 PCNOC_2_ABT_SYND_CLEAR

Type: W
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_2_ABT_SYND_CLEAR

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x00025028 PCNOC_2_ABT_SYND_ID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_2_ABT_SYND_ID

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002502C PCNOC_2_ABT_SYND_ADDR0

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_2_AB_T_SYND_ADDR0

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00025030 PCNOC_2_AB_T_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_2_AB_T_SYND_ADDR1**

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00025034 PCNOC_2_AB_T_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_2_AB_T_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.4 PCNOC_3_BUS_TIMEOUT**0x00026004 PCNOC_3_AB_T_INST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_AB_T_INST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00026008 PCNOC_3_ABT_NUM_SLAVES

Type: R
Clock: AHB Clock
Reset State: 0x00000005

PCNOC_3_ABT_NUM_SLAVES

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002600C PCNOC_3_ABT_TIMER_LOADVAL

Type: RW
Clock: AHB Clock
Reset State: 0x000000FF

PCNOC_3_ABT_TIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00026010 PCNOC_3_ABT_TIMER_MODE

Type: RW
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_3_ABT_TIMER_MODE

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00026014 PCNOC_3_ABT_INTR_STATUS

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_3_ABT_INTR_STATUS

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00026018 PCNOC_3_ABT_INTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_ABT_INTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002601C PCNOC_3_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00026020 PCNOC_3_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00026024 PCNOC_3_AB_T_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_AB_T_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x00026028 PCNOC_3_AB_T_SYND_ID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_AB_T_SYND_ID**

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002602C PCNOC_3_AB_T_SYND_ADDR0**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_3_AB_T_SYND_ADDR0**

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00026030 PCNOC_3_AB_T_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000

PCNOC_3_ABT_SYND_ADDR1

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00026034 PCNOC_3_ABT_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_3_ABT_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.5 PCNOC_4_BUS_TIMEOUT**0x00027004 PCNOC_4_ABT_INST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_4_ABT_INST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00027008 PCNOC_4_ABT_NUM_SLAVES**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000003**PCNOC_4_ABT_NUM_SLAVES**

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002700C PCNOC_4_AB_TTIMER_LOADVAL**Type:** RW**Clock:** AHB Clock**Reset State:** 0x000000FF**PCNOC_4_AB_TTIMER_LOADVAL**

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in AB_TTIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00027010 PCNOC_4_AB_TTIMER_MODE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_4_AB_TTIMER_MODE**

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in AB_TTIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00027014 PCNOC_4_AB_TINTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_4_AB_TINTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00027018 PCNOC_4_AB_TINTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000

PCNOC_4_ABT_INTR_CLEAR

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002701C PCNOC_4_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_4_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00027020 PCNOC_4_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_4_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00027024 PCNOC_4_ABT_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_4_ABT_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x00027028 PCNOC_4_AB_T_SYND_ID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_4_AB_T_SYND_ID

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002702C PCNOC_4_AB_T_SYND_ADDR0

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_4_AB_T_SYND_ADDR0

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00027030 PCNOC_4_AB_T_SYND_ADDR1

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_4_AB_T_SYND_ADDR1

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00027034 PCNOC_4_AB_T_SYND_HREADY

Type: R
Clock: AHB Clock
Reset State: 0xFFFFFFFF

PCNOC_4_ABT_SYND_HREADY

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.6 PCNOC_5_BUS_TIMEOUT

0x00028004 PCNOC_5_ABT_INST_ID

Type: RW

Clock: AHB Clock

Reset State: 0x00000000

PCNOC_5_ABT_INST_ID

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00028008 PCNOC_5_ABT_NUM_SLAVES

Type: R

Clock: AHB Clock

Reset State: 0x00000001

PCNOC_5_ABT_NUM_SLAVES

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002800C PCNOC_5_ABT_TIMER_LOADVAL

Type: RW

Clock: AHB Clock

Reset State: 0x000000FF

PCNOC_5_ABT_TIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00028010 PCNOC_5_ABT_TIMER_MODE

Type: RW

Clock: AHB Clock

Reset State: 0x00000000

PCNOC_5_AB_TTIMER_MODE

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in AB_TTIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00028014 PCNOC_5_AB_TINTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_5_AB_TINTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00028018 PCNOC_5_AB_TINTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_5_AB_TINTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002801C PCNOC_5_AB_TINTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_5_AB_TINTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00028020 PCNOC_5_AB_T_SYND_VALID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_5_AB_T_SYND_VALID

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00028024 PCNOC_5_AB_T_SYND_CLEAR

Type: W
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_5_AB_T_SYND_CLEAR

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (AB_T_SYND_ID, AB_T_SYND_ADDR, AB_T_SYND_HREADY).

0x00028028 PCNOC_5_AB_T_SYND_ID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_5_AB_T_SYND_ID

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002802C PCNOC_5_AB_T_SYND_ADDR0

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_5_ABT_SYND_ADDR0

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00028030 PCNOC_5_ABT_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_5_ABT_SYND_ADDR1**

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00028034 PCNOC_5_ABT_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_5_ABT_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.7 PCNOC_6_BUS_TIMEOUT**0x00029004 PCNOC_6_AB_TINST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_AB_TINST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x00029008 PCNOC_6_ABT_NUM_SLAVES

Type: R
Clock: AHB Clock
Reset State: 0x00000002

PCNOC_6_ABT_NUM_SLAVES

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002900C PCNOC_6_ABT_TIMER_LOADVAL

Type: RW
Clock: AHB Clock
Reset State: 0x000000FF

PCNOC_6_ABT_TIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x00029010 PCNOC_6_ABT_TIMER_MODE

Type: RW
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_6_ABT_TIMER_MODE

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x00029014 PCNOC_6_ABT_INTR_STATUS

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_6_ABT_INTR_STATUS

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x00029018 PCNOC_6_ABT_INTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_ABT_INTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002901C PCNOC_6_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x00029020 PCNOC_6_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x00029024 PCNOC_6_AB_T_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_AB_T_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x00029028 PCNOC_6_AB_T_SYND_ID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_AB_T_SYND_ID**

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002902C PCNOC_6_AB_T_SYND_ADDR0**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_6_AB_T_SYND_ADDR0**

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x00029030 PCNOC_6_AB_T_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000

PCNOC_6_AB_T_SYND_ADDR1

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x00029034 PCNOC_6_AB_T_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_6_AB_T_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.8 PCNOC_7_BUS_TIMEOUT**0x0002A004 PCNOC_7_AB_T_INST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_7_AB_T_INST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x0002A008 PCNOC_7_AB_T_NUM_SLAVES**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000004**PCNOC_7_AB_T_NUM_SLAVES**

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002A00C PCNOC_7_ABT_TIMER_LOADVAL**Type:** RW**Clock:** AHB Clock**Reset State:** 0x000000FF**PCNOC_7_ABT_TIMER_LOADVAL**

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x0002A010 PCNOC_7_ABT_TIMER_MODE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_7_ABT_TIMER_MODE**

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x0002A014 PCNOC_7_ABT_INTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_7_ABT_INTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x0002A018 PCNOC_7_ABT_INTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000

PCNOC_7_ABT_INTR_CLEAR

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002A01C PCNOC_7_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_7_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x0002A020 PCNOC_7_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_7_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x0002A024 PCNOC_7_ABT_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_7_ABT_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x0002A028 PCNOC_7_AB_T_SYND_ID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_7_AB_T_SYND_ID

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002A02C PCNOC_7_AB_T_SYND_ADDR0

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_7_AB_T_SYND_ADDR0

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x0002A030 PCNOC_7_AB_T_SYND_ADDR1

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_7_AB_T_SYND_ADDR1

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x0002A034 PCNOC_7_AB_T_SYND_HREADY

Type: R
Clock: AHB Clock
Reset State: 0xFFFFFFFF

PCNOC_7_ABT_SYND_HREADY

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.9 PCNOC_8_BUS_TIMEOUT**0x0002B004 PCNOC_8_ABT_INST_ID****Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_INST_ID**

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x0002B008 PCNOC_8_ABT_NUM_SLAVES**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000003**PCNOC_8_ABT_NUM_SLAVES**

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002B00C PCNOC_8_ABT_TIMER_LOADVAL**Type:** RW**Clock:** AHB Clock**Reset State:** 0x000000FF

PCNOC_8_ABT_TIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x0002B010 PCNOC_8_ABT_TIMER_MODE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_TIMER_MODE**

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x0002B014 PCNOC_8_ABT_INTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_INTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x0002B018 PCNOC_8_ABT_INTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_INTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002B01C PCNOC_8_ABT_INTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_INTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x0002B020 PCNOC_8_ABT_SYND_VALID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_SYND_VALID**

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x0002B024 PCNOC_8_ABT_SYND_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_SYND_CLEAR**

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x0002B028 PCNOC_8_ABT_SYND_ID**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_SYND_ID**

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.

PCNOC_8_ABT_SYND_ID (cont.)

Bits	Name	Description
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002B02C PCNOC_8_ABT_SYND_ADDR0**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_SYND_ADDR0**

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x0002B030 PCNOC_8_ABT_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_8_ABT_SYND_ADDR1**

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x0002B034 PCNOC_8_ABT_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_8_ABT_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

3.10 PCNOC_9_BUS_TIMEOUT

0x0002C004 PCNOC_9_ABT_INST_ID

Type: RW

Clock: AHB Clock

Reset State: 0x00000000

PCNOC_9_ABT_INST_ID

Bits	Name	Description
31:0	INSTID	SW configurable field to provide unique instance number for each of the AHB Timeout Slaves in the chip.

0x0002C008 PCNOC_9_ABT_NUM_SLAVES

Type: R

Clock: AHB Clock

Reset State: 0x00000003

PCNOC_9_ABT_NUM_SLAVES

Bits	Name	Description
5:0	NUMSLAVES	Specifies the number of slaves on the AHB bus excluding the Timeout Slave. Valid values are from 1 to 32.

0x0002C00C PCNOC_9_ABT_TIMER_LOADVAL

Type: RW

Clock: AHB Clock

Reset State: 0x000000FF

PCNOC_9_ABT_TIMER_LOADVAL

Bits	Name	Description
7:0	LOADVAL	Load the timer with this value, when the timer is in load mode, i.e, MODE field in ABT_TIMER_MODE is 0. Note: LOADVAL of 0 is not valid.

0x0002C010 PCNOC_9_ABT_TIMER_MODE

Type: RW

Clock: AHB Clock

Reset State: 0x00000000

PCNOC_9_AB_TTIMER_MODE

Bits	Name	Description
0	MODE	If this field is 0, the timer is in load mode and the LOADVAL field value in ABT_TIMER_LOADVAL is loaded into the timer. If this field is 1, the timer is in run mode.

0x0002C014 PCNOC_9_AB_TINTR_STATUS**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_9_AB_TINTR_STATUS**

Bits	Name	Description
0	INTRSTATUS	Specifies the timeout interrupt status irrespective of interrupt enable.

0x0002C018 PCNOC_9_AB_TINTR_CLEAR**Type:** W**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_9_AB_TINTR_CLEAR**

Bits	Name	Description
0	INTRCLEAR	Clears the pending interrupt.

0x0002C01C PCNOC_9_AB_TINTR_ENABLE**Type:** RW**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_9_AB_TINTR_ENABLE**

Bits	Name	Description
0	INTRENABLE	Enable an interrupt generation on timeout event.

0x0002C020 PCNOC_9_AB_T_SYND_VALID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_9_AB_T_SYND_VALID

Bits	Name	Description
0	SYNDVALID	Set when the information in other syndrome registers is valid.

0x0002C024 PCNOC_9_AB_T_SYND_CLEAR

Type: W
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_9_AB_T_SYND_CLEAR

Bits	Name	Description
0	SYNDCLEAR	Clears the syndrome valid bit and syndrome information (ABT_SYND_ID, ABT_SYND_ADDR, ABT_SYND_HREADY).

0x0002C028 PCNOC_9_AB_T_SYND_ID

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_9_AB_T_SYND_ID

Bits	Name	Description
15:13	BID	Bus ID of the transaction that caused bus hang.
12:8	PID	Port ID of the transaction that caused bus hang.
7:0	MID	Master ID of the transaction that caused bus hang.

0x0002C02C PCNOC_9_AB_T_SYND_ADDR0

Type: R
Clock: AHB Clock
Reset State: 0x00000000

PCNOC_9_AB_T_SYND_ADDR0

Bits	Name	Description
31:0	SYNDADDR0	Lower 32-bit address field of the transaction that caused bus hang.

0x0002C030 PCNOC_9_AB_T_SYND_ADDR1**Type:** R**Clock:** AHB Clock**Reset State:** 0x00000000**PCNOC_9_AB_T_SYND_ADDR1**

Bits	Name	Description
31:0	SYNDADDR1	Upper 32-bit address field of the transaction that caused bus hang. Reserved for future use.

0x0002C034 PCNOC_9_AB_T_SYND_HREADY**Type:** R**Clock:** AHB Clock**Reset State:** 0xFFFFFFFF**PCNOC_9_AB_T_SYND_HREADY**

Bits	Name	Description
31:0	SYNDHREADY	Contains the status of Hready for each slave on the bus during the timeout event. The valid bit fields are [ABT_NUM_SLAVES-1:0]. Each valid bit field corresponds to a physical slave on the bus.

4 Clock Controller

4.1 GCC_GLOBAL_CLK_CTL_REG

0x01821000 GCC_GPLL0_MODE

Type: RW

Clock: CLK

Reset State: 0x00000000

GPLL0_MODE register configures and controls GPLL0.

GCC_GPLL0_MODE

Bits	Name	Description
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM 0:Deasserts Reset to PLL voting FSM 1:Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enable PLL voting FSM 0:Disabled 1:Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM. The count specifies X * 16 PLL reference clock cycles to wait for biasing the PLL during bring up.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM. The count specifies the number of BIAS wait time interval to wait before determining PLL is locked. If lock count is Y, it will wait Y * PLL_BIAS_COUNT * 16 PLL reference clock cycles before declaring PLL is locked. If this value is set to 0, the lock_det output of the PLL is used instead
3	RESERVED	Reserved
2	PLL_RESET_N	This bitfield is used for reset of digital logic in PLL. This includes the MND counters and integer divider
1	PLL_BYPASSNL	Specify the PLL bypass mode 0:Bypass PLL 1:Use PLL

GCC_GPLL0_MODE (cont.)

Bits	Name	Description
0	PLL_OUTCTRL	Specify the PLL output control 0:Disable PLL output and save power 1:Activate PLL outputs

0x01821004 GCC_GPLL0_L_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL0 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL0 register is the given value of L for that equation.

GCC_GPLL0_L_VAL

Bits	Name	Description
7:0	PLL_L	This bitfield contains 8-bit L value. This specifies the PLL VCO feedback divide ratio.

0x01821008 GCC_GPLL0_M_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL0 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL0 register is the given value of M for that equation.

GCC_GPLL0_M_VAL

Bits	Name	Description
18:0	PLL_M	This bitfield contains 19-bit M value. This specifies the PLL M-value for frac-N accumulator.

0x0182100C GCC_GPLL0_N_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL0 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL0 register is the given value of N for that equation.

GCC_GPLL0_N_VAL

Bits	Name	Description
18:0	PLL_N	This bitfield contains 19-bit N value. This specifies the PLL N-value for frac-N accumulator.

0x01821010 GCC_GPLL0_USER_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register contains register bits for specifying GPLL0 user configuration settings.

GCC_GPLL0_USER_CTL

Bits	Name	Description
31:25	RESERVE_BITS31_25	
24	MN_EN	PLL fractional mode control. 0:Disable 1:Enable
23:21	RESERVE_BITS23_21	
20	VCO_SEL	VCO selection 1: Select low freq VCO (100-500 Mhz) 0: Select high-freq VCO (400-1400 Mhz)
19:13	RESERVE_BITS19_13	
12	PRE_DIV_RATIO	Clk_ref pre-divide ratio. 0: 1 1: 2
11:10	RESERVE_BITS11_10	

GCC_GPLL0_USER_CTL (cont.)

Bits	Name	Description
9:8	POST_DIV_RATIO	Output clock Post divide ration. 00: 1 01: 2 10: Reserved 11: 4
7	OUTPUT_INV	Output invert state. 0: Output invert disable 1: Output invert enable
6:5	RESERVED	Reserved
4	RESERVED	Reserved
3	PLLOUT_LV_EARLY	Enable or disable of pllout_lv_early output. 0: Disable 1: Enable
2	PLLOUT_LV_BIST	Enable or disable of pllout_lv_bist output. 0: Disable 1: Enable
1	PLLOUT_LV_AUX	Enable or disable of pllout_lv_aux output. 0: Disable 1: Enable
0	PLLOUT_LV_MAIN	Enable or disable of pllout_lv_main output. 0: Disable 1: Enable

0x01821014 GCC_GPLL0_CONFIG_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00031000

This register contains register bits for specifying GPLL0 configuration control settings.

GCC_GPLL0_CONFIG_CTL

Bits	Name	Description
31:30	RESERVE_BITS31_30	
29	FORCE_PFD_UP	Force PFD Up (force_PFD<1>). 0 Normal operation (default). 1 Force PFD UP -> 1

GCC_GPLL0_CONFIG_CTL (cont.)

Bits	Name	Description
28	FORCE_PFD_DOWN	Force PFD down (force_PFD<0>). 0 Normal operation (default). 1 Force PFD DN -> 1
27:26	NMOSC_FREQ_CTRL	Noise measurement oscillator frequency control. 00: Highest (2.8 GHz at TT / 1.05V / 40°C) (default) 01: 1/2 highest 10: 1/3 highest 11: 1/4 highest
25:24	PFD_DZSEL	PFD reset pulse width adjustment (PFD_dzsel<1:0>). 00 1x delay (default) 01: 2x delay 10: 3x delay 11: 4x delay
23	NMOSC_EN	Noise measurement oscillator control (nmosc_en) 0: Disable (default) 1: Enable
22	RESERVE_BIT22	
21:20	ICP_DIV	Charge pump bias mirror multiplication factor(icp_div<1:0>). 00: 1 (default) 01: 3/2 10: 7/4 11: 9/4
19:18	IREG_DIV	Regulator bias mirror multiplication factor (ireg_div<1:0>). 00: 1 (default) 01: 7/5 10: 9/5 11: 11/5
17:16	CUSEL	VCO desoupling cap unit size (cusel <1:0>). 00: 125 fF 01: 250 fF 10: 375 fF 11: 500 fF (default)
15	REF_MODE	Reference circuit mode (ref_mode). 0: Bandgap Mode: Seed currents source from bandgap circuit and Nwell refernce circuit active. (default) 1: Supply-independent mode: Seed currents sourced from supply-independent circuit and Nwell reference pulled to VDDA.
14	RESERVE_BIT14	

GCC_GPLL0_CONFIG_CTL (cont.)

Bits	Name	Description
13:12	CFG_LOCKDET	Lock detector phase error threshold (cfg_lockdet<1:0>). 00: 2pi/2 01: 2pi/15 (default) 10: 2pi/23 11: 2pi/31
11	FORCE_ISEED	Seed current control (force_iseed). 0: Turn off seed currents when clock is detected. (default) 1: Keep seed currents on at all times.
10:0	RESERVE_BITS10_0	

0x0182101C GCC_GPLL0_STATUS**Type:** R**Clock:** CLK**Reset State:** 0x00000000

GPLL0 Status register.

GCC_GPLL0_STATUS

Bits	Name	Description
17	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
16	PLL_LOCK_DET	Lock Detect signal from PLL.
15:0	PLL_D	Status output straight from PLL. Bit 0 is clock detect status. Bit 15:1 is shorted to VSSD.

0x01820000 GCC_GPLL1_MODE**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GPLL1_MODE register configures and controls GPLL1.

GCC_GPLL1_MODE

Bits	Name	Description
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM 0:Deasserts Reset to PLL voting FSM 1:Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enable PLL voting FSM 0:Disabled 1:Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM. The count specifies X * 16 PLL reference clock cycles to wait for biasing the PLL during bring up.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM. The count specifies the number of BIAS wait time interval to wait before determining PLL is locked. If lock count is Y, it will wait Y * PLL_BIAS_COUNT * 16 PLL reference clock cycles before declaring PLL is locked. If this value is set to 0, the lock_det output of the PLL is used instead
3	RESERVED	Reserved
2	PLL_RESET_N	This bitfield is used for reset of digital logic in PLL. This includes the MND counters and integer divider
1	PLL_BYPASSNL	Specify the PLL bypass mode 0:Bypass PLL 1:Use PLL
0	PLL_OUTCTRL	Specify the PLL output control 0:Disable PLL output and save power 1:Activate PLL outputs

0x01820004 GCC_GPLL1_L_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL1 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL1 register is the given value of L for that equation.

GCC_GPLL1_L_VAL

Bits	Name	Description
7:0	PLL_L	This bitfield contains 8-bit L value. This specifies the PLL VCO feedback divide ratio.

0x01820008 GCC_GPLL1_M_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL1 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL1 register is the given value of M for that equation.

GCC_GPLL1_M_VAL

Bits	Name	Description
18:0	PLL_M	This bitfield contains 19-bit M value. This specifies the PLL M-value for frac-N accumulator.

0x0182000C GCC_GPLL1_N_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL1 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL1 register is the given value of N for that equation.

GCC_GPLL1_N_VAL

Bits	Name	Description
18:0	PLL_N	This bitfield contains 19-bit N value. This specifies the PLL N-value for frac-N accumulator.

0x01820010 GCC_GPLL1_USER_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register contains register bits for specifying GPLL1 user configuration settings.

GCC_GPLL1_USER_CTL

Bits	Name	Description
31:25	RESERVE_BITS31_25	
24	MN_EN	PLL fractional mode control. 0: Disable 1: Enable
23:21	RESERVE_BITS23_21	
20	VCO_SEL	VCO selection 1: Select low freq VCO (100-500 Mhz) 0: Select high-freq VCO (400-1400 Mhz)
19:13	RESERVE_BITS19_13	
12	PRE_DIV_RATIO	Clk_ref pre-divide ratio. 0: 1 1: 2
11:10	RESERVE_BITS11_10	
9:8	POST_DIV_RATIO	Output clock Post divide ration. 00: 1 01: 2 10: Reserved 11: 4
7	OUTPUT_INV	Output invert state. 0: Output invert disable 1: Output invert enable
6:5	RESERVE_BITS6_5	
4	RESERVED	Reserved
3	PLLOUT_LV_EARLY	Enable or disable of pllout_lv_early output. 0: Disable 1: Enable
2	PLLOUT_LV_BIST	Enable or disable of pllout_lv_bist output. 0: Disable 1: Enable
1	PLLOUT_LV_AUX	Enable or disable of pllout_lv_aux output. 0: Disable 1: Enable

GCC_GPLL1_USER_CTL (cont.)

Bits	Name	Description
0	PLLOUT_LV_MAIN	Enable or disable of pllout_lv_main output. 0: Disable 1: Enable

0x01820014 GCC_GPLL1_CONFIG_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00031000

This register contains register bits for specifying GPLL1 configuration control settings.

GCC_GPLL1_CONFIG_CTL

Bits	Name	Description
31:30	RESERVE_BITS31_30	
29	FORCE_PFD_UP	Force PFD Up (force_PFD<1>). 0 Normal operation (default). 1 Force PFD UP -> 1
28	FORCE_PFD_DOWN	Force PFD down (force_PFD<0>). 0 Normal operation (default). 1 Force PFD DN -> 1
27:26	NMOSC_FREQ_CTRL	Noise measurement oscillator frequency control. 00: Highest (2.8 GHz at TT / 1.05V / 40°C) (default) 01: 1/2 highest 10: 1/3 highest 11: 1/4 highest
25:24	PFD_DZSEL	PFD reset pulse width adjustment (PFD_dzsel<1:0>). 00 1x delay (default) 01: 2x delay 10: 3x delay 11: 4x delay
23	NMOSC_EN	Noise measurement oscillator control (nmosc_en) 0: Disable (default) 1: Enable
22	RESERVE_BIT22	
21:20	ICP_DIV	Charge pump bias mirror multiplication factor(icp_div<1:0>). 00: 1 (default) 01: 3/2 10: 7/4 11: 9/4

GCC_GPLL1_CONFIG_CTL (cont.)

Bits	Name	Description
19:18	IREG_DIV	Regulator bias mirror multiplication factor (ireg_div<1:0>). 00: 1 (default) 01: 7/5 10: 9/5 11: 11/5
17:16	CUSEL	VCO desoupling cap unit size (cusel <1:0>). 00: 125 fF 01: 250 fF 10: 375 fF 11: 500 fF (default)
15	REF_MODE	Reference circuit mode (ref_mode). 0: Bandgap Mode: Seed currents source from bandgap circuit and Nwell reference circuit active. (default) 1: Supply-independent mode: Seed currents sourced from supply-independent circuit and Nwell reference pulled to VDDA.
14	RESERVE_BIT14	
13:12	CFG_LOCKDET	Lock detector phase error threshold (cfg_lockdet<1:0>). 00: $2\pi/2$ 01: $2\pi/15$ (default) 10: $2\pi/23$ 11: $2\pi/31$
11	FORCE_ISEED	Seed current control (force_iseed). 0: Turn off seed currents when clock is detected. (default) 1: Keep seed currents on at all times.
10:0	RESERVE_BITS10_0	

0x0182001C GCC_GPLL1_STATUS**Type:** R**Clock:** CLK**Reset State:** 0x00000000

GPLL1 Status register.

GCC_GPLL1_STATUS

Bits	Name	Description
17	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
16	PLL_LOCK_DET	Lock Detect signal from PLL.

GCC_GPLL1_STATUS (cont.)

Bits	Name	Description
15:0	PLL_D	Status output straight from PLL. Bit 0 is clock detect status. Bit 15:1 is shorted to VSSD.

0x0184A000 GCC_GPLL2_MODE**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GPLL2_MODE register configures and controls GPLL2.

GCC_GPLL2_MODE

Bits	Name	Description
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM 0:Deasserts Reset to PLL voting FSM 1:Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enable PLL voting FSM 0:Disabled 1:Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM. The count specifies X * 16 PLL reference clock cycles to wait for biasing the PLL during bring up.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM. The count specifies the number of BIAS wait time interval to wait before determining PLL is locked. If lock count is Y, it will wait Y * PLL_BIAS_COUNT * 16 PLL reference clock cycles before declaring PLL is locked. If this value is set to 0, the lock_det output of the PLL is used instead
3	RESERVED	Reserved
2	PLL_RESET_N	This bitfield is used for reset of digital logic in PLL. This includes the MND counters and integer divider
1	PLL_BYPASSNL	Specify the PLL bypass mode 0:Bypass PLL 1:Use PLL
0	PLL_OUTCTRL	Specify the PLL output control 0:Disable PLL output and save power 1:Activate PLL outputs

0x0184A004 GCC_GPLL2_L_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL2 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL2 register is the given value of L for that equation.

GCC_GPLL2_L_VAL

Bits	Name	Description
7:0	PLL_L	This bitfield contains 8-bit L value. This specifies the PLL VCO feedback divide ratio.

0x0184A008 GCC_GPLL2_M_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL2 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL2 register is the given value of M for that equation.

GCC_GPLL2_M_VAL

Bits	Name	Description
18:0	PLL_M	This bitfield contains 19-bit M value. This specifies the PLL M-value for frac-N accumulator.

0x0184A00C GCC_GPLL2_N_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the GPLL2 output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of GPLL2 register is the given value of N for that equation.

GCC_GPLL2_N_VAL

Bits	Name	Description
18:0	PLL_N	This bitfield contains 19-bit N value. This specifies the PLL N-value for frac-N accumulator.

0x0184A010 GCC_GPLL2_USER_CTL

Type: RW

Clock: CLK

Reset State: 0x00000000

This register contains register bits for specifying GPLL2 user configuration settings.

GCC_GPLL2_USER_CTL

Bits	Name	Description
31:25	RESERVE_BITS31_25	
24	MN_EN	PLL fractional mode control. 0: Disable 1: Enable
23:21	RESERVE_BITS23_21	
20	VCO_SEL	VCO selection 1: Select low freq VCO (100-500 Mhz) 0: Select high-freq VCO (400-1400 Mhz)
19:13	RESERVE_BITS19_13	
12	PRE_DIV_RATIO	Clk_ref pre-divide ratio. 0: 1 1: 2
11:10	RESERVE_BITS11_10	
9:8	POST_DIV_RATIO	Output clock Post divide ration. 00: 1 01: 2 10: Reserved 11: 4
7	OUTPUT_INV	Output invert state. 0: Output invert disable 1: Output invert enable

GCC_GPLL2_USER_CTL (cont.)

Bits	Name	Description
6:5	RESERVE_BITS6_5	
4	RESERVED	Reserved
3	PLLOUT_LV_EARLY	Enable or disable of pllout_lv_early output. 0: Disable 1: Enable
2	PLLOUT_LV_BIST	Enable or disable of pllout_lv_bist output. 0: Disable 1: Enable
1	PLLOUT_LV_AUX	Enable or disable of pllout_lv_aux output. 0: Disable 1: Enable
0	PLLOUT_LV_MAIN	Enable or disable of pllout_lv_main output. 0: Disable 1: Enable

0x0184A014 GCC_GPLL2_CONFIG_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00031000

This register contains register bits for specifying GPLL2 configuration control settings.

GCC_GPLL2_CONFIG_CTL

Bits	Name	Description
31:30	RESERVE_BITS31_30	
29	FORCE_PFD_UP	Force PFD Up (force_PFD<1>). 0 Normal operation (default). 1 Force PFD UP -> 1
28	FORCE_PFD_DOWN	Force PFD down (force_PFD<0>). 0 Normal operation (default). 1 Force PFD DN -> 1
27:26	NMOSC_FREQ_CTRL	Noise measurement oscillator frequency control. 00: Highest (2.8 GHz at TT / 1.05V / 40°C) (default) 01: 1/2 highest 10: 1/3 highest 11: 1/4 highest

GCC_GPLL2_CONFIG_CTL (cont.)

Bits	Name	Description
25:24	PFD_DZSEL	PFD reset pulse width adjustment (PFD_dzsel<1:0>). 00 1x delay (default) 01: 2x delay 10: 3x delay 11: 4x delay
23	NMOSC_EN	Noise measurement oscillator control (nmosc_en) 0: Disable (default) 1: Enable
22	RESERVE_BIT22	
21:20	ICP_DIV	Charge pump bias mirror multiplication factor (icp_div<1:0>). 00: 1 (default) 01: 3/2 10: 7/4 11: 9/4
19:18	IREG_DIV	Regulator bias mirror multiplication factor (ireg_div<1:0>). 00: 1 (default) 01: 7/5 10: 9/5 11: 11/5
17:16	CUSEL	VCO desoupling cap unit size (cusel <1:0>). 00: 125 fF 01: 250 fF 10: 375 fF 11: 500 fF (default)
15	REF_MODE	Reference circuit mode (ref_mode). 0: Bandgap Mode: Seed currents source from bandgap circuit and Nwell reference circuit active. (default) 1: Supply-independent mode: Seed currents sourced from supply-independent circuit and Nwell reference pulled to VDDA.
14	RESERVE_BIT14	
13:12	CFG_LOCKDET	Lock detector phase error threshold (cfg_lockdet<1:0>). 00: 2pi/2 01: 2pi/15 (default) 10: 2pi/23 11: 2pi/31
11	FORCE_ISEED	Seed current control (force_iseed). 0: Turn off seed currents when clock is detected. (default) 1: Keep seed currents on at all times.
10:0	RESERVE_BITS10_0	

0x0184A01C GCC_GPLL2_STATUS

Type: R
Clock: CLK
Reset State: 0x00000000

GPLL2 Status register.

GCC_GPLL2_STATUS

Bits	Name	Description
17	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
16	PLL_LOCK_DET	Lock Detect signal from PLL.
15:0	PLL_D	Status output straight from PLL. Bit 0 is clock detect status. Bit 15:1 is shorted to VSSD.

0x01823000 GCC_BIMC_PLL_MODE

Type: RW
Clock: CLK
Reset State: 0x00000000

BIMC_PLL_MODE register configures and controls BIMC_PLL.

GCC_BIMC_PLL_MODE

Bits	Name	Description
21	PLL_VOTE_FSM_RESET	Resets PLL voting FSM 0:Deasserts Reset to PLL voting FSM 1:Resets PLL voting FSM
20	PLL_VOTE_FSM_ENA	Enable PLL voting FSM 0:Disabled 1:Enabled
19:14	PLL_BIAS_COUNT	Sets PLL bias count of PLL voting FSM. The count specifies X * 16 PLL reference clock cycles to wait for biasing the PLL during bring up.
13:8	PLL_LOCK_COUNT	Sets PLL lock time of PLL voting FSM. The count specifies the number of BIAS wait time interval to wait before determining PLL is locked. If lock count is Y, it will wait Y * PLL_BIAS_COUNT * 16 PLL reference clock cycles before declaring PLL is locked. If this value is set to 0, the lock_det output of the PLL is used instead
3	RESERVED	Reserved
2	PLL_RESET_N	This bitfield is used for reset of digital logic in PLL. This includes the MND counters and integer divider

GCC_BIMC_PLL_MODE (cont.)

Bits	Name	Description
1	PLL_BYPASSNL	Specify the PLL bypass mode 0:Bypass PLL 1:Use PLL
0	PLL_OUTCTRL	Specify the PLL output control 0:Disable PLL output and save power 1:Activate PLL outputs

0x01823004 GCC_BIMC_PLL_L_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the BIMC_PLL output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of BIMC_PLL register is the given value of L for that equation.

GCC_BIMC_PLL_L_VAL

Bits	Name	Description
7:0	PLL_L	This bitfield contains 8-bit L value. This specifies the PLL VCO feedback divide ratio.

0x01823008 GCC_BIMC_PLL_M_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the BIMC_PLL output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of BIMC_PLL register is the given value of M for that equation.

GCC_BIMC_PLL_M_VAL

Bits	Name	Description
18:0	PLL_M	This bitfield contains 19-bit M value. This specifies the PLL M-value for frac-N accumulator.

0x0182300C GCC_BIMC_PLL_N_VAL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Following equation is used to calculate the BIMC_PLL output frequency

$$VCO = REF * [L + (M/N)]$$

Where R represents the pre-divider of 2 and P represents post-divider

The value of BIMC_PLL register is the given value of N for that equation.

GCC_BIMC_PLL_N_VAL

Bits	Name	Description
18:0	PLL_N	This bitfield contains 19-bit N value. This specifies the PLL N-value for frac-N accumulator.

0x01823010 GCC_BIMC_PLL_USER_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register contains register bits for specifying BIMC_PLL user configuration settings.

GCC_BIMC_PLL_USER_CTL

Bits	Name	Description
31:25	RESERVE_BITS31_25	
24	MN_EN	PLL fractional mode control. 0:Disable 1:Enable
23:21	RESERVE_BITS23_21	
20	VCO_SEL	VCO selection 1: Select low freq VCO (100-500 Mhz) 0: Select high-freq VCO (400-1400 Mhz)

GCC_BIMC_PLL_USER_CTL (cont.)

Bits	Name	Description
19:13	RESERVE_BITS19_13	
12	PRE_DIV_RATIO	Clk_ref pre-divide ratio. 0: 1 1: 2
11:10	RESERVE_BITS11_10	
9:8	POST_DIV_RATIO	Output clock Post divide ration. 00: 1 01: 2 10: Reserved 11: 4
7	OUTPUT_INV	Output invert state. 0: Output invert disable 1: Output invert enable
6:5	RESERVE_BITS6_5	
4	RESERVED	Reserved
3	PLLOUT_LV_EARLY	Enable or disable of pllout_lv_early output. 0: Disable 1: Enable
2	PLLOUT_LV_BIST	Enable or disable of pllout_lv_bist output. 0: Disable 1: Enable
1	PLLOUT_LV_AUX	Enable or disable of pllout_lv_aux output. 0: Disable 1: Enable
0	PLLOUT_LV_MAIN	Enable or disable of pllout_lv_main output. 0: Disable 1: Enable

0x01823014 GCC_BIMC_PLL_CONFIG_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00031000

This register contains register bits for specifying BIMC_PLL configuration control settings.

GCC_BIMC_PLL_CONFIG_CTL

Bits	Name	Description
31:30	RESERVE_BITS31_30	

GCC_BIMC_PLL_CONFIG_CTL (cont.)

Bits	Name	Description
29	FORCE_PFD_UP	Force PFD Up (force_PFD<1>). 0 Normal operation (default). 1 Force PFD UP -> 1
28	FORCE_PFD_DOWN	Force PFD down (force_PFD<0>). 0 Normal operation (default). 1 Force PFD DN -> 1
27:26	NMOSC_FREQ_CTRL	Noise measurement oscillator frequency control. 00: Highest (2.8 GHz at TT / 1.05V / 40°C) (default) 01: 1/2 highest 10: 1/3 highest 11: 1/4 highest
25:24	PFD_DZSEL	PFD reset pulse width adjustment (PFD_dzsel<1:0>). 00 1x delay (default) 01: 2x delay 10: 3x delay 11: 4x delay
23	NMOSC_EN	Noise measurement oscillator control (nmosc_en) 0: Disable (default) 1: Enable
22	RESERVE_BIT22	
21:20	ICP_DIV	Charge pump bias mirror multiplication factor(icp_div<1:0>). 00: 1 (default) 01: 3/2 10: 7/4 11: 9/4
19:18	IREG_DIV	Regulator bias mirror multiplication factor (ireg_div<1:0>). 00: 1 (default) 01: 7/5 10: 9/5 11: 11/5
17:16	CUSEL	VCO decoupling cap unit size (cusel <1:0>). 00: 125 fF 01: 250 fF 10: 375 fF 11: 500 fF (default)
15	REF_MODE	Reference circuit mode (ref_mode). 0: Bandgap Mode: Seed currents source from bandgap circuit and Nwell reference circuit active. (default) 1: Supply-independent mode: Seed currents sourced from supply-independent circuit and Nwell reference pulled to VDDA.
14	RESERVE_BIT14	

GCC_BIMC_PLL_CONFIG_CTL (cont.)

Bits	Name	Description
13:12	CFG_LOCKDET	Lock detector phase error threshold (cfg_lockdet<1:0>). 00: 2pi/2 01: 2pi/15 (default) 10: 2pi/23 11: 2pi/31
11	FORCE_ISEED	Seed current control (force_iseed). 0: Turn off seed currents when clock is detected. (default) 1: Keep seed currents on at all times.
10:0	RESERVE_BITS10_0	

0x0182301C GCC_BIMC_PLL_STATUS**Type:** R**Clock:** CLK**Reset State:** 0x00000000

BIMC_PLL Status register.

GCC_BIMC_PLL_STATUS

Bits	Name	Description
17	PLL_ACTIVE_FLAG	pll_active_flag from PLL voting FSM. It indicates when FSM has enabled the PLL and PLL should be locked.
16	PLL_LOCK_DET	Lock Detect signal from PLL.
15:0	PLL_D	Status output straight from PLL. Bit 0 is clock detect status. Bit 15:1 is shorted to VSSD.

0x01826004 GCC_SYSTEM_NOC_BFDCD_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SYSTEM NOC root clock generator command register. It allows for SW to trigger the configuration data

GCC_SYSTEM_NOC_BFDCD_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01826008 GCC_SYSTEM_NOC_BFDCD_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SYSTEM NOC root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_SYSTEM_NOC_BFDCD_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (BIMC_PLL_AUX.) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: SRC7 (Reserved)

GCC_SYSTEM_NOC_BFDCD_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01827000 GCC_PCNOB_BFDCD_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NOC root clock generator command register. It allows for SW to trigger the configuration data

GCC_PCNOC_BFDCD_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01827004 GCC_PCNOC_BFDCD_CFG_RCGR

Type: RW

Clock: CLK

Reset State: 0x00000000

PC NOC root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_PCNOC_BFDCD_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLLO_MAIN.) 0x2: SRC2 (BIMC_PLL_AUX.) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_PCNOG_BFDCD_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01826020 GCC_SYS_NOC_AXI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000001

System NOC AXI clock branch control register. It allows SW control of CBC soft macro

GCC_SYS_NOC_AXI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01826024 GCC_SYS_NOC_QDSS_STM_AXI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

System NOC QDSS STM AXI clock branch control register. It allows SW control of CBC soft macro

GCC_SYS_NOC_QDSS_STM_AXI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01826028 GCC_SYS_NOC_APSS_AHB_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x00000000

System NOC APSS AHB clock branch control register. It allows SW control of CBC soft macro

GCC_SYS_NOC_APSS_AHB_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x0182602C GCC_SNOC_PCNOC_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000001

System NOC Periph NOC AHB clock branch control register. It allows SW control of CBC soft macro

GCC_SNOC_PCNOC_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01827018 GCC_PCNOC_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

CONFIG NOC block control register

GCC_PCNOC_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0182701C GCC_PCNOC_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000001

Config NOC AHB clock branch control register. It allows SW control of CBC soft macro. Note that during mission mode, the CBC control by this register should

not be disabled. Therefore, this register should not be touched.

GCC_PCNOC_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01827020 GCC_PCNOC_DDR_CFG_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Config NOC DDR config clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_DDR_CFG_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01827024 GCC_PCNOC_RPM_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000001

Config NOC RPM AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_RPM_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

GCC_PCNOG_RPM_AHB_CBCR (cont.)

Bits	Name	Type	Description
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180E000 GCC_IMEM_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

IMEM block control register

GCC_IMEM_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180E004 GCC_IMEM_AXI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x1000CFF0

IMEM AXI clock branch control register. It allows SW control of CBC soft macro

GCC_IMEM_AXI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

GCC_IMEM_AXI_CBCR (cont.)

Bits	Name	Type	Description
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_IMEM_AXI_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x0180E008 GCC_IMEM_CFG_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

IMEM config AHB clock branch control register. It allows SW control of CBC soft macro

GCC_IMEM_CFG_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaverready and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184B000 GCC_MMSS_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

MMSS block control register

GCC_MMSS_BCR

Bits	Name	Description
1	GMEM_AXI_ARES	This bitfield controls asynchronous software reset for the gmem axi clock alone. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0185903C GCC_GMEM_SYS_NOC_AXI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

GMEM System NOC AXI clock branch control register. It allows SW control of CBC soft macro

GCC_GMEM_SYS_NOC_AXI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01831024 GCC_BIMC_GFX_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80004FF0

MMSS GFX clock branch control register. It allows SW control of CBC soft macro

GCC_BIMC_GFX_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_BIMC_GFX_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01849000 GCC_MSS_CFG_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

MSS config AHB clock branch control register. It allows SW control of CBC soft macro

GCC_MSS_CFG_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

GCC_MSS_CFG_AHB_CBCR (cont.)

Bits	Name	Type	Description
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01849004 GCC_MSS_Q6_BIMC_AXI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

MSS Q6 BIMC AXI clock branch control register. It allows SW control of CBC soft macro

GCC_MSS_Q6_BIMC_AXI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
1	HW_CTL	RW	This bit is used to enable hardware dynamic gating of the clock branch. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	0x1: ENABLE 0x0: DISABLE

0x01829000 GCC_QDSS_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

QDSS block control register

GCC_QDSS_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01829004 GCC_QDSS_DAP_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

QDSS DAP AHB clock branch control register. It allows SW control of CBC soft macro

GCC_QDSS_DAP_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01829008 GCC_QDSS_CFG_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

QDSS config AHB clock branch control register. It allows SW control of CBC soft macro

GCC_QDSS_CFG_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01829028 GCC_QDSS_ETR_USB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

QDSS ETR USB clock branch control register. It allows SW control of CBC soft macro

GCC_QDSS_ETR_USB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0182902C GCC_QDSS_STM_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

QDSS STM root clock generator command register. It allows for SW to trigger the configuration data

GCC_QDSS_STM_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01829030 GCC_QDSS_STM_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

QDSS STM root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_QDSS_STM_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_QDSS_STM_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01829044 GCC_QDSS_STM_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

QDSS STM clock branch control register. It allows SW control of CBC soft macro

GCC_QDSS_STM_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01829048 GCC_QDSS_TRACECLKIN_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

QDSS TRACECLKIN root clock generator command register. It allows for SW to trigger the configuration data

GCC_QDSS_TRACECLKIN_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0182904C GCC_QDSS_TRACECLKIN_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

QDSS TRACECLKIN root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_QDSS_TRACECLKIN_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL1_MAIN.) 0x2: SRC2 (GPLL2_AUX.) 0x3: SRC3 (GPLL0_AUX.) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_QDSS_TRACECLKIN_CFG_RCGR (cont.)

GCC_QDSS_TSCTR_DIV8_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01829090 GCC_QDSS_TSCTR_DIV16_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

QDSS TSCTR DIV16 clock branch control register. It allows SW control of CBC soft macro

GCC_QDSS_TSCTR_DIV16_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01830000 GCC_GCC_SLEEP_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GCC SLEEP root clock generator command register. It allows for SW to trigger the configuration data

GCC_GCC_SLEEP_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01841000 GCC_USB_HS_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

USB HS block control register

GCC_USB_HS_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01841004 GCC_USB_HS_SYSTEM_CBCR

Type: RW

Clock: CLK

Reset State: 0x80004FF0

USB HS SYSTEM clock branch control register. It allows SW control of CBC soft macro

GCC_USB_HS_SYSTEM_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)

GCC_USB_HS_SYSTEM_CBCR (cont.)

Bits	Name	Type	Description
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01841008 GCC_USB_HS_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x8000CFF0

USB HS AHB clock branch control register. It allows SW control of CBC soft macro

GCC_USB_HS_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)

GCC_USB_HS_AHB_CBCR (cont.)

Bits	Name	Type	Description
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184100C GCC_USB_HS_INACTIVITY_TIMERS_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

USB HS INACTIVITY TIMERS clock branch control register. It allows SW control of CBC soft macro

GCC_USB_HS_INACTIVITY_TIMERS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01841010 GCC_USB_HS_SYSTEM_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

USB HS SYSTEM root clock generator command register. It allows for SW to trigger the configuration data

GCC_USB_HS_SYSTEM_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01841014 GCC_USB_HS_SYSTEM_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

USB HS SYSTEM root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_USB_HS_SYSTEM_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_USB_HS_SYSTEM_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01841028 GCC_USB2A_PHY_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

USB2A PHY block control register

GCC_USB2A_PHY_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184102C GCC_USB2A_PHY_SLEEP_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

USB 2A PHY sleep clock control register

GCC_USB2A_PHY_SLEEP_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01842000 GCC_SDCC1_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC1 block control register

GCC_SDCC1_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01842004 GCC_SDCC1_APPS_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

SDCC1 application root clock generator command register. It allows for SW to trigger the configuration data

GCC_SDCC1_APPS_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
7	DIRTY_D	R	Indicates change in D register configuration
6	DIRTY_M	R	Indicates change in M register configuration
5	DIRTY_N	R	Indicates change in N register configuration
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01842008 GCC_SDCC1_APPS_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC1 application root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_SDCC1_APPS_CFG_RCGR

Bits	Name	Description
13:12	MODE	This bitfield provides SW selection of MN counter mode. 0x3: SINGLE_EDGE (Single-edge.) 0x2: DUAL_EDGE (Dual-edge.) 0x1: SWALLOW (Swallow.) 0x0: BYPASS (Bypass.)
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_SDCC1_APPS_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0184200C GCC_SDCC1_APPS_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC1 application root clock generator M value register. This register houses the M value for MND divider.

GCC_SDCC1_APPS_M

Bits	Name	Description
7:0	M	This bitfield represents M Value of the M/N:D Counter

0x01842010 GCC_SDCC1_APPS_N

Type: RW

Clock: CLK

Reset State: 0x00000000

SDCC1 application root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_SDCC1_APPS_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01842014 GCC_SDCC1_APPS_D

Type: RW

Clock: CLK

Reset State: 0x00000000

SDCC1 application root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_SDCC1_APPS_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x01842018 GCC_SDCC1_APPS_CBCR

Type: RW

Clock: CLK

Reset State: 0x80004FF0

SDCC1 application clock branch control register. It allows SW control of CBC soft macro

GCC_SDCC1_APPS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_SDCC1_APPS_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184201C GCC_SDCC1_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x8000CFF0

SDCC1 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_SDCC1_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slave ready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

GCC_SDCC1_AHB_CBCR (cont.)

Bits	Name	Type	Description
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_SDCC1_AHB_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01842020 GCC_SDCC1_MISC**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC1 misc register

GCC_SDCC1_MISC

Bits	Name	Description
0	CDC_ARES	This bitfield controls asynchronous software reset for the CDC block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01843000 GCC_SDCC2_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC2 block control register

GCC_SDCC2_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01843004 GCC_SDCC2_APPS_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

SDCC2 application root clock generator command register. It allows for SW to trigger the configuration data

GCC_SDCC2_APPS_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
7	DIRTY_D	R	Indicates change in D register configuration
6	DIRTY_M	R	Indicates change in M register configuration
5	DIRTY_N	R	Indicates change in N register configuration
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01843008 GCC_SDCC2_APPS_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC2 application root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_SDCC2_APPS_CFG_RCGR

Bits	Name	Description
13:12	MODE	This bitfield provides SW selection of MN counter mode. 0x3: SINGLE_EDGE (Single-edge.) 0x2: DUAL_EDGE (Dual-edge.) 0x1: SWALLOW (Swallow.) 0x0: BYPASS (Bypass.)
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLLO_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_SDCC2_APPS_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0184300C GCC_SDCC2_APPS_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SDCC2 application root clock generator M value register. This register houses the M value for MND divider.

GCC_SDCC2_APPS_M

Bits	Name	Description
7:0	M	This bitfield represents M Value of the M/N:D Counter

0x01843010 GCC_SDCC2_APPS_N

Type: RW

Clock: CLK

Reset State: 0x00000000

SDCC2 application root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_SDCC2_APPS_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01843014 GCC_SDCC2_APPS_D

Type: RW

Clock: CLK

Reset State: 0x00000000

SDCC2 application root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_SDCC2_APPS_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x01843018 GCC_SDCC2_APPS_CBCR

Type: RW

Clock: CLK

Reset State: 0x80004FF0

SDCC2 application clock branch control register. It allows SW control of CBC soft macro

GCC_SDCC2_APPS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_SDCC2_APPS_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184301C GCC_SDCC2_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x8000CFF0

SDCC2 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_SDCC2_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slave ready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

GCC_SDCC2_AHB_CBCR (cont.)

Bits	Name	Type	Description
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_SDCC2_AHB_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01801000 GCC_BLSP1_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BLSP1 block control register

GCC_BLSP1_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01801004 GCC_BLSP1_SLEEP_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x80000000

BLSP1 SLEEP clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_SLEEP_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x01801008 GCC_BLSP1_AHB_CBCR

Type: RW

Clock: CLK

Reset State: 0x8000CFF0

BLSP1 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slave ready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)

GCC_BLSP1_AHB_CBCR (cont.)

Bits	Name	Type	Description
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x01802000 GCC_BLSP1_QUP1_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BLSP1 QUP1 block control register

GCC_BLSP1_QUP1_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01802004 GCC_BLSP1_QUP1_SPI_APPS_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 QUP1 SPI application clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_QUP1_SPI_APPS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01802008 GCC_BLSP1_QUP1_I2C_APPS_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 QUP1 I2C application clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_QUP1_I2C_APPS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180200C GCC_BLSP1_QUP1_I2C_APPS_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 QUP1 I2C application root clock generator command register. It allows for SW to trigger the configuration data

GCC_BLSP1_QUP1_I2C_APPS_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01802010 GCC_BLSP1_QUP1_I2C_APPS_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BLSP1 QUP1 I2C application root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_BLSP1_QUP1_I2C_APPS_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_BLSP1_QUP1_I2C_APPS_CFG_RCGR (cont.)

Bits	Name	Description

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCGR. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0180301C GCC_BLSP1_QUP2_SPI_APPS_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BLSP1 QUP2 SPI application root clock generator M value register. This register houses the M value for MND divider.

GCC_BLSP1_QUP2_SPI_APPS_M

Bits	Name	Description
7:0	M	This bitfield represents M Value of the M/N:D Counter

0x01803020 GCC_BLSP1_QUP2_SPI_APPS_N

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 QUP2 SPI application root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_BLSP1_QUP2_SPI_APPS_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01803024 GCC_BLSP1_QUP2_SPI_APPS_D

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 QUP2 SPI application root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_BLSP1_QUP2_SPI_APPS_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x01803028 GCC_BLSP1_UART2_BCR

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 UART2 block control register

GCC_BLSP1_UART2_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180302C GCC_BLSP1_UART2_APPS_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 UART2 application clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_UART2_APPS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01803030 GCC_BLSP1_UART2_SIM_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 UART2 SIM clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_UART2_SIM_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01803034 GCC_BLSP1_UART2_APPS_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 UART2 application root clock generator command register. It allows for SW to trigger the configuration data

GCC_BLSP1_UART2_APPS_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
7	DIRTY_D	R	Indicates change in D register configuration
6	DIRTY_M	R	Indicates change in M register configuration
5	DIRTY_N	R	Indicates change in N register configuration
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01803038 GCC_BLSP1_UART2_APPS_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BLSP1 UART2 application root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_BLSP1_UART2_APPS_CFG_RCGR

Bits	Name	Description
13:12	MODE	This bitfield provides SW selection of MN counter mode. 0x3: SINGLE_EDGE (Single-edge.) 0x2: DUAL_EDGE (Dual-edge.) 0x1: SWALLOW (Swallow.) 0x0: BYPASS (Bypass.)
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_BLSP1_UART2_APPS_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCGR. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0180303C GCC_BLSP1_UART2_APPS_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BLSP1 UART2 application root clock generator M value register. This register houses the M value for MND divider.

GCC_BLSP1_UART2_APPS_M

Bits	Name	Description
15:0	M	This bitfield represents M Value of the M/N:D Counter

0x01803040 GCC_BLSP1_UART2_APPS_N

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 UART2 application root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_BLSP1_UART2_APPS_N

Bits	Name	Description
15:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01803044 GCC_BLSP1_UART2_APPS_D

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 UART2 application root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_BLSP1_UART2_APPS_D

Bits	Name	Description
15:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x01804018 GCC_BLSP1_QUP3_BCR

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 QUP3 block control register

GCC_BLSP1_QUP3_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180401C GCC_BLSP1_QUP3_SPI_APPS_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BLSP1 QUP3 SPI application clock branch control register. It allows SW control of CBC soft macro

GCC_BLSP1_QUP3_SPI_APPS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x01805030 GCC_BLSP1_QUP4_SPI_APPS_N

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 QUP4 SPI application root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_BLSP1_QUP4_SPI_APPS_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01805034 GCC_BLSP1_QUP4_SPI_APPS_D

Type: RW

Clock: CLK

Reset State: 0x00000000

BLSP1 QUP4 SPI application root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_BLSP1_QUP4_SPI_APPS_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x0182E020 GCC_SPMI_PCNOA_AHB_CBCR

Type: RW

Clock: CLK

Reset State: 0x10008000

GCC_SPMI_PCNOA_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	
30:28	NOC_HANDSHAKE_FSM_STATUS	R	
15	NOC_HANDSHAKE_FSM_ENABLE	RW	0x1: ENABLE 0x0: DISABLE

0x0182F01C GCC_SPDM_PCNOA_CY_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

SPDM Periph NOC cycle counter clock branch control register. It allows SW control of CBC soft macro

GCC_SPDM_PCNOA_CY_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01831020 GCC_BIMC_APSS_AXI_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x00000000

BIMC APSS AXI clock branch control register. It allows SW control of CBC soft macro

GCC_BIMC_APSS_AXI_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x0183201C GCC_DDR_DIM_CFG_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

DDR DIM config clock branch control register. It allows SW control of CBC soft macro

GCC_DDR_DIM_CFG_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0181207C GCC_APSS_TCU_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

APSS TCU Aysnc Mode root clock generator command register. It allows for SW to trigger the configuration data

GCC_APSS_TCU_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration

GCC_APSS_TCU_CMD_RCGR (cont.)

Bits	Name	Type	Description
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01812080 GCC_APSS_TCU_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

APSS TCU Async Mode BIMC GPU root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_APSS_TCU_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN) 0x2: SRC2 (BIMC_PLL_AUX.) 0x3: SRC3 (GPLL1_AUX.) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_APSS_TCU_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01831028 GCC_BIMC_GPU_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BIMC GPU root clock generator command register. It allows for SW to trigger the configuration data

GCC_BIMC_GPU_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0183102C GCC_BIMC_GPU_CFG_RCGR

Type: RW

Clock: CLK

Reset State: 0x00000000

BIMC GPU root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_BIMC_GPU_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN) 0x2: SRC2 (BIMC_PLL_AUX.) 0x3: SRC3 (GPLL1_AUX.) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_BIMC_GPU_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01831040 GCC_BIMC_GPU_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

BIMC GPU clock control register

GCC_BIMC_GPU_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01831044 GCC_BIMC_TCU_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x00000000

BIMC clock for BIMC-TCU Interface, clock branch control register. It allows SW control of CBC soft macro

GCC_BIMC_TCU_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x0181C000 GCC_ULTAUDIO_PCNO_C_MPORT_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

ULTAUDIO SYS_NOC MPORT clock branch control register. It allows SW control of CBC soft macro

GCC_ULTAUDIO_PCNO_C_MPORT_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

GCC_ULTAUDIO_PCNOG_MPORT_CBCR (cont.)

Bits	Name	Type	Description
1	HW_CTL	RW	This bit is used to enable hardware dynamic gating of the clock branch. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0181C004 GCC_ULTAUDIO_PCNOG_SWAY_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

ULTAUDIO SYS_NOG SWAY clock branch control register. It allows SW control of CBC soft macro

GCC_ULTAUDIO_PCNOG_SWAY_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slave ready and socketcon handshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0181C0B4 GCC_ULT_AUDIO_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

ULT_AUDIO block control register

GCC_ULT_AUDIO_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01846000 GCC_APSS_AHB_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

APSS AHB root clock generator command register. It allows for SW to trigger the configuration data

GCC_APSS_AHB_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01846004 GCC_APSS_AHB_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

APSS AHB root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_APSS_AHB_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: Reserved

GCC_APSS_AHB_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCGR. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x01846018 GCC_APSS_AHB_MISC**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

APSS AHB clock control misc configuration register. It allows for SW to configure clock dividers used to generate the APSS AHB clock

GCC_APSS_AHB_MISC

Bits	Name	Description
7:4	APSS_AHB_CLK_AUTO_SCALE_DIV	This bitfield is used to configure the div ratio when auto scaling is enable. 0x0: DIV1 (Divide by 1.) 0x1: DIV2 (Divide by 2.) 0x2: DIV3 (Divide by 3.) 0x3: DIV4 (Divide by 4.) 0x4: DIV5 (Divide by 5.) 0x5: DIV6 (Divide by 6.) 0x6: DIV7 (Divide by 7.) 0x7: DIV8 (Divide by 8.) 0x8: DIV9 (Divide by 9.) 0x9: DIV10 (Divide by 10.) 0xA: DIV11 (Divide by 11.) 0xB: DIV12 (Divide by 12.) 0xC: DIV13 (Divide by 13.) 0xD: DIV14 (Divide by 14.) 0xE: DIV15 (Divide by 15.) 0xF: DIV16 (Divide by 16.)
0	APSS_AHB_CLK_AUTO_SCALE_DIS	This bit controls whether RPM clock automatic clock scaling can be disabled. 0x1: SCALE_DISABLE (Auto APSS AHB clock scaling is disable.) 0x0: SCALE_NOT_DISABLE (Auto APSS AHB clock scaling is enable.)

0x0184601C GCC_APSS_AHB_CBCR

Type: RW

Clock: CLK

Reset State: 0x10008000

APSS AHB clock branch control register. It allows SW control of CBC soft macro

GCC_APSS_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state

GCC_APSS_AHB_CBCR (cont.)

Bits	Name	Type	Description
15	NOC_HANDSHAKE_FSM_EN	RW	This bitfield enables the FSM to use so that slaverdy and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01846020 GCC_APSS_AXI_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x00000000

APSS AXI clock branch control register. It allows SW control of CBC soft macro

GCC_APSS_AXI_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x01848000 GCC_PCNOC_BUS_TIMEOUT0_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 0 block control register

GCC_PCNOC_BUS_TIMEOUT0_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848004 GCC_PCNOB_BUS_TIMEOUT0_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 0 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOB_BUS_TIMEOUT0_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848008 GCC_PCNOB_BUS_TIMEOUT1_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 1 block control register

GCC_PCNOB_BUS_TIMEOUT1_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184800C GCC_PCNOB_BUS_TIMEOUT1_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 1 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOB_BUS_TIMEOUT1_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848010 GCC_PCNOB_BUS_TIMEOUT2_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 2 block control register

GCC_PCNOB_BUS_TIMEOUT2_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848014 GCC_PCNOB_BUS_TIMEOUT2_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 2 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOB_BUS_TIMEOUT2_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848018 GCC_PCNOB_BUS_TIMEOUT3_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 3 block control register

GCC_PCNOB_BUS_TIMEOUT3_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184801C GCC_PCNOB_BUS_TIMEOUT3_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 3 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOB_BUS_TIMEOUT3_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848020 GCC_PCNOB_BUS_TIMEOUT4_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 4 block control register

GCC_PCNOC_BUS_TIMEOUT4_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848024 GCC_PCNOC_BUS_TIMEOUT4_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 4 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_BUS_TIMEOUT4_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848028 GCC_PCNOC_BUS_TIMEOUT5_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 5 block control register

GCC_PCNOC_BUS_TIMEOUT5_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184802C GCC_PCNOB_BUS_TIMEOUT5_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 5 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOB_BUS_TIMEOUT5_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848030 GCC_PCNOB_BUS_TIMEOUT6_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 6 block control register

GCC_PCNOB_BUS_TIMEOUT6_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848034 GCC_PCNOB_BUS_TIMEOUT6_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 6 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_BUS_TIMEOUT6_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848038 GCC_PCNOC_BUS_TIMEOUT7_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 7 block control register

GCC_PCNOC_BUS_TIMEOUT7_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184803C GCC_PCNOC_BUS_TIMEOUT7_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 7 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_BUS_TIMEOUT7_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848040 GCC_PCNOB_BUS_TIMEOUT8_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 8 block control register

GCC_PCNOB_BUS_TIMEOUT8_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848044 GCC_PCNOB_BUS_TIMEOUT8_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 8 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOB_BUS_TIMEOUT8_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01848048 GCC_PCNOB_BUS_TIMEOUT9_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PC NoC BUS time out 9 block control register

GCC_PCNOC_BUS_TIMEOUT9_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0184804C GCC_PCNOC_BUS_TIMEOUT9_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PC NoC BUS time out 9 AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_BUS_TIMEOUT9_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0181700C GCC_PCNOC_MPU_CFG_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

PC NOC MPU config AHB clock branch control register. It allows SW control of CBC soft macro

GCC_PCNOC_MPU_CFG_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state

GCC_PCNOG_MPU_CFG_AHB_CBCR (cont.)

Bits	Name	Type	Description
15	NOC_HANDSHAKE_FSM_EN	RW	This bitfield enables the FSM to use so that slaverdy and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01812010 GCC_GFX_TBU_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80004FF0

GFX TBU clock branch control register. It allows SW control of CBC soft macro. The CBC enable for CRYPTO clock will be managed by clock voting registers.

GCC_GFX_TBU_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)

GCC_GFX_TBU_CBCR (cont.)

Bits	Name	Type	Description
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x01812014 GCC_VENUS_TBU_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80004FF0

VENUS TBU clock branch control register. It allows SW control of CBC soft macro. The CBC enable for CRYPTO clock will be managed by clock voting registers.

GCC_VENUS_TBU_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_VENUS_TBU_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x01812098 GCC_APSS_TCU_ASYNC_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00004FF0

APSS TCU Async Mode clock branch control register. It allows SW control of CBC soft macro.

GCC_APSS_TCU_ASYNC_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicates if the clock branch is halted. This is default ON clock only if APSS TCU - BIMC async mode is enabled. 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)

GCC_APSS_TCU_ASYNC_CBCR (cont.)

Bits	Name	Type	Description
12	FORCE_MEM_PERIPH_OF F	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x01812018 GCC_APSS_TCU_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00004FF0

APSS TCU clock branch control register. It allows SW control of CBC soft macro. The CBC enable for CRYPTO clock will be managed by clock voting registers.

GCC_APSS_TCU_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_APSS_TCU_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x0181201C GCC_MDP_TBU_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80004FF0

MDP TBU clock branch control register. It allows SW control of CBC soft macro. The CBC enable for CRYPTO clock will be managed by clock voting registers.

GCC_MDP_TBU_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)

GCC_MDP_TBU_CBCR (cont.)

Bits	Name	Type	Description
12	FORCE_MEM_PERIPH_OF F	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_JPEG_TBU_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x01812038 GCC_SMMU_CFG_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

SMMU CFG clock branch control register. It allows SW control of CBC soft macro

GCC_SMMU_CFG_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
30:28	NOC_HANDSHAKE_FSM_STATUS	R	This bitfield is used to check the FSM state
15	NOC_HANDSHAKE_FSM_ENABLE	RW	This bitfield enables the FSM to use so that slaveredy and socketcon hankshake is used prior to affecting the enable of the clock branch cell. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0181203C GCC_VFE_TBU_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80004FF0

VFE TBU clock branch control register. It allows SW control of CBC soft macro

GCC_VFE_TBU_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
14	FORCE_MEM_CORE_ON	RW	This bit force the core on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
13	FORCE_MEM_PERIPH_ON	RW	This bit force the periph_on signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
12	FORCE_MEM_PERIPH_OFF	RW	This bit force the periph_off signal to remain active during halt state of the clk. 0x1: FORCE_ENABLE (Force-on Mode.) 0x0: FORCE_DISABLE (Normal Mode force disabled.)
11:8	WAKEUP	RW	This bitfield specifies the number of clock cycles it takes for the clock to turn back on. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

GCC_VFE_TBU_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP	RW	This bitfield specifies the number of clock cycles till complete sleep where headswitch of the corresponding memories will be opened. 0x0: CLOCK0 (Zero cycle) 0x1: CLOCK1 (One cycle) 0x2: CLOCK2 (Two cycles) 0x3: CLOCK3 (Three cycles) 0x4: CLOCK4 (Four cycles) 0x5: CLOCK5 (Five cycles) 0x6: CLOCK6 (Six cycles) 0x7: CLOCK7 (Seven cycles) 0x8: CLOCK8 (Eight cycles) 0x9: CLOCK9 (Nine cycles) 0xA: CLOCK10 (Ten cycles) 0xB: CLOCK11 (Eleven cycles) 0xC: CLOCK12 (Twelve cycles) 0xD: CLOCK13 (Thirteen cycles) 0xE: CLOCK14 (Fourteen cycles) 0xF: CLOCK15 (Fifteen cycles)

0x01812044 GCC_GTCU_AHB_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x80000000

GTCU AHB clock branch control register. It allows SW control of CBC soft macro

GCC_GTCU_AHB_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x01812094 GCC_GTCU_AHB_BRIDGE_CBCR**Type:** R**Clock:** CLK**Reset State:** 0x80000000

GTCU AHB2AHB Bridge clock branch control register. It allows SW control of CBC soft macro

GCC_GTCU_AHB_BRIDGE_CBCR

Bits	Name	Description
31	CLK_OFF	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off

0x0187C004 GCC_SMMU_CATS_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

SMMU CATS64 clock control register

GCC_SMMU_CATS_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0187C000 GCC_SMMU_CATS_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SMMU CATS Block control register

GCC_SMMU_CATS_BCR

Bits	Name	Description
0	BLK_ARES	This is for reset for the CATS 64 and CATS 128 Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01812000 GCC_SMMU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SMMU Blocks control register

GCC_SMMU_BCR

Bits	Name	Description
0	BLK_ARES	This can be used to disable the clocks of the SMMU blocks. Each TBU/TCU and CFG Clock has its own BCR, hence this need not be used for reset 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01812050 GCC_APSS_TCU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

APSS TCU Blocks control register

GCC_APSS_TCU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01862000 GCC_MDP_TBU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

MDP TBU Blocks control register

GCC_MDP_TBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01863000 GCC_GFX_TBU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GFX TBU Blocks control register

GCC_GFX_TBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01864000 GCC_GFX_TCU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GFX TCU Blocks control register

GCC_GFX_TCU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01865000 GCC_MSS_TBU_AXI_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

MSS TBU Blocks control register

GCC_MSS_TBU_AXI_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01867000 GCC_MSS_TBU_Q6_AXI_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

MSS Q6 TBU Blocks control register

GCC_MSS_TBU_Q6_AXI_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01866000 GCC_MSS_TBU_GSS_AXI_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

MSS GSS TBU Blocks control register

GCC_MSS_TBU_GSS_AXI_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01868000 GCC_GTCU_AHB_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GTCU AHB Blocks control register

GCC_GTCU_AHB_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01869000 GCC_SMMU_CFG_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SMMU CFG Clock Blocks control register

GCC_SMMU_CFG_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0186A000 GCC_VFE_TBU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

VFE TBU Blocks control register

GCC_VFE_TBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0186B000 GCC_VENUS_TBU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

VENUS TBU Blocks control register

GCC_VENUS_TBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0186C000 GCC_JPEG_TBU_BCR

Type: RW

Clock: CLK

Reset State: 0x00000000

JPEG TBU Blocks control register

GCC_JPEG_TBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0186D000 GCC_PRONTO_TBU_BCR

Type: RW

Clock: CLK

Reset State: 0x00000000

PRONTO TBU Blocks control register

GCC_PRONTO_TBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01812058 GCC_PCNOCTBU_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PCNOCTBU Blocks control register

GCC_PCNOCTBU_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0183600C GCC_RPM_SMMU_CLOCK_BRANCH_ENA_VOTE**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

RPM SMMU clock enable voting register for votable clocks.

GCC_RPM_SMMU_CLOCK_BRANCH_ENA_VOTE

Bits	Name	Description
13	GTCU_AHB_CLK_ENA	Enable GTCU_AHB Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
12	SMMU_CFG_CLK_ENA	Enable SMMU_CFG Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
11	PCNOCTBU_CLK_ENA	Enable PCNOCTBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
10	JPEG_TBU_CLK_ENA	Enable JPEG_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
9	VFE_TBU_CLK_ENA	Enable VFE_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
8	MSS_TBU_Q6_AXI_CLK_ENA	Enable MSS_Q6_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

GCC_RPM_SMMU_CLOCK_BRANCH_ENA_VOTE (cont.)

Bits	Name	Description
7	MSS_TBU_GSS_AXI_CLK_ENA	Enable MSS_GSS_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
6	MSS_TBU_AXI_CLK_ENA	Enable MSS_AXI_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
5	VENUS_TBU_CLK_ENA	Enable VENUS_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
4	MDP_TBU_CLK_ENA	Enable MDP_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
3	GFX_TBU_CLK_ENA	Enable GFX_TBU Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
2	GFX_TCU_CLK_ENA	Enable GFX_TCU Clock 0x0: ENABLE (In this bit of this register, there is a need to write '0' to enable the clock.) 0x1: DISABLE (This bit got merged into a flop tray and to have 0 as Disable we had to add a Flop which CL asked to avoid.)
1	APSS_TCU_CLK_ENA	Enable APSS_TCU Clock 0x0: ENABLE (This is the same case as above bit. '0' enables the clock and reason is same.) 0x1: DISABLE (This bit also got merged into a flop tray and to avoid Flop ECO we have '1' as Disable.)
0	PRONTO_TBU_CLK_ENA	Enable PRONTO_TBU clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01836008 GCC_RPM_CLOCK_SLEEP_ENA_VOTE**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

RPM clock sleep voting register for votable clocks.

GCC_RPM_CLOCK_SLEEP_ENA_VOTE

Bits	Name	Description
17	IMEM_AXI_CLK_SLEEP_ENA	Enable for allowing sleeping of IMEM AXI clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
16	SYS_NOC_APSS_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping sys_noc_apss_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
15	BIMC_APSS_AXI_CLK_SLEEP_ENA	Enable for allowing sleeping bimc_apss_axi_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
14	APSS_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping apss_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
13	APSS_AXI_CLK_SLEEP_ENA	Enable for allowing sleeping apss_axi_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
12	MPM_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping mpm_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
11	GMEM_SYS_NOC_AXI_CLK_SLEEP_ENA	Enable for allowing sleeping gmem_sys_noc_axi_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
10	BLSP1_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping blsp1_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
9	BLSP1_SLEEP_CLK_SLEEP_ENA	Enable for allowing sleeping blsp1_sleep_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
8	PRNG_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping prng_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
7	BOOT_ROM_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping boot_rom_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
6	MSG_RAM_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping msg_ram_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
5	TLMM_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping tlmm_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

GCC_RPM_CLOCK_SLEEP_ENA_VOTE (cont.)

Bits	Name	Description
4	TLMM_CLK_SLEEP_ENA	Enable for allowing sleeping tmm_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
3	SPMI_PCNOA_AHB_CLK_SLEEP_ENA	0x1: ENABLE 0x0: DISABLE
2	CRYPTO_CLK_SLEEP_ENA	Enable for allowing sleeping crypto_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
1	CRYPTO_AXI_CLK_SLEEP_ENA	Enable for allowing sleeping crypto_axi_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CRYPTO_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping crypto_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01836010 GCC_RPM_SMMU_CLOCK_SLEEP_ENA_VOTE**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

RPM SMMU clock sleep voting register for votable clocks.

GCC_RPM_SMMU_CLOCK_SLEEP_ENA_VOTE

Bits	Name	Description
13	GTCU_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping of GTCU_AHB Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
12	SMMU_CFG_CLK_SLEEP_ENA	Enable for allowing sleeping of SMMU_CFG Clock 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

1	CRYPTO_AXI_CLK_SLEEP_ENA	Enable for allowing sleeping crypto_axi_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CRYPTO_AHB_CLK_SLEEP_ENA	Enable for allowing sleeping crypto_ahb_clk 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01810004 GCC_VENUS_RESTART**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

VENUS_RESTART register allows SW to restart (reset) Venus

GCC_VENUS_RESTART

Bits	Name	Description
0	VENUS_RESTART	Allows restart (reset) to VENUS. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01811000 GCC_WCSS_RESTART**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

WCSS_RESTART register allows SW to restart (reset) Wireless Sub-system

GCC_WCSS_RESTART

Bits	Name	Description
0	WCSS_RESTART	Allows restart (reset) to WCSS. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01815008 GCC_RESET_STATUS**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

RESET STATUS Captures reset status for various sources.

GCC_RESET_STATUS

Bits	Name	Description
5	SECURE_WDOG_EXPIRE_STATUS	Set when secure wdog expire happens. 1: Secure wdog expired
4	PMIC_ABNORMAL_RESIN_STATUS	Set when abnormal resin occurs. 1: abnormal resin triggered
3	TSENSE_RESET_STATUS	Set when temperature sensor activates. 1: tsensor triggered
2	SRST_STATUS	Set high when any SRST triggered. 1: srst triggered
1:0	RESERVED	RESERVED

0x0181500C GCC_SW_SRST**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

SW SRST allows system reset for debugger.

GCC_SW_SRST

Bits	Name	Description
0	SW_SRST	set to reset system. 0x1: ENABLE (Software System reset enable.) 0x0: DISABLE (Software System reset disable.)

0x0181301C GCC_PROC_HALT**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

PROC HALT allows halting processor for debugger.

GCC_PROC_HALT

Bits	Name	Description
0	PROC_HALT	Clear to release halt to processor. 0x1: HALT (Processor halt.) 0x0: NOT_HALT (Processor not halt.)

0x01874004 GCC_CLOCK_FRQ_MEASURE_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

The clock frequency measure control register holds the value to load in the XO DIV4 counter. It also contains the enable to turn on both up and down counters for measure frequency for the corresponding debug clock.

NOTE The XO DIV4 counter use the gcc_xo_div4_clk. One must enable the gcc_xo_div4_clk by programming GCC_XO_DIV4_CBCR.

GCC_CLOCK_FRQ_MEASURE_CTL

Bits	Name	Description
20	CNT_EN	This bitfield is used to enable both the Up and Down counter. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
19:0	XO_DIV4_TERM_CNT	After being loaded, this value is decremented and used to compare in order to figure out the frequency of the clock being measured. $\text{Freq}(\text{measure clock}) = \text{Freq}(\text{XO_DIV4}) * (\text{MEASURE_CNT} + 1.5) / (\text{XO_DIV4_TERM_CNT} + 3.5)$

0x01874008 GCC_CLOCK_FRQ_MEASURE_STATUS**Type:** R**Clock:** CLK**Reset State:** 0x00000000

This register is read only register which contains the status of the measurement counter and its value.

It is used to figure out the frequency of the clock being measured at the end.

GCC_CLOCK_FRQ_MEASURE_STATUS

Bits	Name	Description
25	XO_DIV4_CNT_DONE	This bitfield is automatically set (1) when the XO_DIV4 counter terminates. It can be polled by the microprocessor to determine when the value of the measurement counter is valid
24:0	MEASURE_CNT	These read only register bits hold the value stored in the measurement counter, which is used to figure out the frequency of the clock being measured. $\text{Freq}(\text{measure clock}) = \text{Freq}(\text{XO_DIV4}) * (\text{MEASURE_CNT} + 1.5) / (\text{XO_DIV4_TERM_CNT} + 3.5)$

0x01808000 GCC_GP1_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

GP1 clock branch control register. It allows SW control of CBC soft macro

GCC_GP1_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01808004 GCC_GP1_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

GP1 root clock generator command register. It allows for SW to trigger the configuration data

GCC_GP1_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
7	DIRTY_D	R	Indicates change in D register configuration
6	DIRTY_M	R	Indicates change in M register configuration
5	DIRTY_N	R	Indicates change in N register configuration
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01808008 GCC_GP1_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP1 root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_GP1_CFG_RCGR

Bits	Name	Description
13:12	MODE	This bitfield provides SW selection of MN counter mode. 0x3: SINGLE_EDGE (Single-edge.) 0x2: DUAL_EDGE (Dual-edge.) 0x1: SWALLOW (Swallow.) 0x0: BYPASS (Bypass.)
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: SRC7 (Unused(Grounded).)

GCC_GP1_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0180800C GCC_GP1_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP1 root clock generator M value register. This register houses the M value for MND divider.

GCC_GP1_M

Bits	Name	Description
7:0	M	This bitfield represents M Value of the M/N:D Counter

0x01808010 GCC_GP1_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP1 root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_GP1_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01808014 GCC_GP1_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP1 root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_GP1_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x01809000 GCC_GP2_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

GP2 clock branch control register. It allows SW control of CBC soft macro

GCC_GP2_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01809004 GCC_GP2_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

GP2 root clock generator command register. It allows for SW to trigger the configuration data

GCC_GP2_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
7	DIRTY_D	R	Indicates change in D register configuration
6	DIRTY_M	R	Indicates change in M register configuration
5	DIRTY_N	R	Indicates change in N register configuration
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01809008 GCC_GP2_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP2 root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_GP2_CFG_RCGR

Bits	Name	Description
13:12	MODE	This bitfield provides SW selection of MN counter mode. 0x3: SINGLE_EDGE (Single-edge.) 0x2: DUAL_EDGE (Dual-edge.) 0x1: SWALLOW (Swallow.) 0x0: BYPASS (Bypass.)
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: SRC7 (Unused(Grounded).)

GCC_GP2_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0180900C GCC_GP2_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP2 root clock generator M value register. This register houses the M value for MND divider.

GCC_GP2_M

Bits	Name	Description
7:0	M	This bitfield represents M Value of the M/N:D Counter

0x01809010 GCC_GP2_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP2 root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_GP2_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x01809014 GCC_GP2_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP2 root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_GP2_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x0180A000 GCC_GP3_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

GP3 clock branch control register. It allows SW control of CBC soft macro

GCC_GP3_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180A004 GCC_GP3_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

GP3 root clock generator command register. It allows for SW to trigger the configuration data

GCC_GP3_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
7	DIRTY_D	R	Indicates change in D register configuration
6	DIRTY_M	R	Indicates change in M register configuration
5	DIRTY_N	R	Indicates change in N register configuration
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0180A008 GCC_GP3_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP3 root clock generator configuration register. It allows for SW to configure Root Clock Generation Macro

GCC_GP3_CFG_RCGR

Bits	Name	Description
13:12	MODE	This bitfield provides SW selection of MN counter mode. 0x3: SINGLE_EDGE (Single-edge.) 0x2: DUAL_EDGE (Dual-edge.) 0x1: SWALLOW (Swallow.) 0x0: BYPASS (Bypass.)
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (CXO.) 0x1: SRC1 (GPLL0_MAIN.) 0x2: SRC2 (Unused(Grounded).) 0x3: SRC3 (Unused(Grounded).) 0x4: SRC4 (Unused(Grounded).) 0x5: SRC5 (Unused(Grounded).) 0x6: SRC6 (Unused(Grounded).) 0x7: SRC7 (Unused(Grounded).)

GCC_GP3_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0180A00C GCC_GP3_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP3 root clock generator M value register. This register houses the M value for MND divider.

GCC_GP3_M

Bits	Name	Description
7:0	M	This bitfield represents M Value of the M/N:D Counter

0x0180A010 GCC_GP3_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP3 root clock generator N value register. This register houses the NOT(N-M) value for MND divider.

GCC_GP3_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	This bitfield represents NOT(N-M) Value of the M/N:D Counter

0x0180A014 GCC_GP3_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

GP3 root clock generator D value register. This register houses the NOT 2D value for MND divider.

GCC_GP3_D

Bits	Name	Description
7:0	NOT_2D	This bitfield represents NOT(2*D) Value of the M/N:D Counter

0x01860000 GCC_APSS_MISC**Type:** RW**Clock:** CLK**Reset State:** 0x00000003

This register contains 3 bits which are described below.

GCC_APSS_MISC

Bits	Name	Description
2	AUX2_CLK_ENABLE	To enable AUX2 clock for APSS, from GPLL1. This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
1	AUX1_CLK_ENABLE	To enable AUX1 clock for APSS, from GPLL0. This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	RPM_RESET_REMOVAL	This bitfield should be programmed to remove RPM Core from Reset. 0x1: RESET (RPM COre is in Reset.) 0x0: RELEASE (RPM COre reset is released.)

0x0187F000 GCC_TIC_MODE_APSS_BOOT**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register contains one bit which when set, will allow APSS to BOOT in TIC Mode.

GCC_TIC_MODE_APSS_BOOT

Bits	Name	Description
0	APSS_BOOT_IN_TIC_MODE	This bitfield should be programmed for any use case of TIC needing to boot APSS in TIC Mode. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01840000 GCC_USB_BOOT_CLOCK_CTL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register contains one bit which when set, will turn on all clocks necessary to access USB 2.0 during boot code.

GCC_USB_BOOT_CLOCK_CTL

Bits	Name	Description
0	CLK_ENABLE	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x01835000 GCC_RAW_SLEEP_CLK_CTRL**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register contains one bit which when set, will turn off the gating feature of raw sleep clock when XO clock is disabled at the XO pad by MPM.

GCC_RAW_SLEEP_CLK_CTRL

Bits	Name	Description
0	GATING_DISABLE	This bitfield controls the disable to the raw sleep clock gating feature. 0x1: DISABLE (Sleep clock gating is disabled so that when XO clock is disabled at pad, raw sleep clock will keep running.) 0x0: ENABLE (Sleep clock gating is enabled so that when XO clock is disabled at pad, raw sleep clock will stop running at well.)

0x01800008 GCC_GCC_SPARE0_REG**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register is spare register protected by RPU

GCC_GCC_SPARE0_REG

Bits	Name	Description
31:0	SPARE_BITS	32 bits spare bits

0x0180000C GCC_GCC_SPARE1_REG**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register is spare register protected by RPU

GCC_GCC_SPARE1_REG

Bits	Name	Description
31:0	SPARE_BITS	32 bits spare bits

0x0187E000 GCC_GCC_SPARE2_REG**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register is spare register not protected by RPU

GCC_GCC_SPARE2_REG

Bits	Name	Description
31:0	SPARE_BITS	32 bits spare bits

0x0187E004 GCC_GCC_SPARE3_REG**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

This register is spare register not protected by RPU

GCC_GCC_SPARE3_REG

Bits	Name	Description
31:0	SPARE_BITS	32 bits spare bits

0x0182A000 GCC_DCD_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

DCD block control register

GCC_DCD_BCR

Bits	Name	Description
0	BLK_ARES	This bitfield controls asynchronous software reset for the block. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0182A004 GCC_DCD_XO_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000001

DCD XO clock branch control register. It allows SW control of DCD XO CBC soft macro

GCC_DCD_XO_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0182A008 GCC_SNOC_DCD_CONFIG**Type:** RW**Clock:** CLK**Reset State:** 0x00004045

This register contains register bits for specifying DCD user configuration settings.

GCC_SNOC_DCD_CONFIG

Bits	Name	Description
31	DCD_ENABLE	Enable bit for DCD
14:0	ALLOWED_DIV	Allowed divide values for DCD

0x0182A00C GCC_SNOC_DCD_HYSTERESIS_CNT**Type:** RW**Clock:** CLK**Reset State:** 0x00100080

This register contains register bits for specifying DCD user configuration settings.

GCC_SNOC_DCD_HYSTERESIS_CNT

Bits	Name	Description
31:12	FIRST_CNT	Hysteresis count on first divide on DCD
11:0	NEXT_CNT	Hysteresis count on succeeding divides on DCD

0x0182A010 GCC_PCNOCD_DCD_CONFIG**Type:** RW**Clock:** CLK**Reset State:** 0x00004045

This register contains register bits for specifying DCD user configuration settings.

GCC_PCNOCD_DCD_CONFIG

Bits	Name	Description
31	DCD_ENABLE	Enable bit for DCD
14:0	ALLOWED_DIV	Allowed divide values for DCD

0x0182A014 GCC_PCNOCD_DCD_HYSTERESIS_CNT**Type:** RW**Clock:** CLK**Reset State:** 0x00100080

This register contains register bits for specifying DCD user configuration settings.

GCC_PCNOG_DCD_HYSTERESIS_CNT

Bits	Name	Description
31:12	FIRST_CNT	Hysteresis count on first divide on DCD
11:0	NEXT_CNT	Hysteresis count on succeeding divides on DCD

0x0182F024 GCC_MM_SPDM_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**GCC_MM_SPDM_BCR**

Bits	Name	Description
0	BLK_ARES	

0x0182F028 GCC_SPDM_JPEG0_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_JPEG0

GCC_SPDM_JPEG0_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F02C GCC_SPDM_MDP_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_MDP

GCC_SPDM_MDP_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F034 GCC_SPDM_VCODEC0_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_VCODEC0

GCC_SPDM_VCODEC0_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F038 GCC_SPDM_VFE0_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_VFE0

GCC_SPDM_VFE0_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF

GCC_SPDM_VFE0_CBCR (cont.)

Bits	Name	Type	Description
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F03C GCC_SPDM_GFX3D_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_GFX3D

GCC_SPDM_GFX3D_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F040 GCC_SPDM_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_AHB

GCC_SPDM_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F044 GCC_SPDM_PCLK0_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_PCLK0

GCC_SPDM_PCLK0_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0182F048 GCC_SPDM_CSI0_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for MM_SPDM_CSI0

GCC_SPDM_CSI0_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0184C000 GCC_VCODEC0_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Root Clock Generator Command Register VCODEC0

GCC_VCODEC0_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	The ROOT_OFF status allows SW to determine if the generator is actively producing a clock 0: Active 1: Not Active
7	DIRTY_D	R	Dirty bit for the D register. This bit is active if the D register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
6	DIRTY_N	R	Dirty bit for the N register. This bit is active if the N register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
5	DIRTY_M	R	Dirty bit for the M register. This bit is active if the M register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
4	DIRTY_CFG_RCGR	R	Dirty bit for the CFG_RCGR register. This bit is active if the CFG_RCGR register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
1	ROOT_EN		The ROOT_EN bit controls the output of the clock generator. This enable may be Ore with a HW clock enable and then sent to the RCG. 0: Disabled 1: Enabled
0	UPDATE		This UPDATE bit is SW and HW modified. SW sets the bit when the configuration values are programmed, and when they have taken effect, then HW clears the bit to 0. 0: Not Active 1: Active

0x0184C004 GCC_VCODEC0_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Clock Generator Config Register for VCODEC0

GCC_VCODEC0_CFG_RCGR

Bits	Name	Description
13:12	MODE	mode 00: bypass mode 01: swallow mode 10: dual edge mode 11: single edge mode
10:8	SRC_SEL	Root Source Select 000: cxo 001: GPLLO_MAIN 010: gnd 011: gnd 100: gnd 101: gnd 110: gnd 111: Reserved

GCC_VCODEC0_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	The SRC_DIV bits define the integer and half integer portion of the divider setting. 00000: Div 1 00001: Div 1 00010: Div 1.5 00011: Div 2 00100: Div 2.5 00101: Div 3 00110: Div 3.5 00111: Div 4 01000: Div 4.5 01001: Div 5 01010: Div 5.5 01011: Div 6 01100: Div 6.5 01101: Div 7 01110: Div 7.5 01111: Div 8 10000: Div 8.5 10001: Div 9 10010: Div 9.5 10011: Div 10 10100: Div 10.5 10101: Div 11 10110: Div 11.5 10111: Div 12 11000: Div 12.5 11001: Div 13 11010: Div 13.5 11011: Div 14 11100: Div 14.5 11101: Div 15 11110: Div 15.5 11111: Div 16

0x0184C008 GCC_VCODEC0_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program M for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_VCODEC0_M

Bits	Name	Description
7:0	M	Program M

0x0184C00C GCC_VCODEC0_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_N_MINUS_M (1's complement of N-M); The N value derived is used for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_VCODEC0_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	Program NOT_N_MINUS_M

0x0184C010 GCC_VCODEC0_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_2D (1's complement of 2D); The D value derived is used for the MND divider, where the duty cycle is D/N

GCC_VCODEC0_D

Bits	Name	Description
7:0	NOT_2D	Program NOT_2D

0x0184C014 GCC_VENUS0_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for VENUS0

GCC_VENUS0_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0184C018 GCC_VENUS0_GDSCR**Type:** RW**Clock:** CLK**Reset State:** 0x00222001

GDS Registers for VENUS0

GCC_VENUS0_GDSCR

Bits	Name	Type	Description
31	PWR_ON	R	PWR State 0: Power collapsed 1: Power on
30:27	GDSC_STATE	R	GDS FSM State 0000: PowerOff 0001: AssertAresAndRampUp_en_few 0010: DeassertAres 0011: RampUp_en_rest 0100: PowerOn 0101: UnclampIO 0110: NoRetainFF 0111: RestoreFF 1000: NA 1001: NA 1010: NA 1011: NA 1100: DisableClk 1101: RetainFF 1110: NA 1111: ClampIOAndSaveFF

GCC_VENUS0_GDSCR (cont.)

Bits	Name	Type	Description
23:20	EN_REST_WAIT		Wait cntr for the remaining PD switches to power on 0000: cntr value is cxc x 1 cycle 0001: cntr value is cxc x 2 cycle 0010: cntr value is cxc x 4 cycle [default] 0011: cntr value is cxc x 8 cycle 0100: cntr value is cxc x 16 cycle 0101: cntr value is cxc x 32 cycle 0110: cntr value is cxc x 64 cycle 0111: cntr value is cxc x 128 cycle 1000: cntr value is cxc x 256 cycle 1001: cntr value is cxc x 512 cycle 1010: cntr value is cxc x 1024 cycle 1011: cntr value is cxc x 2048 cycle 1100: cntr value is cxc x 2048 cycle 1101: cntr value is cxc x 2048 cycle 1110: cntr value is cxc x 2048 cycle 1111: cntr value is cxc x 2048 cycle
19:16	EN_FEW_WAIT		Wait cntr for the first few PD switches to power on 0000: cntr value is cxc x 1 cycle 0001: cntr value is cxc x 2 cycle 0010: cntr value is cxc x 4 cycle [default] 0011: cntr value is cxc x 8 cycle 0100: cntr value is cxc x 16 cycle 0101: cntr value is cxc x 32 cycle 0110: cntr value is cxc x 64 cycle 0111: cntr value is cxc x 128 cycle 1000: cntr value is cxc x 256 cycle 1001: cntr value is cxc x 512 cycle 1010: cntr value is cxc x 1024 cycle 1011: cntr value is cxc x 2048 cycle 1100: cntr value is cxc x 2048 cycle 1101: cntr value is cxc x 2048 cycle 1110: cntr value is cxc x 2048 cycle 1111: cntr value is cxc x 2048 cycle

GCC_VENUS0_GDSCR (cont.)

Bits	Name	Type	Description
15:12	CLK_DIS_WAIT		Wait while all clocks in this PD are turned off 0000: cntr value is cxo x 1 cycle 0001: cntr value is cxo x 2 cycle 0010: cntr value is cxo x 4 cycle [default] 0011: cntr value is cxo x 8 cycle 0100: cntr value is cxo x 16 cycle 0101: cntr value is cxo x 32 cycle 0110: cntr value is cxo x 64 cycle 0111: cntr value is cxo x 128 cycle 1000: cntr value is cxo x 256 cycle 1001: cntr value is cxo x 512 cycle 1010: cntr value is cxo x 1024 cycle 1011: cntr value is cxo x 2048 cycle 1100: cntr value is cxo x 2048 cycle 1101: cntr value is cxo x 2048 cycle 1110: cntr value is cxo x 2048 cycle 1111: cntr value is cxo x 2048 cycle
10	RESTORE		Restore 0: Not Active 1: Active

GCC_CSI1_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	The SRC_DIV bits define the integer and half integer portion of the divider setting. 00000: Div 1 00001: Div 1 00010: Div 1.5 00011: Div 2 00100: Div 2.5 00101: Div 3 00110: Div 3.5 00111: Div 4 01000: Div 4.5 01001: Div 5 01010: Div 5.5 01011: Div 6 01100: Div 6.5 01101: Div 7 01110: Div 7.5 01111: Div 8 10000: Div 8.5 10001: Div 9 10010: Div 9.5 10011: Div 10 10100: Div 10.5 10101: Div 11 10110: Div 11.5 10111: Div 12 11000: Div 12.5 11001: Div 13 11010: Div 13.5 11011: Div 14 11100: Div 14.5 11101: Div 15 11110: Div 15.5 11111: Div 16

0x0184F038 GCC_CAMSS_CSI1_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_CSI1

GCC_CAMSS_CSI1_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0184F03C GCC_CAMSS_CSI1_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CSI1

GCC_CAMSS_CSI1_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0184F040 GCC_CAMSS_CSI1_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CSI1_AHB

GCC_CAMSS_CSI1_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0184F044 GCC_CAMSS_CSI1PHY_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_CSI1PHY

GCC_CAMSS_CSI1PHY_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0184F048 GCC_CAMSS_CSI1PHY_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CSI1PHY

GCC_CAMSS_CSI1PHY_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0184F04C GCC_CAMSS_CSI1RDI_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_CSI1RDI

GCC_CAMSS_CSI1RDI_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0184F050 GCC_CAMSS_CSI1RDI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CSI1RDI

GCC_CAMSS_CSI1RDI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0184F054 GCC_CAMSS_CSI1PIX_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_CSI1PIX

GCC_CAMSS_CSI1PIX_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0184F058 GCC_CAMSS_CSI1PIX_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CSI1PIX

GCC_CAMSS_CSI1PIX_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x01850000 GCC_CAMSS_ISPIF_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_ISPIF

GCC_CAMSS_ISPIF_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x01850004 GCC_CAMSS_ISPIF_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_ISPIF_AHB

GCC_CAMSS_ISPIF_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x01851000 GCC_CCI_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Root Clock Generator Command Register CCI

GCC_CCI_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	The ROOT_OFF status allows SW to determine if the generator is actively producing a clock 0: Active 1: Not Active
7	DIRTY_D	R	Dirty bit for the D register. This bit is active if the D register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
6	DIRTY_N	R	Dirty bit for the N register. This bit is active if the N register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
5	DIRTY_M	R	Dirty bit for the M register. This bit is active if the M register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
4	DIRTY_CFG_RCGR	R	Dirty bit for the CFG_RCGR register. This bit is active if the CFG_RCGR register is written, and will clear after the update bit asserts. 0: Not Active 1: Active

GCC_CCI_CMD_RCGR (cont.)

Bits	Name	Type	Description
1	ROOT_EN		The ROOT_EN bit controls the output of the clock generator. This enable may be ORed with a HW clock enable and then sent to the RCG. 0: Disabled 1: Enabled
0	UPDATE		This UPDATE bit is SW and HW modified. SW sets the bit when the configuration values are programmed, and when they have taken effect, then HW clears the bit to 0. 0: Not Active 1: Active

0x01851004 GCC_CCI_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Clock Generator Config Register for CCI

GCC_CCI_CFG_RCGR

Bits	Name	Description
13:12	MODE	mode 00: bypass mode 01: swallow mode 10: dual edge mode 11: single edge mode
10:8	SRC_SEL	Root Source Select; Note gcc_gp1l1 is a backup 480Mhz source and the PLL may not be on. Only request SW to turn on if other sources cannot generate the required clock. 000: cxo 001: gnd 010: GPLLO_AUX 011: gnd 100: gnd 101: gnd 110: gnd 111: Reserved

GCC_CCI_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	The SRC_DIV bits define the integer and half integer portion of the divider setting. 00000: Div 1 00001: Div 1 00010: Div 1.5 00011: Div 2 00100: Div 2.5 00101: Div 3 00110: Div 3.5 00111: Div 4 01000: Div 4.5 01001: Div 5 01010: Div 5.5 01011: Div 6 01100: Div 6.5 01101: Div 7 01110: Div 7.5 01111: Div 8 10000: Div 8.5 10001: Div 9 10010: Div 9.5 10011: Div 10 10100: Div 10.5 10101: Div 11 10110: Div 11.5 10111: Div 12 11000: Div 12.5 11001: Div 13 11010: Div 13.5 11011: Div 14 11100: Div 14.5 11101: Div 15 11110: Div 15.5 11111: Div 16

0x01851008 GCC_CCI_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program M for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_CCI_M

Bits	Name	Description
7:0	M	Program M

0x0185100C GCC_CCI_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_N_MINUS_M (1's complement of N-M); The N value derived is used for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_CCI_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	Program NOT_N_MINUS_M

0x01851010 GCC_CCI_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_2D (1's complement of 2D); The D value derived is used for the MND divider, where the duty cycle is D/N

GCC_CCI_D

Bits	Name	Description
7:0	NOT_2D	Program NOT_2D

0x01851014 GCC_CAMSS_CCI_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_CCI

GCC_CAMSS_CCI_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x01851018 GCC_CAMSS_CCI_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CCI

GCC_CAMSS_CCI_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x0185101C GCC_CAMSS_CCI_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_CCI_AHB

GCC_CAMSS_CCI_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x01852000 GCC_MCLK0_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Root Clock Generator Command Register MCLK0

GCC_MCLK0_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	The ROOT_OFF status allows SW to determine if the generator is actively producing a clock 0: Active 1: Not Active
7	DIRTY_D	R	Dirty bit for the D register. This bit is active if the D register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
6	DIRTY_N	R	Dirty bit for the N register. This bit is active if the N register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
5	DIRTY_M	R	Dirty bit for the M register. This bit is active if the M register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
4	DIRTY_CFG_RCGR	R	Dirty bit for the CFG_RCGR register. This bit is active if the CFG_RCGR register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
1	ROOT_EN		The ROOT_EN bit controls the output of the clock generator. This enable may be ORed with a HW clock enable and then sent to the RCG. 0: Disabled 1: Enabled
0	UPDATE		This UPDATE bit is SW and HW modified. SW sets the bit when the configuration values are programmed, and when they have taken effect, then HW clears the bit to 0. 0: Not Active 1: Active

0x01852004 GCC_MCLK0_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Clock Generator Config Register for MCLK0

GCC_MCLK0_CFG_RCGR

Bits	Name	Description
13:12	MODE	mode 00: bypass mode 01: swallow mode 10: dual edge mode 11: single edge mode
10:8	SRC_SEL	Root Source Select; Note gcc_gpll1 is a backup 480Mhz source and the PLL may not be on. Only request SW to turn on if other sources cannot generate the required clock. 000: cxo 001: GPLL0_MAIN 010: GPLL1_AUX 011: gnd 100: gnd 101: gnd 110: core_pi_sleep_clk 111: Reserved

GCC_MCLK0_CFG_RCGR (cont.)

GCC_MM_GP0_M

Bits	Name	Description
7:0	M	Program M

0x0185400C GCC_MM_GP0_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_N_MINUS_M (1's complement of N-M); The N value derived is used for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_MM_GP0_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	Program NOT_N_MINUS_M

0x01854010 GCC_MM_GP0_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_2D (1's complement of 2D); The D value derived is used for the MND divider, where the duty cycle is D/N

GCC_MM_GP0_D

Bits	Name	Description
7:0	NOT_2D	Program NOT_2D

0x01854014 GCC_CAMSS_GP0_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_GP0

GCC_CAMSS_GP0_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x01854018 GCC_CAMSS_GP0_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_GP0

GCC_CAMSS_GP0_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x01855000 GCC_MM_GP1_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Root Clock Generator Command Register GP1

GCC_MM_GP1_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	The ROOT_OFF status allows SW to determine if the generator is actively producing a clock 0: Active 1: Not Active

GCC_MM_GP1_CMD_RCGR (cont.)

Bits	Name	Type	Description
7	DIRTY_D	R	Dirty bit for the D register. This bit is active if the D register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
6	DIRTY_N	R	Dirty bit for the N register. This bit is active if the N register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
5	DIRTY_M	R	Dirty bit for the M register. This bit is active if the M register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
4	DIRTY_CFG_RCGR	R	Dirty bit for the CFG_RCGR register. This bit is active if the CFG_RCGR register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
1	ROOT_EN		The ROOT_EN bit controls the output of the clock generator. This enable may be ORed with a HW clock enable and then sent to the RCG. 0: Disabled 1: Enabled
0	UPDATE		This UPDATE bit is SW and HW modified. SW sets the bit when the configuration values are programmed, and when they have taken effect, then HW clears the bit to 0. 0: Not Active 1: Active

0x01855004 GCC_MM_GP1_CFG_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Clock Generator Config Register for GP1

GCC_MM_GP1_CFG_RCGR

Bits	Name	Description
13:12	MODE	mode 00: bypass mode 01: swallow mode 10: dual edge mode 11: single edge mode
10:8	SRC_SEL	Root Source Select; Note gcc_gpll1 is a backup 480Mhz source and the PLL may not be on. Only request SW to turn on if other sources cannot generate the required clock. 000: cxo 001: GPLL0_MAIN 010: GPLL1_AUX 011: gnd 100: gnd 101: gnd 110: core_pi_sleep_clk 111: Reserved

GCC_MM_GP1_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	The SRC_DIV bits define the integer and half integer portion of the divider setting. 00000: Div 1 00001: Div 1 00010: Div 1.5 00011: Div 2 00100: Div 2.5 00101: Div 3 00110: Div 3.5 00111: Div 4 01000: Div 4.5 01001: Div 5 01010: Div 5.5 01011: Div 6 01100: Div 6.5 01101: Div 7 01110: Div 7.5 01111: Div 8 10000: Div 8.5 10001: Div 9 10010: Div 9.5 10011: Div 10 10100: Div 10.5 10101: Div 11 10110: Div 11.5 10111: Div 12 11000: Div 12.5 11001: Div 13 11010: Div 13.5 11011: Div 14 11100: Div 14.5 11101: Div 15 11110: Div 15.5 11111: Div 16

0x01855008 GCC_MM_GP1_M**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program M for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_MM_GP1_M

Bits	Name	Description
7:0	M	Program M

0x0185500C GCC_MM_GP1_N**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_N_MINUS_M (1's complement of N-M); The N value derived is used for the MND divider, where division ration is $F_{out} = F_{in} \cdot (M / N)$

GCC_MM_GP1_N

Bits	Name	Description
7:0	NOT_N_MINUS_M	Program NOT_N_MINUS_M

0x01855010 GCC_MM_GP1_D**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

Program NOT_2D (1's complement of 2D); The D value derived is used for the MND divider, where the duty cycle is D/N

GCC_MM_GP1_D

Bits	Name	Description
7:0	NOT_2D	Program NOT_2D

0x01855014 GCC_CAMSS_GP1_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_GP1

GCC_CAMSS_GP1_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x01855018 GCC_CAMSS_GP1_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_GP1

GCC_CAMSS_GP1_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x01856000 GCC_CAMSS_TOP_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_TOP

GCC_CAMSS_TOP_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0185A014 GCC_CAMSS_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

PSCBC Registers for CAMSS_TOP_AHB

GCC_CAMSS_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled. 1: Clock Enabled.

0x0185A018 GCC_CAMSS_AHB_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_AHB

GCC_CAMSS_AHB_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x01856004 GCC_CAMSS_TOP_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80008000

PSCBC Registers for CAMSS_AHB

GCC_CAMSS_TOP_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
30:28	NOC_HANDSHAKE_FSM_STATE	R	FSM State 000: OFFS = Off 001: WFON = Wait For Clk On 010: SRIU = Slave Ready is Up 011: WFSL = Wait for Socketcon Low 100: WOFF = Wait for Clk Off 101: Not Used 110: Not Used 111: Not Used
15	NOC_HANDSHAKE_FSM_EN		SlaveReady and Socket Connect FSM Enable; Default is 1 0: SW Clock Enabled 1: FSM Clock Enabled
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled. 1: Clock Enabled.

0x01856008 GCC_CAMSS_MICRO_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for CAMSS_MICRO

GCC_CAMSS_MICRO_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0185600C GCC_CAMSS_MICRO_AHB_CBCR**Type:** RW**Clock:** CLK**Reset State:** 0x80004FF0

PSCBC Registers for CAMSS_MICRO_AHB

GCC_CAMSS_MICRO_AHB_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Branch Clock Off 0: Clock is ON 1: Clock is OFF
14	FORCE_MEM_CORE_ON		Force Mem Core bits to be on 0: Memory Core can be powered down by the clock branch slp control 1: Force Memory Core to be powered on (default)
13	FORCE_MEM_PERIPH_ON		Force Mem Periph logics to be on 0: Memory Periphery logic can be powered down by the clock branch slp control (default) 1: Force Memory Periphery logic to be powerd on
12	FORCE_MEM_PERIPH_OF F		Force Mem Periph logics to be off 0: Memory Periphery logic is powered on by the clock branch slp control (default) 1: Force Memory Periphery logic to be powerd off
11:8	WAKEUP		When the clock is enabled, the memory control signal will be turned on immediately, but the clock will remain gated until WAKEUP clock cycles later. 0000: Number of clock cycle 1 0001: Number of clock cycle 2 0010: Number of clock cycle 3 0011: Number of clock cycle 4 0100: Number of clock cycle 5 0101: Number of clock cycle 6 0110: Number of clock cycle 7 1000: Number of clock cycle 8 1001: Number of clock cycle 9 1010: Number of clock cycle 10 1011: Number of clock cycle 11 1100: Number of clock cycle 12 1101: Number of clock cycle 13 1110: Number of clock cycle 14 1111: Number of clock cycle 15

GCC_CAMSS_MICRO_AHB_CBCR (cont.)

Bits	Name	Type	Description
7:4	SLEEP		When the clock is disabled, the clock will be gated immediately, but the memory control signals will not be turned off until a delay of SLEEP clock cycles. 0000: Number of clock cycle 1 0001: Number of clock cycle 2 0010: Number of clock cycle 3 0011: Number of clock cycle 4 0100: Number of clock cycle 5 0101: Number of clock cycle 6 0110: Number of clock cycle 7 1000: Number of clock cycle 8 1001: Number of clock cycle 9 1010: Number of clock cycle 10 1011: Number of clock cycle 11 1100: Number of clock cycle 12 1101: Number of clock cycle 13 1110: Number of clock cycle 14 1111: Number of clock cycle 15
0	CLK_ENABLE		SW Clock Enable Bit 0: Clock Disabled 1: Clock Enabled

0x01857000 GCC_JPEG0_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Root Clock Generator Command Register JPEG0

GCC_JPEG0_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	The ROOT_OFF status allows SW to determine if the generator is actively producing a clock 0: Active 1: Not Active
4	DIRTY_CFG_RCGR	R	Dirty bit for the CFG_RCGR register. This bit is active if the CFG_RCGR register is written, and will clear after the update bit asserts. 0: Not Active 1: Active

GCC_JPEG0_CMD_RCGR (cont.)

Bits	Name	Type	Description
1	ROOT_EN		The ROOT_EN bit controls the output of the clock generator. This enable may be ORed with a HW clock enable and then sent to the RCG. 0: Disabled 1: Enabled

0x0185902C GCC_GMEM_BCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000

BCR Registers for GMEM

GCC_GMEM_BCR

Bits	Name	Description
0	BLK_ARES	The block asynchronous reset bit, when set, the block clocks are disabled and the ares_out signals go active. 0: Not Active 1: Active

0x0185A000 GCC_CAMSS_AHB_CMD_RCGR**Type:** RW**Clock:** CLK**Reset State:** 0x80000000

Root Clock Generator Command Register CAMSS_AHB

GCC_CAMSS_AHB_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	The ROOT_OFF status allows SW to determine if the generator is actively producing a clock 0: Active 1: Not Active
7	DIRTY_D	R	Dirty bit for the D register. This bit is active if the D register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
6	DIRTY_N	R	Dirty bit for the N register. This bit is active if the N register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
5	DIRTY_M	R	Dirty bit for the M register. This bit is active if the M register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
4	DIRTY_CFG_RCGR	R	Dirty bit for the CFG_RCGR register. This bit is active if the CFG_RCGR register is written, and will clear after the update bit asserts. 0: Not Active 1: Active
1	ROOT_EN		The ROOT_EN bit controls the output of the clock generator. This enable may be ORed with a HW clock enable and then sent to the RCG. 0: Disabled 1: Enabled
0	UPDATE		This UPDATE bit is SW and HW modified. SW sets the bit when the configuration values are programmed, and when they have taken effect, then HW clears the bit to 0. 0: Not Active 1: Active

Bits	Name	Description
4:0	SRC_DIV	Specifies the integer and half integer portion of the divider setting of the RCG. The value specified is $2N-1$ where N is the divide ratio. For example, if the half integer divide ratio is 2.5, the SRC_DIV value should be set at 0x04. 0: Bypass 1: Div-1 2: Div-1.5 3: Div-2 4: Div-2.5 5: Div-3 6: Div-3.5 7: Div-4 8: Div-4.5 9: Div-5 10: Div-5.5 11: Div-6 12: Div-6.5 13: Div-7 14: Div-7.5 15: Div-8 16: Div-8.5 17: Div-9 18: Div-9.5 19: Div-10 20: Div-10.5 21: Div-11 22: Div-11.5 23: Div-12 24: Div-12.5 25: Div-13 26: Div-13.5 27: Div-14 28: Div-14.5 29: Div-15 30: Div-15.5 31: Div-16

5 Core Top CSR

5.1 TCSR_TCSR_MUTEX

TCSR mutex

5.1.1 TCSR_TCSR_MUTEX

TCSR mutex

**0x01905000+ TCSR_MUTEX_REG_n, n=[0..31]
0x1000*n**

Type: RW

Clock: AHB_CLK

Reset State: 0x00000000

The MUTEX_REGn register specifies the information regarding the access status of each of the 32 sections of memory, which is denoted by n. Register contents of 0 imply that the respective section of memory is free to use, and therefore unlocked. Non-zero contents would imply that the respective section of memory is in use, and therefore locked

TCSR_MUTEX_REG_n

Bits	Name	Description
7:0	MUTEX	Mutex register data

5.2 TCSR_TCSR_REGS

TCSR internal

5.2.1 TCSR_TCSR_REGS

TCSR internal

0x01939800 TCSR_MUTEX_REG_RESET**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

The MUTEX_REG_RESET register resets the MUTEX_REG_%n% blocks. Software has to assert the reset in order to clear the MUTEX_REGn. The reset bit needs to be de-asserted before SW can write to Mutex registers

TCSR_MUTEX_REG_RESET

Bits	Name	Description
0	MUTEX_RESET	0: deasserts reset 1: asserts reset

0x0193B07C TCSR_TCSR_CLK_EN**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000001

This register controls HW clock gating logics in core_top_csr block

TCSR_TCSR_CLK_EN

Bits	Name	Description
0	TCSR_CLK_EN	0: clock gating logic is enabled. clock to TCSR is turned off when there is no AHB transactions. 1: Clock gating logic is disabled. clock to TCSR is always on

0x0193C000 TCSR_TIMEOUT_SLAVE_GLB_EN**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls all the timeout slaves in the chip

TCSR_TIMEOUT_SLAVE_GLB_EN

Bits	Name	Description
0	TIMEOUT_SLAVE_GLB_EN	Enable bit to globally enable or disable all the timeout slaves in the chip 0: Disable 1: enable

**0x0193D000+ TCSR_TZ_WONCE_n, n=[0..15]
0x04*n****Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Trust Zone Write Once registers

TCSR_TZ_WONCE_n

Bits	Name	Description
31:0	TZ_WONCE_ADDRESS	Write once registers used by TZ to pass address. This register is reset only on chip POR and can be written only once after POR

0x0193D100 TCSR_BOOT_MISC_DETECT**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Boot download Cookie register

TCSR_BOOT_MISC_DETECT

Bits	Name	Description
31:0	BOOT_MISC_DETECT	32-bit register used by Apps PBL to check cookie and enter DLOAD mode. This register is reset only at chip POR and retains value across all other resets

9	RPM_IRQ_STATUS_CAMSS_IRQ3	RPM IRQ Status for camss_irq3 from camss
8	RPM_IRQ_STATUS_CAMSS_IRQ4	RPM IRQ Status for camss_irq4 from camss
7	RPM_IRQ_STATUS_CAMSS_IRQ5	RPM IRQ Status for camss_irq5 from camss
6	RPM_IRQ_STATUS_CAMSS_IRQ6	RPM IRQ Status for camss_irq6 from camss
5	RPM_IRQ_STATUS_CAMSS_IRQ7	RPM IRQ Status for camss_irq7 from camss
4	RPM_IRQ_STATUS_CAMSS_IRQ8	RPM IRQ Status for camss_irq8 from camss
3	RPM_IRQ_STATUS_CAMSS_IRQ9	RPM IRQ Status for camss_irq9 from camss
2	RPM_IRQ_STATUS_CSIPHY_0_IRQ	RPM IRQ Status for csiphy_0_irq from csiphy
1	RPM_IRQ_STATUS_CSIPHY_1_IRQ	RPM IRQ Status for csiphy_1_irq from csiphy

0x0193E010 TCSR_MMSS_OXILI_GC_SYS_AHB_STATUS**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

Read Only registers for Oxili debug purpose

TCSR_MMSS_OXILI_GC_SYS_AHB_STATUS

Bits	Name	Description
31:0	OXILI_GC_SYS_AHB_STATUS	GC_SYS_AHB_STATUS from Oxili [31] Reserved [30:28] Status of the ahb request signals [27] Reserved [26:24] Status of the ahb grant signals [23] Indicates transfer from CP PFP is split [22] Indicates transfer from CP ME is split [21:20] Gives the master id for the transfer 0 - HOST master 1 - CP ME master 2 - CP PFP master [19:16] Gives the slave id for the transfer 0 - MISC 1 - VBIF 2 - PC 3 - CP 4 - RBP 5 - UCHE 6 - HLSQ 7 - TSE 8 - VFD 9 - VPC 10 - VSC 11 - Reserved [15] Indicates there is transfer in progress [14] Indicates a transfer was a write transfer [13] Reserved [12] Indicates a current transfer is being stalled [11] Indicates a transfer completed [10] Indicates a split transfer on last transfer [09] Indicates a error transfer on last transfer [08] Reserved [07:00] This is the higher 8 bits of the transfer timeout counter

0x0193E014 TCSR_MMSS_OXILI_CMD_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Command registers for Oxili debug purpose

TCSR_MMSS_OXILI_CMD_REG

Bits	Name	Description
3:0	OXILI_CMD	Command registers for Oxili debug purpose [0] Release the bus that is waiting for a transfer to complete. The bus will return an ERROR response. This is for debug purpose. If another transfer is performed to the slave that is hanging, the bus could hang again. [1] Reset the transfer timeout counter [3:2] unused

0x0193E020 TCSR_MMSS_DSI_ULP_CLAMP_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

DSI ULP CLAMP CONTROLLER

TCSR_MMSS_DSI_ULP_CLAMP_CTRL

Bits	Name	Description
15	DSI0_CLAMP_EN	DSI0 CLAMP Enable
9	DSI0_CLKLN_EN	DSI0 CLKLN Enable
8	DSI0_CLKLN_ULPS_REQUEST	DSI0 CLKLN ULPS Request
7	DSI0_DLN0_EN	DSI0 DLN0 Enable
6	DSI0_DLN0_ULPS_REQUEST	DSI0 DLN0 ULPS Request
5	DSI0_DLN1_EN	DSI0 DLN1 Enable
4	DSI0_DLN1_ULPS_REQUEST	DSI0 DLN1 ULPS Request
3	DSI0_DLN2_EN	DSI0 DLN2 Enable
2	DSI0_DLN2_ULPS_REQUEST	DSI0 DLN2 ULPS Request
1	DSI0_DLN3_EN	DSI0 DLN3 Enable

TCSR_MMSS_DSI_ULP_CLAMP_CTRL (cont.)

Bits	Name	Description
0	DSI0_DLN3_ULPS_REQUE ST	DSI0 DLN3 ULPS Request

0x0193E024 TCSR_MMSS_DSI_PHYRESET_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

DSI PHY RESET CONTROL REGISTER

TCSR_MMSS_DSI_PHYRESET_CTRL

Bits	Name	Description
0	DSI_PHYRESET_CTRL	When set to 0, no effect, when set to 1 DSI PHY will not be reset by mmcc_mdss_ahb_ares

0x0193E030 RESERVED**0x0193E034 RESERVED****0x0193E038 TCSR_MMSS_IMEM_RAM_CONFIG****Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

IMEM RAM Configuration

TCSR_MMSS_IMEM_RAM_CONFIG

Bits	Name	Description
2	EX_RAM_CLK_EN	Not Used in A305 design
1:0	EX_RAM_CONFIG	External ram access configuration 00: No External ram allocated to AXI 10: All external ram allocated to AXI Note: EX_RAM_CONFIG[1] is used as the selector for glitch free Mux

0x0193F000 TCSR_TBU_BYPASS_ENABLE**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

TBU bypass enable register

TCSR_TBU_BYPASS_ENABLE

Bits	Name	Description
9:0	TBU_BYPASS_ENABLE	TBU bypass enable register for SMMU.

0x01941000 TCSR_QPDI_DISABLE_CFG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000001

Qualcomm PMIC debug interface disable

TCSR_QPDI_DISABLE_CFG

Bits	Name	Description
0	QPDI_DISABLE_CFG	QPDI disable bit. 1=Disable 0=Enable.

0x01942080 TCSR_COMPILER_VDDCX_ACC_0**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Compiler RAM ACC value of VDD CX power domain

TCSR_COMPILER_VDDCX_ACC_0

Bits	Name	Description
31:26	COMPILER_HDHPLLSP127	ACC[6:1] bits for HDHPLLSP127. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
25:20	COMPILER_HPLVRF	ACC[6:1] bits for HPLVRF(2-port). ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX

TCSR_COMPILER_VDDCX_ACC_0 (cont.)

Bits	Name	Description
19:16	COMPILER_LLRF240_1	ACC[3:0] bits for LLRF240(1-port)
15:12	COMPILER_STDSP155	ACC[3:0] bits for STDSP155
11:8	COMPILER_LLRF240_2	ACC[3:0] bits for LLRF240(2-port)
7:4	COMPILER_LLDP155	ACC[3:0] bits for LLPDP155
3:0	COMPILER_LLSP155	ACC[3:0] bits for LLSP155/UDHLLSP155

0x01942084 TCSR_COMPILER_VDDCX_ACC_1**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Complier RAM ACC value of VDD CX power domain

TCSR_COMPILER_VDDCX_ACC_1

Bits	Name	Description
3:0	COMPILER_UHDLLPDP155	ACC[3:0] bits for UHDLLPDP155

0x01942090 TCSR_CUSTOM_VDDCX_ACC_0**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Custom RAM ACC value of VDD CX power domain

TCSR_CUSTOM_VDDCX_ACC_0

Bits	Name	Description
31:30	CUSTOM_UHPSP127_L	ACC[2:1] bits for UHPSP127. This is partial field. Rest of the bits of this field[6:3] are in next register(CUSTOM_VDDCX_ACC_1). ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
29:24	CUSTOM_UHPSP155_OTHERS	ACC[6:1] bits for UHPSP155 for others. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
23:18	CUSTOM_UHPSP155_DATA	ACC[6:1] bits for UHPSP155 for L1 data. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
17:12	CUSTOM_8P_RF	ACC[6:1] bits for 8P RF. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX

TCSR_CUSTOM_VDDCX_ACC_0 (cont.)

Bits	Name	Description
11:6	CUSTOM_6P_RF	ACC[6:1] bits for 6P RF. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
5:0	CUSTOM_HPLVF240_BYPASS	ACC[6:1] bits for HPLVF240_bypass. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX

0x01942094 TCSR_CUSTOM_VDDCX_ACC_1**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Custom RAM ACC value of VDD CX power domain

TCSR_CUSTOM_VDDCX_ACC_1

Bits	Name	Description
21:16	CUSTOM_VHPLLSP127	ACC[6:1] bits for VHPLLSP127. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
15:10	CUSTOM_HPLLSP155	ACC[6:1] bits for HPLLSP155. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
9:4	CUSTOM_HPLLSP127	ACC[6:1] bits for HPLLSP127. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX
3:0	CUSTOM_UHPSP127_H	ACC[6:3] bits for UHPSP127. This is partial field. Rest of the bits of this field[2:1] are in previous register(CUSTOM_VDDCX_ACC_0). ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_VDDCX

0x01942100 TCSR_MEM_ACC_SEL_VDDCX**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000001

This register controls ACC mode of VDD CX power domain

TCSR_MEM_ACC_SEL_VDDCX

Bits	Name	Description
1:0	MEM_ACC_SEL_VDDCX	2'b01: Nominal 2'b11: Turbo 2'b00: SVS 2'b10: Reserved

0x01946000 TCSR_MEM_ACC_SEL_APC**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000101

This register controls ACC mode of APC L1 and L2 power domain

TCSR_MEM_ACC_SEL_APC

Bits	Name	Description
9:8	MEM_ACC_SEL_APC_L2	Mode control only for APC L2 memories 2'b01: Nominal 2'b11: Turbo 2'b00: SVS 2'b10: Reserved
1:0	MEM_ACC_SEL_APC_L1	Mode control only for APC L1 memories 2'b01: Nominal 2'b11: Turbo 2'b00: SVS 2'b10: Reserved

0x01946004 TCSR_CUSTOM_APC_ACC**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Custom RAM ACC value of APC power domain

TCSR_CUSTOM_APC_ACC

Bits	Name	Description
11:6	CUSTOM_UHPSP155_APC_L2	ACC[6:1] bits for UHPSP155 for L2. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_APC_L2
5:0	CUSTOM_UHPSP155_APC_L1	ACC[6:1] bits for UHPSP155 for L1. ACC[0] & ACC[7] are derived from mode selected by MEM_ACC_SEL_APC_L1

0x01947000 TCSR_SYS_POWER_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

indicate status of MPM power controls

TCSR_SYS_POWER_CTRL

Bits	Name	Description
15:0	SYS_POWER_CTRL	[15:11] reserved [10:8] USB PORT TYPE 3'b000 = SDP (500mA HID Grant) 3'b001 = DCP 3'b010 = CDP 3'b011 = ACA-Dock 3'b100 = ACA-A 3'b101 = ACA-B 3'b110 = ACA-C 3'b111 = None/Unconfigured ABOVE_WEAK_TH 1'b0 = VBAT is below the weak (bootable) threshold 1'b1 = VBAT is above the weak (bootable) threshold [6:5] CHG_PATH 2'b00 = None (PMIC is powered from battery, no valid charger attached) 2'b01 = USB path charger attached 2'b10 = DCIN path charger attached 2'b11 = Both USB and DCIN path chargers are attached [4] SKIP 1'b0 = Standard PMIC dual stage PON sequence, primary sequence first 1'b1 = Single stage PON sequence, includes primary followed by secondary sequence without MSM PMIC PON Handshake required. [3] FLCB_PMIC 1'b0 = PMIC is non-FLCB compatible or 3rd party PMIC 1'b1 = PMIC is FLCB compatible [2] BATTERY_PRESENT (passed from PMIC PBL_ACCESS1 register) 1'b0 = No Battery 1'b1 = Battery is present in the system [1:0] Reserved

0x01947004 TCSR_USB_CORE_ID**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register indicate the USB core ID which is used for download during boot

TCSR_USB_CORE_ID

Bits	Name	Description
1:0	USB_CORE_ID	2'b00 = core 0 2'b01 = core 1 2'b10 = core 2 2'b11 = core 3

0x01948000 TCSR_LDO_SLEEP_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO sleep

TCSR_LDO_SLEEP_CTRL

Bits	Name	Description
0	LDO_SLEEP	0 = LDO is on 1 = LDO is off; This state is not considered available. It would potentially cause reliability damage

0x01948004 TCSR_LDO_UPDATE_STATE_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO control update

TCSR_LDO_UPDATE_STATE_CTRL

Bits	Name	Description
0	LDO_UPDATE_STATE	0 = the LDO latches are not enabled 1 = LDO Latches are enabled to change state.

0x01948008 TCSR_LDO_OBIAS_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO output bias

TCSR_LDO_OBIAS_CTRL

Bits	Name	Description
0	LDO_OBIAS_ON	0 = output stage has no internal current sinking 1 = LDO internally sinks 10uA from Ppass

0x0194800C TCSR_LDO_VREF_CONFIG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000007

Adjust the vref voltage that goes from the SCALER to the REG

TCSR_LDO_VREF_CONFIG

Bits	Name	Description
3:0	LDO_VREF_CONFIG	$vref = 0.8625 + (-0.0125 * vref_config<3:0>)$; 0000 mapped to 1000 internally. Effectively 0000 => 1000

0x01948010 TCSR_LDO_IB_CONFIG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000002

Adjust the internal ibias current that goes from the SCALER to Regulator

TCSR_LDO_IB_CONFIG

Bits	Name	Description
2:0	LDO_IB_CONFIG	$ireg = 0.25\mu A + 0.25\mu A * ldo_ib_config<2:0>$; 000 mapped to 100 internally

0x01948014 TCSR_LDO_BGC_CONFIG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**TCSR_LDO_BGC_CONFIG**

Bits	Name	Description
2:0	LDO_BGC	LDO_BGC[0] = 0: power down local reference LDO_BGC[0] = 1: power up local reference LDO_BGC[1]: reserved LDO_BGC[2]: reserved

0x01948018 TCSR_LDO_VREF_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

LDO Vref select

TCSR_LDO_VREF_CTRL

Bits	Name	Description
16	LDO_VREF_SEL_OVR	0 = selects LDO_VREF_SEL_MPM 1 = selects LDO_VREF_SW
0	LDO_VREF_SEL_SW	0 = selects PMIC 1.25V reference 1 = selects local BAND gap reference

0x0194801C TCSR_LDO_LD_EN**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO load

TCSR_LDO_LD_EN

Bits	Name	Description
31	LDO_LD_EN	LDO_LD_EN = 0: disables the test load at LDO output LDO_LD_EN = 1: Enable the test load

0x01948020 TCSR_LDO_LD_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO load current

TCSR_LDO_LD_CTRL

Bits	Name	Description
23:16	LDO_LD_MSB	8'b0 = no load from bigger current branch oad current = $0.5\text{mA} * \text{ldo001_ld_lsb}<0> + 0.5\text{mA} * \text{ldo001_ld_lsb}<1> + 0.5\text{mA} * \text{ldo001_ld_lsb}<2> + 0.5\text{mA} * \text{ldo001_ld_lsb}<3> + 1\text{mA} * \text{ldo001_ld_lsb}<4> + 1\text{mA} * \text{ldo001_ld_lsb}<5> + 1\text{mA} * \text{ldo001_ld_lsb}<6> + 1\text{mA} * \text{ldo001_ld_lsb}<7>$
7:0	LDO_LD_LSB	8'b0 = no load from smaller current branch Load current = $0.125\text{mA} * \text{ldo001_ld_lsb}<0> + 0.125\text{mA} * \text{ldo001_ld_lsb}<1> + 0.125\text{mA} * \text{ldo001_ld_lsb}<2> + 0.125\text{mA} * \text{ldo001_ld_lsb}<3> + 0.25\text{mA} * \text{ldo001_ld_lsb}<4> + 0.25\text{mA} * \text{ldo001_ld_lsb}<5> + 0.25\text{mA} * \text{ldo001_ld_lsb}<6> + 0.25\text{mA} * \text{ldo001_ld_lsb}<7>$

0x01948024 TCSR_LDO_OSC_RESETB**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO Oscillator

TCSR_LDO_OSC_RESETB

Bits	Name	Description
31	LDO_OSC_RESETB	0 = disables the noise measure oscillator 1 = enables the noise measure oscillator

0x01948028 TCSR_LDO_OSC_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO Oscillator

TCSR_LDO_OSC_CTRL

Bits	Name	Description
1:0	LDO_OSC_CTRL	00 = Noise measurement oscillator frequency control Highest (2.8 GHz at TT / 1.05V / 40°C) 01 = 1/2 highest 10 = 1/3 highest 11 = 1/4 highest

0x0194802C TCSR_LDO_DFT_EN_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO in DFT mode

TCSR_LDO_DFT_EN_CTRL

Bits	Name	Description
31	LDO_DFT_EN	0 = Reserved 1 = Reserved

0x01948030 TCSR_LDO_DFT_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Control the LDO in DFT bus output selection

TCSR_LDO_DFT_CTRL

Bits	Name	Description
2:0	LDO_DFT_CONFIG	3'b000: Reserved 3'b001: Reserved 3'b010: Reserved 3'b011: Reserved 3'b100: Reserved 3'b101: Reserved 3'b110: Reserved 3'b111: Reserved

0x0194A000 TCSR_SPDM_CNT_CLK_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls Mux selects for cycle clock multiplexors to select one clock from two possible inputs, cy_clk_a and cy_clk_b. There is one mux per cycle counter and each mux select is 1-bit wide

TCSR_SPDM_CNT_CLK_CTRL

Bits	Name	Description
15:0	SPDM_CNT_CLK_MUX_SEL	cycle clock mux sel bit n is for mux n

0x0194A004 TCSR_SPDM_DLY_FIFO_EN**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register enables delay fifo for each offline 4bit port input. Delay fifos are used to transfer offline data between the source and the SPDM core pseudo-synchronously

TCSR_SPDM_DLY_FIFO_EN

Bits	Name	Description
31:0	SPDM_DLY_FIFO_EN	each bit corresponds to delay for fifo used for offline port Bit[0] corresponds to delay for fifo used for offline port #0 bit value 0: Disable 1: Enable

0x0194A008 TCSR_SPDM_STG1_MUX_SEL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls Mux selects for stage 1 muxes to select 8 primary ports to monitor 32 offline ports. Each stage 1 mux is 2-bits wide and selects 1 of 4 offline ports

TCSR_SPDM_STG1_MUX_SEL

Bits	Name	Description
15:0	SPDM_STG1_MUX_SEL	Bits 31:16 Reserved_31_16 15:14 spdm_stg1_mux_sel7 selects between Port #19, Port #23, Port #27, Port #31 to create Primary Port #7 13:12 spdm_stg1_mux_sel6 selects between Port #18, Port #22, Port #26, Port #30 to create Primary Port #6 11:10 spdm_stg1_mux_sel5 selects between Port #17, Port #21, Port #25, Port #29 to create Primary Port #5 9:8 spdm_stg1_mux_sel4 selects between Port #16, Port #20, Port #24, Port #28 to create Primary Port #4 7:6 spdm_stg1_mux_sel3 selects between Port #3, Port #7, Port #11, Port #15 to create Primary Port #3 5:4 spdm_stg1_mux_sel2 selects between Port #2, Port #6, Port #10, Port #14 to create Primary Port #2 3:2 spdm_stg1_mux_sel1 selects between Port #1, Port #5, Port #9, Port #13 to create Primary Port #1 1:0 spdm_stg1_mux_sel0 selects between Port #0, Port #4, Port #8, Port #12 to create Primary Port #0

0x0194A00C TCSR_SPDM_STG2_A_MUX_SEL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls Mux selects for stage 3 multiplexors to select one bit from each port (selected in stage 2 mux) for monitoring in an offline monitor. There is one mux per offline monitor and each stage 3 mux select is 2-bits wide

TCSR_SPDM_STG2_A_MUX_SEL

Bits	Name	Description
31:0	SPDM_STG2_A_MUX_SEL	Bits 31:30 spdm_stg2_a_mux_sel12 selects between Primary Ports #0-#3 for monitoring in offline monitor #15 29:28 spdm_stg2_a_mux_sel12 selects between Primary Ports #0-#3 for monitoring in offline monitor #14 27:26 spdm_stg2_a_mux_sel12 selects between Primary Ports #0-#3 for monitoring in offline monitor #13 25:24 spdm_stg2_a_mux_sel12 selects between Primary Ports #0-#3 for monitoring in offline monitor #12 23:22 spdm_stg2_a_mux_sel11 selects between Primary Ports #0-#3 for monitoring in offline monitor #11 21:20 spdm_stg2_a_mux_sel10 selects between Primary Ports #0-#3 for monitoring in offline monitor #10 19:18 spdm_stg2_a_mux_sel9 selects between Primary Ports #0-#3 for monitoring in offline monitor #9 17:16 spdm_stg2_a_mux_sel8 selects between Primary Ports #0-#3 for monitoring in offline monitor #8 15:14 spdm_stg2_a_mux_sel7 selects between Primary Ports #0-#3 for monitoring in offline monitor #7 13:12 spdm_stg2_a_mux_sel6 selects between Primary Ports #0-#3 for monitoring in offline monitor #6 11:10 spdm_stg2_a_mux_sel5 selects between Primary Ports #0-#3 for monitoring in offline monitor #5 9:8 spdm_stg2_a_mux_sel4 selects between Primary Ports #0-#3 for monitoring in offline monitor #4 7:6 spdm_stg2_a_mux_sel3 selects between Primary Ports #0-#3 for monitoring in offline monitor #3 5:4 spdm_stg2_a_mux_sel2 selects between Primary Ports #0-#3 for monitoring in offline monitor #2 3:2 spdm_stg2_a_mux_sel1 selects between Primary Ports #0-#3 for monitoring in offline monitor #1 1:0 spdm_stg2_a_mux_sel0

TCSR_SPDM_STG2_A_MUX_SEL (cont.)

Bits	Name	Description
		selects between Primary Ports #0-#3 for monitoring in offline monitor #0

0x0194A010 TCSR_SPDM_STG2_B_MUX_SEL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls Mux selects for stage 2 muxes to select one of 4 primary ports (selected in stage 1 mux) for monitoring in an offline monitor. There is one mux per offline monitor and each stage 2 mux select is 2-bits wide

TCSR_SPDM_STG2_B_MUX_SEL

Bits	Name	Description
31:0	SPDM_STG2_B_MUX_SEL	Bits 31:30 spdm_stg2_b_mux_sel31 selects between Primary Ports #4-#7 for monitoring in offline monitor #31 29:28 spdm_stg2_b_mux_sel30 selects between Primary Ports #4-#7 for monitoring in offline monitor #30 27:26 spdm_stg2_b_mux_sel29 selects between Primary Ports #4-#7 for monitoring in offline monitor #29 25:24 spdm_stg2_b_mux_sel28 selects between Primary Ports #4-#7 for monitoring in offline monitor #28 23:22 spdm_stg2_b_mux_sel27 selects between Primary Ports #4-#7 for monitoring in offline monitor #27 21:20 spdm_stg2_b_mux_sel26 selects between Primary Ports #4-#7 for monitoring in offline monitor #26 19:18 spdm_stg2_b_mux_sel25 selects between Primary Ports #4-#7 for monitoring in offline monitor #25 17:16 spdm_stg2_b_mux_sel24 selects between Primary Ports #4-#7 for monitoring in offline monitor #24 15:14 spdm_stg2_b_mux_sel23 selects between Primary Ports #4-#7 for monitoring in offline monitor #23 13:12 spdm_stg2_b_mux_sel22 selects between Primary Ports #4-#7 for monitoring in offline monitor #22 11:10 spdm_stg2_b_mux_sel21 selects between Primary Ports #4-#7 for monitoring in offline monitor #21 9:8 spdm_stg2_b_mux_sel20 selects between Primary Ports #4-#7 for monitoring in offline monitor #20 7:6 spdm_stg2_b_mux_sel19 selects between Primary Ports #4-#7 for monitoring in offline monitor #19 5:4 spdm_stg2_b_mux_sel18 selects between Primary Ports #4-#7 for monitoring in offline monitor #18 3:2 spdm_stg2_b_mux_sel17 selects between Primary Ports #4-#7 for monitoring in offline monitor #17 1:0 spdm_stg2_b_mux_sel16

TCSR_SPDM_STG2_B_MUX_SEL (cont.)

Bits	Name	Description
		selects between Primary Ports #4-#7 for monitoring in offline monitor #16

0x0194A014 TCSR_SPDM_STG3_A_MUX_SEL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls Mux selects for stage 3 multiplexors to select one bit from each port (selected in stage 2 mux) for monitoring in an offline monitor. There is one mux per offline monitor and each stage 3 mux select is 2-bits wide

TCSR_SPDM_STG3_A_MUX_SEL

Bits	Name	Description
31:0	SPDM_STG3_A_MUX_SEL	Bits 31:30 spdm_stg3_a_mux_sel15 selects one of 4-bits from Stage 2 Mux #15 for monitoring in offline monitor #15 29:28 spdm_stg3_a_mux_sel14 selects one of 4-bits from Stage 2 Mux #14 for monitoring in offline monitor #14 27:26 spdm_stg3_a_mux_sel13 selects one of 4-bits from Stage 2 Mux #13 for monitoring in offline monitor #13 25:24 spdm_stg3_a_mux_sel12 selects one of 4-bits from Stage 2 Mux #12 for monitoring in offline monitor #12 23:22 spdm_stg3_a_mux_sel11 selects one of 4-bits from Stage 2 Mux #11 for monitoring in offline monitor #11 21:20 spdm_stg3_a_mux_sel10 selects one of 4-bits from Stage 2 Mux #10 for monitoring in offline monitor #10 19:18 spdm_stg3_a_mux_sel9 selects one of 4-bits from Stage 2 Mux #9 for monitoring in offline monitor #9 17:16 spdm_stg3_a_mux_sel8 selects one of 4-bits from Stage 2 Mux #8 for monitoring in offline monitor #8 15:14 spdm_stg3_a_mux_sel7 selects one of 4-bits from Stage 2 Mux #7 for monitoring in offline monitor #7 13:12 spdm_stg3_a_mux_sel6 selects one of 4-bits from Stage 2 Mux #6 for monitoring in offline monitor #6 11:10 spdm_stg3_a_mux_sel5 selects one of 4-bits from Stage 2 Mux #5 for monitoring in offline monitor #5 9:8 spdm_stg3_a_mux_sel4 selects one of 4-bits from Stage 2 Mux #4 for monitoring in offline monitor #4 7:6 spdm_stg3_a_mux_sel3 selects one of 4-bits from Stage 2 Mux #3 for monitoring in offline monitor #3 5:4 spdm_stg3_a_mux_sel2 selects one of 4-bits from Stage 2 Mux #2 for monitoring in offline monitor #2 3:2 spdm_stg3_a_mux_sel1 selects one of 4-bits from Stage 2 Mux #1 for monitoring in offline monitor #1 1:0 spdm_stg3_a_mux_sel0

TCSR_SPDM_STG3_A_MUX_SEL (cont.)

Bits	Name	Description
		selects one of 4-bits from Stage 2 Mux #0 for monitoring in offline monitor #0

0x0194A018 TCSR_SPDM_STG3_B_MUX_SEL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register controls Mux selects for stage 3 multiplexors to select one bit from each port (selected in stage 2 mux) for monitoring in an offline monitor. There is one mux per offline monitor and each stage 3 mux select is 2-bits wide.

TCSR_SPDM_STG3_B_MUX_SEL

Bits	Name	Description
31:0	SPDM_STG3_B_MUX_SEL	Bits 31:30 spdm_stg3_a_mux_sel15 selects one of 4-bits from Stage 2 Mux #15 for monitoring in offline monitor #15 29:28 spdm_stg3_a_mux_sel14 selects one of 4-bits from Stage 2 Mux #14 for monitoring in offline monitor #14 27:26 spdm_stg3_a_mux_sel13 selects one of 4-bits from Stage 2 Mux #13 for monitoring in offline monitor #13 25:24 spdm_stg3_a_mux_sel12 selects one of 4-bits from Stage 2 Mux #12 for monitoring in offline monitor #12 23:22 spdm_stg3_a_mux_sel11 selects one of 4-bits from Stage 2 Mux #11 for monitoring in offline monitor #11 21:20 spdm_stg3_a_mux_sel10 selects one of 4-bits from Stage 2 Mux #10 for monitoring in offline monitor #10 19:18 spdm_stg3_a_mux_sel9 selects one of 4-bits from Stage 2 Mux #9 for monitoring in offline monitor #9 17:16 spdm_stg3_a_mux_sel8 selects one of 4-bits from Stage 2 Mux #8 for monitoring in offline monitor #8 15:14 spdm_stg3_a_mux_sel7 selects one of 4-bits from Stage 2 Mux #7 for monitoring in offline monitor #7 13:12 spdm_stg3_a_mux_sel6 selects one of 4-bits from Stage 2 Mux #6 for monitoring in offline monitor #6 11:10 spdm_stg3_a_mux_sel5 selects one of 4-bits from Stage 2 Mux #5 for monitoring in offline monitor #5 9:8 spdm_stg3_a_mux_sel4 selects one of 4-bits from Stage 2 Mux #4 for monitoring in offline monitor #4 7:6 spdm_stg3_a_mux_sel3 selects one of 4-bits from Stage 2 Mux #3 for monitoring in offline monitor #3 5:4 spdm_stg3_a_mux_sel2 selects one of 4-bits from Stage 2 Mux #2 for monitoring in offline monitor #2 3:2 spdm_stg3_a_mux_sel1 selects one of 4-bits from Stage 2 Mux #1 for monitoring in offline monitor #1 1:0 spdm_stg3_a_mux_sel0

TCSR_SPDM_STG3_B_MUX_SEL (cont.)

Bits	Name	Description
		selects one of 4-bits from Stage 2 Mux #0 for monitoring in offline monitor #0

0x0194B000 RESERVED**0x0194B080+ TCSR_PHSS_UART_PRONTO_INT_SEL_n, n=[0..1]
0x10*n****Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Each register select which PHSS interrupt goes to one bit interrupt output. register %n% controls phss_uart_pronto_int[%n%]. the enabled interrupts ORed together to generate output.

TCSR_PHSS_UART_PRONTO_INT_SEL_n

Bits	Name	Description
1	PRONTO_BLSP1_UART_2_IRQ_ENABLE	1 = enabled. 0 = disabled
0	PRONTO_BLSP1_UART_1_IRQ_ENABLE	1 = enabled. 0 = disabled

**0x0194B0C0+ TCSR_PHSS_UART_MSS_INT_SEL_n, n=[0..1]
0x10*n****Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Each register select which PHSS interrupt goes to one bit interrupt output to MSS. register %n% controls phss_uart_mss_int[%n%]. the enabled interrupts ORed together to generate output

TCSR_PHSS_UART_MSS_INT_SEL_n

Bits	Name	Description
1	MSS_BLSP1_UART_2_IRQ_ENABLE	1 = enabled. 0 = disabled
0	MSS_BLSP1_UART_1_IRQ_ENABLE	1 = enabled. 0 = disabled

**0x0194B100+ TCSR_PHSS_QUP_PRONTO_INT_SEL_n, n=[0..1]
0x10*n**
Type: RW**Clock:** AHB_CLK**Reset State:** 0x00000000

select which PHSS interrupt goes to one bit interrupt output to PRONTO. register %n% controls phss_qup_pronto_int[%n%]. the enabled interrupts ORed together to generate output

TCSR_PHSS_QUP_PRONTO_INT_SEL_n

Bits	Name	Description
5	PRONTO_BLSP1_QUP_6_I RQ_ENABLE	1 = enabled. 0 = disabled
4	PRONTO_BLSP1_QUP_5_I RQ_ENABLE	1 = enabled. 0 = disabled
3	PRONTO_BLSP1_QUP_4_I RQ_ENABLE	1 = enabled. 0 = disabled
2	PRONTO_BLSP1_QUP_3_I RQ_ENABLE	1 = enabled. 0 = disabled
1	PRONTO_BLSP1_QUP_2_I RQ_ENABLE	1 = enabled. 0 = disabled
0	PRONTO_BLSP1_QUP_1_I RQ_ENABLE	1 = enabled. 0 = disabled

**0x0194B140+ TCSR_PHSS_QUP_MSS_INT_SEL_n, n=[0..1]
0x10*n**
Type: RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Each register select which PHSS interrupt goes to one bit interrupt output to MSS. register %n% controls phss_qup_mss_int[%n%]. the enabled interrupts ORed together to generate output

TCSR_PHSS_QUP_MSS_INT_SEL_n

Bits	Name	Description
5	MSS_BLSP1_QUP_6_IRQ_ ENABLE	1 = enabled. 0 = disabled
4	MSS_BLSP1_QUP_5_IRQ_ ENABLE	1 = enabled. 0 = disabled
3	MSS_BLSP1_QUP_4_IRQ_ ENABLE	1 = enabled. 0 = disabled

TCSR_PHSS_QUP_MSS_INT_SEL_n (cont.)

Bits	Name	Description
2	MSS_BLSP1_QUP_3_IRQ_ENABLE	1 = enabled. 0 = disabled
1	MSS_BLSP1_QUP_2_IRQ_ENABLE	1 = enabled. 0 = disabled
0	MSS_BLSP1_QUP_1_IRQ_ENABLE	1 = enabled. 0 = disabled

0x0194D020 TCSR_TIMEOUT_INTR_STATUS**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

This is interrupt status register

TCSR_TIMEOUT_INTR_STATUS

Bits	Name	Description
22	ULTAUDIO_AHBI_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
20	MSS_CONFIG_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
14	SNOC_S1_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
13	SNOC_S0_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
9	PCNOC_S9_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
8	PCNOC_S8_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
7	PCNOC_S7_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted

TCSR_TIMEOUT_INTR_STATUS (cont.)

Bits	Name	Description
6	PCNOC_S6_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
5	PCNOC_S5_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
4	PCNOC_S4_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
3	PCNOC_S3_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
2	PCNOC_S2_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
1	PCNOC_S1_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted
0	PCNOC_S0_TIMEOUT_IRQ	Status of interrupt 1 = interrupt asserted. 0 = interrupt deasserted

0x0194D030 TCSR_TIMEOUT_INTR_RPM_ENABLE**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This is interrupt enable register for RPM. Set a bit to 1 enables the corresponding interrupt to propagate

TCSR_TIMEOUT_INTR_RPM_ENABLE

Bits	Name	Description
22	ULTAUDIO_AHBI_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
20	MSS_CONFIG_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
14	SNOC_S1_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled

TCSR_TIMEOUT_INTR_RPM_ENABLE (cont.)

Bits	Name	Description
13	SNOC_S0_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
9	PCNOC_S9_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
8	PCNOC_S8_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
7	PCNOC_S7_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
6	PCNOC_S6_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
5	PCNOC_S5_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
4	PCNOC_S4_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
3	PCNOC_S3_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
2	PCNOC_S2_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
1	PCNOC_S1_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
0	PCNOC_S0_TIMEOUT_IRQ_RPM_ENABLE	1 = interrupt enabled. 0 = interrupt disabled

0x0194D040 TCSR_TIMEOUT_INTR_APSS_ENABLE**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This is interrupt enable register for APSS

TCSR_TIMEOUT_INTR_APSS_ENABLE

Bits	Name	Description
22	ULTAUDIO_AHBI_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
20	MSS_CONFIG_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled

TCSR_TIMEOUT_INTR_APSS_ENABLE (cont.)

Bits	Name	Description
14	SNOC_S1_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
13	SNOC_S0_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
9	PCNOC_S9_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
8	PCNOC_S8_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
7	PCNOC_S7_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
6	PCNOC_S6_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
5	PCNOC_S5_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
4	PCNOC_S4_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
3	PCNOC_S3_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
2	PCNOC_S2_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
1	PCNOC_S1_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled
0	PCNOC_S0_TIMEOUT_IRQ_APSS_ENABLE	1 = interrupt enabled. 0 = interrupt disabled

0x0194D070 TCSR_PRONTO_BUS_TIMEOUT_RESET**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This is SW reset register for the u_ahb_bus_timeout_snoc_s3 for Pronto

TCSR_PRONTO_BUS_TIMEOUT_RESET

Bits	Name	Description
0	WCSS_BUS_TIMEOUT_NO_C_SOFT_RESET	1 = reset asserted. 0 = reset de-asserted

0x0194F000 TCSR_MSSQ6_HALTREQ**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request

TCSR_MSSQ6_HALTREQ

Bits	Name	Description
0	MSSQ6_HALTREQ	AXI bus Halt request

0x0194F004 TCSR_MSSQ6_HALTACK**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request acknowledge

TCSR_MSSQ6_HALTACK

Bits	Name	Description
0	MSSQ6_HALTACK	AXI bus Halt request acknowledge

0x0194F008 TCSR_MSSQ6_MASTER_IDLE**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000001

AXI bus is idle

TCSR_MSSQ6_MASTER_IDLE

Bits	Name	Description
0	MSSQ6_MASTER_IDLE	AXI bus is idle

0x0194F010 TCSR_MSSQ6_POWER_STATE**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

indicate power state of QDSP6 in MSS

TCSR_MSSQ6_POWER_STATE

Bits	Name	Description
0	MSSQ6_POWER_STATE	1 = power is on 0 = power is off

0x01951000 TCSR_MSS_NC_HALTREQ**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request

TCSR_MSS_NC_HALTREQ

Bits	Name	Description
0	MSS_NC_HALTREQ	AXI bus Halt request

0x01951004 TCSR_MSS_NC_HALTACK**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request acknowledge

TCSR_MSS_NC_HALTACK

Bits	Name	Description
0	MSS_NC_HALTACK	AXI bus Halt request acknowledge

0x01951008 TCSR_MSS_NC_MASTER_IDLE**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000001

AXI bus is idle

TCSR_MSS_NC_MASTER_IDLE

Bits	Name	Description
0	MSS_NC_MASTER_IDLE	AXI bus is idle

0x01953000 TCSR_SDC1_HALTREQ**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request

TCSR_SDC1_HALTREQ

Bits	Name	Description
0	SDC1_HALTREQ	AXI bus Halt request

0x01953004 TCSR_SDC1_HALTACK**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request acknowledge

TCSR_SDC1_HALTACK

Bits	Name	Description
0	SDC1_HALTACK	AXI bus Halt request acknowledge

0x01953008 TCSR_SDC1_MASTER_IDLE**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000001

AXI bus is idle

TCSR_SDC1_MASTER_IDLE

Bits	Name	Description
0	SDC1_MASTER_IDLE	AXI bus is idle

0x01954000 TCSR_SDC2_HALTREQ**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request

TCSR_SDC2_HALTREQ

Bits	Name	Description
0	SDC2_HALTREQ	AXI bus Halt request

0x01954004 TCSR_SDC2_HALTACK**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

AXI bus Halt request acknowledge

TCSR_SDC2_HALTACK

Bits	Name	Description
0	SDC2_HALTACK	AXI bus Halt request acknowledge

0x01954008 TCSR_SDC2_MASTER_IDLE**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000001

AXI bus is idle

TCSR_SDC2_MASTER_IDLE

Bits	Name	Description
0	SDC2_MASTER_IDLE	AXI bus is idle

0x01955000 TCSR_ULT_AUDIO_CORE_ABORT_REQ**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

ULT audio SSR abort request

TCSR_ULT_AUDIO_CORE_ABORT_REQ

Bits	Name	Description
0	ULT_AUDIO_CORE_ABORT_REQ	ULTaudio abort request for Sub System Reset

0x01955004 TCSR_ULT_AUDIO_CORE_ABORT_ACK**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

ULTaudio SSR abort request acknowledge

TCSR_ULT_AUDIO_CORE_ABORT_ACK

Bits	Name	Description
0	ULT_AUDIO_CORE_ABORT_ACK	ULTaudio abort request acknowledge for Sub System Reset

0x01957000 TCSR_PNOC_SNOC_MEMTYPE**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x0000000A

Mux for selecting pnoc to snoc amemtype, shared and innershared

TCSR_PNOC_SNOC_MEMTYPE

Bits	Name	Description
8	MEM_TYPE_SEL	- 0 = Amemtype value selected from PNOC. - 1 = Amemtype value selected from register phss_pnoc_snoc_memtype.
4	INNERSHARED_VALUE	Ainnershared value for MEM_TYPE_SEL = 1
3	SHARED_VALUE	Ashared value for MEM_TYPE_SEL = 1
2:0	MEM_TYPE_VALUE	Amemtype value for MEM_TYPE_SEL = 1

6 DMA Engine for Hardware Retention BIMC Wrapper

6.1 DEHR_BIMC

DEHR Configuration

6.1.1 DEHR_BIMC_DEHR

DEHR Configuration

0x004B2010 DEHR_BIMC_DEHR_CGC_CFG

Type: RW

Clock: dehr_cfg_clk

Reset State: 0x00000000

DEHR_BIMC_DEHR_CGC_CFG

Bits	Name	Description
0	SW_CGC_DISABLE	When set, it disables the low power feature (no gated clock).

0x004B2104 DEHR_BIMC_DEHR_MSA_CFG

Type: R

Clock: dehr_cfg_clk

Reset State: 0x00000000

This register provides the status of DEHR_ENA and DEHR_LOCK bits of DEHR_SEC_CFG register owned by MSA

DEHR_BIMC_DEHR_MSA_CFG

Bits	Name	Description
4	MSA_DEHR_ENA	When read, returns the DEHR_ENA bit value in DEHR_SEC_CFG register
0	MSA_DEHR_LOCK	When read, returns the DEHR_LOCK bit value in DEHR_SEC_CFG register

0x004B2140 DEHR_BIMC_DEHR_RAM_CFG**Type:** RW**Clock:** dehr_cfg_clk**Reset State:** 0x00000000**DEHR_BIMC_DEHR_RAM_CFG**

Bits	Name	Description
15:0	CFG_BASE_ADDR	Defines the RAM base address for configuration data.

0x004B2200 DEHR_BIMC_DEHR_DMA_STATUS**Type:** RW**Clock:** dehr_cfg_clk**Reset State:** 0x00000000**DEHR_BIMC_DEHR_DMA_STATUS**

Bits	Name	Type	Description
20	RESTORE_IN_PROGRESS	R	When set, it tells us it is in the middle of the Restore operation. It is automatically cleared when RESTORE_DONE bit is set.
16	RESTORE_DONE	RW	The Restore operation is done. It is automatically cleared when next Restore operation starts.
4	SAVE_IN_PROGRESS	R	When set, it tells us it is in the middle of Save operation. This bit is automatically cleared when SAVE_DONE bit is set.
0	SAVE_DONE	RW	The Save Operation is done. It is automatically cleared when next Save operation starts.

0x004B2404 DEHR_BIMC_DEHR_SW_DMA_CFG**Type:** RW**Clock:** dehr_cfg_clk**Reset State:** 0x00000000

The register can be used to manually start Save or Restore operation

DEHR_BIMC_DEHR_SW_DMA_CFG

Bits	Name	Description
8	SW_RESTORE_REQ	When DBG_ENA is set, set this bit to 1 will manually start the Restore operation.
0	SW_SAVE_REQ	When DBG_ENA is set, set this bit to 1 will manually start the Save operation.

0x004B3000 DEHR_BIMC_DEHR_SEC_CFG**Type:** RW**Clock:** dehr_cfg_clk**Reset State:** 0x00000000**DEHR_BIMC_DEHR_SEC_CFG**

Bits	Name	Description
4	DEHR_ENA	When set, DEHR gets the authentication, and is able to do save/restore operations. It cannot be set unless the DEHR_LOCK is also set. It can be cleared at any time
0	DEHR_LOCK	When set, it is not allowed to update the configuration of the DEHR

7 EBI1 Physical Layer Configuration

7.1 DIM_C00_DDRPHY_CA

0x00480000 DIM_C00_DIM_CA_TOP_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000031

The DIM_CA_TOP_CFG register configures the following:

DIM_CA_TOP_CFG

DIM_C00_DIM_CA_TOP_CFG

Bits	Name	Description
24	CA_LB_MODE_SEL	Selects external or internal loop back mode 1'b1: internal loop back mode 1'b0: external loop back mode (default)
23	CA_LB_MODE_EN	Enables external or internal loop back mode 1'b1: loop back mode enabled 1'b0: loop back mode disabled (default)
22	RESERVED	Reserved
21	MISR_DATA_CLK_SEL	selects b/w MISR data or SEED and Loopback clock or FF clock 1'b1: reserved 1'b0: seed from csr ff clk (default)
20	ILOCAL_CTLR_SEL	Select source of PCNT/NCNT/PNCNT_VALID 1'b1: external 1'b0: internal (default)
16	SDR_MODE_EN	1'b1: Enables SDR mode on address bus 1'b0: Enables DDR mode on address bus (default)
8	RESERVED	Reserved

DIM_C00_DIM_CA_TOP_CFG (cont.)

Bits	Name	Description
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1'b1) 1'b1: with pipe extend (default) 1'b0: without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1: with pipe extend (default) 1'b0: without pipe extend
0	WR_CLK_SEL	Write clock select 1'b1: With write CDC (default) 1'b0: Bypass write CDC, write clock from cdiv2 phi2 output

0x00480010 DIM_C00_DIM_CA_PAD_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_CA_PAD_CFG0 register configures the following:

DIM_CA_PAD_CFG0

DIM_C00_DIM_CA_PAD_CFG0

Bits	Name	Description
31	CA_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	CA_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	CA_LV_MODE	Mode pin for high/low voltage regime
28	CA_ODT_ENA	Enable bit for on-die termination
27:26	CA_ODT	Impedance control bit settings for on-die termination
25:24	CA_PULL	Input pull control 2'b00: no pull (default) 2'b01: pull down 2'b10: keeper 2'b11: pull up
21:20	CA_NSLEW	Slew rate control bits for output path NMOS
17:16	CA_PSLEW	Slew rate control bits for output path PMOS

DIM_C00_DIM_CA_PAD_CFG0 (cont.)

Bits	Name	Description
13:12	CA_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	CA_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	CA_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CA_ROUT	Impedance control bit settings for output driver
2:0	CA_DCC	Duty cycle correction bits for output path

0x00480014 DIM_C00_DIM_CA_PAD_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0xE0220440

The DIM_CA_PAD_CFG1 register configures the following:

DIM_CA_PAD_CFG1

DIM_C00_DIM_CA_PAD_CFG1

Bits	Name	Description
31	CK_DDR_MODE1	Mode select for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	CK_DDR_MODE0	Mode select for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	CK_LV_MODE	Mode select for high/low voltage regime
28	CK_CMFB_ENA	Common mode feedback loop enable
27	CK_ODT_ENA1	Enable bit for on-die termination (when hp_mode = 1'b1)
26	CK_ODT_ENA	Enable bit for on-die termination (when hp_mode = 1'b0)
25:24	CK_ODT	Impedance control bit settings for on-die termination
21:20	CK_NSLEW	Slew rate control bits for output path NMOS
17:16	CK_PSLEW	Slew rate control bits for output path PMOS
13	CK_CUR_MODE1	Current/Voltage mode selection (when hp_mode = 1'b1) 1'b1: Current mode 1'b0: Voltage mode (default)
12	CK_CUR_MODE0	Current/Voltage mode selection (when hp_mode = 1'b0) 1'b1: Current mode 1'b0: Voltage mode (default)

DIM_C00_DIM_CA_PAD_CFG1 (cont.)

Bits	Name	Description
10:8	CK_I_DRV	Control bit settings for bias current
7	CK_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	CK_ROUT	Impedance control bit settings for output driver
2:0	CK_DCC	Duty cycle correction bits for output path

0x00480018 DIM_C00_DIM_CA_PAD_CFG2**Type:** RW**Clock:** HCLK**Reset State:** 0x1000000A

The DIM_CA_PAD_CFG2 register configures the following:

DIM_CA_PAD_CFG2

DIM_C00_DIM_CA_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CNTL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x0048001C DIM_C00_DIM_CA_PAD_CFG3**Type:** RW**Clock:** HCLK**Reset State:** 0x30300000

The DIM_CA_PAD_CFG3 register configures the following:

DIM_CA_PAD_CFG3

DIM_C00_DIM_CA_PAD_CFG3

Bits	Name	Description
31:30	CS_N_IE	
29:28	CS_N_OE	
25	CK_IE	
24	CK_OE	
23:22	CKE_IE	
21:20	CKE_OE	
19:10	CA_IE	
9:0	CA_OE	

0x00480020 DIM_C00_DIM_CA_PAD_CFG4**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_PAD_CFG4 register configures the following:

DIM_CA_PAD_CFG4

DIM_C00_DIM_CA_PAD_CFG4

Bits	Name	Description
31:30	CS_N_OE_DYN_ENA	Enable dynamic control of CS_N OE 1'b1: Dynamic control enabled and CS_N_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CS_N OE gated by CA_PAD_CFG3 bits Note: This register should not be set in external loopback mode since it will change the IE control source.
29:28	CS_N_OE_DYN	Dynamic OE control for each of the CS_N outputs, OR-ed with common controller OE.
23:22	CKE_OE_DYN_ENA	Enable dynamic control of CKE OE 1'b1: Dynamic control enabled and CKE_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CKE OE gated by CA_PAD_CFG3 bits
21:20	CKE_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

DIM_C00_DIM_CA_PAD_CFG4 (cont.)

Bits	Name	Description
19:10	CA_OE_DYN_ENA	Enable dynamic control of CA OE 1'b1: Dynamic control enabled and CA_OE_DYN[n] bits are OR-ed with common OE from controller 1'b0: (default) Dynamic control disabled, CA OE gated by CA_PAD_CFG3 bits
9:0	CA_OE_DYN	Dynamic OE control for each of the CA outputs, OR-ed with common controller OE.

0x00480024 DIM_C00_DDRPHY_CA_MISR_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x872C56BD

The DDRPHY_CA_MISR_CFG register configures the following:

DDRPHY_CA_MISR_CFG

DIM_C00_DDRPHY_CA_MISR_CFG

Bits	Name	Description
31:0	SEED_VALUE	Loopback MISR seed

0x00480028 DIM_C00_DDRPHY_CA_MISR_EVEN_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_CA_MISR_EVEN_STATUS register configures the following:

DDRPHY_CA_MISR_EVEN_STATUS

DIM_C00_DDRPHY_CA_MISR_EVEN_STATUS

Bits	Name	Description
31:0	SIGNATURE	Even clock Loopback MISR signature

0x0048002C DIM_C00_DDRPHY_CA_MISR_ODD_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_CA_MISR_ODD_STATUS register configures the following:

DDRPHY_CA_MISR_ODD_STATUS

DIM_C00_DDRPHY_CA_MISR_ODD_STATUS

Bits	Name	Description
31:0	SIGNATURE	Odd Clock Loopback MISR signature

0x00480030 DIM_C00_DIM_CA_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x02000000

The DIM_CA_CDC_CTLR_CFG0 register configures the following:

DIM_CA_CDC_CTLR_CFG0

DIM_C00_DIM_CA_CDC_CTLR_CFG0

Bits	Name	Description
25	ERROR_CODE_UPDATE_EN	1'b1: Enable overwriting (default) the error code for subsequent calibrations. 1'b0: Disable overwriting the error code during subsequent calibrations
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled

DIM_C00_DIM_CA_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x00480034 DIM_C00_DIM_CA_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_CTLR_CFG1 register configures the following:

DIM_CA_CDC_CTLR_CFG1

DIM_C00_DIM_CA_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1

DIM_C00_DIM_CA_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x00480038 DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG0

DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0048003C DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_CA_CDC_CAL_TIMER_CFG1

DIM_C00_DIM_CA_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x00480040 DIM_C00_DIM_CA_CDC_REFCOUNT_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000000

The DIM_CA_CDC_REFCOUNT_CFG register configures the following:

DIM_CA_CDC_REFCOUNT_CFG

DIM_C00_DIM_CA_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x00480044 DIM_C00_DIM_CA_CDC_COARSE_CAL_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000000

The register DIM_CA_CDC_COARSE_CAL_CFG configures the following:

DIM_CA_CDC_COARSE_CAL_CFG

DIM_C00_DIM_CA_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x00480048 DIM_C00_DIM_CA_CDC_RSVD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_RSVD_CFG register configures the following:

DIM_CA_CDC_RSVD_CFG

DIM_C00_DIM_CA_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0048004C DIM_C00_DIM_CA_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_OFFSET_CFG register configures the following:

DIM_CA_CDC_OFFSET_CFG

DIM_C00_DIM_CA_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset

DIM_C00_DIM_CA_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x00480050 DIM_C00_DIM_CA_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_DELAY_CFG register configures the following:

DIM_CA_CDC_DELAY_CFG

DIM_C00_DIM_CA_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x00480054 DIM_C00_DIM_CA_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_SW_MODE_CFG register configures the following:

DIM_CA_CDC_SW_MODE_CFG

DIM_C00_DIM_CA_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0048005C DIM_C00_DIM_CA_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000**DIM_C00_DIM_CA_CDC_SW_OVRD_CFG**

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTEN R_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x00480070 DIM_C00_DIM_CA_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_CA_CDC_STATUS0 register configures the following:

DIM_CA_CDC_STATUS0

DIM_C00_DIM_CA_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x00480074 DIM_C00_DIM_CA_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_CDC_STATUS1 register configures the following:

DIM_CA_CDC_STATUS1

DIM_C00_DIM_CA_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x00480078 DIM_C00_DIM_CA_CDC_STATUS2

Type: R

Clock: HCLK

Reset State: 0x10331033

The DIM_CA_CDC_STATUS2 register configures the following:

DIM_CA_CDC_STATUS2

DIM_C00_DIM_CA_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x0048007C DIM_C00_DIM_CA_CDC_STATUS3

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_CA_CDC_STATUS3 register configures the following:

DIM_CA_CDC_STATUS3

DIM_C00_DIM_CA_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking

DIM_C00_DIM_CA_CDC_STATUS3 (cont.)

Bits	Name	Description
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x004800E0 DIM_C00_DIM_CA_IOC_CTLR_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the following:

DIM_CA_IOC_CTLR_CFG

DIM_C00_DIM_CA_IOC_CTLR_CFG

Bits	Name	Description
31	CAL_NOW	SW: RW Set this bit to 1'b1 will cause the IO calibration starts immediately. 0x0: NO_OP (no-op) 0x1: START_IOCAL_IMMEDIATELY (start IOCal immediately This bit has to be cleared after the calibration has been done.)
30	IO_CAL_AUTO	Periodic auto calibration mode. Writing a '1' to this bit will trigger periodic auto calibration with the period specified in IOC_CTLR_TIMER_CFG register. If '0', it disables the timer based on sleep clock. Note that this does not impact the timer based on fixed frequency clock (ffclk).
29	IO_CAL_FF_TIMER_EN	Fixed Frequency Timer mode. Writing a '1' to this bit will set the timer running off tcxo clock. If '0', it disables the timer based on fixed frequency clock.
28	IO_CAL_BANDGAP_DYN_CTRL	Enable dynamic control of the bandgap element: This low-power feature is only available on x2 core. Bit reserved for x0/x1 cores. 1'b1: Enabled - bandgap element turned on only during IO calibration or when current mode is enabled. 1'b0: Disabled (default) - bandgap element turned on/off statically based on BANDHGAP_ENA0/1 bits.
25	SW_FFCLK_ON	Writing a '1' to this field will turn on the fixed frequency (xo) clock on signal
24	LV_MODE	SW: RW Enable/Disable low-voltage mode (MIF2 pad only) 0x0: ENUM_1_8V (1.8V) 0x1: NON_1_8V (non-1.8V)

DIM_C00_DIM_CA_IOC_CTLR_CFG (cont.)

Bits	Name	Description
20:16	MARGIN_LOAD	SW: RW If the difference between the current IOCal result is greater than the last result by the number specified here, then the IOCal controller will request value update to DDR controller. 0x0: ALWAYS_UPDATE (always update)
13:12	IMP_SEL	SW: RW Select bits to choose which impedance to calibrate to
10	PN_SEL_CA	SW: RW Enables loading of HW calibrated values for ca pads. Writing a '1' to this bit would let the IOCAL to request traffic stall on ca pads when it is time to update the pads with the new value.
9	PN_SEL_DATA	SW: RW Enables loading of HW calibrated values for dq/dqs pads. Writing a '1' to this bit would let the IOCAL to request traffic stall on data pads when it is time to update the pads with the new value.
8	CAL_USE_LAST	SW: RW Select the initial value to start IO calibration 0x0: START_FROM_A_FIXED_VALUES_SPECIFIED_IN_IOC_CTLR_PNCNT_CFG (start from a fixed values specified in IOC_CTLR_PNCNT_CFG (default)) 0x1: START_FROM_PREVIOUS_IOCAL_PNCNT_RESULTS (start from previous IOCal PNCNT results)
6:4	SAMPLE_POINT	SW: RW Specify number of samples per measure point 0x0: ENUM_1 (1) 0x1: ENUM_3 (3) 0x2: ENUM_5 (5) 0x3: ENUM_7 (7) 0x4: ENUM_9 (9) 0x5: ENUM_11 (11) 0x6: ENUM_13 (13) 0x7: ENUM_15 (15)
3	DDR_MODE1	
2	DDR_MODE0	
1	BANDGAP_ENA1	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: DISABLE (disable) 0x1: ENABLE (enable)
0	BANDGAP_ENA0	SW: RW Pin to enable bandgap independent of diff_ctl 0x0: DISABLE (disable) 0x1: ENABLE (enable)

0x004800E4 DIM_C00_DIM_CA_IOC_CTLR_PNCNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_IOC_CTLR_CFG register configures the following:

This register contains the initial value for the next calibration to start from. Software can set the hardware to either start calibration from a fixed value or from previous results. If software chooses to use fixed value by setting CAN_USE_LAST in register IOC_CTLR_CFG to be 0, then the values in this register will be used.

DIM_CA_IOC_CTLR_CFG

DIM_C00_DIM_CA_IOC_CTLR_PNCNT_CFG

Bits	Name	Description
12:8	NCNT_INIT_CSR	SW: RW Starting PCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted
4:0	PCNT_INIT_CSR	SW: RW Starting NCNT value used in calibration. Only take effect when CAN_USE_LAST is asserted

0x004800E8 DIM_C00_DIM_CA_IOC_CTLR_TIMER_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_IOC_CTLR_TIMER_CFG register configures the following:

DIM_CA_IOC_CTLR_TIMER_CFG

DIM_C00_DIM_CA_IOC_CTLR_TIMER_CFG

Bits	Name	Description
31:16	TIMER_PERIOD	SW: RW Recalibration Period. The period is measured in timer clock cycles. Typically it's a 32kHz clock. The minimum period that can be programmed is 3. 0,1,2: Invalid values
15:0	FF_TIMER_PERIOD	SW: RW Recalibration Period for the timer running of xo clock. 0x0: INVALID (Invalid)

0x004800EC DIM_C00_DIM_CA_IOC_CTLR_TIMER_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_CA_IOC_CTLR_TIMER_STATUS register configures the following:

DIM_CA_IOC_CTLR_TIMER_STATUS

DIM_C00_DIM_CA_IOC_CTLR_TIMER_STATUS

Bits	Name	Description
15:0	TIMER_STATUS	Current Auto Calibration Timer value. As this register is written in sleep clock domain and read in xo clock domain and no hardware synchronization in place, It is required by the software to read this register 4 times to get the correct value.

0x004800F4 DIM_C00_DIM_CA_IOC_CTLR_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00011010

The DIM_CA_IOC_CTLR_STATUS register configures the following:

DIM_CA_IOC_CTLR_STATUS

DIM_C00_DIM_CA_IOC_CTLR_STATUS

Bits	Name	Description
31	INIT_ILOCAL_DONE	SW: R The very first IO Calibration is finished This bit is sticky. once it becomes 1'b1 until software writes it back to 0. 0x0: INIT_CAL_NEVER_DONE (Init-cal never done) 0x1: INIT_CAL_FINISHED (Init-cal finished)
18	ILOCAL_DONE_D	SW: R IO Calibration is finished 0x0: IN_PROGRESS (in progress) 0x1: FINISHED (finished)
17	ILOCAL_BUSY	SW: R Status of calibration State machine 0x0: IDLE (idle) 0x1: BUSY (busy)

DIM_C00_DIM_CA_IOC_CTLR_STATUS (cont.)

Bits	Name	Description
16	SYNC_COMP	SW: R comp value from IOCal pad
12:8	NCNT_HOLD	SW: R Current NCNT value used
4:0	PCNT_HOLD	SW: R Current PCNT value used

0x00480100 DIM_C00_DIM_CA_CA_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_CA_CA_IOC_SLV_CFG register configures the following:

This register specifies the overriding pcnt and ncnt values. Overriding mode is controlled by PNCNT_HW_LOAD_EN bit in this register.

DIM_CA_CA_IOC_SLV_CFG

DIM_C00_DIM_CA_CA_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: OVERRIDE (override (default)) 0x1: AUTO_CAL (auto cal)
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	controls if the NOFFSET is added for subtracted on top of calibration result 0x0: ADD (Add) 0x1: SUBTRACT (Subtract)
12:8	NCNT_SW_OFFSET	SW: RW The offset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: COUNT_0 (count 0(default))

DIM_C00_DIM_CA_CA_IOC_SLV_CFG (cont.)

Bits	Name	Description
7	PCNT_OFFSET_SIGN	controls if the POFFSET is added for subtracted on top of calibration result 0x0: ADD (Add) 0x1: SUBTRACT (Subtract)
4:0	PCNT_SW_OFFSET	SW: RW The offset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: COUNT_0 (count 0(default))

0x00480104 DIM_C00_DIM_CA_CA_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_CA_CA_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_C00_DIM_CA_CA_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

0x00480110 DIM_C00_DIM_CA_CK_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_CA_CK_IOC_SLV_CFG register configures the following:

DIM_CA_CK_IOC_SLV_CFG

DIM_C00_DIM_CA_CK_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	Select PCNT/NCNT Source for pads. This is the mux control that chooses either auto calibrated value or the software override value. 0x0: OVERRIDE (override (default)) 0x1: AUTO_CAL (auto cal)

DIM_C00_DIM_CA_CK_IOC_SLV_CFG (cont.)

Bits	Name	Description
28:24	NCNT_SW_VAL	SW: RW NCNT Override Value for the pads
20:16	PCNT_SW_VAL	SW: RW PCNT Override Value for the pads
15	NCNT_OFFSET_SIGN	controls if the NOFFSET is added for subtracted on top of calibration result 0x0: ADD (Add) 0x1: SUBTRACT (Subtract)
12:8	NCNT_SW_OFFSET	SW: RW The offset applied on top of NCNT value from calibration before it gets sent to IO pads 0x0: COUNT_0 (count 0(default))
7	PCNT_OFFSET_SIGN	controls if the POFFSET is added for subtracted on top of calibration result 0x0: ADD (Add) 0x1: SUBTRACT (Subtract)
4:0	PCNT_SW_OFFSET	SW: RW The offset applied on top of PCNT value from calibration before it gets sent to IO pads 0x0: COUNT_0 (count 0(default))

0x00480114 DIM_C00_DIM_CA_CK_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_CA_CK_IOC_SLV_STATUS register configures the following:

DIM_CA_CK_IOC_SLV_STATUS

DIM_C00_DIM_CA_CK_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	The final NCNT value that is applied to the pads.
4:0	PAD_PCNT	The final PCNT value that is applied to the pads.

7.2 DIM_D00_DDRPHY_DQ

0x00480800 DIM_D00_DIM_DQ_TOP_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D00_DIM_DQ_TOP_CFG

Bits	Name	Description
30	DQ_LB_MODE_SEL	Selects external or internal loop back mode 1'b1: internal loop back mode 1'b0: external loop back mode (default)
29	DQ_LB_MODE_EN	Enables external or internal loop back mode 1'b1: loop back mode enabled 1'b0: loop back mode disabled (default)
28	RESERVED	Reserved
27	MISR_DATA_CLK_SEL	selects b/w MISR data or SEED and Loopback clock or FF clock 1'b1: from dte 1'b0: seed from csr ff clk (default)
26	CDC_LDO_EN	Enablement of CDC LDO 1'b1: Enabled 1'b0: Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
24	CDC_SWITCH_BYPASS_OF F	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1'b1: Enable the RCW 1'b0: Disabled (default)
8	RESERVED	Reserved
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1'b1) 1'b1: with pipe extend (default) 1'b0: without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1: with pipe extend (default) 1'b0: without pipe extend

DIM_D00_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
0	WR_CLK_SEL	Write clock select 1'b1: With write CDC (default) 1'b0: Bypass write CDC, write clock from cdiv2 phi2 output

0x00480810 DIM_D00_DIM_DQ_PAD_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D00_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x00480814 DIM_D00_DIM_DQ_PAD_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D00_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00: no pull (default) 2'b01: pull down 2'b10: keeper 2'b11: pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x00480818 DIM_D00_DIM_DQ_PAD_CFG2**Type:** RW**Clock:** HCLK**Reset State:** 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D00_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CN TL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x0048081C DIM_D00_DIM_DQ_DQ_SMT_STATUS

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_DQ_SMT_STATUS register reflects the status of SMT signals from DQ pads intended for CA training:

DIM_DQ_DQ_SMT_STATUS

DIM_D00_DIM_DQ_DQ_SMT_STATUS

Bits	Name	Description
7:0	DIM_DQ_DQ_SMT_STATUS	Status of SMT pins from DQ pads

0x00480820 DIM_D00_DIM_DQ_PAD_CFG3

Type: RW

Clock: HCLK

Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D00_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1'b1: differential output (default) 1'b0: single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x00480824 DIM_D00_DIM_DQ_PAD_CFG4**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D00_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes

DIM_D00_DIM_DQ_PAD_CFG4 (cont.)

Bits	Name	Description
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x0048080C DIM_D00_DDRPHY_DQ_MISR_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x872C56BD

The DDRPHY_DQ_MISR_CFG register configures the following:

DDRPHY_DQ_MISR_CFG

DIM_D00_DDRPHY_DQ_MISR_CFG

Bits	Name	Description
31:0	SEED_VALUE	Loopback MISR seed

0x00480828 DIM_D00_DDRPHY_DQ_MISR_EVEN_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_EVEN_STATUS register configures the following:

DDRPHY_DQ_MISR_EVEN_STATUS

DIM_D00_DDRPHY_DQ_MISR_EVEN_STATUS

Bits	Name	Description
31:0	SIGNATURE	Even clock Loopback MISR signature

0x0048082C DIM_D00_DDRPHY_DQ_MISR_ODD_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_ODD_STATUS register configures the following:

DDRPHY_DQ_MISR_ODD_STATUS

DIM_D00_DDRPHY_DQ_MISR_ODD_STATUS

Bits	Name	Description
31:0	SIGNATURE	Odd Clock Loopback MISR signature

0x00480830 DIM_D00_DIM_DQ_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x02000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D00_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
26	ERROR_CODE_UPDATE_EN	1'b1: Enable overwriting (default) the error code for subsequent calibrations. 1'b0: Disable overwriting the error code during subsequent calibrations
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration

DIM_D00_DIM_DQ_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x00480834 DIM_D00_DIM_DQ_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D00_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used

DIM_D00_DIM_DQ_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x00480838 DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0048083C DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D00_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x00480840 DIM_D00_DIM_DQ_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D00_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x00480844 DIM_D00_DIM_DQ_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D00_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x00480848 DIM_D00_DIM_DQ_CDC_RSVD_CFG

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D00_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0048084C DIM_D00_DIM_DQ_RD_CDC_OFFSET_CFG

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D00_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset

DIM_D00_DIM_DQ_RD_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x00480850 DIM_D00_DIM_DQ_RD_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D00_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x00480854 DIM_D00_DIM_DQ_RD_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D00_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0048085C DIM_D00_DIM_DQ_RD_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D00_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.

DIM_D00_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x00480860 DIM_D00_DIM_DQ_RD_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D00_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x00480870 DIM_D00_DIM_DQ_RD_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D00_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x00480874 DIM_D00_DIM_DQ_RD_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D00_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x00480878 DIM_D00_DIM_DQ_RD_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D00_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x0048087C DIM_D00_DIM_DQ_RD_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D00_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D00_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00480880 DIM_D00_DIM_DQ_RD_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D00_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x004808AC DIM_D00_DIM_DQ_WR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D00_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count

DIM_D00_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x004808B0 DIM_D00_DIM_DQ_WR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D00_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x004808B4 DIM_D00_DIM_DQ_WR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D00_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D00_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x004808BC DIM_D00_DIM_DQ_WR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D00_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x004808D0 DIM_D00_DIM_DQ_WR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D00_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window during SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x004808D4 DIM_D00_DIM_DQ_WR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D00_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x004808D8 DIM_D00_DIM_DQ_WR_CDC_STATUS2

Type: R

Clock: HCLK

Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D00_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x004808DC DIM_D00_DIM_DQ_WR_CDC_STATUS3

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D00_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking

DIM_D00_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00480900 DIM_D00_DIM_DQ_DQ_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D00_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00480904 DIM_D00_DIM_DQ_DQ_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D00_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS

DIM_D00_DIM_DQ_DQ_IOC_SLV_STATUS (cont.)

Bits	Name	Description
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x00480910 DIM_D00_DIM_DQ_DQS_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D00_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00480914 DIM_D00_DIM_DQ_DQS_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D00_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

7.3 DIM_D01_DDRPHY_DQ

0x00481000 DIM_D01_DIM_DQ_TOP_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D01_DIM_DQ_TOP_CFG

Bits	Name	Description
30	DQ_LB_MODE_SEL	Selects external or internal loop back mode 1'b1: internal loop back mode 1'b0: external loop back mode (default)
29	DQ_LB_MODE_EN	Enables external or internal loop back mode 1'b1: loop back mode enabled 1'b0: loop back mode disabled (default)
28	RESERVED	Reserved
27	MISR_DATA_CLK_SEL	selects b/w MISR data or SEED and Loopback clock or FF clock 1'b1: from dte 1'b0: seed from csr ff clk (default)
26	CDC_LDO_EN	Enablement of CDC LDO 1'b1: Enabled 1'b0: Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1'b1: Enable the RCW 1'b0: Disabled (default)
8	RESERVED	Reserved
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1'b1) 1'b1: with pipe extend (default) 1'b0: without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1: with pipe extend (default) 1'b0: without pipe extend

DIM_D01_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
0	WR_CLK_SEL	Write clock select 1'b1: With write CDC (default) 1'b0: Bypass write CDC, write clock from cdiv2 phi2 output

0x00481010 DIM_D01_DIM_DQ_PAD_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D01_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x00481014 DIM_D01_DIM_DQ_PAD_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D01_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00: no pull (default) 2'b01: pull down 2'b10: keeper 2'b11: pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x00481018 DIM_D01_DIM_DQ_PAD_CFG2**Type:** RW**Clock:** HCLK**Reset State:** 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D01_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CN TL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x0048101C DIM_D01_DIM_DQ_DQ_SMT_STATUS

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_DQ_SMT_STATUS register reflects the status of SMT signals from DQ pads intended for CA training:

DIM_DQ_DQ_SMT_STATUS

DIM_D01_DIM_DQ_DQ_SMT_STATUS

Bits	Name	Description
7:0	DIM_DQ_DQ_SMT_STATUS	Status of SMT pins from DQ pads

0x00481020 DIM_D01_DIM_DQ_PAD_CFG3

Type: RW

Clock: HCLK

Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D01_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1'b1: differential output (default) 1'b0: single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x00481024 DIM_D01_DIM_DQ_PAD_CFG4**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D01_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes

DIM_D01_DIM_DQ_PAD_CFG4 (cont.)

Bits	Name	Description
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x0048100C DIM_D01_DDRPHY_DQ_MISR_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x872C56BD

The DDRPHY_DQ_MISR_CFG register configures the following:

DDRPHY_DQ_MISR_CFG

DIM_D01_DDRPHY_DQ_MISR_CFG

Bits	Name	Description
31:0	SEED_VALUE	Loopback MISR seed

0x00481028 DIM_D01_DDRPHY_DQ_MISR_EVEN_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_EVEN_STATUS register configures the following:

DDRPHY_DQ_MISR_EVEN_STATUS

DIM_D01_DDRPHY_DQ_MISR_EVEN_STATUS

Bits	Name	Description
31:0	SIGNATURE	Even clock Loopback MISR signature

0x0048102C DIM_D01_DDRPHY_DQ_MISR_ODD_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_ODD_STATUS register configures the following:

DDRPHY_DQ_MISR_ODD_STATUS

DIM_D01_DDRPHY_DQ_MISR_ODD_STATUS

Bits	Name	Description
31:0	SIGNATURE	Odd Clock Loopback MISR signature

0x00481030 DIM_D01_DIM_DQ_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x02000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D01_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
26	ERROR_CODE_UPDATE_EN	1'b1: Enable overwriting (default) the error code for subsequent calibrations. 1'b0: Disable overwriting the error code during subsequent calibrations
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration

DIM_D01_DIM_DQ_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x00481034 DIM_D01_DIM_DQ_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D01_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used

DIM_D01_DIM_DQ_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x00481038 DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0048103C DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D01_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x00481040 DIM_D01_DIM_DQ_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D01_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x00481044 DIM_D01_DIM_DQ_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D01_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x00481048 DIM_D01_DIM_DQ_CDC_RSVD_CFG

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D01_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0048104C DIM_D01_DIM_DQ_RD_CDC_OFFSET_CFG

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D01_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset

DIM_D01_DIM_DQ_RD_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x00481050 DIM_D01_DIM_DQ_RD_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D01_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x00481054 DIM_D01_DIM_DQ_RD_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D01_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0048105C DIM_D01_DIM_DQ_RD_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D01_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTEN R_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.

DIM_D01_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x00481060 DIM_D01_DIM_DQ_RD_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D01_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x00481070 DIM_D01_DIM_DQ_RD_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D01_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x00481074 DIM_D01_DIM_DQ_RD_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D01_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x00481078 DIM_D01_DIM_DQ_RD_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D01_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x0048107C DIM_D01_DIM_DQ_RD_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D01_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D01_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00481080 DIM_D01_DIM_DQ_RD_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D01_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x004810AC DIM_D01_DIM_DQ_WR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D01_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count

DIM_D01_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x004810B0 DIM_D01_DIM_DQ_WR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D01_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x004810B4 DIM_D01_DIM_DQ_WR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D01_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D01_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x004810BC DIM_D01_DIM_DQ_WR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D01_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x004810D0 DIM_D01_DIM_DQ_WR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D01_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x004810D4 DIM_D01_DIM_DQ_WR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D01_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x004810D8 DIM_D01_DIM_DQ_WR_CDC_STATUS2

Type: R

Clock: HCLK

Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D01_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x004810DC DIM_D01_DIM_DQ_WR_CDC_STATUS3

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D01_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking

DIM_D01_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00481100 DIM_D01_DIM_DQ_DQ_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D01_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00481104 DIM_D01_DIM_DQ_DQ_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D01_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS

DIM_D01_DIM_DQ_DQ_IOC_SLV_STATUS (cont.)

Bits	Name	Description
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x00481110 DIM_D01_DIM_DQ_DQS_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D01_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00481114 DIM_D01_DIM_DQ_DQS_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D01_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

7.4 DIM_D02_DDRPHY_DQ

0x00481800 DIM_D02_DIM_DQ_TOP_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D02_DIM_DQ_TOP_CFG

Bits	Name	Description
30	DQ_LB_MODE_SEL	Selects external or internal loop back mode 1'b1: internal loop back mode 1'b0: external loop back mode (default)
29	DQ_LB_MODE_EN	Enables external or internal loop back mode 1'b1: loop back mode enabled 1'b0: loop back mode disabled (default)
28	RESERVED	Reserved
27	MISR_DATA_CLK_SEL	selects b/w MISR data or SEED and Loopback clock or FF clock 1'b1: from dte 1'b0: seed from csr ff clk (default)
26	CDC_LDO_EN	Enablement of CDC LDO 1'b1: Enabled 1'b0: Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1'b1: Enable the RCW 1'b0: Disabled (default)
8	RESERVED	Reserved
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1'b1) 1'b1: with pipe extend (default) 1'b0: without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1: with pipe extend (default) 1'b0: without pipe extend

DIM_D02_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
0	WR_CLK_SEL	Write clock select 1'b1: With write CDC (default) 1'b0: Bypass write CDC, write clock from cdiv2 phi2 output

0x00481810 DIM_D02_DIM_DQ_PAD_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D02_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x00481814 DIM_D02_DIM_DQ_PAD_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D02_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00: no pull (default) 2'b01: pull down 2'b10: keeper 2'b11: pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x00481818 DIM_D02_DIM_DQ_PAD_CFG2**Type:** RW**Clock:** HCLK**Reset State:** 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D02_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CN TL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x0048181C DIM_D02_DIM_DQ_DQ_SMT_STATUS

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_DQ_SMT_STATUS register reflects the status of SMT signals from DQ pads intended for CA training:

DIM_DQ_DQ_SMT_STATUS

DIM_D02_DIM_DQ_DQ_SMT_STATUS

Bits	Name	Description
7:0	DIM_DQ_DQ_SMT_STATUS	Status of SMT pins from DQ pads

0x00481820 DIM_D02_DIM_DQ_PAD_CFG3

Type: RW

Clock: HCLK

Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D02_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1'b1: differential output (default) 1'b0: single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x00481824 DIM_D02_DIM_DQ_PAD_CFG4**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D02_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes

DIM_D02_DIM_DQ_PAD_CFG4 (cont.)

Bits	Name	Description
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x0048180C DIM_D02_DDRPHY_DQ_MISR_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x872C56BD

The DDRPHY_DQ_MISR_CFG register configures the following:

DDRPHY_DQ_MISR_CFG

DIM_D02_DDRPHY_DQ_MISR_CFG

Bits	Name	Description
31:0	SEED_VALUE	Loopback MISR seed

0x00481828 DIM_D02_DDRPHY_DQ_MISR_EVEN_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_EVEN_STATUS register configures the following:

DDRPHY_DQ_MISR_EVEN_STATUS

DIM_D02_DDRPHY_DQ_MISR_EVEN_STATUS

Bits	Name	Description
31:0	SIGNATURE	Even clock Loopback MISR signature

0x0048182C DIM_D02_DDRPHY_DQ_MISR_ODD_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_ODD_STATUS register configures the following:

DDRPHY_DQ_MISR_ODD_STATUS

DIM_D02_DDRPHY_DQ_MISR_ODD_STATUS

Bits	Name	Description
31:0	SIGNATURE	Odd Clock Loopback MISR signature

0x00481830 DIM_D02_DIM_DQ_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x02000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D02_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
26	ERROR_CODE_UPDATE_EN	1'b1: Enable overwriting (default) the error code for subsequent calibrations. 1'b0: Disable overwriting the error code during subsequent calibrations
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration

DIM_D02_DIM_DQ_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x00481834 DIM_D02_DIM_DQ_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D02_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used

DIM_D02_DIM_DQ_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x00481838 DIM_D02_DIM_DQ_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D02_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0048183C DIM_DQ_DIM_DQ_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_DQ_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x00481840 DIM_DQ_DIM_DQ_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_DQ_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x00481844 DIM_DQ_DIM_DQ_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D02_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x00481848 DIM_D02_DIM_DQ_CDC_RSVD_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D02_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0048184C DIM_D02_DIM_DQ_RD_CDC_OFFSET_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D02_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset

DIM_D02_DIM_DQ_RD_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x00481850 DIM_D02_DIM_DQ_RD_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D02_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x00481854 DIM_D02_DIM_DQ_RD_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D02_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0048185C DIM_D02_DIM_DQ_RD_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D02_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.

DIM_D02_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x00481860 DIM_D02_DIM_DQ_RD_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D02_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x00481870 DIM_D02_DIM_DQ_RD_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D02_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x00481874 DIM_D02_DIM_DQ_RD_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D02_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x00481878 DIM_D02_DIM_DQ_RD_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D02_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x0048187C DIM_D02_DIM_DQ_RD_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D02_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D02_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00481880 DIM_D02_DIM_DQ_RD_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D02_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x004818AC DIM_D02_DIM_DQ_WR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D02_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count

DIM_D02_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x004818B0 DIM_D02_DIM_DQ_WR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D02_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x004818B4 DIM_D02_DIM_DQ_WR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D02_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D02_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x004818BC DIM_D02_DIM_DQ_WR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D02_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x004818D0 DIM_D02_DIM_DQ_WR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D02_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x004818D4 DIM_D02_DIM_DQ_WR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D02_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x004818D8 DIM_D02_DIM_DQ_WR_CDC_STATUS2

Type: R

Clock: HCLK

Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D02_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x004818DC DIM_D02_DIM_DQ_WR_CDC_STATUS3

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D02_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking

DIM_D02_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00481900 DIM_D02_DIM_DQ_DQ_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D02_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00481904 DIM_D02_DIM_DQ_DQ_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D02_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS

DIM_D02_DIM_DQ_DQ_IOC_SLV_STATUS (cont.)

Bits	Name	Description
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x00481910 DIM_D02_DIM_DQ_DQS_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D02_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00481914 DIM_D02_DIM_DQ_DQS_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D02_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

7.5 DIM_D03_DDRPHY_DQ

0x00482000 DIM_D03_DIM_DQ_TOP_CFG

Type: RW

Clock: HCLK

Reset State: 0x00000031

The DIM_DQ_TOP_CFG register configures the following:

DIM_DQ_TOP_CFG

DIM_D03_DIM_DQ_TOP_CFG

Bits	Name	Description
30	DQ_LB_MODE_SEL	Selects external or internal loop back mode 1'b1: internal loop back mode 1'b0: external loop back mode (default)
29	DQ_LB_MODE_EN	Enables external or internal loop back mode 1'b1: loop back mode enabled 1'b0: loop back mode disabled (default)
28	RESERVED	Reserved
27	MISR_DATA_CLK_SEL	selects b/w MISR data or SEED and Loopback clock or FF clock 1'b1: reserved 1'b0: seed from csr ff clk (default)
26	CDC_LDO_EN	Enablement of CDC LDO 1'b1: Enabled 1'b0: Disabled LDO and power provided from switches (default)
25	CDC_SWITCH_RC_EN	Enablement of CDC power RC (LPF) switch 1'b1: Enabled 1'b0: Disabled (default)
24	CDC_SWITCH_BYPASS_OFF	Enablement of CDC power bypass switch 1'b1: Disabled 1'b0: Enabled (default)
16	RCW_EN	Enablement of the Read Capture Window 1'b1: Enable the RCW 1'b0: Disabled (default)
8	RESERVED	Reserved
5	WR_PIPE_EXTEND1	Write pipe extend select (when hp_mode = 1'b1) 1'b1: with pipe extend (default) 1'b0: without pipe extend
4	WR_PIPE_EXTEND0	Write pipe extend select (when hp_mode = 1'b0) 1'b1: with pipe extend (default) 1'b0: without pipe extend

DIM_D03_DIM_DQ_TOP_CFG (cont.)

Bits	Name	Description
0	WR_CLK_SEL	Write clock select 1'b1: With write CDC (default) 1'b0: Bypass write CDC, write clock from cdiv2 phi2 output

0x00482010 DIM_D03_DIM_DQ_PAD_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG0 register configures the following:

DIM_DQ_PAD_CFG0

DIM_D03_DIM_DQ_PAD_CFG0

Bits	Name	Description
31	DQ_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQ_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQ_LV_MODE	Mode select for high/low voltage regime
28	DQ_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQ_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQ_PULL_B	Input pull control
21:20	DQ_NSLEW	Slew rate control bits for output path NMOS
17:16	DQ_PSLEW	Slew rate control bits for output path PMOS
13:12	DQ_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQ_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	DQ_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQ_ROUT	Impedance control bit settings for output driver
2:0	DQ_DCC	Duty cycle correction bits for output path

0x00482014 DIM_D03_DIM_DQ_PAD_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG1 register configures the following:

DIM_DQ_PAD_CFG1

DIM_D03_DIM_DQ_PAD_CFG1

Bits	Name	Description
31	DQS_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	DQS_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
29	DQS_LV_MODE	Mode select for high/low voltage regime
28	DQS_ODT_ENA	Unused - ODT controlled by PAD_CFG3
27:26	DQS_ODT	Unused - ODT controlled by PAD_CFG3
25:24	DQS_PULL	Input pull control 2'b00: no pull (default) 2'b01: pull down 2'b10: keeper 2'b11: pull up
21:20	DQS_NSLEW	Slew rate control bits for output path NMOS
17:16	DQS_PSLEW	Slew rate control bits for output path PMOS
13:12	DQS_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	DQS_PRXDEL	Delay control bits to increase strength of PMOS input drive
7	DQS_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	DQS_ROUT	Impedance control bit settings for output driver
2:0	DQS_DCC	Duty cycle correction bits for output path

0x00482018 DIM_D03_DIM_DQ_PAD_CFG2**Type:** RW**Clock:** HCLK**Reset State:** 0x1000000A

The DIM_DQ_PAD_CFG2 register configures the following:

DIM_DQ_PAD_CFG2

DIM_D03_DIM_DQ_PAD_CFG2

Bits	Name	Description
29	VREF_LDO_ENA	Enable VREF pad LDO Must be 0 for x2 core as there is no internal LDO
28	VREF_PASSGATE_ENA	Enable pass gate from padsig to vref_int pin (default 1)
27:24	VREF_SP_OUT	Unused
21:18	VREF_SP_IN	Unused
17	VREF_BYPASS_ENA	Enable bypass gate from resistive divider to vref_int pin
16	VREF_RDIV_ENA	Enable resistive divider for VREF voltage control
13:8	VREF_PULLDN_SPEED_CN TL	Unused
5:0	VREF_LEVEL_CNTL	Control over the VREF voltage level through resistive divider

0x0048201C DIM_D03_DIM_DQ_DQ_SMT_STATUS

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_DQ_SMT_STATUS register reflects the status of SMT signals from DQ pads intended for CA training:

DIM_DQ_DQ_SMT_STATUS

DIM_D03_DIM_DQ_DQ_SMT_STATUS

Bits	Name	Description
7:0	DIM_DQ_DQ_SMT_STATUS	Status of SMT pins from DQ pads

0x00482020 DIM_D03_DIM_DQ_PAD_CFG3

Type: RW

Clock: HCLK

Reset State: 0x1000FF11

The DIM_DQ_PAD_CFG3 register configures the following:

DIM_DQ_PAD_CFG3

DIM_D03_DIM_DQ_PAD_CFG3

Bits	Name	Description
28	DQS_DIFF_MODE	DQS output mode control 1'b1: differential output (default) 1'b0: single-ended output; _n output is HIZ
27	RCW_ODT_ENA1	Enable ODT for RCW pad (when hp_mode=1)
26	RCW_ODT_ENA0	Enable ODT for RCW pad (when hp_mode=0)
25:24	RCW_ODT	Impedance control for on-die termination on RCW pad
23	DQ_ODT_ENA1	Enable ODT for DQ pads (when hp_mode=1)
22	DQ_ODT_ENA0	Enable ODT for DQ pads (when hp_mode=0)
21:20	DQ_ODT	Impedance control for on-die termination on DQ pads
19	DQS_ODT_ENA1	Enable ODT for DQS pad (when hp_mode=1)
18	DQS_ODT_ENA0	Enable ODT for DQS pad (when hp_mode=0)
17:16	DQS_ODT	Impedance control for on-die termination on DQS pad
15:8	DQ_IE_OE	Enable both input receiver and output driver for all DQ pads
5	RCW_IE_OE	Enable both input receiver and output driver for RCW pad
4	DQS_IE_OE	Enable both input receiver and output driver for DQS pad
1	DM_IE	Input received enable for DM pad
0	DM_OE	Output driver enable for DM pad

0x00482024 DIM_D03_DIM_DQ_PAD_CFG4**Type:** RW**Clock:** HCLK**Reset State:** 0xE0222240

The DIM_DQ_PAD_CFG4 register configures the following:

DIM_DQ_PAD_CFG4

DIM_D03_DIM_DQ_PAD_CFG4

Bits	Name	Description
31	RCW_DDR_MODE1	Mode pin for DDR (when hp_mode = 1'b1) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes
30	RCW_DDR_MODE0	Mode pin for DDR (when hp_mode = 1'b0) 1'b1: DDR2 modes (default) 1'b0: DDR1 modes

DIM_D03_DIM_DQ_PAD_CFG4 (cont.)

Bits	Name	Description
29	RCW_LV_MODE	Mode select for high/low voltage regime
25:24	RCW_PULL_B	Input pull control
21:20	RCW_NSLEW	Slew rate control bits for output path NMOS
17:16	RCW_PSLEW	Slew rate control bits for output path PMOS
13:12	RCW_NRXDEL	Delay control bits to increase strength of NMOS input drive
9:8	RCW_PRXDEL	Delay control bits to increase strength of PMOS input driver
7	RCW_VM_SHIFT_ENA	VM (voltage at output of on-die termination) shift enable bit
6:4	RCW_ROUT	Impedance control bit settings for output driver
2:0	RCW_DCC	Duty cycle correction bits for output path

0x0048200C DIM_D03_DDRPHY_DQ_MISR_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x872C56BD

The DDRPHY_DQ_MISR_CFG register configures the following:

DDRPHY_DQ_MISR_CFG

DIM_D03_DDRPHY_DQ_MISR_CFG

Bits	Name	Description
31:0	SEED_VALUE	Loopback MISR seed

0x00482028 DIM_D03_DDRPHY_DQ_MISR_EVEN_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_EVEN_STATUS register configures the following:

DDRPHY_DQ_MISR_EVEN_STATUS

DIM_D03_DDRPHY_DQ_MISR_EVEN_STATUS

Bits	Name	Description
31:0	SIGNATURE	Even clock Loopback MISR signature

0x0048202C DIM_D03_DDRPHY_DQ_MISR_ODD_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DDRPHY_DQ_MISR_ODD_STATUS register configures the following:

DDRPHY_DQ_MISR_ODD_STATUS

DIM_D03_DDRPHY_DQ_MISR_ODD_STATUS

Bits	Name	Description
31:0	SIGNATURE	Odd Clock Loopback MISR signature

0x00482030 DIM_D03_DIM_DQ_CDC_CTLR_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x02000000

The DIM_DQ_CDC_CTLR_CFG0 register configures the following:

DIM_DQ_CDC_CTLR_CFG0

DIM_D03_DIM_DQ_CDC_CTLR_CFG0

Bits	Name	Description
26	ERROR_CODE_UPDATE_EN	1'b1: Enable overwriting (default) the error code for subsequent calibrations. 1'b0: Disable overwriting the error code during subsequent calibrations
25	STAGGER_CAL_ENA	1'b1: Stagger calibration of write and read CDCs once after the other to reduce peak voltage drop. 1'b0: Both write and read CDCs calibrated simultaneously This bit is introduced on the x2 core, so not present on x0 and x1 versions of DIM/PHY.
24	TRACKING_CAL_ENA	1'b1: Relationship between subunits and oscillator count is learnt and used for tracking calibration. 1'b0: Periodic calibration triggers cause full recalibration
23:20	OSC_COUNT_ERR_TOLERANCE	Magnitude of the difference between oscillator count and target count when the algorithm assumes convergence and stops further search.
19	TRACK_CALIB_MODE	1'b0: Tracking calibration uses previous Target_count value. 1'b1 Accurate mode: Target_count is recomputed at the start of tracking calibration

DIM_D03_DIM_DQ_CDC_CTLR_CFG0 (cont.)

Bits	Name	Description
18	FULL_DELAY	1'b0: unitstep and subunit caps are from calibration or SW settings 1'b1: All unit step and subunit caps are selected for the delay arrays.
17	HW_AUTOCAL_ENA	1'b1: Enables periodic auto calibration 1'b0: Periodic calibration is disabled
16	SW_TRIG_FULL_CALIB	A low to high transition on this register bit triggers the CDC calibration statemachine to initiate full calibration of the standby delay array. Also resets tracking mode for the delay arrays.
13:12	OSC_PRE_DIV	The factor by which the raw oscillator frequency is divided before being given to the counting logic. 2'b00 Divide by 1 2'b01 Divide by 2 2'b10 Divide by 4 2'b11 Divide by 8
10:0	TMUX_CHAR	Cchar is a characterized constant equal to the ratio of output mux offset delay to average unit step delay. This register is programmed by multiplying the constant with 1024 and rounding to the nearest integer. E.g. if Cchar = 0.67, $RO(0.67 * 1024) = 686$, hence program TMUX_CHAR = 11'h2AE

0x00482034 DIM_D03_DIM_DQ_CDC_CTLR_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CTLR_CFG1 register configures the following:

DIM_DQ_CDC_CTLR_CFG1

DIM_D03_DIM_DQ_CDC_CTLR_CFG1

Bits	Name	Description
26:24	OSC_COUNT_DELAY	Number of oscillator cycles from the end of reference gate signal to assertion of oscillation counter done. Legal values are from 0 to 4.
23:20	STANDBY_DELAY	This is the number of reference clock cycles from when a newly calibrated delay array is made active to when the current active delay array is put into standby mode. 4'b0: Disables the counter. Hardware waits for explicit acknowledgement of delay array switch from CDC. Others: Explicit acknowledgement mode is disabled and the counter is used

DIM_D03_DIM_DQ_CDC_CTLR_CFG1 (cont.)

Bits	Name	Description
18:16	DEL_MODE_DELAY	Number of reference clock cycles between putting a newly calibrated delay array in delay mode to selecting it as the active delay array. The minimum allowed value is 1
14:12	OSC_MODE_DELAY	Number of reference clock cycles between putting a delay array in oscillator mode to starting the oscillation counter. This delay is allowed for the oscillations to stabilize through the delay array. The minimum allowed value is 1
10:8	DECODER_DELAY	Number of reference clock cycles allowed for unitstep and subunit counts to be encoded into the unit and finecap select lines on the DDA. The minimum allowed value is 1.
6:4	DIVIDER_DELAY	Number of reference clock cycles allowed for arithmetic division operations. The minimum allowed value is 1
2:0	MULTIPLIER_DELAY	Number of reference clock cycles allowed for arithmetic multiplication operations. The minimum allowed value is 1

0x00482038 DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG0**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG0 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG0

DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG0

Bits	Name	Description
24	INVALID_TIMER_ENA	1'b1: Enable the timer counting number of missed calibration intervals after which the CDC is invalid. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
23:20	INVALID_TIMER_VAL	Number of missed calibration intervals after which CDC invalid state is asserted.
16	TIMER_ENA	1'b1: Enables 32 kHz sleep clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
15:0	TIMER_VAL	Count value for periodic autocalibration interval based on sleep clock.

0x0048203C DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG1**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_CAL_TIMER_CFG1 register configures the following:

DIM_DQ_CDC_CAL_TIMER_CFG1

DIM_D03_DIM_DQ_CDC_CAL_TIMER_CFG1

Bits	Name	Description
12	FF_TIMER_ENA	1'b1: Enables reference clock based periodic autocalibration timer. 1'b0: Timer disabled A low to high transition on this register bit loads the timer with programmed value below.
9:0	FF_TIMER_VAL	Count value for periodic autocalibration interval based on reference clock.

0x00482040 DIM_D03_DIM_DQ_CDC_REFCOUNT_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_REFCOUNT_CFG register configures the following:

DIM_DQ_CDC_REFCOUNT_CFG

DIM_D03_DIM_DQ_CDC_REFCOUNT_CFG

Bits	Name	Description
31:16	TREF	Reference clock period programmed in pico seconds.
13:8	CCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during coarse calibration. Maximum supported value is 59.
5:0	FCAL_REF_COUNT	Number of reference clock cycles used for oscillation counts during fine calibration. Maximum supported value is 59

0x00482044 DIM_D03_DIM_DQ_CDC_COARSE_CAL_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The register DIM_DQ_CDC_COARSE_CAL_CFG configures the following:

DIM_DQ_CDC_COARSE_CAL_CFG

DIM_D03_DIM_DQ_CDC_COARSE_CAL_CFG

Bits	Name	Description
12:8	CCAL_SUBUNIT_CAPS	Subunit count needed for an effective unit step count of 32 during coarse calibration. This value is also used by software oscillator mode.
5:0	CCAL_UNITSTEPS	unitstep count needed for an effective unit step count of 32 during coarse calibration.

0x00482048 DIM_D03_DIM_DQ_CDC_RSVD_CFG

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_CDC_RSVD_CFG register configures the following:

DIM_DQ_CDC_RSVD_CFG

DIM_D03_DIM_DQ_CDC_RSVD_CFG

Bits	Name	Description
15:0	TEMP_FIELD	Reserved register

0x0048204C DIM_D03_DIM_DQ_RD_CDC_OFFSET_CFG

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_OFFSET_CFG register configures the following:

DIM_DQ_RD_CDC_OFFSET_CFG

DIM_D03_DIM_DQ_RD_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset

DIM_D03_DIM_DQ_RD_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x00482050 DIM_D03_DIM_DQ_RD_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_DELAY_CFG register configures the following:

DIM_DQ_RD_CDC_DELAY_CFG

DIM_D03_DIM_DQ_RD_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x00482054 DIM_D03_DIM_DQ_RD_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_RD_CDC_SW_MODE_CFG

DIM_D03_DIM_DQ_RD_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x0048205C DIM_D03_DIM_DQ_RD_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_RD_CDC_SW_OVRD_CFG

DIM_D03_DIM_DQ_RD_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTEN R_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.

DIM_D03_DIM_DQ_RD_CDC_SW_OVRD_CFG (cont.)

Bits	Name	Description
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x00482060 DIM_D03_DIM_DQ_RD_CDC_SLAVE_DDA_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_SLAVE_DDA_CFG register configures the following:

DIM_DQ_RD_CDC_SLAVE_DDA_CFG

DIM_D03_DIM_DQ_RD_CDC_SLAVE_DDA_CFG

Bits	Name	Description
17	SLAV_DDA_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit-step count 1'b0: Programmed offset is added/subtracted from the unit-step count
16	SLAV_DDA_OFFSET_SIGN	1'b1: Offset is subtracted from the unit-step count. This subtraction feature is not supported on x0 and x1 PHY cores (bit RESERVED). Supported on the x2 core version. 1'b0: Offset is added to the unit-step count
15:12	SLAVE_DDA_OFFSET	unit-step offset for slave DDA.
10:0	SLAVE_DDA_DELAY	Delay required from slave DDA programmed in pico seconds.

0x00482070 DIM_D03_DIM_DQ_RD_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_RD_CDC_STATUS0 register configures the following:

DIM_DQ_RD_CDC_STATUS0

DIM_D03_DIM_DQ_RD_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x00482074 DIM_D03_DIM_DQ_RD_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS1 register configures the following:

DIM_DQ_RD_CDC_STATUS1

DIM_D03_DIM_DQ_RD_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x00482078 DIM_D03_DIM_DQ_RD_CDC_STATUS2**Type:** R**Clock:** HCLK**Reset State:** 0x10331033

The DIM_DQ_RD_CDC_STATUS2 register configures the following:

DIM_DQ_RD_CDC_STATUS2

DIM_D03_DIM_DQ_RD_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x0048207C DIM_D03_DIM_DQ_RD_CDC_STATUS3**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_RD_CDC_STATUS3 register configures the following:

DIM_DQ_RD_CDC_STATUS3

DIM_D03_DIM_DQ_RD_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration

DIM_D03_DIM_DQ_RD_CDC_STATUS3 (cont.)

Bits	Name	Description
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00482080 DIM_D03_DIM_DQ_RD_CDC_STATUS4**Type:** R**Clock:** HCLK**Reset State:** 0x000000FF

The DIM_DQ_RD_CDC_STATUS4 register configures the following:

DIM_DQ_RD_CDC_STATUS4

DIM_D03_DIM_DQ_RD_CDC_STATUS4

Bits	Name	Description
7:4	SLAVE_DDA_DA1_TAPS	Number if unit taps applied to delay array 1 of slave DDA
3:0	SLAVE_DDA_DA0_TAPS	Number if unit taps applied to delay array 0 of slave DDA

0x004820AC DIM_D03_DIM_DQ_WR_CDC_OFFSET_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_OFFSET_CFG register configures the following:

DIM_DQ_WR_CDC_OFFSET_CFG

DIM_D03_DIM_DQ_WR_CDC_OFFSET_CFG

Bits	Name	Description
20	SUBUNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as subunit count 1'b0: Programmed offset is added/subtracted from the subunit count
19	SUBUNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the subunit count 1'b0: Offset is added to the subunit count
16:12	SUBUNIT_OFFSET	Software subunit offset
8	UNIT_OFFSET_MODE	1'b1: The programmed offset is directly loaded as unit step count 1'b0: Programmed offset is added/subtracted from the unit step count

DIM_D03_DIM_DQ_WR_CDC_OFFSET_CFG (cont.)

Bits	Name	Description
7	UNIT_OFFSET_SIGN	1'b1: Offset is subtracted from the unitstep count 1'b0: Offset is added to the unitstep count
5:0	UNIT_OFFSET	Software unitstep offset

0x004820B0 DIM_D03_DIM_DQ_WR_CDC_DELAY_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_DELAY_CFG register configures the following:

DIM_DQ_WR_CDC_DELAY_CFG

DIM_D03_DIM_DQ_WR_CDC_DELAY_CFG

Bits	Name	Description
28	TARGET_COUNT_ENA	1'b1: Enable software specified Target_count for calibration instead of value calculated by hardware. 1'b0: Hardware computed Target_count used.
27:16	TARGET_COUNT	Software specified Target_count to which the statemachine calibrates
11:0	DELAY_VAL	Delay required from CDC programmed in pico seconds. This value has to be greater than the minimum delay supported by DDA Tmin.

0x004820B4 DIM_D03_DIM_DQ_WR_CDC_SW_MODE_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_MODE_CFG register configures the following:

DIM_DQ_WR_CDC_SW_MODE_CFG

DIM_D03_DIM_DQ_WR_CDC_SW_MODE_CFG

Bits	Name	Description
3	SW_DEL_MODE	A low to high transition on this register bit puts the delay array selected by SW_DA_SEL into delay mode and connects it to the DDA output. This register has to remain set for the duration of SW controlled delay mode.

DIM_D03_DIM_DQ_WR_CDC_SW_MODE_CFG (cont.)

Bits	Name	Description
2	SW_OSC_MODE	Reserved register.
1	SW_DA_SEL	Selects the delay array inside DDA during software delay or oscillator mode.
0	SW_LOAD	1'b1: Enable loading of the software offsets from the offset configuration register. This register has to remain set for the duration of SW mode operation.

0x004820BC DIM_D03_DIM_DQ_WR_CDC_SW_OVRD_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_SW_OVRD_CFG register configures the following:

DIM_DQ_WR_CDC_SW_OVRD_CFG

DIM_D03_DIM_DQ_WR_CDC_SW_OVRD_CFG

Bits	Name	Description
16	SW_REF_GATE	Write 1'b1 to start the reference window. Write 1'b0 to end the reference window. Number of reference cycle in the window will be reported in SW_REF_GATE_COUNT in CDC_STATUS0
11	SW_OVRD_DA1_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in oscillator-mode
10	SW_OVRD_DA1_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 1 in delay-mode
9	SW_OVRD_DA0_OSC_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in oscillator-mode
8	SW_OVRD_DA0_IN_EN	In software override mode, 1'b1 written to this bit puts delay array 0 in delay-mode
3	SW_OVRD_CDC_COUNTERR_RST	1'b1 written to this bit resets the oscillation counter. Follow this with 1'b0 before setting reference gate.
2	SW_OVRD_LOAD_DA_SEL	In software override mode, this bit select the delay array to which unit and subunit offset values from CDC_OFFSET_CFG register will be loaded.
1	SW_OVRD_ACTV_DA_SEL	In software override mode, this register selects the delay array connected to the CDC output
0	SW_OVRD_ENA	1'b1 written to this bit puts the CDC interface in software override mode where the below register bits control the CDC. 1'b0: CDC is under hardware control

0x004820D0 DIM_D03_DIM_DQ_WR_CDC_STATUS0**Type:** R**Clock:** HCLK**Reset State:** 0x0000000C

The DIM_DQ_WR_CDC_STATUS0 register configures the following:

DIM_DQ_WR_CDC_STATUS0

DIM_D03_DIM_DQ_WR_CDC_STATUS0

Bits	Name	Description
26:24	CDC_ERROR_CODE	Error code for internal errors: 3'b000: No error 3'b001: Programmed delay less than Tmux 3'b010: Programmed delay less than Tmin 3'b011: Unit-step overflow: Overflow during fine calibration. Desired delay cannot be realized even when all unit-steps are selected. 3'b100: Unit-step underflow 3'b101: Unit-step overflow: Overflow during coarse calibration. Estimated unit steps needed to realize the desired delay are greater than the total number of unit-steps in design. Note: The CDC_ERROR_CODE is not a sticky register and is updated after each CDC calibration.
23:16	SW_REF_GATE_COUNT	Number of reference clock cycles in the software generated oscillation gate window doing SW override mode
15:4	OSC_COUNT	Current value of oscillator count
3	CURR_SEL_DA	This bit indicates the current active delay array connected to the output. 1'b0: DA0 is selected 1'b1: DA1 is selected
2	CTLR_SM_IDLE	1'b1 Indicates that the calibration state machine is idle 1'b0 indicates calibration statemachine is busy
1	OSC_DONE	This status register is set after oscillations count is finished by CDC. It gets reset when a new oscillator count is started.
0	CALIBRATION_DONE	1'b1 indicates that calibration is done and CURR_SUBUNIT_STEPS, CURR_UNIT_STEPS status registers are valid.

0x004820D4 DIM_D03_DIM_DQ_WR_CDC_STATUS1**Type:** R**Clock:** HCLK**Reset State:** 0x00000000

The DIM_DQ_WR_CDC_STATUS1 register configures the following:

DIM_DQ_WR_CDC_STATUS1

DIM_D03_DIM_DQ_WR_CDC_STATUS1

Bits	Name	Description
27:16	CURR_DELAY_VALUE	HW Computed value of current delay after calibration by the state machine. This register is valid if CALIBRATION_DONE status bit is set.
11:0	CURR_TMUX_DELAY	Current value of output mux offset delay computed by HW.

0x004820D8 DIM_D03_DIM_DQ_WR_CDC_STATUS2

Type: R

Clock: HCLK

Reset State: 0x10331033

The DIM_DQ_WR_CDC_STATUS2 register configures the following:

DIM_DQ_WR_CDC_STATUS2

DIM_D03_DIM_DQ_WR_CDC_STATUS2

Bits	Name	Description
28:24	DA1_SUBUNITS	Current value of subunit cap settings applied to delay array 1
21:16	DA1_UNITSTEPS	Current value of unit steps applied to delay array 1
12:8	DA0_SUBUNITS	Current value of subunit cap settings applied to delay array 0
5:0	DA0_UNITSTEPS	Current value of unit steps applied to delay array 0

0x004820DC DIM_D03_DIM_DQ_WR_CDC_STATUS3

Type: R

Clock: HCLK

Reset State: 0x00000000

The DIM_DQ_WR_CDC_STATUS3 register configures the following:

DIM_DQ_WR_CDC_STATUS3

DIM_D03_DIM_DQ_WR_CDC_STATUS3

Bits	Name	Description
31:24	NUM_OF_OSC_ITER	Number of oscillator iterations before convergence was achieved during tracking

DIM_D03_DIM_DQ_WR_CDC_STATUS3 (cont.)

Bits	Name	Description
23:12	COUNT_ERROR	Difference between target and actual oscillator counts at the start of tracking calibration
11:0	CURR_TARGET_COUNT	HW computed value of current Target_count used by the calibration state machine.

0x00482100 DIM_D03_DIM_DQ_DQ_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQ_IOC_SLV_CFG register configures the following:

DIM_DQ_DQ_IOC_SLV_CFG

DIM_D03_DIM_DQ_DQ_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL	
15	NCNT_OFFSET_SIGN	
12:8	NCNT_SW_OFFSET	
7	PCNT_OFFSET_SIGN	
4:0	PCNT_SW_OFFSET	

0x00482104 DIM_D03_DIM_DQ_DQ_IOC_SLV_STATUS**Type:** R**Clock:** HCLK**Reset State:** 0x00001010

The DIM_DQ_DQ_IOC_SLV_STATUS register configures the following:

DIM_CA_CA_IOC_SLV_STATUS

DIM_D03_DIM_DQ_DQ_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS

DIM_D03_DIM_DQ_DQ_IOC_SLV_STATUS (cont.)

Bits	Name	Description
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

0x00482110 DIM_D03_DIM_DQ_DQS_IOC_SLV_CFG**Type:** RW**Clock:** HCLK**Reset State:** 0x10100000

The DIM_DQ_DQS_IOC_SLV_CFG register configures the following:

DIM_DQ_DQS_IOC_SLV_CFG

DIM_D03_DIM_DQ_DQS_IOC_SLV_CFG

Bits	Name	Description
31	PNCNT_HW_LOAD_EN	
28:24	NCNT_SW_VAL	
20:16	PCNT_SW_VAL

The DIM_DQ_DQS_IOC_SLV_STATUS register configures the following:

DIM_DQ_DQS_IOC_SLV_STATUS

DIM_D03_DIM_DQ_DQS_IOC_SLV_STATUS

Bits	Name	Description
12:8	PAD_NCNT	Impedance calibration bit settings for NMOS
4:0	PAD_PCNT	Impedance calibration bit settings for PMOS

7.6 EBI1_AHB2PHY

AHB2PHY

7.6.1 EBI1_AHB2PHY

AHB2PHY

0x0049F008 EBI1_AHB2PHY_BROADCAST_EN_CFG_LOWER

Type: RW

Clock: hclk

Reset State: 0x00000000

AHB2PHY_BROADCAST_EN_CFG_LOWER register configures the PHY chip select lower broadcast enables.

EBI1_AHB2PHY_BROADCAST_EN_CFG_LOWER

Bits	Name	Description
31:0	BROADCAST_EN_LOWER	ENABLE(1) DISABLE(0) bit[0]: broadcast for the chip select 0 (o_phy_cs[0]) bit[1]: broadcast for the chip select 1 (o_phy_cs[1]) bit[2]: broadcast for the chip select 2 (o_phy_cs[2]) bit[31]: broadcast for the chip select (o_phy_cs[31])

0x0049F00C EBI1_AHB2PHY_BROADCAST_EN_CFG_UPPER

Type: RW

Clock: hclk

Reset State: 0x00000000

AHB2PHY_BROADCAST_EN_CFG_UPPER register configures the PHY chip select upper broadcast enables.

EBI1_AHB2PHY_BROADCAST_EN_CFG_UPPER

Bits	Name	Description
29:0	BROADCAST_EN_UPPER	ENABLE(1) DISABLE(0) bit[0]: broadcast for the chip select 0 (o_phy_cs[32]) bit[1]: broadcast for the chip select 1 (o_phy_cs[33]) bit[2]: broadcast for the chip select 2 (o_phy_cs[34]) bit[29]: broadcast for the chip select (o_phy_cs[61])

0x0049F010 EBI1_AHB2PHY_TOP_CFG**Type:** RW**Clock:** hclk**Reset State:** 0x00000000

AHB2PHY_TOP_CFG register configures AHB2PHY PHY wait states.

EBI1_AHB2PHY_TOP_CFG

Bits	Name	Description
5:4	WRITE_WAIT_STATES	0x0: NO_WAIT_STATES 0x1: ONE_WAIT_STATE 0x2: TWO_WAIT_STATES 0x3: THREE_WAIT_STATES
1:0	READ_WAIT_STATES	0x0: NO_WAIT_STATES 0x1: ONE_WAIT_STATE 0x2: TWO_WAIT_STATES 0x3: THREE_WAIT_STATES

7.7 EBI1_AHB2PHY_BROADCAST

AHB2PHY Broadcast Address Space

7.7.1 EBI1_AHB2PHY_BROADCAST

AHB2PHY Broadcast Address Space

**0x0049F800+ EBI1_AHB2PHY_BROADCAST_ADDRESS_SPACE_n, n=[0..255]
0x4*n****Type:** RW**Clock:** hclk**Reset State:** 0x00000000

A write or read access to this space activates all PHY chip selects that have their broadcast enable bit set to a 1.

EBI1_AHB2PHY_BROADCAST_ADDRESS_SPACE_n

Bits	Name	Description
31:0	BROADCAST_SPACE	The entire 1 kB address space for this slave chip select is dedicated to the Broadcast function. If a write or read access is performed in this address space the chip selects of all PHY slaves that have been enabled will be active during the access. A PHY slave is enabled for broadcast by setting the BROADCAST_EN bit in the AHB2PHY_BROADCAST_EN_CFG register. Each PHY slave has a dedicated bit in this register.

8 A53SS

8.1 APCS_QTMR_AC

QTMR AC Block

8.1.1 APCS_QTMR_AC

QTMR AC Block

0x0B020000 APCS_QTMR_AC_CNTFRQ

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Restricted

Counter Frequency register. Counter frequency in ticks per second

APCS_QTMR_AC_CNTFRQ

Bits	Name	Description
31:0	CNTFRQ	

0x0B020004 APCS_QTMR_AC_CNTSR

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Restricted

The Counter Secure Register (CNTSR) contains a bit for Secure access to each timer frame, including both views of the timer frame and the access to the associated CNTACR and CNTVOFF registers in the Access Control region.

APCS_QTMR_AC_CNTSR

Bits	Name	Description
6:0	NSN	Non-secure access to frame N. N lies from 0 to \$NUM_FRAME-1 (# of configured frame) 0x0: SECURE_ONLY (Secure access only - non-secure access is RAZ/WI) 0x1: SECURE_OR_NONSECURE (Secure or Non-secure access)

0x0B020008 APCS_QTMR_AC_CNTTID**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Both

The Counter Timer ID (CNTTID) is 32-bit register that identifies the number of timer frames implemented, which frame have virtual offsets and timers, and which frames have second views

APCS_QTMR_AC_CNTTID

Bits	Name	Description
31:28	F7_CFG	Frame 7 configuration (same definition as Frame 0)
27:24	F6_CFG	Frame 6 configuration (same definition as Frame 0)
23:20	F5_CFG	Frame 5 configuration (same definition as Frame 0)
19:16	F4_CFG	Frame 4 configuration (same definition as Frame 0)
15:12	F3_CFG	Frame 3 configuration (same definition as Frame 0)
11:8	F2_CFG	Frame 2 configuration (same definition as Frame 0)
7:4	F1_CFG	Frame 1 configuration (same definition as Frame 0)
3:0	F0_CFG	Frame 0 configuration 0x3: RSVD (Reserved (Read as zero)) 0x2: FPLO (Frame has second view) 0x1: FVI (Virtual frame implemented) 0x0: FI (Frame implemented)

**0x0B020040+ APCS_QTMR_AC_CNTACR_n, n=[0..6]
0x4*n****Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTSR[n]

The Counter Access Control Register (CNTACR) provide access control to the individual elements of timer frame n, including the second view of that timer frame n

APCS_QTMR_AC_CNTACR_n

Bits	Name	Description
5	RWPT	Read/Write access to CNTP_*register 0x0: ACCESS_DENIED (Access denied) 0x1: ACCESS_ALLOWED (Access allowed)
4	RWVT	Read/Write access to CNTV_*register 0x0: ACCESS_DENIED (Access denied) 0x1: ACCESS_ALLOWED (Access allowed)

0x0B023004 APCS_F1_QTMR_V1_CNTPCT_HI**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RPCT]

The upper 32 bits of Physical Counter

APCS_F1_QTMR_V1_CNTPCT_HI

Bits	Name	Description
23:0	CNTPCT_HI	Higher bits [31:0] of Physical Counter

0x0B023008 APCS_F1_QTMR_V1_CNTVCT_LO**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RVCT]

The lower 32 bits of Virtual Counter

APCS_F1_QTMR_V1_CNTVCT_LO

Bits	Name	Description
31:0	CNTVCT_LO	Lower bits [31:0] of Virtual Counter

0x0B02300C APCS_F1_QTMR_V1_CNTVCT_HI**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RVCT]

The upper 32 bits of Virtual Counter

APCS_F1_QTMR_V1_CNTVCT_HI

Bits	Name	Description
23:0	CNTVCT_HI	Higher bits [31:0] of Virtual Counter

0x0B023010 APCS_F1_QTMR_V1_CNTFRQ**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RFRQ]

Read QTMR_AC_CNTFRQ register

APCS_F1_QTMR_V1_CNTFRQ

Bits	Name	Description
31:0	CNTFRQ	Counter frequency in ticks per second

0x0B023014 APCS_F1_QTMR_V1_CNTPL0ACR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Both

The Second View Counter Access Control Register (CNTPL0ACR) provide second view access control to the individual elements of timer frame n, except CNTVOFF and CNTPL0ACR registers

APCS_F1_QTMR_V1_CNTPL0ACR

Bits	Name	Description
9	PL0CTEN	Second view read/write access to CNTP_* register
8	PL0VTEN	Second view read/write access to CNTV_* register
1	PL0VCTEN	Second view read access to CNTVCT and CNTFRQ register

APCS_F1_QTMR_V1_CNTPL0ACR (cont.)

Bits	Name	Description
0	PL0PCTEN	Second view read access to CNTPCT and CNTFRQ register

0x0B023018 APCS_F1_QTMR_V1_CNTVOFF_LO**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RVOFF]

Read QTMR_AC_CNTVOFF_LO_n register

APCS_F1_QTMR_V1_CNTVOFF_LO

Bits	Name	Description
31:0	CNTVOFF_LO	Lower bits [31:0] of virtual Offset for Frame

0x0B02301C APCS_F1_QTMR_V1_CNTVOFF_HI**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RVOFF]

Read QTMR_AC_CNTVOFF_HI_n register

APCS_F1_QTMR_V1_CNTVOFF_HI

Bits	Name	Description
23:0	CNTVOFF_HI	Higher bits [31:0] of virtual Offset for Frame

0x0B023020 APCS_F1_QTMR_V1_CNTP_CVAL_LO**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWPT]

The Physical Timer Compare Value register is compare against the CNTPCT counter. The interrupt signal is asserted when the CNTPCT counter is greater than equal to CNTP_CVAL

APCS_F1_QTMR_V1_CNTP_CVAL_LO

Bits	Name	Description
31:0	CNTP_CVAL_LO	Lower bits [31:0] of compare value for interrupt for Frame

0x0B023024 APCS_F1_QTMR_V1_CNTP_CVAL_HI**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWPT]

The Physical Timer Compare Value register is compare against the CNTPCT counter. The interrupt signal is asserted when the CNTPCT counter is greater than equal to CNTP_CVAL

APCS_F1_QTMR_V1_CNTP_CVAL_HI

Bits	Name	Description
23:0	CNTP_CVAL_HI	Higher bits [31:0] of compare value for interrupt for Frame

0x0B023028 APCS_F1_QTMR_V1_CNTP_TVAL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWPT]

An alternative 32 bit TVAL view to provide read or write CVAL register.

The TVAL reads:

$$TVAL = (CVAL - CNTP)$$

The TVAL write CVAL with:

$$CVAL = (CNTP + \text{signExtend}(TVAL))$$

APCS_F1_QTMR_V1_CNTP_TVAL

Bits	Name	Description
31:0	CNTP_TVAL	Timer Value in tick per second for Frame

0x0B02302C APCS_F1_QTMR_V1_CNTP_CTL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWPT]

The Physical Timer Control Register which can disable the timer and can mask its interrupt. If the timer is disabled, interrupt are masked, but the timer value continue to count down.

APCS_F1_QTMR_V1_CNTP_CTL

Bits	Name	Type	Description
2	ISTAT	R	Interrupt Status before masking (Read Only) 0x0: INTERRUPT_NOT_PENDING 0x1: INTERRUPT_PENDING
1	IMSK	RW	Mask Interrupt 0x0: UNMASK_INTERRUPT 0x1: MASK_INTERRUPT
0	EN	RW	Enable Timer 0x0: DISABLED 0x1: ENABLED

0x0B023030 APCS_F1_QTMR_V1_CNTV_CVAL_LO**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Compare Value register is compare against the CNTVCT counter. The interrupt signal is asserted when the CNTVCT counter is greater than equal to CNTV_CVAL. This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

APCS_F1_QTMR_V1_CNTV_CVAL_LO

Bits	Name	Description
31:0	CNTV_CVAL_LO	Lower bits [31:0] of compare value for interrupt for Frame n

0x0B023034 APCS_F1_QTMR_V1_CNTV_CVAL_HI**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Compare Value register is compare against the CNTVCT counter. The interrupt signal is asserted when the CNTVCT counter is greater than equal to CNTV_CVAL. This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

APCS_F1_QTMR_V1_CNTV_CVAL_HI

Bits	Name	Description
23:0	CNTV_CVAL_HI	Higher bits [31:0] of compare value for interrupt for Frame n

0x0B023038 APCS_F1_QTMR_V1_CNTV_TVAL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

An alternative 32 bit TVAL view to provide read or write CVAL register.

The TVAL reads:

$$TVAL = (CVAL - (CNTP - CNTVOFF))$$

The TVAL write CVAL with:

$$CVAL = (CNTP - CNTVOFF) + \text{signExtend}(TVAL)$$

This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

APCS_F1_QTMR_V1_CNTV_TVAL

Bits	Name	Description
31:0	CNTV_TVAL	Timer Value in tick per second for Frame

0x0B02303C APCS_F1_QTMR_V1_CNTV_CTL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Control Register which can disable the timer and can mask its interrupt. If the timer is disabled, interrupt are masked, but the timer value continue to count down.

This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

APCS_F1_QTMR_V1_CNTV_CTL

Bits	Name	Type	Description
2	ISTAT	R	Interrupt Status before masking (Read Only) 0x0: INTERRUPT_NOT_PENDING 0x1: INTERRUPT_PENDING
1	IMSK	RW	Mask Interrupt 0x0: UNMASK_INTERRUPT 0x1: MASK_INTERRUPT
0	EN	RW	Enable Timer 0x0: DISABLED 0x1: ENABLED

QTMR_AC_CNTTID register.

APCS_F3_QTMR_V1_CNTV_CVAL_HI

Bits	Name	Description
23:0	CNTV_CVAL_HI	Higher bits [31:0] of compare value for interrupt for Frame n

0x0B025038 APCS_F3_QTMR_V1_CNTV_TVAL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

An alternative 32 bit TVAL view to provide read or write CVAL register.

The TVAL reads:

$$TVAL = (CVAL - (CNTP - CNTVOFF))$$

The TVAL write CVAL with:

$$CVAL = (CNTP - CNTVOFF) + \text{signExtend}(TVAL)$$

This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

APCS_F3_QTMR_V1_CNTV_TVAL

Bits	Name	Description
31:0	CNTV_TVAL	Timer Value in tick per second for Frame

0x0B02503C APCS_F3_QTMR_V1_CNTV_CTL

Type: RW

Clock: SYS_TMR_CLK

Reset State: 0x00000000

Security Treatment: Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Control Register which can disable the timer and can mask its interrupt. If the timer is disabled, interrupt are masked, but the timer value continue to count down.

This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

APCS_F3_QTMR_V1_CNTV_CTL

Bits	Name	Type	Description
2	ISTAT	R	Interrupt Status before masking (Read Only) 0x0: INTERRUPT_NOT_PENDING 0x1: INTERRUPT_PENDING
1	IMSK	RW	Mask Interrupt 0x0: UNMASK_INTERRUPT 0x1: MASK_INTERRUPT
0	EN	RW	Enable Timer 0x0: DISABLED 0x1: ENABLED

0x0B01811C RESERVED**0x0B018120 RESERVED****0x0B018124 RESERVED****8.11 APCS_KPSS_WDT****0x0B017000 APCS_WDOG_SECURE****Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000001**Security Treatment:** Restricted

The WDOG_SECURE register is used to enable or disable non-secure bus transactions. The bus **security** status is signaled by APROTNS pin. When APROTNS is set to '0' the state of the APCS_WDTSECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APCS_WDTSECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APCS_WDTSECURE register, non secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_WDTSECURE register correspond to.

APCS_WDOG_SECURE

Bits	Name	Description
0	WDT	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for the Watch Dog Timer registers: WDOG_RESET, WDOG_CTL, WDOG_STATUS, WDOG_BARK_TIME, WDOG_BITE_TIME, WDOG_TEST_LOAD, STATUS, WDOG_TEST_LOAD, WDOG_TEST)

0x0B017004 APCS_WDOG_RESET**Type:** W**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** .Controlled by WDOG_SECURE [WDT].

The WDOG_RESET register resets the watch dog counter. In normal operation, the microprocessor should periodically write this command register to reset the watch dog counter. This command register also disables the watchdog freeze

APCS_WDOG_RESET

Bits	Name	Description
0	RESET	This bit generates the WDT_STB during the non-sleep mode. A pulse is generated on WDT_STB when this bit is written with a ?1

0x0B017008 APCS_WDOG_CTL**Type:** W**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** .Controlled by WDOG_SECURE [WDT].

The WDOG_CTL register controls when the watch dog timer is enabled.

APCS_WDOG_CTL

Bits	Name	Description
1	UNMASKED_INT_ENABLE	Enable unmasked interrupt (IRQ or FIQ) to wake up the wdog timer: 0x1: ENABLE (Enable) 0x0: DISABLE (Disable)

APCS_WDOG_CTL (cont.)

Bits	Name	Description
0	ENABLE	Enable wdog timer: 0x1: ENABLE (Enable) 0x0: DISABLE (Disable)

0x0B01700C APCS_WDOG_STATUS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** .Controlled by WDOG_SECURE [WDT].

The WDOG_STATUS register is the watchdog status register.

APCS_WDOG_STATUS

Bits	Name	Description
31	FROZEN	This bit indicates whether the or not wdog timer is frozen at count 0. 0x1: YES (frozen) 0x0: NO (not frozen)
20:1	COUNT	Counter value [19:0] of the watch dog counter. Note: The sleep counter value is sampled using the AHB clk. Multiple reads are required to determine the value (assuming AHB clk is much faster than sleep clock).
0	EXPIRED_STATUS	0x1: YES (expired (wdog timer has expired)) 0x0: NO (not expired (wdog timer has not expired))

0x0B017010 APCS_WDOG_BARK_TIME**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x0007FFFF**Security Treatment:** .Controlled by WDOG_SECURE [WDT].

The WDOG_BARK_TIME register defines the time in sleep_clk when to assert the watchdog ('bark') interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog ('bark') interrupt.

..

APCS_WDOG_BARK_TIME

Bits	Name	Description
19:0	DATA	The WDOG counter value on which to trigger the bark interrupt.

0x0B017014 APCS_WDOG_BITE_TIME**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x000FFFFFF**Security Treatment:** .Controlled by WDOG_SECURE [WDT].

The WDOG_BITE_TIME register defines the time in sleep_clk when to assert the watchdog ('bark') interrupts. The value can be between 0 and 12787 (the time when the watchdog times out). The default value is 0x3FFF, but this reset value is not readable through the AHB interface. Note that this value is larger than the watchdog timeout of 0x31F3, effectively disabling the watchdog ('bark') interrupt.

SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command.

APCS_L2_SAW2_SPM_DLY

Bits	Name	Description
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x0B012038 APCS_L2_SAW2_SPM_STS2**Type:** R**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SPM power control status.

APCS_L2_SAW2_SPM_STS2

Bits	Name	Description
15:0	CURR_PWR_CTL	Power control Outputs

**0x0B012400+ APCS_L2_SAW2_SPM_SLP_SEQ_ENTRY_n, n=[0..31]
0x4*n****Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

APCS_L2_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description
29:24	CMD3	SPM PWR CMD3
21:16	CMD2	SPM PWR CMD2
13:8	CMD1	SPM PWR CMD1
5:0	CMD0	SPM PWR CMD0

**0x0B012040+ APCS_L2_SAW2_SPM_PMIC_DATA_n, n=[0..5]
0x4*n****Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [PWR_CTL].

This register provide the PMIC data values for SPM FSM PMIC transaction.

APCS_L2_SAW2_SPM_PMIC_DATA_n

Bits	Name	Description
26:24	DLY	PMIC Delay. Controls the time between SPM_SLP_SEQ PMIC command with SAW2_SPM_PMIC_DATA_n and the next SPM_SLP_SEQ command. Time range: 13.33us to 1.7ms
20	SIZE	PMIC DATA size 0x0: ENUM_ONE_BYTE 0x1: ENUM_TWO_BYTE
18:16	ADR_IDX	PMIC Arbiter Address Index. Drive the saw_pmic_addr_idx output port.
7:0	DATA	PMIC DATA sent to the PMIC Arbiter

8.14 APCS_BANKED_SAW2

0x0B009000 APCS_BANKED_SAW2_SECURE**Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus **security** status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to '0' the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to '1', the SAW2_SECURE register **security** treatment bit of that register must be '1' for access to be granted. If the **security** treatment bit of the register is set to '0', the non-secure (ahb_saw_hprotns = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the SAW2_SECURE register, non secure agents will always read '0'. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

APCS_BANKED_SAW2_SECURE

Bits	Name	Description
2	SAW_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST, SAW2_VERSION)

8.17 APCS_ALIAS2_SAW2

0x0B0A9000 APCS_ALIAS2_SAW2_SECURE

Type: RW

Clock: sys_ref_clk

Reset State: 0x00000000

Security Treatment: Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus **security** status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to '0' the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to '1', the SAW2_SECURE register **security** treatment bit of that register must be '1' for access to be granted. If the **security** treatment bit of the register is set to '0', the non-secure (ahb_saw_hprotns = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the SAW2_SECURE register, non secure agents will always read '0'. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

APCS_ALIAS2_SAW2_SECURE

Bits	Name	Description
2	SAW_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST, SAW2_VERSION)

1	PWR	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for the global sleep control registers: L2_PWR_CTL, L2_PWR_STATUS, DBG_PWR_CTL)
0	STS	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for the global clock control registers: PWR_CTL_OVERRIDE, GLB_CLK_STATUS, APCS_L2_AUX_CLK_SEL)

0x0B011004 APCS_TZ_IPC_INTERRUPT**Type:** W**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

The TZ_IPC_INTERRUPT register is used by trustzone software to send Inter-process communication interrupt to RPM

APCS_TZ_IPC_INTERRUPT

Bits	Name	Description
23:20	TZ_SPARE_IPC	TZ Spare IPC Interrupt
2:0	RPM_TZ_IPC	TZ Interrupt to RPM

0x0B011008 APCS_IPC_INTERRUPT**Type:** W**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** None

Inter-process communication signals from A53 to other masters.

APCS_IPC_INTERRUPT

Bits	Name	Description
23:20	SPARE_IPC	Spare Interrupt
19:16	WCN_IPC	Interrupt to WConnect (LPASS).
15:12	MSS_IPC	Interrupt to GPS
11:8	ADSP_IPC	Interrupt to ADSP (LPASS).
2:0	RPM_HLOS_IPC	HLOS Interrupt to RPM.

0x0B01100C APCS_PWR_CTL_OVERRIDE**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by GLB_SECURE [PWR].

The PWR_CTL_OVERRIDE register is used to enable the global APCS clocks. This is used to workaround hardware dynamic clock gating problems.

APCS_PWR_CTL_OVERRIDE

Bits	Name	Description
22	PRESETDBG	When Set, this bit drives PRESETDBGn signal ZERO
21:18	L1_RAM_COLLAPSE_DIS	When Set, this bit will override the L1 RAM collapse operation by SPM. Instead the L1 rams will be retained in the case where APC voltage is retained
17	SCU_RAM_COLLAPSE_DIS	When Set, this bit will override the SCU RAM collapse operation by SPM. Instead the SCU rams will be retained in the case where APC voltage is retained
16	L2_RET_SLP_DIS	When set, this bit will take L2 array out of retention mode. This bit needs to be set before the vdd_mx voltage is lowered. The L2 data will be lost if vdd_mx is lowered to a voltage level such that the internal array voltage is below the retention voltage.
4:0	CLK_EN	Clock enables for global APCS clocks. This is only to workaround hardware dynamic clock gating problems. 0x1: ALWAYS_ENABLED (Always enabled) 0x0: DYNAMICALLY_ENABLED_BY_HARDWARE (dynamically enabled by hardware) [5]= SYS_apcsL2Aux_Clk [4] = SYS_apccL2Pll_Clk [3] = SYS_apcsPiSleep_Clk [2] = SYS_apcsRef_Clk [1] = SYS_apcsAhb_Clk [0] = SYS_apcsQsb_Clk)

0x0B011010 APCS_GLB_CLK_STATUS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by GLB_SECURE [STS].

The GLB_CLK_STATUS register is used to monitor the output of the clock gating cells.

APCS_GLB_CLK_STATUS

Bits	Name	Description
19:16	QGIC_WAKEUP	Wakeup output of QGIC

APCS_GLB_CLK_STATUS (cont.)

Bits	Name	Description
4:0	STS	Status for global APCS clocks 0x1: TOGGLING (toggling,) 0x0: HALTED (halted [5]= APCS_sysL2AuxClkOnReq [4] = APCS_sysApcsPllClkOnReq [3] = APCS_sysSleepClkOnReq [2] = APCS_sysRefClkOnReq [1] = APCS_sysAhbClkOnReq [0] = APCS_sysQsbClkOnReq)

0x0B011014 APCS_L2_PWR_CTL**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x0000010F**Security Treatment:** Controlled by GLB_SECURE [PWR].

The L2_PWR_CTL register controls the L2 Global Distributed Head Switch and L2 array head switches.

APCS_L2_PWR_CTL

Bits	Name	Description
28	PMIC_APC_ON	Report that PMIC APC supply is ON
25:16	L2_HS_CNT	Count value for headswitched L2 logic
13	L2_RET_SLP	
12	SYS_RESET	Setting this bit asserts the SYS_apccSys_Areset_N input to the A53SS CPU, causing a warm system reset (all powered non-debug logic will be reset) to the CPU core without resetting subsystem functions such as timers, clock control, etc.
11	L2_SLEEP_STATE	Report L2 logic is in sleep state
10	L2_HS_RST	When set, this bit asserts reset to the headswitched L2 logic
9	L2_HS_EN	When set, this bit closes the switches for the headswitched L2 logic, putting it into an operational state
8	L2_HS_CLAMP	When set, this bit clamps the outputs from the headswitched L2 logic into the unswitched domain This bit is ORed with SAW outputs before passing to the CPU(resets to 1).

APCS_L2_PWR_CTL (cont.)

Bits	Name	Description
3:0	L2_ARRAY_HS	When set, these bits closes the array head switches for 512 KB sections of the L2 cache array. When clear (default reset value), array head switch is open, resulting a lower cache array leakage when data does not need to be retained in the array. This bits is ORed with SAW outputs before passing to the CPU

0x0B011018 APCS_L2_PWR_STATUS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x03013100**Security Treatment:** Controlled by GLB_SECURE [STS].

The L2_PWR_STATUS register contains the status bits necessary to support an MP with foot switched L2.

.

APCS_L2_PWR_STATUS

Bits	Name	Description
28	APC_SUPPLY_ON	This bit reflect if PMIC APC SUPPLY is ON or OFF
27	SAW_SLP_ACK	This bit reflects the status of APCS_apccL2SleepAck signal
26	DBG_PWRUP_REQ	This bit reflects the status of SYS_apcsDbgPwrUpReq
25	L2_CLK_IDLE	This bit reflects the status of the APCC_sysL2ClkIdle signal
24	L2_SLV_IDLE	This bit reflects the status of the APCC_qsbSlvIdle signal
20:16	L2_HW_EVENT	This bit reflects the status of APCS_sysL2HWEvents[4:0] signals
13	DBG_RST_STS	This bit reflects the status of APCS_apccDbg_Areset_N signal
12	L2_HS_RST_STS	This bit reflects the status of APCS_apccL2swvd_Areset_N signal
10	L2_RET_SLP_STS	This bit reflects the status of APCS_apccSwCtlL2RetentionSleep signal
9	L2_HS_STS	Status for headswitched L2 logic
8	L2_CLMP_STS	This bit reflects the status of APCS_apccClampL2swvd signal
3:0	L2_ARRAY_HS_STS	This bit reflects the status of APCS_apccSwCtlL2ArrayCollapse signal

0x0B011030 APCS_IDR**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00404744**Security Treatment:** Controlled by GLB_SECURE [STS].

This read only register reports the PARAMETER information for the A53SS core.

APCS_IDR

Bits	Name	Description
26:25	CFG_APCPLL	Indicate APC PLL FUSE value
24	QDSSGEN	Indicate the QDSS version configuration value
23:21	CFG_HBID	Indicate the A53SS HBID configuration value
20:16	CFG_HPID	Indicate the A53SS HPID configuration value
15:12	L2_SIZE	Indicate number of L2 Data Array implemented. Each L2 Data Array Size is 128 KB (for 1MB L2) or 64 KB (for 512 KB L2)
11:8	NUM_FRAME	Indicate number of QTMR physical frame implemented
7:4	VARIANT	Reserved for A53SS
3:0	NUM_CPU	Indicates number of Cortex-A53 CPU implemented.

0x0B011034 APCS_XO_CBCR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000001**Security Treatment:** Controlled by GLB_SECURE [PWR].

This register provides software control for A53SS XO clock gating.

APCS_XO_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Read Only. This bit indicates if the clock branch is halted..
1	HW_CTL	RW	This bit indicates dynamic clock gating is supported.
0	SW_CTL	RW	Clock enables for A53SS XO clock.

0x0B011038 APCS_SLEEP_CBCR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000001**Security Treatment:** Controlled by GLB_SECURE [PWR].

This register provides software control for A53SS SLEEP clock gating.

APCS_SLEEP_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	Read Only. This bit indicates if the clock branch is halted..
1	HW_CTL	RW	This bit indicates dynamic clock gating is supported.
0	SW_CTL	RW	Clock enables for A53SS SLEEP clock.

0x0B011050 APCS_CMD_RCGR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x80000002**Security Treatment:** Controlled by GLB_SECURE [PWR].

HM_RCG Command Register. It allows for SW to trigger the configuration data

APCS_CMD_RCGR

Bits	Name	Type	Description
31	ROOT_OFF	R	This bitfield provides indication on status of the RCG; Mainly for SW to determine if the generator is actively producing clock 1: Clock Off 0: Clock On; Generator is actively producing the clock
4	DIRTY_CFG_RCGR	R	Indicates change in CFG_RCGR register configuration
1	ROOT_EN	RW	Enable Clock Generator output. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	UPDATE	RW	Update to the new programmed configuration. It should be cleared upon switching to new configuration 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0B011054 APCS_CFG_RCGR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by GLB_SECURE [PWR].

HM_RCG Configuration Register. It allows for SW to configure Root Clock Generation Macro

APCS_CFG_RCGR

Bits	Name	Description
10:8	SRC_SEL	This bitfield selects clock source that will be used to source the RCG output 0x0: SRC0 (refRoot_Clk.) 0x1: SRC1 (SYS_apcsAux_Clk_0.) 0x2: SRC2 (SYS_apcsAux_Clk_1.) 0x3: SRC3 (SYS_apcsAux_Clk_2.) 0x4: SRC4 (SYS_apcsAux_Clk_3.) 0x5: SRC5 (APCN_apcPll_Clk.) 0x6: SRC6 (SYS_apcsQsb_Clk.) 0x7: reserved

APCS_CFG_RCGR (cont.)

Bits	Name	Description
4:0	SRC_DIV	This field defines the integer and half integer portion of the divider setting of the RCG. The value specifies is $2N-1$ where N is the divide ratio. For example, if the half integer divide ration is 2.5, the src_div should be set at 00100. 0x0: BYPASS (Bypsss.) 0x1: DIV1 (Divide by 1.) 0x2: DIV1_5 (Divide by 1.5.) 0x3: DIV2 (Divide by 2.) 0x4: DIV2_5 (Divide by 2.5.) 0x5: DIV3 (Divide by 3.) 0x6: DIV3_5 (Divide by 3.5.) 0x7: DIV4 (Divide by 4.) 0x8: DIV4_5 (Divide by 4.5.) 0x9: DIV5 (Divide by 5.) 0xA: DIV5_5 (Divide by 5.5.) 0xB: DIV6 (Divide by 6.) 0xC: DIV6_5 (Divide by 6.5.) 0xD: DIV7 (Divide by 7.) 0xE: DIV7_5 (Divide by 7.5.) 0xF: DIV8 (Divide by 8.) 0x10: DIV8_5 (Divide by 8.5.) 0x11: DIV9 (Divide by 9.) 0x12: DIV9_5 (Divide by 9.5.) 0x13: DIV10 (Divide by 10.) 0x14: DIV10_5 (Divide by 10.5.) 0x15: DIV11 (Divide by 11.) 0x16: DIV11_5 (Divide by 11.5.) 0x17: DIV12 (Divide by 12.) 0x18: DIV12_5 (Divide by 12.5.) 0x19: DIV13 (Divide by 13.) 0x1A: DIV13_5 (Divide by 13.5.) 0x1B: DIV14 (Divide by 14.) 0x1C: DIV14_5 (Divide by 14.5.) 0x1D: DIV15 (Divide by 15.) 0x1E: DIV15_5 (Divide by 15.5.) 0x1F: DIV16 (Divide by 16.)

0x0B011058 APCS_CORE_CBCR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x80000000**Security Treatment:** Controlled by GLB_SECURE [PWR].

CBCR Register. It allows SW control of CBC soft macro

APCS_CORE_CBCR

Bits	Name	Type	Description
31	CLK_OFF	R	This bitfield indicated if the clock branch is halted 0:Clock On 1:Clock Off
1	HW_CTL	RW	This bit is used to enable hardware dynamic gating of the clock branch. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)
0	CLK_ENABLE	RW	This bitfield indicated if the clock branch is enabled. 0x1: ENABLE (Enable.) 0x0: DISABLE (Disable.)

0x0B01106C APCS_A53_CFG_STS

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000002

Security Treatment: Controlled by GLB_SECURE [PWR].

A53_CFG_STS Register

APCS_A53_CFG_STS

Bits	Name	Description
31:24	CLUSTERIDAFF1	Value read in the Cluster ID Affinity Level 1field, MPIDR bits [15:8], of the CP15 MPDIR register. These pins are only sampled during reset of the processor.
23:16	CLUSTERIDAFF2	Value read in the Cluster ID Affinity Level 2field, MPIDR bits [23:16], of the CP15 MPDIR register. These pins are only sampled during reset of the processor.
1	ACINACTM	
0	CFGSDISABLE	

0x0B011074 APCS_AUX_CLK_ON

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Controlled by GLB_SECURE [PWR].

AUX_CLK_ON Register

APCS_AUX_CLK_ON

Bits	Name	Description
3:0	AUX_CLK_ON_REQ	

0x0B011078 APCS_QSB_LP

Type: RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000001**Security Treatment:** Controlled by GLB_SECURE [PWR].

QSB_LP Clock on Req Register

APCS_QSB_LP

Bits	Name	Description
6:1	QSB_LP_CNTR	No of Core clock cycle to wait before clock_on req is pulled low, once bus goes idle
0	QSB_LP_OVERRIDE_BIT	Override bit to disable LP functionality, once set qsb_clock_on is always one

0x0B011100 APCS_APPS_BOOTFSM_CTL

Type: RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** none

BOOTFSM Override register. This register can be used to go to particular states. This register can override state only if DBGEN is zero.

APCS_APPS_BOOTFSM_CTL

Bits	Name	Description
7:4	STATE_OVERRIDE_VAL	STATE Value that need to be updated
0	STATE_OVERRIDE	update state with STATE_OVERRIDE_VAL. Edge is sampled by HW.

0x0B011104 APCS_APPS_BOOTFSM_STATUS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** none

BOOTFSM status register. This register can be used to check the current states as well as some relevant signal status. This will reflect the current status of signals.

APCS_APPS_BOOTFSM_STATUS

Bits	Name	Description
31:0	BOOTFSM_STATUS	Status will be updated whenever there is a state change.

0x0B011110 APCS_L2_SPM_AUX_STARTADDR**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

AUX Start Address for L2 SPM

APCS_L2_SPM_AUX_STARTADDR

Bits	Name	Description
16	AUX_STARTADDR_SEL	Select Auxiliary start address for L2SPM
8:0	AUX_STARTADDR	Auxiliary start address for L2SPM

0x0B011200 APCS_L2_SPM_VOTE_TZ**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0xC000FFFF**Security Treatment:** Restricted

TZ Vote for SPM functionality

APCS_L2_SPM_VOTE_TZ

Bits	Name	Description
31	PMIC_HANDSHAKE_EN	TZ Vote for SPM <-> PMIC Handshake. If not set, SPM cannot initiate any requests from PMIC

APCS_L2_SPM_VOTE_TZ (cont.)

Bits	Name	Description
30	RPM_HANDSHAKE_EN	TZ Vote for SPM <-> RPM Handshake. If not set, SPM cannot initiate handshake with RPM
15:0	PWR_CTL_EN	TZ Vote for SPM PWR_CTL bits. If not set, PWR_CTL bit is forced LOW

0x0B011204 APCS_L2_SPM_VOTE_HLOS**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0xC000FFFF**Security Treatment:** Controlled by GLB_SECURE [VOTE].

HLOS Vote for SPM functionality

APCS_L2_SPM_VOTE_HLOS

Bits	Name	Description
31	PMIC_HANDSHAKE_EN	HLOS Vote for SPM <-> PMIC Handshake. If not set, SPM cannot initiate any requests from PMIC
30	RPM_HANDSHAKE_EN	HLOS Vote for SPM <-> RPM Handshake. If not set, SPM cannot initiate handshake with RPM
15:0	PWR_CTL_EN	HLOS Vote for SPM PWR_CTL bits. If not set, PWR_CTL bit is forced LOW

0x0B011208 APCS_L2_SPM_VOTE_INT_STATUS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** None

Interrupt generated due to contention in Voting

APCS_L2_SPM_VOTE_INT_STATUS

Bits	Name	Description
31	PMIC_HANDSHAKE_INT_STATUS	Set when there is a contention in Voting from TZ/HYP/HLOS
30	RPM_HANDSHAKE_INT_STATUS	Set when there is a contention in Voting from TZ/HYP/HLOS
15:0	PWR_CTL_INT_STATUS	Set when there is a contention in Voting from TZ/HYP/HLOS

0x0B01120C APCS_L2_SPM_VOTE_INT_CLEAR**Type:** W**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** None

Interrupt Clear register

APCS_L2_SPM_VOTE_INT_CLEAR

Bits	Name	Description
31	PMIC_HANDSHAKE_INT_CLEAR	Self Clear register to reset the interrupt generated due to contention
30	RPM_HANDSHAKE_INT_CLEAR	Self Clear register to reset the interrupt generated due to contention
15:0	PWR_CTL_INT_CLEAR	Self Clear register to reset the interrupt generated due to contention

0x0B011220 APCS_AINACTS_CNT**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by GLB_SECURE [ACP].

AINACTS Count register

APCS_AINACTS_CNT

Bits	Name	Type	Description
31	AINACTS_CNT_WIP	R	AINACTS_CNT update in progress. The count value needs to be written into a register in XO clock domain. Any updates the count value while this bit is set HIGH shall be ignored
23:0	AINACTS_CNT_VAL	RW	No. of XO (19.2Mhz) cycles to wait before setting AINACTS once ACP bus goes idle

0x0B011228 APCS_ACP_L2_PM_STATUS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00040040**Security Treatment:** Controlled by GLB_SECURE [STS]

ACP/L2 Power Management Controller Status register

APCS_ACP_L2_PM_STATUS

Bits	Name	Description
31	QSB_CLK_ON_REQ	reflects the value of signal qsb_clk_on_req
30	WSTARTS	reflects the value of signal wstarts
29:24	WR_REQ_CNT	reflects the value of signal wr_req_cnt
23	ALL_CORE_IN_STBL_LPM	reflects the value of signal all_core_in_stbl_lpm
22	L2SPM_WAIT_REQ	reflects the value of signal l2spm_wait_req
21	L2SPM_TIMER_TRIG_ACK	reflects the value of signal l2spm_timer_trig_ack
20	L2SPM_TIMER_TRIG	reflects the value of signal l2spm_timer_trig
19	CBC_EN_OVERRIDE	reflects the value of signal cbc_en_override
18	MASK_ACP_XFERS	reflects the value of signal mask_acp_xfers
17:16	STATE	reflects the state of acp_l2_pm_ctl FSM
15	L2SPM_PC_MODE_QSB	reflects the state of signal l2spm_pc_mode_qsb
14	AINACTS_CNT_WR_ACK	reflects the state of signal ainacts_cnt_wr_ack
13	ACP_STALL	reflects the state of signal acp_stall: When this is asserted all the Request channels AR/AW/W are Masked and A53SS will not serve any new transfers
12	L2FLUSHDONE	reflects the state of signal HW signal L2FLUSHDONE. Note this reflects the state of CORTEXA53 pin L2FLUSHDONE. This is latched on to CSR L2FlushDone
11	L2FLUSHREQ	reflects the state of signal HW signal L2FLUSHREQ. Note it is generated when L2FlushReq is programmed and acp transfers are stalled. This gets deasserted on receiving L2FLUSHDONE from A53
10	TIMER_EXP	reflects the value of signal timer_exp
9	TIMER_EN	reflects the value of signal timer_en
8	TIMER_TRIG_ACK_QSB	reflects the value of signal timer_trig_ack_qsb
7	TIMER_TRIG	reflects the value of signal timer_trig
6	AINACTS	reflects the value of signal ainacts
5:0	XFER_CNT	reflects the value of outstanding transfer count on ACP bus

0x0B011244 APCS_QCHANNEL_CPU_NEON**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x000F000F**Security Treatment:** Restricted

Qchannel handshake for CPU/NEON

APCS_QCHANNEL_CPU_NEON

Bits	Name	Type	Description
31:28	NEONQACTIVE	R	Q channel interface for NEON
27:24	NEONQDENY	R	Q channel interface for NEON
23:20	NEONQACCEPTN	R	Q channel interface for NEON
19:16	NEONQREQN	RW	Q channel interface for NEON
15:12	CPUQACTIVE	R	Q channel interface for CPU
11:8	CPUQDENY	R	Q channel interface for CPU
7:4	CPUQACCEPTN	R	Q channel interface for CPU
3:0	CPUQREQN	RW	Q channel interface for CPU

0x0B011248 APCS_QCHANNEL_L2**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000001**Security Treatment:** Restricted

Qchannel handshake for L2

APCS_QCHANNEL_L2

Bits	Name	Type	Description
3	L2QACTIVE	R	Q channel interface for L2
2	L2QDENY	R	Q channel interface for L2
1	L2QACCEPTN	R	Q channel interface for L2
0	L2QREQN	RW	Q channel interface for L2

0x0B01122C APCS_MISC_PWR_CTL**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by GLB_SECURE [ACP].

Miscellaneous Power Control Register

APCS_MISC_PWR_CTL

Bits	Name	Description
8	CLR_EX_MON_REQ	Reserved/Not used
4	ACP_STALL_REQ	Stall transactions on ACP channel
0	L2_FLUSH_REQ	L2 Flush Request

0x0B011230 APCS_MISC_PWR_STS**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by GLB_SECURE [ACP].

Miscellaneous Power Status Register

APCS_MISC_PWR_STS

Bits	Name	Description
8	CLR_EX_MON_ACK	Reserved/Not used
4	ACP_STALL_ACK	ACP transactions stalled
0	L2_FLUSH_DONE	L2 FLush Complete acknowledge

0x0B011240 APCS_CORE_HS_STATE**Type:** R**Clock:** SYS_AHB_CLK**Reset State:** 0x00000000**Security Treatment:** None

Power collapse info for each of the core just before watchdog expiry

APCS_CORE_HS_STATE

Bits	Name	Description
3:0	HS_STATE	Head switch state for each of the core latched just before watch dog expiry. The state retains its value across watch dog reset 0x1: SET (Core was powered On before watch dog expiry) 0x0: CLEAR (Core was powered Off before watch dog expiry)

8.20 APCS_KPSS_CFG**0x0B010000 APCS_CFG_SECURE****Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00000001**Security Treatment:** Restricted

The CFG_SECURE register is used to enable or disable non-secure bus transactions. The bus **security** status is signaled by A53SS's APROTNS pin. When APROTNS is set to '0' the state of the CFG_SECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the CFG_SECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the CFG_SECURE register, non secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APCS_GCCSECURE register correspond to.

APCS_CFG_SECURE

Bits	Name	Description
0	GLB_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for the global control registers: START_ADDR.)

0x0B010004 APCS_BOOT_START_ADDR_SEC**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00100005**Security Treatment:** Controlled by CFG_SECURE[CFG_CTL].

The BOOT_START_ADDR_SEC register is used to determine the address to boot from in secure mode. It resets to the value on SYS_apcsCFGRSTADDR[31:16]. Reset by SYS_apcsSYSPor_Ares|SYS_apcsSys_Ares

APCS_BOOT_START_ADDR_SEC

Bits	Name	Description
31:16	START_ADDR	Start address for the A53
2	BOOT_128KB_EN	128 KB BOOT enable
1	VINITHI	0 = starts exceptions vectors at address 0x00000000 1 = starts exception vectors at address 0xFFFF0000
0	REMAP_EN	Enable remapping

0x0B010008 APCS_BOOT_START_ADDR_NSEC**Type:** RW**Clock:** SYS_AHB_CLK**Reset State:** 0x00100000**Security Treatment:** Secure and Nonsecure access

The BOOT_START_ADDR_NSEC register is used to determine the address to boot from in non-secure mode. It resets to the value on SYS_apcsCFGRSTADDR[31:16]. Reset by SYS_apcsSYSPor_Ares|SYS_apcsSys_Ares

APCS_BOOT_START_ADDR_NSEC

Bits	Name	Type	Description
31:16	START_ADDR	RW	Start address for the A53
2	BOOT_128KB_EN	RW	128 KB BOOT enable

8.24 APCS_ALIAS2_KPSS_ACS

0x0B0A8000 APCS_ALIAS2_APC_SECURE

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x0000000F

Security Treatment: Restricted

The APC_SECURE register is used to enable or disable non-secure bus transactions. The bus **security** status is signaled by A53SS's APROTNS pin. When APROTNS is set to '0' the state of the APC_SECURE register is not considered - a secure transaction is always allowed. When APROTNS is set to '1', the APC_SECURE register's SECURE bit must be '1' for access to be granted. If the SECURE bit is set to '0', the non-secure (APROTNS = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the APC_SECURE register, non secure agents will always read '0'. Secure agents will see the actual value of the register. The same is true for the registers or bits each bit in the APC_SECURE register correspond to.

APCS_ALIAS2_APC_SECURE

Bits	Name	Description
3	VOTE	Secure bit for SPM Voting by HLOS 0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for SPM Vote registers: SPM_VOTE_HLOS)
2	RESERVED	Reserved

0	SLP_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for the clock control registers: CPU_PWR_CTL, CPU_TRGTD_DBG_RST, APC_PWR_GATE_CTL, APC_A53_CFG_STS)

0x0B0A8004 APCS_ALIAS2_CPU_PWR_CTL

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000088

Security Treatment: Controlled by APC_SECURE [SLP_CTL].

The CPU_PWR_CTL register is used to control the clamps, reset and array head switches.

APCS_ALIAS2_CPU_PWR_CTL

Bits	Name	Description
16	CLK_EN	Clock enables for CORE clock. This is only to workaround hardware dynamic clock gating problems. 0x1: ALWAYS_ENABLED (Always enabled) 0x0: DYNAMICALLY_ENABLED_BY_HARDWARE (dynamically enabled by hardware) [20:18]= SYS_apcNAux_Clk[3:1] [17] = SYS_apcsRef_Clk [16] = SYS_apcNPIL_Clk)
10	CORE_SLEEP_STATE	Report that the CPU is in sleep state
7	CORE_PWRD_UP	Report that the CPU is powered up.
6	GATE_CLK	When set, this bit forces the CPU clock to be gated off. This control is intended to permit external masters such as the RPM to gate off the CPU clock during sleep modes, when power control is being done by an external master instead of the SPM. The output of this register bit is ORed with a clock gating control output from the SPM, so that if either the SPM asserts the control, or the RPM sets this bit, the CPU clock will be gated off. When set, this bit gate the CPU clock that must be asserted during sleep state. This bit is ORed with a SAW output before passing to the CPU core.
5	COREPOR_RST	When set, this bit asserts corepor areset to the CPU core.
4	CORE_RST	When set, this bit asserts core areset to the COPU core.
3	CORE_MEM_HS	When cleared, this bit opens a head switch to put the Core Memories into a low-leakage, non-data-retaining state. This bit is ORed with a SAW output before passing to the CPU core.
2	L1_RST_DIS	When set, this bit disables L1 initialization during low power mode exit
1	CORE_MEM_CLAMP	When set this bit clamps the output from the headswitch Core Memories. This bit is OR'ed with saw outputs before passing to the Core Memories
0	CLAMP	When set, this bit asserts the clamp signal that must be asserted prior to collapsing CPU voltage, vdd_apc0. This bit is ORed with SAW output before passing to the CPU core.

0x4*n**
Type: RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in an GICD_ISENABLER register controls the enabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int Dependant access rules.

NOTE The GICD_ISENABLER register at address offset 0x0100 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ISENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ICENABLER register.)) 0x1: SET (SET (Enables INTID N.))

**0x0B000180+ APCS_GICD_ICENABLERn, n=[0..8]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in an GICD_ICENABLER register controls the disabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int Dependant access rules.

NOTE The GICD_ICENABLER register at address offset 0x0180 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ICENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ISENABLER register.)) 0x1: CLR (CLR (Disables INTID N.))

**0x0B000200+ APCS_GICD_ISPENDRn, n=[0..8]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ISPENDR register provides the pending status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt to the Pending (or Active and Pending) state

NOTE The GICD_ISPENDR register at address offset 0x0200 is repeated once per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

APCS_GICD_ISPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ICPENDR register.)) 0x1: SET (SET (Sets INTID N to the Pending state.))

**0x0B000280+ APCS_GICD_ICPENDRn, n=[0..8]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ICPENDR register provides the pending status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt out of the Pending (or Active and Pending) state

NOTE The GICD_ICPENDR register at address offset 0x0280 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

APCS_GICD_ICPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ISPENDR register.)) 0x1: CLR (CLR (Clears INTID N. from the pending state.))

**0x0B000300+ APCS_GICD_ISACTIVERn, n=[0..8]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ISACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt to the Active (or Active and Pending) state

NOTE The GICD_ISACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ISACTIVERn

Bits	Name	Description
31:0	INT	0x0: DO_NOTHING (DO NOTHING) 0x1: SET (SET)

**0x0B000380+ APCS_GICD_ICACTIVER_n, n=[0..8]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ICACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt out of the Active (or Active and Pending) state

NOTE The GICD_ICACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

APCS_GICD_ICACTIVER_n

Bits	Name	Description
31:0	INT	0x1: CLR (CLR) 0x0: DO_NOTHING (DO NOTHING)

**0x0B000400+ APCS_GICD_IPRIORITYR_n, n=[0..71]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each field in the GICD_IPRIORITYR registers controls the priority level of an interrupt.

NOTE The GICD_IPRIORITYR registers at address offsets 0x0400 to 0x41C are repeated once per CPU Interface. These are only accessible from the designated CPU and control the priority levels for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupt priority levels.

NOTE This register is byte addressable.

The GICD_IPRIORITYR register behaves differently depending on the **security** setting of interrupt associated with the address written (NS-int) and the **security** of the bus transaction (NS-prot). Figure 26-1 shows how these differences affect different types of access.

Figure 26-1 Summary of the secure and non-secure views of interrupt priority

APCS_GICD_IPRIORITYR_n

Bits	Name	Description
31:27	INT3	
23:19	INT2	

APCS_GICD_IPRIORITYRn (cont.)

Bits	Name	Description
15:11	INT1	
7:3	INT0	All bits cleared (0x0) is the highest priority. All bits set (5'b11111) is the lowest priority. For non-secure write access, the MSB is always set (1). For non-secure read access, the MSB is always clear (0). Non-secure entities can't use the highest priorities without secure software setting such a priority. The highest priorities are typically reserved for secure software. On the other hand, secure software can, if needed, write and read the MSB. Secure entities have access to all priorities. Secure interrupts can use priority numbers 5'b10000-5'b11111 (the lower half of the priority spectrum) if needed. Due to strict 'less than' comparisons used in the CPU interface, setting an interrupt's priority to 5'b11111 effectively disables that interrupt. The number of priorities actually supported is 32. Software can determine this number by writing 0xFF and reading back the result.

**0x0B000800+ APCS_GICD_ITARGETSRn, n=[0..71]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each field in the GICD_ITARGETSR registers controls the destination CPU(s) of an interrupt.

NOTE The GICD_ITARGETSR registers at address offsets 0x0800 to 0x81C are not actually implemented. (PPI interrupts, being private, only have one destination CPU. SGI interrupts are generated by the GICD_SGIR register only and do not need the GICD_ITARGETSR.) The remaining registers control the SPI interrupt destinations.

NOTE This register is byte addressable.

APCS_GICD_ITARGETSRn

Bits	Name	Description
31:24	INT3	
23:16	INT2	
15:8	INT1	

APCS_GICD_ITARGETSRn (cont.)

Bits	Name	Description
7:0	INT0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Setting this field to 0 will disable the interrupt as no CPU will see it set. For INTIDs < 32 (the SGI and PPI), reads return the bit corresponding to the CPU performing the read (i.e. CPU 0 reads back 0x01010101). Writes are ignored. The number of CPUs actually supported is determined by NUM_CPU generic. Software can determine this number by writing 0xFF and reading back the result.

**0x0B000C00+APCS_GICD_ICFGRn, n=[0..17]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x55555555**Security Treatment:** NS-int Dependant

Each field in the GICD_ICFGR registers allows:

- control of type of an SPI:
- level-sensitive
- edge-sensitive
- reading the type of PPIs and SGIs

NOTE: The GICD_ICFGR registers at address offsets 0x0C00 to 0xC04 are repeated once per CPU Interface. These are only accessible from the designated CPU and allow read access for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

NOTE: PPI(0) is the maintenance interrupt and must be configured as level type.

NOTE: This register is not byte addressable, interrupts should be disabled before configuring their type.

NOTE: Reset state for GICD_ICFGR0 is 0xaaaaaaaa.

APCS_GICD_ICFGRn

Bits	Name	Description
31:30	INT15	
29:28	INT14	
27:26	INT13	
25:24	INT12	
23:22	INT11	

APCS_GICD_ICFGRn (cont.)

Bits	Name	Description
21:20	INT10	
19:18	INT9	
17:16	INT8	
15:14	INT7	
13:12	INT6	
11:10	INT5	
9:8	INT4	
7:6	INT3	
5:4	INT2	
3:2	INT1	
1:0	INT0	0x0: LVL_N_TO_N (LVL N to N) 0x1: LVL_1_TO_N (LVL 1 to N) 0x2: EDGE_N_TO_N (EDGE N to N) 0x3: EDGE_1_TO_N (EDGE 1 to N) These bits behave differently for each of the three interrupt types as follows: - For SGI, read back as 0b10 - SGI interrupts are edge-sensitive and use the N-N model. - For PPI/SPI, read/writable as 0b01 or 0b11 - PPI/SPI interrupts can be edge or level sensitive and use the 1-N model.)

**0x0B000F10+ APCS_GICD_CPENDSGIRn, n=[0..3]
 0x4*n**
Type: RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

Each field in the GICD_CPENDSGIR register, when written as 1, clears the corresponding pending bit of the source CPU for the corresponding SGI.

NOTE If the SGI is marked secure, only a secure access can access that SGI's pending bits.

NOTE This register is byte addressable.

APCS_GICD_CPENDSGIRn

Bits	Name	Description
31:24	SGI3	

APCS_GICD_CPENDSGIRn (cont.)

Bits	Name	Description
23:16	SGI2	
15:8	SGI1	
7:0	SGI0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Writing a 1 to any bit clears the pending status bit from the CPU to the SGI.

**0x0B000F20+ APCS_GICD_SPENDSGIRn, n=[0..3]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

Each field in the GICD_SPENDSGIR register, when written as 1, sets the corresponding pending bit of the source CPU for the corresponding SGI.

NOTE If the SGI is marked secure, only a secure access can access that SGI's pending bits.

NOTE This register is byte addressable.

APCS_GICD_SPENDSGIRn

Bits	Name	Description
31:24	SGI3	
23:16	SGI2	
15:8	SGI1	
7:0	SGI0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Writing a 1 to any bit sets the pending status bit from the CPU to the SGI.

**0x0B001100+ APCS_GICH_LRn, n=[0..3]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICH_LRn provides access to each of the list registers in the Hypervisor Interface.

APCS_GICH_LRn

Bits	Name	Description
31	HW	Indicates that this is a Hardware interrupt. When this bit is set, bits 19:10 contain the Physical interrupt number, and when this interrupt is subject to an EOI request, a Deactivate Interrupt request will be sent to the Interrupt Distributor.
30	GRP	Indicates that this interrupt should be treated as Group1. This means that the interrupt will present as an IRQ if GICV_CTLR[EnableG1] bit is set. If the GRP bit is clear, the interrupt is put into Group0 and will present as either IRQ or FIQ depending on the setting of the GICV_CTLR[FIQen] but only if GICV_CTLR[EnableG0] bit is also set. This bit is also used with GICV_CTLR[CBPR] to determine which Binary Point register is used in GICV for preemption calculations.
29:28	STATE	0x0: IDL (IDL (INVALID)) 0x1: PNA (PNA (PENDING, NOT ACTIVE)) 0x2: A (A (ACTIVE)) 0x3: PA (PA (PENDING and ACTIVE)) NOTE: for hardware interrupts, the PENDING+ACTIVE state is held in the physical Distributor rather than the VCPUIF. The PENDING+ACTIVE state (11) should only be used for software originated interrupts (Virtual Devices) or SGIs.)
27:23	PRI	Indicates the priority of this interrupt. This is converted to a traditional 8 bit QGIC priority value by appending three zero bits.
19:10	PHY_ID	The physical ID of the interrupt (which SGI/PPI/SPI is it?). When the HW bit is set this field indicates the physical interrupt ID, which is forwarded to the Distributor when this interrupt is subject to an EOI request. See below for details when the HW bit is clear. If the Physical ID is between 16 and 31 inclusive (PPI space), the Deactivation will apply to the PPI associated with the same physical CPU as the VCPUIF making the request. If the Physical ID is between 0 and 15 inclusive (SGI space), the Deactivation will still apply to SGI associated with the same physical CPU as the VCPUIF making the request but it is expected that the HW bit and Physical ID will NOT be used for SGIs.
9:0	VIRTL_ID	Indicates the Virtual ID. This ID is returned to the Guest OS when this interrupt is acknowledged via the GICV_IAR (Interrupt Acknowledge register).

9 OCIMEM Wrapper CSR

9.1 OCIMEM_CSR

Description of OCIMEM Control and Status Register Space.

9.1.1 OCIMEM_CSR

OCIMEM Core Control Registers

Description of OCIMEM Control and Status Register Space.

0x0005000C OCIMEM_GEN_STAT

Type: R

Reset State: 0x00000000

OCIMEM_GEN_STAT

Bits	Name	Description
1	AXI_ERR_SLEEP	Access to memory in sleep mode error. This field set on the first AXI error and is cleared by writing OCIMEM_INTC_CLR.AXI_ERR_INT_CLR
0	AXI_ERR_DECODE	Address decode error on an AXI port. This field set on the first AXI error and is cleared by writing OCIMEM_INTC_CLR.AXI_ERR_INT_CLR

0x00050010 OCIMEM_INTC_CLR

Type: RW

Reset State: 0x00000000

OCIMEM Interrupt Control. Writing a '1' to any bit field clears the associated interrupt. Writing follow-up '0s' is not required

OCIMEM_INTC_CLR

Bits	Name	Description
0	AXI_ERR_INT_CLR	Clear AXI error interrupt

0x00050014 OCIMEM_INTC_MASK**Type:** RW**Reset State:** 0x00000001

OCIMEM Interrupt Mask. This register is used to mask (disable) interrupt sources.

OCIMEM_INTC_MASK

Bits	Name	Description
0	AXI_ERR_INT_MSK	AXI error interrupt mask bit

0x00050018 OCIMEM_INTC_STAT**Type:** R**Reset State:** 0x00000000

OCIMEM Interrupt Status register.

OCIMEM_INTC_STAT

Bits	Name	Description
0	AXI_ERR_INT_STAT	AXI Address decode error. Query OCIMEM_GEN_STAT register for additional details on error. Clear by writing OCIMEM_INTC_CLR.AXI_ERR_INT_CLR

0x0005001C OCIMEM_OSW_STATUS**Type:** R**Reset State:** 0x00000001

OCIMEM OSW Status Register

OCIMEM_OSW_STATUS

Bits	Name	Description
5	OSW_RRESP_FIFO_FULL	Indicate whether FIFO is full. 0 - NOT FULL 1 - FULL
4	OSW_WRESP_FIFO_FULL	Indicate whether FIFO is full. 0 - NOT FULL 1 - FULL
3	OSW_RDDATA_FIFO_FULL	Indicate whether FIFO is full. 0 - NOT FULL 1 - FULL
2	OSW_WRDATA_FIFO_FULL	It indicates whether the Write Data FIFO within OSW0 is currently FULL or not.
1	OSW_CMDFIFO_FULL	It indicates whether the Command FIFO within OSW0 is currently FULL or not.
0	OSW_STAT_IDLE	It indicates whether OSW0 is currently IDLE or BUSY.

0x00050034 OCIMEM_PSCGC_TIMERS**Type:** RW**Reset State:** 0x00000F0F

This register sets the timers that ensure that there is sufficient margin between the memory clocks turning off/on and the memory sleep signals begin asserted/de-asserted

OCIMEM_PSCGC_TIMERS

Bits	Name	Description
11:8	TO_SLEEP_COUNTER	4 bit count down, must be 20ns
3:0	WAKEUP_COUNTER	4 bit count down, must be 20ns

0x00050038 OCIMEM_PSCGC_STAT**Type:** R**Reset State:** 0x00000000

This register provides the clk-off status of each memory cgc controller.

OCIMEM_PSCGC_STAT

Bits	Name	Description
0	M0_PSCGC_CLKOFF	Indicates clock-off status for the associated memory macro

0x0005003C OCIMEM_PSCGC_M0_M7_CTL**Type:** RW**Reset State:** 0x00000002

Memory Banks 0 to 7 PSCGC Power Control. This register is used to perform fine-grain sleep control over OCIMEM memory macros.

OCIMEM_PSCGC_M0_M7_CTL

Bits	Name	Description
2:0	M0_PSCGC_CTL	Controls the inputs {async_clk_halt, up_force_core_on, up_force_periph_on} for the 3 macros in Bank 0 in Elan. These macros are put to sleep/waken together. bit [2 1 0] 0 0 0 = norm_passthru - upstream sleep-controller is in control (default) 0 1 0 = norm_force_core_on - memory core is forced on 0 0 1 = norm_force_periph_on - peripheral controller is forced on 0 1 1 = norm_force_all_on - peripheral controller and core are forced on 1 1 0 = slp_ret - sleep with retention, periph off 1 1 1 = slp_ret_periph_on - sleep with retention, periph on 1 0 0 = slp_nret - sleep without retention other = Not supported Note: 1. typical sequence from normal to sleep with retention state sequence (one prgm write): norm_passthru -> slp_ret 2. typical sequence from sleep with retention to normal state sequence (two prgm writes): slp_ret -> norm_force_core_on -> norm_passthru 3. typical sequence from normal to sleep no retention state sequence (one prgm write): norm_passthru -> slp_nret 4. typical sequence from sleep no retention to normal state sequence (one prgm write): slp_nret -> norm_passthru

0x00050060 OCIMEM_ERR_ADDRESS**Type:** R**Reset State:** 0x00000000

The OCIMEM_ERR_ADDRESS register contains the lower (from NOC slave port) address of the request that caused the AXI bus error. This register will be updated by hardware upon the detection of an AXI address decode or sleep error. Once set, the register will be locked until bit OCIMEM_INTC_CLR.AXI_ERR_INT_CLR is written to clear the error.

OCIMEM_ERR_ADDRESS

Bits	Name	Description
31:0	ERROR_ADDRESS	Lower (System NOC Slave port) address of the request that caused the bus error. For Elan 2 MB is reserved so MSB is bit 20:3 are significant

0x00050064 OCIMEM_AXI_ERR_SYNDROME

Type: R

Reset State: 0x00000000

The OCIMEM_AXI_ERR_SYNDROME register provides various data about the request that caused the AXI bus error. This register will be updated by hardware upon the detection of an address decode or sleep error. Once set, the register will be locked until bit OCIMEM_INTC_CLR.AXI_ERR_INT_CLR is written to clear the error.

OCIMEM_AXI_ERR_SYNDROME

Bits	Name	Description
31:29	ERROR_ABID	The Bus ID of the request that caused the bus error.
28:24	ERROR_APID	The Port ID of the request that caused the bus error.
23:16	ERROR_AMID	The Master ID of the request that caused the bus error.
14:8	ERROR_ATID	The Transfer ID of the request that caused the bus error
5	ERROR_ABURST	The ABURST of the request that caused the bus error
4	ERROR_AWRITE	The awrite of the request that caused bus error
3:0	ERROR_ALEN	The burst length of the request that caused bus error

10 WCSS

10.1 WCSS_BT_SYSCCLK

10.1.1 WCSS_A_BT_SYSCCLK_BT_SYSCCLK

0x0A440050 WCSS_A_BT_SYSCCLK_CMPR_EN

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_SYSCCLK_CMPR_EN

Bits	Name	Description
1	CMPR_INT_STAT_1	Comparator Interrupt Status
0	CMPR_EN_0	0x1: Enable comparator interrupt

0x0A440054 WCSS_A_BT_SYSCCLK_CMPR_INTGR

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_SYSCCLK_CMPR_INTGR

Bits	Name	Description
27:0	CMPR_INTGR_27_0	Integer part of the comparator

0x0A440058 WCSS_A_BT_SYSCCLK_CMPR_FRACT

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_SYSCLK_CMPR_FRACT

Bits	Name	Description
12:0	CMPR_FRACT_12_0	Fractional part of the comparator

0x0A440070 WCSS_A_BT_SYSCLK_COUNTVAL**Type:** RW**Clock:** PCLK**Reset State:** 0x0000FA00**WCSS_A_BT_SYSCLK_COUNTVAL**

Bits	Name	Description
16:0	COUNTVAL_16_0	Average number of 16 MHz cycles in an LPO clock cycle. A read returns the last calculated lpo_countval. A write forces a new lpo_countval to be loaded. Bit 16:7 is the integer portion of lpo_countval. Bit 6:0 is the fractional portion of lpo_countval.

0x0A440100 WCSS_A_BT_SYSCLK_CONTROL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Calibration Control

WCSS_A_BT_SYSCLK_CONTROL

Bits	Name	Description
2	CONTROL_2	0x0: selects calibration length of 64. 0x1: selects calibration length of 128.
1:0	CONTROL_1_0	0x0: Calibrator disabled. 0x1: Calibrate once when issued. 0x2: Calibrate when issued, repeat calibration after exiting deep sleep. 0x3: Calibrate continuously.

0x0A440104 WCSS_A_BT_SYSCCLK_COMPLETE**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_SYSCCLK_COMPLETE**

Bits	Name	Description
0	COMPLETE_0	Single sticky bit that is set when the calibration is complete. This bit can be set or cleared by writing to this register.

0x0A440120 WCSS_A_BT_SYSCCLK_CLKN_CAPTURE_CTL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_SYSCCLK_CLKN_CAPTURE_CTL**

Bits	Name	Description
2	CLKN_CAPTURE_BUSY	Indicates hardware is enabled to generate CLKN_PULSE_32K and pulse has not completed 0x0: Idle 0x1: Busy
1	CLKN_PULSE_32K	One 32K768 pulse status
0	CLKN_CAPTURE_PULSE_EN	Write 1 to enable the generation of a pulse on the next edge of the 32k768 sleep clock. Bit is self clearing.

0x0A440124 WCSS_A_BT_SYSCCLK_CLKN_CAPTURE_INTEGER_VAL**Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_SYSCCLK_CLKN_CAPTURE_INTEGER_VAL**

Bits	Name	Description
27:0	CLKN_INTEGER	integer value captured by CLKN_PULSE_32K.

0x0A440128 WCSS_A_BT_SYSCLK_CLKN_CAPTURE_FRACT_VAL

Type: R
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_SYSCLK_CLKN_CAPTURE_FRACT_VAL

Bits	Name	Description
12:0	CLKN_FRACT	fractional value captured by CLKN_PULSE_32K.

0x0A440130 WCSS_A_BT_SYSCLK_MASTER_MEM_ADDR

Type: RW
Clock: PCLK
Reset State: 0x0000FB29

WCSS_A_BT_SYSCLK_MASTER_MEM_ADDR

Bits	Name	Description
15:0	MASTER_ADDR	Upper 16 bits of address (31:16) used for LC accesses to AHB address space. LC sources the lower AHB addresses bits (15:0).

0x0A440134 WCSS_A_BT_SYSCLK_SLAVE_BT_ADDR

Type: RW
Clock: PCLK
Reset State: 0x0000FB00

WCSS_A_BT_SYSCLK_SLAVE_BT_ADDR

Bits	Name	Description
15:7	SLAVE_ADDR	Upper 9 bits of address (31:23) used for LC accesses to crypto (through AHB).
6:0	RESERVED_X134	

0x0A4400A0 WCSS_A_BT_SYSCLK_PVC_SSB12_INTR

Type: RW
Clock: PCLK
Reset State: 0x00000008

Raw status

WCSS_A_BT_SYSCLK_PVC_SSB12_INTR

Bits	Name	Description
8	PVC_RESET	0x1: reset all PVC hardware (FIFO, PVC, SSB1). 0x0: no reset.
7	FLUSH_PVC_FIFO	0x1: Flush PVC FIFO. 0x0: no flush.
6	ENABLE_PVC_BUSY_INTR	0x1: enable PVC_BUSY condition to activate SSB12_INTR interrupt line. 0x0: disabled.
5	PVC_BUSY	0x1: PVC SSB12 hardware port is busy. 0x0: Software performs SSB12 reads/writes when this bit is unset, to allow PVC traffic priority.
4	SSB12_INT	0x1: SSB12_INT_ENABLE[0] is set and SSB12_RD_STATUS[27] is set.
3	PVC_FIFO_EMPTY	Raw PVC_FIFO_EMPTY status
2	ENABLE_PVC_FIFO_EMPTY_INTR	0x1: enable PVC_FIFO_EMPTY condition to activate SSB12_INTR interrupt line.
1	PVC_FIFO_FULL	Raw PVC_FIFO_FULL status.
0	ENABLE_PVC_FIFO_FULL_INTR	0x1: enable PVC_FIFO_FULL condition to activate SSB12_INTR interrupt line.

10.2 WCSS_BT**10.2.1 WCSS_A_BT_BT_LINK_CTRL****0x0A3FF000 WCSS_A_BT_INT_0_INTERRUPT_CONTROL****Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_INT_0_INTERRUPT_CONTROL**

Bits	Name	Description

1	MASKSLOT	0x0: Masked 0x1: Unmasked
0	MASKPRE	0x0: Masked 0x1: Unmasked

0x0A3FF008 WCSS_A_BT_INT_0_BTC_INTERRUPT_STATUS_AND_ACKNOWLEDGE**Type:** RW**Clock:** PCLK**Reset State:** 0x0000000A

The Int0En and corresponding mask registers do not affect the raw status interrupt register.

WCSS_A_BT_INT_0_BTC_INTERRUPT_STATUS_AND_ACKNOWLEDGE

Bits	Name	Description
9	STATRXABORT	Raw Rx abort status 0x0: No abort 0x1: abort
8	STATRSSI	RSSI capture from serial interface status 0x0: RSSI not captured 0x1: RSSI captured
7	STATFS	Raw coex_frame_sync interrupt status 0x0: No interrupt 0x1: Interrupt is pending
6	STATTXABORT	Raw Tx abort interrupt status 0x0: No interrupt 0x1: Interrupt is pending
5	STATTX	Raw Tx interrupt status 0x0: No interrupt 0x1: Interrupt is pending
4	STATLC	Raw LC interrupt status 0x0: No interrupt 0x1: Interrupt is pending
3	STATHALF	Raw pre-halfslot interrupt status 0x0: No interrupt 0x1: Interrupt is pending
2	STATRX	Raw Rx interrupt status 0x0: No interrupt 0x1: Interrupt is pending
1	STATSLOT	Raw slot-timer interrupt status 0x0: No interrupt 0x1: Interrupt is pending
0	STATPRE	Raw preslot interrupt status 0x0: No interrupt 0x1: Interrupt is pending

0x0A3FF00C WCSS_A_BT_INT_0_BTC_PRE SLOT_FILTER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Int0 preslot filter control and status; shared down counter that is loaded or cleared by writing to this address decrements every preslot timeout until the down counter reaches zero

WCSS_A_BT_INT_0_BTC_PRE SLOT_FILTER

Bits	Name	Description
7:0	PRESLOTFLTR	Range is 0 to 0xFF (255) preslot time-outs Write : starts the filter by loading the number of consecutive preslot time-outs to be filtered; writing a zero immediately disables the filter. Read : returns the current number of preslots still to be filtered; zero indicates that the filter is no longer active.

0x0A3FF010 WCSS_A_BT_INT_0_BTC_SLOT_BURST_TIMER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Int0 programmable slot timer; generates an interrupt at a specific time during a slot.

WCSS_A_BT_INT_0_BTC_SLOT_BURST_TIMER

Bits	Name	Description
13	HALFSLOT	0x0: Use half slot 0 0x1: Use half slot 1
12:0	SLOTTIMER	Indicates at which fractional bt clock location to fire the interrupt Time during slot=[312.5 usec * SlotTimer(13)]+[62.5 nsec * SlotTimer(12:0)] Fractional range=0 to 0x1387 (4999) resolution = 62.5 nsec

0x0A3FF014 WCSS_A_BT_BLUETOOTH_CLOCK_N_COMPARATOR_INTERRUPT_CONTROL_STATUS**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

ClkCmpEn does not affect this register's raw status.

WCSS_A_BT_BLUETOOTH_CLOCK_N_COMPARATOR_INTERRUPT_CONTROL_STATUS

Bits	Name	Description
5	CLKCMPINT2	Raw clock N comparator interrupt status. 0x0: No interrupt 0x1: interrupt is pending

WCSS_A_BT_BLUETOOTH_CLOCK_N_COMPARATOR_INTERRUPT_CONTROL_STATUS

Bits	Name	Description
4	CLKCMPEN2	Clock N comparator interrupt enable 0x0: Disables interrupt and clears interrupt status ClkCmplInt = 0 0x1: Enables interrupt
3	CLKCMPINT1	Raw clock N comparator interrupt status 0x0: No interrupt 0x1: interrupt is pending
2	CLKCMPEN1	Clock N comparator interrupt enable 0x0: Disables interrupt and clears interrupt status ClkCmplInt = 0 0x1: Enables interrupt
1	CLKCMPINT0	Raw clock N comparator interrupt status 0x0: No interrupt 0x1: interrupt is pending
0	CLKCMPEN0	Clock N comparator interrupt enable 0x0: Disables interrupt and clears interrupt status ClkCmplInt = 0 0x1: Enables interrupt

0x0A3FF018 WCSS_A_BT_CAPTURED_BT_CLKN_INTEGER_PORTION**Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_CAPTURED_BT_CLKN_INTEGER_PORTION**

Bits	Name	Description
27:0	BTCLKN_40_13	Bits 40:13 of the clkn captured instantly when a Tx or Rx hard align

0x0A3FF01C WCSS_A_BT_CAPTURED_BT_CLKN_FRACTIONAL_PORTION**Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_CAPTURED_BT_CLKN_FRACTIONAL_PORTION**

Bits	Name	Description
12:0	BTCLKN_12_0	Bits 12:0 of the clkn captured instantly when a Tx or Rx hard align

0x0A3FF020 WCSS_A_BT_CAPTURED_BT_CLKA_INTEGER_PORTION

Type: R
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_CAPTURED_BT_CLKA_INTEGER_PORTION

Bits	Name	Description
27:0	BTCLKA_40_13	Bits 40:13 of the local ClkA captured instantly when a Tx or Rx hard align

0x0A3FF024 WCSS_A_BT_CAPTURED_BT_CLKA_FRACTIONAL_PORTION

Type: R
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_CAPTURED_BT_CLKA_FRACTIONAL_PORTION

Bits	Name	Description
12:0	BTCLKA_12_0	Bits 12:0 of the local ClkA captured instantly when a Tx or Rx hard align

0x0A3FF028 WCSS_A_BT_BT_CLOCK_CONTROL

Type: RW
Clock: PCLK
Reset State: 0x00000000

This register does not apply to LE.

WCSS_A_BT_BT_CLOCK_CONTROL

Bits	Name	Description
2	CLKNLDSEL	Select edge detector circuit to use for coex_frame_sync 0x0: use qct_edge_detect component 0x1: use edge detector from register delays
1	CLKNLDEN	Enable load of BT CLKN on a rising edge of LTE coex_frame_sync 0x0: Disabled 0x1: Load BT ClkN value into LTE Frame Sync Captured ClkN registers on rising edge of coex_frame_sync

WCSS_A_BT_BT_CLOCK_CONTROL (cont.)

Bits	Name	Description
0	LDFHS	Load clk(27:2) from the last received FHS packet into the Bt ClkA(27:2) counter; bit(1:0) of Bt ClkA remains unchanged 0x0: No change 0x1: Load FHS clk 27:2 into Bt ClkA27:2 fractional bits stall during the load

0x0A3FF02C WCSS_A_BT_BT_CLOCK_ALU_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

This is the Bluetooth clock ALU command register and issues (writes) the ALU command as programmed in the individual registers. It does not handle long LE packets because of the MOD 5000 operation inside the ALU.

WCSS_A_BT_BT_CLOCK_ALU_COMMAND

Bits	Name	Description
18:16	OP_0	Selects input 0 of the Bluetooth clock ALU 0x0: Zeroes 0x1: bt_clk operand register 0x2: bt_clkn 0x3: bt_clka 0x4: bt_clk accumulator register 0x5: bt_clk_cap and zeroes
14:12	OP_1	Selects input 1 of the Bluetooth clock ALU 0x0: Zeroes 0x1: bt_clk operand register 0x2: bt_clkn 0x3: bt_clka 0x4: bt_clk accumulator register 0x5: bt_clk_cap and zeroes
8	OP	Executed by the Bluetooth clock ALU 0x0: Add OP_0 + OP_1 0x1: Subtract OP_0 - OP_1
6	LR	Load accumulator register with entire ALU result; not affected by update fields. 0x0: Do not capture alu result in accumulator register 0x1: Update the integer IntgrAcc and fractional FracAcc accumulator registers with the ALU result for read-back or accumulation or both

WCSS_A_BT_BT_CLOCK_ALU_COMMAND (cont.)

Bits	Name	Description
5	LN	Load ClkN counter with the entire or partial ALU result. 0x0: Do not capture ALU result in Bt ClkN 0x1: Update the entire or partial integer and fractional Bt ClkN counters with the alu result according to the update fields. Fractional bits stall during the load.
4	LA	Load ClkA counter with the entire or partial ALU result. 0x0: Do not capture ALU result in Bt ClkA 0x1: Update the entire or partial integer and fractional Bt ClkA counters with the ALU result according to update fields. Fractional bits stall during load
3	UU	Update upper Bt Clk field allows bit(27:2) of Bt ClkN or Bt ClkA, or both, to be updated when an LN or LA, or both, ALU command is issued. 0x0: Do not update bit 27:2 0x1: Update bit 27:2
2	U1	Update Bt Clk (1) field (U1) allows bit(1) of Bt ClkN and/or Bt ClkA to be updated when a LN and/or LA alu command is issued. 0x0: Do not update bit 1 0x1: Update bit 1
1	U0	Update Bt Clk (0) field allows bit(0) of Bt ClkN and/or Bt ClkA to be updated when a LN and/or LA alu command is issued. 0x0: Do not update bit 0 0x1: Update bit 0
0	UF	Update fractional Bt Clk field allows the 13-bit fractional portion of Bt ClkN and/or Bt ClkA to be updated when an LN and/or LA alu command is issued. 0x0: Do not update fractional bits 0x1: Update fractional bits

0x0A3FF030 WCSS_A_BT_BT_CLOCK_ALU_INTEGER_OPERAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_BT_CLOCK_ALU_INTEGER_OPERAND

Bits	Name	Description
27:0	INTGROPRND	Integer portion of the Bluetooth clock ALU scratchpad operand; selected as an input to the ALU by OP_0 and OP_1; does not apply to LE. Range is 0 to 0xFFFFFFFF halfslots Resolution is 312.5 usec

0x0A3FF034 WCSS_A_BT_BT_CLOCK_ALU_FRACTIONAL_OPERAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BT_CLOCK_ALU_FRACTIONAL_OPERAND**

Bits	Name	Description
12:0	FRACOPRND	Fractional portion of the Bluetooth clock ALU scratchpad operand; selected as an input to the ALU by OP_0 and OP_1; does not apply to LE. Range = 0 to 0x1387 (4999) Resolution = 62.5 nsec

0x0A3FF038 WCSS_A_BT_BT_CLOCK_ALU_INTEGER_ACCUMULATOR**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BT_CLOCK_ALU_INTEGER_ACCUMULATOR**

Bits	Name	Description
27:0	INTGRACC	Integer portion of the Bluetooth clock ALU accumulator register; shared register that is selected as an input to the ALU by OP_0 and OP_1; can also be loaded with the result of an ALU operation when the LR command bit is set; does not apply to LE. Range = 0 to 0xFFFFFFFF halfslots Resolution = 312.5 usec

0x0A3FF03C WCSS_A_BT_BT_CLOCK_ALU_FRACTIONAL_ACCUMULATOR**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BT_CLOCK_ALU_FRACTIONAL_ACCUMULATOR**

Bits	Name	Description
12:0	FRACACC	Fractional portion of the Bluetooth clock ALU accumulator register; shared register that is selected as an input to the ALU by OP_0 and OP_1 can also be loaded with the result of an ALU operation when the LR command bit is set; does not apply to LE. Range = 0 to 0x1387 (4999) Resolution = 62.5 nsec

0x0A3FF040 WCSS_A_BT_LTE_FRAME_SYNC_CAPTURED_BT_CLKN_INTEGER_PORTION**Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_LTE_FRAME_SYNC_CAPTURED_BT_CLKN_INTEGER_PORTION**

Bits	Name	Description
27:0	BTCLKN_40_13	Bits 40:13 of the ClkN captured at the rising edge of coex_frame_sync

0x0A3FF044 WCSS_A_BT_LTE_FRAME_SYNC_CAPTURED_BT_CLKN_FRACTIONAL_PORTION**Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_LTE_FRAME_SYNC_CAPTURED_BT_CLKN_FRACTIONAL_PORTION**

Bits	Name	Description
12:0	BTCLKN_12_0	Bits 12:0 of the ClkN captured at the rising edge of coex_frame_sync

0x0A3FF048 WCSS_A_BT_ENCRYPTION_CONTROL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_ENCRYPTION_CONTROL**

Bits	Name	Description
3	MIC_EN	For encryption and decryption when MIC is disabled, software should program the Crypto CNTR mode: 0x0: Disable MIC (for Crypto) 0x1: Enable MIC (for Crypto)
2	CRYPTO_EN	0x0: Disable Crypto 0x1: Enable Crypto for encryption, decryption
1	BRENCREN	Enables encryption for broadcast packets during transmit and receive; a broadcast packet has an all-zero am_addr field in the packet header; shall be set to 0 for LE. 0x0: Disable broadcast encryption 0x1: Enable broadcast encryption, except for FHS packets
0	ENCREN	Enables encryption for non-broadcast packets during transmit and receive; a non-broadcast packet has a non-zero am_addr field in the packet header; applies to BR/EDR and LE. 0x0: Disable non-broadcast encryption. 0x1: Enable non-broadcast encryption, except for FHS packets

0x0A3FF04C WCSS_A_BT_ENCRYPTION_K_C_KEY_0_LE_SESSION_KEY_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_ENCRYPTION_K_C_KEY_0_LE_SESSION_KEY_0**

Bits	Name	Description
31:0	ENCRKEY_31_0	KC encryption key is 128 bits long, using 4 consecutive words; loaded into the encryption engine during blending for transmit and receive.

0x0A3FF050 WCSS_A_BT_ENCRYPTION_K_C_KEY_1_LE_SESSION_KEY_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_ENCRYPTION_K_C_KEY_1_LE_SESSION_KEY_1**

Bits	Name	Description
31:0	ENCRKEY_63_32	See ENCRYPTION_K_C_KEY_0_LE_SESSION_KEY_0.

0x0A3FF054 WCSS_A_BT_ENCRYPTION_K_C_KEY_2_LE_SESSION_KEY_2**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_ENCRYPTION_K_C_KEY_2_LE_SESSION_KEY_2**

Bits	Name	Description
31:0	ENCRKEY_95_64	See ENCRYPTION_K_C_KEY_0_LE_SESSION_KEY_0.

0x0A3FF058 WCSS_A_BT_ENCRYPTION_K_C_KEY_3_LE_SESSION_KEY_3**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_ENCRYPTION_K_C_KEY_3_LE_SESSION_KEY_3**

Bits	Name	Description
31:0	ENCRKEY_127_96	See ENCRYPTION_K_C_KEY_0_LE_SESSION_KEY_0.

0x0A3FF05C WCSS_A_BT_CAPTURED_UAP**Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_CAPTURED_UAP**

Bits	Name	Description
7:0	UAPCAP	UAP field of the BdAddr(31:24) that was captured by the link controller; used to initialize the HEC and CRC LFSRs for the Tx and Rx data paths.

0x0A3FF060 WCSS_A_BT_BT_DEVICE_ADDRESS_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BT_DEVICE_ADDRESS_0**

Bits	Name	Description
31:0	BDADDR_31_0	Bluetooth device address, which is 48 bits long using two consecutive words; used directly by the hop kernel and the encryption engine. UAP portion, BdAddr(31:24), is captured and frozen at the TxCmdTo/RxCmdTo; used to initialize the Tx and Rx HEC and CRC LFSRs For LE, the BdAddr field is used to initialize the CRC LFSR input BdAddr(23:0) used as the 24-bit CRC initialization value for the LE CRC BdAddr(47:24) are unused in LE

0x0A3FF064 WCSS_A_BT_BT_DEVICE_ADDRESS_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BT_DEVICE_ADDRESS_1**

Bits	Name	Description
15:0	BDADDR_47_32	See BT_DEVICE_ADDRESS_0

0x0A3FF068 WCSS_A_BT_HOP_CONTROL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HOP_CONTROL**

Bits	Name	Description
7	AFHEN	Enables adaptive frequency hopping; enables the same channel mechanism and the substitution of a valid channel for a bad channel; shall be set to 0 for LE. 0x0: Disable 0x1: Enable

WCSS_A_BT_HOP_CONTROL (cont.)

Bits	Name	Description
6	OFFSEONLY	Controls the use of HopOffset when generating the hop frequency (HopFreq) for the radio synthesizer; shall be set to 1 for LE (software must program the hop frequency.) 0x0: Add HopOffset and the calculated channel to generate HopFreq; normal 0x1: Use HopOffset directly to generate HopFreq; testing/LE functional
4	FRZCLK	Controls portions of the captured Bluetooth clock when an LC command recaptures the selected Bluetooth clock (Capt0 = 1 or Capt1 = 1); shall be set to 0 for LE. 0x0: Update entire captured Bluetooth clock with the selected Bluetooth clock + 1 0x1: Freeze bits 16:12, 4:2, 0 of the captured Bluetooth clock; update rest of the captured Bluetooth clock with the selected Bluetooth clock + 1
3	PGTRAIN	Selects the page train (and koffset) to be used when the hop kernel calculates a new channel. 0x0: Use A train koffset = 24 0x1: Use B train koffset = 8
2:0	HOPTYPE	Selects the hopping sequence to be used by the hop kernel when calculating a channel; Shall be set to 000 for LE. 0x0: Page scan/inquiry scan, X00 0x1: Page/inquiry, X01 0x2: Slave page response/inquiry response 0x6: Master page response/inquiry response 0x3: Connection, X11

0x0A3FF06C WCSS_A_BT_HOP_N_COUNT**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_HOP_N_COUNT

Bits	Name	Description
4:0	HOPNCNT	N count to be used by the hop kernel when calculating a channel; used by the hop kernel only when HopType = master page response/inquiry response or slave page response / inquiry response; Shall be set to 0 for LE.

0x0A3FF070 WCSS_A_BT_HOP_OFFSET**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HOP_OFFSET**

Bits	Name	Description
6:0	HOPOFFSET	Hop offset register, which should be set to 2 in normal mode (OffsetOnly = 0); is added to the calculated channel (0 to 78) to produce a valid frequency offset (2 to 80 Mhz). In BT test mode (OffsetOnly = 1), used directly, therefore it should be set to a valid frequency offset within the specified range Valid range = 0x02 (2) to 0x50 (80) Mhz; values out of range are not restricted.

0x0A3FF074 WCSS_A_BT_HOP_COEXISTENCE_LOW_CHANNEL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HOP_COEXISTENCE_LOW_CHANNEL**

Bits	Name	Description
6:0	LOWCHAN	Lower limit of the 802.11x range of channels (see Coexistence Command). Range = 0 to 0x4E (78)

0x0A3FF078 WCSS_A_BT_HOP_COEXISTENCE_HIGH_CHANNEL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HOP_COEXISTENCE_HIGH_CHANNEL**

Bits	Name	Description
6:0	HIGHCHAN	Upper limit of the 802.11x range of channels (see Coexistence command). Range = 0 to 0x4E (78)

0x0A3FF07C WCSS_A_BT_HOP_AFH_CHANNEL_MAP_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

AFH channel map, which is 79 bits long; using 3 consecutive words; shall be set to 0 for LE. The hop kernel indexes this channel map only when adaptive frequency hopping is enabled (AfhEn = 1). Each bit location represents a corresponding channel (bit 0 is channel 0, etc).

A particular channel can be avoided by setting its corresponding bit location to indicate a bad channel. When the hop kernel calculates a channel that is deemed bad according to this channel map, it substitutes a valid AFH channel.

WCSS_A_BT_HOP_AFH_CHANNEL_MAP_0

Bits	Name	Description
31:0	AFHMAP_31_0	Each bit location represents a corresponding channel (bit 0 is channel 0, etc). 0: Indicates a bad channel to be avoided. 1: Indicates a valid channel

0x0A3FF080 WCSS_A_BT_HOP_AFH_CHANNEL_MAP_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HOP_AFH_CHANNEL_MAP_1**

Bits	Name	Description
31:0	AFHMAP_63_32	See HOP_AFH_CHANNEL_MAP_0

0x0A3FF084 WCSS_A_BT_HOP_AFH_CHANNEL_MAP_2

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_HOP_AFH_CHANNEL_MAP_2

Bits	Name	Description
14:0	AFHMAP_78_64	See HOP_AFH_CHANNEL_MAP_0

0x0A3FF088 WCSS_A_BT_HOP_HALF_SLOT_0_BCA_CHANNEL

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_HOP_HALF_SLOT_0_BCA_CHANNEL

Bits	Name	Description
6:0	BCA0CHAN	Channel that is added to HopOffset when a power burst measurement (bad channel assessment) LC command is issued for halfslot 0 (see Cmd0). Valid range = 0 to 0x4E (78); values out of range are not restricted.

0x0A3FF08C WCSS_A_BT_HOP_HALF_SLOT_1_BCA_CHANNEL

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_HOP_HALF_SLOT_1_BCA_CHANNEL

Bits	Name	Description
6:0	BCA1CHAN	See HOP_HALF_SLOT_0_BCA_CHANNEL

0x0A3FF090 WCSS_A_BT_HOP_FREQUENCY

Type: R
Clock: PCLK
Reset State: 0x00000000

Hop frequency generated for the radio synthesizer; the high-level priority scheme that shows how the other hop registers are used to generate the hop frequency:

HopFreq <= HopOffset when (OffsetOnly = 1) else

HopOffset + Bca0Chan when (servicing Cmd0 = RxBca) else

HopOffset + Bca1Chan when (servicing Cmd1 = RxBca) else

HopOffset + calculated channel

WCSS_A_BT_HOP_FREQUENCY

Bits	Name	Description
6:0	HOPFREQ	Valid range = 0x02 (2) to 0x50 (80) Mhz. Values out of range are not restricted.

0x0A3FF094 WCSS_A_BT_LE_CHANNEL_INDEX

Type: RW

Clock: PCLK

Reset State: 0x00000000

Used as the seed to the LE whitening LFSR; not the same value as the hop frequency; this field is written once per LE event because the frequency of all packets in a LE event are the same; not used for BR/EDR packets.

WCSS_A_BT_LE_CHANNEL_INDEX

Bits	Name	Description
5:0	LECHANNELINDEX	Valid range = 0 to 39; values out of range are not restricted.

0x0A3FF098 WCSS_A_BT_HOP_FREQUENCY_1

Type: R

Clock: PCLK

Reset State: 0x00000000

Hop frequency from previous packet HOP_FREQUENCY is captured in HOP_FREQUENCY_1 at the beginning of LC RM_TUNING state

WCSS_A_BT_HOP_FREQUENCY_1

Bits	Name	Description
6:0	HOPFREQ	Valid range = 0x02 (2) to 0x50 (80) Mhz. Values out of range are not restricted.

0x0A3FF0A0 WCSS_A_BT_LC_COMMAND_HALF_SLOT_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Link controller command register for halfslot 0. For write, issues the link control command as programmed in the individual registers; processed at the TxCmdTo/RxCmdTo when the selected Bluetooth clock bit(0) = 1; these time-outs precede the first halfslot. For read, returns the last command that was issued.

WCSS_A_BT_LC_COMMAND_HALF_SLOT_0

Bits	Name	Description
7	MODMODE	Selects between BR/EDR and LE for the next link controller command. 0x0: BR/EDR 0x1: LE
6	CAPT0	Capture field that controls the capturing of the selected Bluetooth clock + 1 and the UAP portion of the BdAddr when this command is issued; capturing takes place at the TxCmdTo/RxCmdTo preceding the first halfslot. 0x0: Disable capturing 0x1: Enable capturing
5:4	CALC0	Calculate field that controls whether the hop calculator runs when this command is issued; decision to run the hop calculator occurs at the TxCmdTo/RxCmdTo preceding the first halfslot. AfhEn = 0: Hop calculator runs when Cmd0 Idle AfhEn = 1: Hop calculator runs when Cmd0 Idle and bt_clk(1) = 1 0x0: Link controller automatically runs the hop calculator 0x1: Force the hop calculator to run regardless of Cmd0 0x2: Force disabling of the hop calculator regardless of Cmd0

WCSS_A_BT_LC_COMMAND_HALF_SLOT_0 (cont.)

Bits	Name	Description
3:0	CMD0	Command field that controls what activity will take place during the first halfslot. 0x0: Idle do not Tx or Rx 0x1: Tx 0x2: Rx data 0x3: Rx data X scrambler initialized with hop calculator X input 0x4: Rx ID 0x6: Rx scan data 0x7: Rx scan data X scrambler initialized with hop calculator X input 0x8: Rx scan ID 0x9: Rx BCA bad channel assessment power burst measurement 0xA: Continuous Tx test mode configured by transmit buffer 0xB: Continuous Rx Test Mod_1 1 Mbps data 0xC: Continuous Rx Test Mod_2 2 Mbps data 0xD: Continuous Rx Test Mod_3 3 Mbps data 0xE: Tx X scrambler initialized with hop calculator X input

0x0A3FF0A4 WCSS_A_BT_LC_COMMAND_HALF_SLOT_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_LC_COMMAND_HALF_SLOT_1**

Bits	Name	Description
7	MODMODE	Selects between BR/EDR and LE for the next link controller command. 0x0: BR/EDR 0x1: LE
6	CAPT1	Capture field that controls the capturing of the selected Bluetooth clock + 1 and the UAP portion of the BdAddr when this command is issued; capturing takes place at the TxCmdTo/RxCmdTo preceding the first halfslot. 0x0: Disable capturing 0x1: Enable capturing

WCSS_A_BT_LC_COMMAND_HALF_SLOT_1 (cont.)

Bits	Name	Description
5:4	CALC1	Calculate field that controls whether the hop calculator runs when this command is issued; decision to run the hop calculator occurs at the TxCmdTo/RxCmdTo preceding the first halfslot. AfhEn = 0: Hop calculator runs when Cmd0 Idle AfhEn = 1: Hop calculator runs when Cmd0 Idle and bt_clk(1) = 1 0x0: Link controller automatically runs the hop calculator 0x1: Force the hop calculator to run regardless of Cmd0 0x2: Force disabling of the hop calculator regardless of Cmd0
3:0	CMD1	Command field that controls what activity will take place during the first halfslot. 0x0: Idle do not Tx or Rx 0x1: Tx 0x2: Rx data 0x3: Rx data X scrambler initialized with hop calculator X input 0x4: Rx ID 0x6: Rx scan data 0x7: Rx scan data X scrambler initialized with hop calculator X input 0x8: Rx scan ID 0x9: Rx BCA bad channel assessment power burst measurement 0xA: Continuous Tx test mode configured by transmit buffer 0xB: Continuous Rx Test Mod_1 1 Mbps data 0xC: Continuous Rx Test Mod_2 2 Mbps data 0xD: Continuous Rx Test Mod_3 3 Mbps data 0xE: Tx X scrambler initialized with hop calculator X input

0x0A3FF0A8 WCSS_A_BT_LC_ABORT_ISSUE_AND_STATUS**Type:** RW**Clock:** PCLK**Reset State:** 0x0000000F**WCSS_A_BT_LC_ABORT_ISSUE_AND_STATUS**

Bits	Name	Description
6	COEXLATE	Coexistence command timing; late window is from the coexistence command time-out to the BtClk(0) rollover. 0x0: Coexistence command was issued on time 0x1: Coexistence command was issued late

WCSS_A_BT_LC_ABORT_ISSUE_AND_STATUS (cont.)

Bits	Name	Description
5	LC1LATE	LC command halfslot 1 timing; late window is from the appropriate Tx, Rx, or last command time-out to the BtClk rollover that marks halfslot 1. 0x0: LC command halfslot 1 was issued on time 0x1: LC command halfslot 1 was issued late
4	LC0LATE	LC command halfslot 0 timing; late window is from the appropriate Tx, Rx, or last command time-out to the BtClk rollover that marks halfslot 0. 0x0: LC command halfslot 0 was issued on time 0x1: LC command halfslot 0 was issued late
3	HOPDONE	Hop calculator state machine status 0x0: Hop calculator state machine is calculating a frequency not done 0x1: Hop calculator state machine is not calculating a frequency done
2	COEXDONE	Coexistence state machine status 0x0: Coexistence state machine is processing a command not done 0x1: Coexistence state machine is not processing a command done
1	LCDONE	Link controller state machine status 0x0: Link controller state machine is processing a command not done 0x1: Link controller state machine is not processing a command done
0	LCABORT	Link controller abort control and status Read: 0x0: link controller abort is still in progress (not done) 0x1: link controller abort has been completed (done) Write: 0x0: No change 0x1: Issue an abort to the link controller

0x0A3FF0AC WCSS_A_BT_LL_R_TRIGGER_REPETITION**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_LL_R_TRIGGER_REPETITION

Bits	Name	Description
13:0	REPEAT	Desired repetition of trigger AC, in unit of 32usec. Minimum value is 2 since at least a sync0 and a sync1 will be sent.

0x0A3FF0B0 WCSS_A_BT_RX_CONTROL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_RX_CONTROL**

Bits	Name	Description
6	CDWINEN	Enables the carrier detect window 0x0: Disable 0x1: Enable
5	HECALL	Controls the checking of the HEC bits. To save power the receiver should be disabled immediately upon detecting a HEC error. However, the entire HEC should be received before aborting if software needs an accurate number of 1/3 FEC errors that occurred during the packet header. 0x0: Check the HEC on the fly as the bits are received and abort the receive immediately if a HEC mismatch is detected 0x1: Receive all the HEC bits before checking for a possible HEC mismatch
4	HEC1SLOT	Controls the receive abort of 1-slot packets due to an AM address mismatch. In some cases, it is vital to receive the entire packet header and check the HEC before aborting due to an AM address mismatch. For example: A slave device may not transmit during an Sco frame if the received packet (from the master) was intended for another device. To detect this, the slave device must check the AM address and verify the HEC before deciding to transmit. 0x0: Immediately abort receiving a 1-slot packet due to an AM address mismatch 0x1: Always check the HEC before aborting the receive of a 1-slot packet due to an AM address mismatch

WCSS_A_BT_RX_CONTROL (cont.)

Bits	Name	Description
3	RXAMADIS	Disables the receive AM address filter 0x0: Enable the AM address filter; only packets with a valid AM address in the base AM address array to be received; receive of packets with an invalid AM address are aborted and the AmAddrBad status is set. 0x1: Disable the AM address filter; packets with any AM address are received and the AmAddrBad status is never set
2	WININTEN	Enables asserting of the Rx interrupt for a receive window time-out; receive window time-out is generated when servicing any Rx LC command, except Rx Bca 0x0: Prevents a receive window time-out from assert Rx interrupt 0x1: Enables a receive window time-out to assert Rx interrupt
1	HDRALIGNEN	Enables slot alignment for receiving non-ID packets; enables capturing of the frame timing error FrameErr right before slot alignment. Slot alignment occurs when a received packet header is deemed valid - when the HEC matches and the number of 1/3 FEC packet header errors is below the specified threshold; the following Bluetooth clock adjustment is made: [Bt ClkA = integer captured clock(27:0) & fractional RxHdrAlign(12:0)] 0x0: Disable non-ID packet slot alignment 0x1: Enable non-ID packet slot alignment on a valid packet header; first capture the FrameErr before slot alignment
0	ACDALIGNEN	Enables slot alignment for receiving ID packets. Slot alignment occurs when the receiver detects a valid access code - when the modem correlator matches the sync word; the following Bluetooth clock adjustment is made: [Bt ClkA = integer Bt ClkA(27:2) & 00 & fractional RxAcAlign(12:0)] 0x0: Disable ID packet slot alignment 0x1: Enable ID packet slot alignment on a valid access code detect

0x0A3FF0B4 WCSS_A_BT_RX_NORMAL_APERTURE_WINDOW**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Normal aperture receive window duration, which is opened only after receiving 70 new symbols when these LC commands are being serviced:

Rx data Rx data X Rx ID

WCSS_A_BT_RX_NORMAL_APERTURE_WINDOW

Bits	Name	Description
5:0	ACDWIN	Range = 0 to 0x3F (63) usec 0x0: Value of zero is used to open an infinite receive window

0x0A3FF0B8 WCSS_A_BT_RX_WIDE_APERTURE_WINDOW**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Wide aperture receive window duration, which is opened only after receiving 70 new symbols when these LC commands are being serviced:

Rx scan data

Rx scan data X

Rx scan ID

WCSS_A_BT_RX_WIDE_APERTURE_WINDOW

Bits	Name	Description
21:0	SCANWIN	Range = 0 to 0x3FFFFFF (4,194,303) usec 0x0: Value of zero is used to open an infinite receive window

0x0A3FF0BC WCSS_A_BT_RX_BCA_WINDOW**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Bad channel assessment receive window duration, which is opened immediately when the Rx Bca LC command is being serviced; software must disable the modem correlator prior to running BCA.

WCSS_A_BT_RX_BCA_WINDOW

Bits	Name	Description
8:0	BCAWIN	Range = 0 to 0x1FF (511) usec 0x0: Value of zero is used to open an infinite receive window 0x1: Value of one is used to open an infinite receive window

0x0A3FF0C0 WCSS_A_BT_SW_WHITEN_SEED

Type: RW

Clock: PCLK

Reset State: 0x00000000

Whitening seed and enable for LLR trigger

WCSS_A_BT_SW_WHITEN_SEED

Bits	Name	Description
7:1	SEED	7 bit seed
0	EN	enable signal to use the seed to initialize LFSR.

0x0A3FF0C4 WCSS_A_BT_RX_ACL_HEADER_THRESHOLD

Type: RW

Clock: PCLK

Reset State: 0x00000000

Threshold of 1/3 FEC errors allowed in an ACL packet header; does not apply to LE. If the number of 1/3 FEC errors in an ACL packet header exceeds this threshold, the receive is aborted and the HdrFecBad status is set

WCSS_A_BT_RX_ACL_HEADER_THRESHOLD

Bits	Name	Description
4:0	ACLTHRESH	Threshold of 18 or larger prevents receive from aborting Range = 0 to 0x1F (31) errors

0x0A3FF0C8 WCSS_A_BT_RX_SCO_HEADER_THRESHOLD**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Threshold of 1/3 FEC errors allowed in a SCO packet header; does not apply to LE. If the number of 1/3 FEC errors in a SCO packet header exceeds this threshold, the receive is aborted and the HdrFecBad status is set

WCSS_A_BT_RX_SCO_HEADER_THRESHOLD

Bits	Name	Description
4:0	SCOTHRESH	Threshold of 18 or larger prevents the receive from aborting Range = 0 to 0x1F (31) errors

0x0A3FF0CC WCSS_A_BT_HOP_OFFSET_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HOP_OFFSET_1**

Bits	Name	Description
6:0	HOPOFFSET	Hop offset register for the 2nd half-slot. Added in for LLR.

0x0A3FF0D0 WCSS_A_BT_RX_SYNC_WORD_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_RX_SYNC_WORD_0**

Bits	Name	Description
31:0	RX_SYNC_WORD_0	Bit [31:0] of the sync_word

0x0A3FF0D4 WCSS_A_BT_RX_SYNC_WORD_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_RX_SYNC_WORD_1

Bits	Name	Description
31:0	RX_SYNC_WORD_1	Bit [63:32] of the sync_word

0x0A3FF0D8 WCSS_A_BT_RX_SCO_PAYLOAD_LENGTH**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Payload byte length that is used to receive Sco or eSco packets; Before an Sco or eSco packet is to be received, this length field must be set to the expected payload byte length, which is predefined for Sco packets but can vary, as negotiated, for eSco packets Dv packets do not use this length field; does not apply to LE

WCSS_A_BT_RX_SCO_PAYLOAD_LENGTH

Bits	Name	Description
9:0	RXSCOLNGTH	Range = 0 to 0x3FF (1023) bytes

0x0A3FF0DC WCSS_A_BT_RX_AM_ADDRESS_ARRAY_POINTER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Pointer to the word-aligned starting address of the receive base AM address array, located in internal RAM; not a pointer to a link-list; does not apply to LE. Receive logic reads from base AM address array offset by the received base AM address for every packet type that has a packet header

WCSS_A_BT_RX_AM_ADDRESS_ARRAY_POINTER

Bits	Name	Description
15:2	RXAMAPTR	Range = 0 to 16k words (the RAM may be sized smaller)

0x0A3FF0E0 WCSS_A_BT_RX_BUFFER_SCO_POINTER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Pointer to the starting address of the Sco receive buffer link-list, which with its corresponding buffer are located in the internal RAM; receive logic accesses this link-list and writes to its corresponding buffer while receiving a Sco or eSco packet with a non-zero payload byte length; (voice portion of Dv, Hv1, Hv2, Hv3, Hv4, Hv5, 2-Hv3, 2-Hv5, 3-Hv1, 3-Hv3, 3-Hv5); does not apply to LE

WCSS_A_BT_RX_BUFFER_SCO_POINTER

Bits	Name	Description
15:2	RXSCOPTR	Range = 0 to 16k words (the RAM may be sized smaller)

0x0A3FF0E4 WCSS_A_BT_RX_BUFFER_ACL_POINTER

Type: RW

Clock: PCLK

Reset State: 0x00000000

Pointer to the starting address of the Acl (non-Lmp) receive buffer link-list, which with its corresponding buffer are located in the internal RAM; Receive logic accesses this link-list and writes to its corresponding buffer while receiving a non-Lmp Acl packet with a non-zero payload byte length (data portion of non-LMP Dv, non-Lmp Dm1, Dm3, Dm5, Dh1, Dh3, Dh5, 2-Dh1, 2-Dh3, 2-Dh5, 3-Dh1, 3-Dh3, 3-Dh5) does not apply to LE

WCSS_A_BT_RX_BUFFER_ACL_POINTER

Bits	Name	Description
15:2	RXACLPTR	Range = 0 to 16k words (the RAM may be sized smaller)

0x0A3FF0E8 WCSS_A_BT_RX_BUFFER_LMP_POINTER

Type: RW

Clock: PCLK

Reset State: 0x00000000

Pointer to the starting address of the Lmp receive buffer link-list, which with its corresponding buffer is located in the internal RAM; does not apply to LE. Receive logic accesses this link-list and writes to its corresponding buffer while receiving a Lmp packet with a non-zero payload byte length (data portion of Lmp Dv, Lmp Dm1)

WCSS_A_BT_RX_BUFFER_LMP_POINTER

Bits	Name	Description
15:2	RXLMPPTR	Range = 0 to 16k words (the Ram may be sized smaller)

0x0A3FF0EC WCSS_A_BT_RX_BUFFER_CONTROL_POINTER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Pointer to the starting address of the control receive buffer link-list, which with its corresponding buffer are located in the internal RAM; does not apply to LE. Receive logic will access this link-list and write to its corresponding buffer while receiving a Control packet with a non-zero payload byte length (FHS, Aux)

WCSS_A_BT_RX_BUFFER_CONTROL_POINTER

Bits	Name	Description
15:2	RXCNTLPTR	Range = 0 to 16k words (the Ram may be sized smaller)

0x0A3FF0F0 WCSS_A_BT_RX_BUFFER_LE_POINTER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Pointer to the starting address of the LE receive buffer link-list, which with its corresponding buffer is located in the internal RAM. Receive logic will access this link-list and write to its corresponding buffer while receiving a LE packet with a non-zero payload byte length (data portion of all LE data packets)

WCSS_A_BT_RX_BUFFER_LE_POINTER

Bits	Name	Description
15:2	RXLELPTR	Range = 0 to 16k words (the Ram may be sized smaller)

0x0A3FF0F4 WCSS_A_BT_RX_LOW_POWER_CONTROL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_RX_LOW_POWER_CONTROL**

Bits	Name	Description
4	LPPSBISTDONE	Once software has read the 1 result, the value is cleared automatically 0x0: BIST not done 0x1: BIST complete

WCSS_A_BT_RX_LOW_POWER_CONTROL (cont.)

Bits	Name	Description
3	LPPSBISTSTART	Initially, should be written with a 1 for start of the test prior to a half slot boundary. The first BIST period is synchronized to the halfslot; every subsequent period is fully under software control, which must also program LPPSBISTEn, LPPSBISTTimer and LowPwrEn. Must be toggled between BIST periods to start the next test 0x0: No action 0x1: Start LPPS BIST
2	LPPSBISTEN	0x0: Disable LPPS BIST 0x1: Enable LPPS BIST
1	EDABORTEN	Energy detect abort enable 0x0: Leave receiver on during duration of the scan window; hardware shuts receiver off only at the window time out interrupt; software still has option to write an LC abort during this period 0x1: Immediately turn the receiver off after the first energy detect interrupt is received
0	LOWPWREN	Low power mode enable, which enables the energy detect block in the radio/modem and also controls related logic in the link controller 0x0: Disable low power mode 0x1: Enable low power mode

0x0A3FF0FC WCSS_A_BT_SYNC_WORD**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Programmable wait time for Sync Word detection. The enable is self cleared by HW after SW sets it.

WCSS_A_BT_SYNC_WORD

Bits	Name	Description
7:1	DELAY	In unit of usec, default to 32. SW should tune it for LLR RX
0	DELAY_SEL	self clearing after both halfslot commands are done

0x0A3FF100 WCSS_A_BT_RX_COMPOSITE_STATUS**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Composite receive status register: Write, a write of any value to this address clears the StatValid status register Read, returns the status of the current or last receive operation

WCSS_A_BT_RX_COMPOSITE_STATUS

Bits	Name	Description
8	RXABORT	Indicates Rx abort status 0x0: coexistence rx abort has not been encountered 0x1: The receive operation has been aborted by coexistence
7	STATVALID	Indicates that the receive status is valid. Software clears this status bits by writing any value to this particular address. Hardware sets this status bit at the beginning of the receive operation when all the receive status bits are cleared 0x0: The receive status registers has not been updated by hardware 0x1: The receive status registers has been updated with the latest status
6	RXBUFERR	Receive buffer link-list overflow status (disabled by RxBufDis); always cleared at the beginning of the receive operation 0x0: Null pointer has not been encountered 0x1: The receive operation was aborted due to a Null Pointer that was read from one of the receive link-lists
5	AMADDRBAD	AM address filter status (disabled by RxAmaDis), which is always cleared at the beginning of the receive operation; does not apply to LE 0x0: Invalid AM address has not been encountered 0x1: Receive operation has been aborted for an invalid AM address; PktHdr contains new AM address and packet index fields

WCSS_A_BT_RX_COMPOSITE_STATUS (cont.)

Bits	Name	Description
4	ACDVALID	EnergyDet; operates in conjunction with the low power mode enable: always cleared at the beginning of the receive operation LowPwrEn = 0 indicates that a valid access code has been detected; 0x0: A valid access code has not been detected 0x1: A valid access code has been detected while the receive window was open and energy was detected controlled by AcdCarrier LowPwrEn = 1 indicates that energy has been detected; During a receive the value is held until software has read it even if there are more energy detection events. 0x0: No energy detected 0x1: Packet detector has detected energy
3	RXHALFSLOT	Indicates which LC halfslot command (Cmd0, Cmd1) was being serviced when the receive status bits were generated; updated at the beginning of the receive operation 0x0: Receive status is generated by Cmd0 first halfslot 0x1: Receive status is generated by Cmd1 second halfslot
2	PYLDBAD	Composite receive payload status; PyldFecBad, CrcBad, and LengthBad status bits are OR-ed together to indicate that the receive operation was aborted due to an error during the payload; does not apply to LE
1	PKTHDRBAD	Composite receive packet header status; ExtFecBad, HdrFecBad, and HecBad status bits are OR-ed together to indicate that the receive operation was aborted due to an error during the packet/extended header
0	WINTO	(Duplicated) Receive window time-out status (disabled by an infinite receive window duration); always cleared at the beginning of the receive operation 0x0: Receive window has not timed out 0x1: Receive operation ended due to a receive window time-out; valid access code was not detected or the Bca window timed out

0x0A3FF104 WCSS_A_BT_RX_DETAILED_BAD_STATUS**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_RX_DETAILED_BAD_STATUS

Bits	Name	Description
7	PYLD FECBAD	Payload 2/3 FEC uncorrectable double error checker status (disabled by RxFecDis) always cleared at the beginning of the receive operation; does not apply to LE 0x0: An uncorrectable 2/3 FEC error has not been encountered during the payload 0x1: The receive operation has been aborted due to a 2/3 FEC uncorrectable double error in the payload
6	CRCBAD	CRC checker status (disabled by Rx_crcDis); always cleared at the beginning of the receive operation 0x0: A CRC mismatch has not been encountered 0x1: The receive operation has been aborted for a CRC mismatch; timing of the CRC check is based on the Hec_crcCapt control register
5	LENGTHBAD	Payload length checker status (disabled by RxLnghDis); always cleared at the beginning of the receive operation 0x0: Payload byte length is less-than-or-equal to the allowed maximum 0x1: Receive operation has been aborted for a payload byte length that exceeds the maximum for that particular packet type; payload length from the receive payload header is used; however, for Sco and eSco packets the programmed expected payload length RxScoLngh is used
3	HDR FECBAD	Packet header 1/3 FEC error checker status (disabled by a large threshold); always cleared at the beginning of the receive operation; does not apply to LE. 0x0: Number of 1/3 FEC errors during the packet header is within limits 0x1: Receive operation has been aborted because the number of 1/3 FEC errors during the packet header has exceeded the AclThresh or ScoThresh threshold; this check occurs at the end of the packet header and may not occur if an HEC error checked on the fly aborts the receive operation early
2	HECBAD	HEC checker status (disabled by RxHecDis); always cleared at the beginning of the receive operation; does not apply to LE. 0x0: HEC mismatch has not been encountered 0x1: Receive operation has been aborted due to a HEC mismatch; timing of the HEC check is based on the HecAll and Hec_crcCapt control registers

WCSS_A_BT_RX_DETAILED_BAD_STATUS (cont.)

Bits	Name	Description
1	AMADDRBAD	(Duplicated) AM address filter status (disabled by RxAmaDis); does not apply to LE
0	WINTO	(Duplicated) Receive window time-out status (disabled by an infinite receive window duration)

0x0A3FF108 WCSS_A_BT_RX_FEC_AND_DONE_STATUS**Type:** R**Clock:** PCLK**Reset State:** 0x00000010**WCSS_A_BT_RX_FEC_AND_DONE_STATUS**

Bits	Name	Description
6	CRCGOOD	CRC checker status (forced by RxCrcDis); always cleared at the beginning of the receive operation. 0x0: CRC has not been checked or a mismatch was encountered 0x1: 16-bit CRC field was received without any mismatches
5	HECGOOD	HEC checker status (forced by RxHecDis); always cleared at the beginning of the receive operation; does not apply to LE 0x0: HEC has not been checked or a mismatch was encountered 0x1: 8-bit HEC field was received without any mismatches
4	RXPKTDONE	Status of the receive logic; rising edge of this status bit marks the end of a receive operation. Software can use this rising edge when receiving a 60 byte 2-Hv3 with CRC to set the preslot time-out; currently the longest per-slot packet (excluding extended headers) 0x0: Receive logic is busy with a receive operation 0x1: Receive logic is not busy with a receive operation
3	FECHDRFLAG	Status of packet header 1/3 FEC error counter (FecHdrCnt); this flag and counter is not disabled by a large AclThresh or ScoThresh threshold; does not apply to LE 0x0: FecHdrCnt counter is equal to zero 0x1: FecHdrCnt counter is not equal to zero
1	FECCORFLAG	Status of payload 1/3 or 2/3 FEC single error corrected counter (FecCorCnt); this flag and counter is not disabled with PyldFecDis; does not apply to LE. 0x0: FecCorCnt counter is equal to zero 0x1: FecCorCnt counter is not equal to zero

WCSS_A_BT_RX_FEC_AND_DONE_STATUS (cont.)

Bits	Name	Description
0	FECDETFLAG	Status of payload 2/3 FEC uncorrectable double error detected counter (FecDetCnt); this flag and counter is not disabled with PyldFecDis; does not apply to LE. 0x0: FecDetCnt counter is equal to zero 0x1: FecDetCnt counter is not equal to zero

0x0A3FF10C WCSS_A_BT_RX_FRAME_TIMING_ERROR**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

Receive frame timing error (updating is disabled by HdrAlignEn); when a valid packet header of a non-ID packet is detected, this register is updated with the current fractional bits of Bt ClkA right before hard-aligning the entire Bt ClkA

WCSS_A_BT_RX_FRAME_TIMING_ERROR

Bits	Name	Description
13:0	FRAMEERR	BR/EDR, range = 0 to 0x1387 (4999); resolution = 62.5 nsec LE, range = 0 to 0x3FFF (16383); resolution = 62.5 nsec; LE Usage TBD

0x0A3FF11C WCSS_A_BT_RX_PACKET_HEADER_ERROR_COUNT**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

Packet header 1/3 FEC error counter (flagged by FecHdrFlag); Always cleared at the beginning of the receive operation does not apply to LE

WCSS_A_BT_RX_PACKET_HEADER_ERROR_COUNT

Bits	Name	Description
4:0	FECHDRCNT	Range = 0 to 0x12 (18) bit errors (limited by the packet header length)

0x0A3FF124 WCSS_A_BT_RX_PAYLOAD_2_3_FEC_ERROR_DETECTED_COUNT

Type: R
Clock: PCLK
Reset State: 0x00000000

Payload 2/3 FEC uncorrectable double error detected counter (flagged by FecDetFlag); Always cleared at the beginning of the receive operation does not apply to LE

WCSS_A_BT_RX_PAYLOAD_2_3_FEC_ERROR_DETECTED_COUNT

Bits	Name	Description
7:0	FECDETCNT	Range = 0 to 0xFF (255) bit errors

0x0A3FF128 WCSS_A_BT_RX_PAYLOAD_FEC_ERROR_CORRECTED_COUNT

Type: R
Clock: PCLK
Reset State: 0x00000000

Payload 1/3 or 2/3 FEC single error corrected counter (flagged by FecCorFlag); Always cleared at the beginning of the receive operation does not apply to LE

WCSS_A_BT_RX_PAYLOAD_FEC_ERROR_CORRECTED_COUNT

Bits	Name	Description
7:0	FECCORCNT	Range = 0 to 0xFF (255) bit errors

0x0A3FF12C WCSS_A_BT_RX_ENERGY_DETECT_COUNT

Type: R
Clock: PCLK
Reset State: 0x00000000

Copy of the 16 LSBS of the Rx wide aperture window, captured when the energy detect block found a strong signal Value held until software has read it, then it may be updated by hardware Software must set the LowPwrEn bit in the Rx low power control register before this metric becomes active Cleared at the beginning of a receive operation

WCSS_A_BT_RX_ENERGY_DETECT_COUNT

Bits	Name	Description
15:0	EDCNT	Count value has a resolution of 1 us

0x0A3FF134 WCSS_A_BT_RX_LE_PAYLOAD_HEADER_DATA**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

LE payload byte length from the last receive operation; always cleared at the beginning of the receive operation

WCSS_A_BT_RX_LE_PAYLOAD_HEADER_DATA

Bits	Name	Description
25:24	B_1	LE header from the last receive operation
23:16	LELENGTH	The LE payload byte length from the last receive operation
7:0	LEHDR	The LE header from the last receive operation

0x0A3FF138 WCSS_A_BT_RX_PACKET_HEADER_DATA**Type:** R**Clock:** PCLK**Reset State:** 0x00007F00

Combination of the packet header bits of the last receive operation; aligned to match the format of the packet header in the transmit buffer

WCSS_A_BT_RX_PACKET_HEADER_DATA

Bits	Name	Description
18	SEQN	Sequence number from the packet header of the last receive operation; always cleared at the beginning of the receive operation
17	ARQN	Acknowledge indication from the packet header of the last receive operation; always cleared at the beginning of the receive operation
16	FLOW1	Flow control from the packet header of the last receive operation; always cleared at the beginning of the receive operation
14:8	PKTINDEX	Packet index decoded from the last receive operation PktIndex(6): 0 PktIndex(5): 0 PktIndex(4): Sco_ptt and/or Acl_ptt field read from the base am address array PktIndex(3:0): Type code initially forced by the LC command being serviced or later updated from the received packet header

WCSS_A_BT_RX_PACKET_HEADER_DATA (cont.)

Bits	Name	Description
2:0	BASEAMA	Active member address from the packet header of the last receive operation; always cleared at the beginning of the receive operation

0x0A3FF13C WCSS_A_BT_RX_PAYLOAD_HEADER_DATA**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

Combination of the payload header bits of the last receive operation These bits are aligned to match the format of the payload header in the transmit buffer

WCSS_A_BT_RX_PAYLOAD_HEADER_DATA

Bits	Name	Description
25:16	PYDLNGTH	The payload byte length from the last receive operation The RxScoLngth is loaded into this register when receiving Sco or eSco packets. A length of 18 bytes is loaded into this register when receiving FHS packets. For all other packets the length field from the payload header is loaded into this register. always cleared at the beginning of the receive operation
11:8	UNDEF	Undefined field from a 2-byte payload header of the last receive operation. Undef(0) bit has been defined as the msb (10th bit) of the payload byte length for enhanced rate Acl packets (2-Dh1, 2-Dh3, 2-Dh5, 3-Dh1, 3-Dh3, and 3-Dh5) If one of these packets are received then Undef(0) = 0 and PyldLngth indicates the correct payload byte length always cleared at the beginning of the receive operation
2	FLOW2	Flow control from the payload header of the last receive operation always cleared at the beginning of the receive operation
1:0	LCH	Logical channel indicator from the payload header of the last receive operation always cleared at the beginning of the receive operation

0x0A3FF144 WCSS_A_BT_RX_PACKET_HEADER_HEC

Type: R
Clock: PCLK
Reset State: 0x00000000

HEC field from the packet header of the last receive operation; always cleared at the beginning of the receive operation; The HecCrcCapt control register must be set for the entire HEC field to be received does not apply to LE

WCSS_A_BT_RX_PACKET_HEADER_HEC

Bits	Name	Description
7:0	PKTHDRHEC	

0x0A3FF148 WCSS_A_BT_RX_PAYLOAD_CRC

Type: R
Clock: PCLK
Reset State: 0x00000000

CRC field from the payload of the last receive operation; always cleared at the beginning of the receive operation. HecCrcCapt control register must be set for the entire CRC field to be received

WCSS_A_BT_RX_PAYLOAD_CRC

Bits	Name	Description
23:0	PYLDCRC	For BR/EDR, the CRC is the lower 16 bits For LE, the CRC is 23 bits

0x0A3FF14C WCSS_A_BT_TX_SCO_PAYLOAD_LENGTH

Type: RW
Clock: PCLK
Reset State: 0x00000000

Payload byte length that is used to transmit Sco or eSco packets; DV packets do not use this length field; Before a Sco or eSco packet is transmitted, this length field must be set to the correct payload byte length Payload byte length is predefined for Sco packets but can vary, as negotiated, for eSco packets does not apply to LE

WCSS_A_BT_TX_SCO_PAYLOAD_LENGTH

Bits	Name	Description
9:0	TXSCOLNGTH	Range = 0 to 0x3FF (1023) bytes

0x0A3FF150 WCSS_A_BT_TX_BUFFER_POINTER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Pointer to the starting address of the transmit buffer link-list, which with its corresponding buffer are located in the internal RAM. Transmit logic accesses this link-list and read from its corresponding buffer while transmitting any packet or continuous pattern. As a safety feature, software can write a null pointer to the first entry of the transmit link-list or simply set this pointer to zero. After software configures the transmit data portion of the link-list then the null pointer can be replaced with a valid entry that points the first word of the transmit buffer. This method prevents old data from being transmitted if software does not meet their deadlines; also more robust than inverting the CRC field with TxInvCrc.

WCSS_A_BT_TX_BUFFER_POINTER

Bits	Name	Description
15:2	TXBUFPTR	Range = 0 to 16k words (the RAM may be sized smaller)

0x0A3FF158 WCSS_A_BT_TX_STATUS**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

Transmit buffer link-list overflow status; the transmit logic is allowed to request one extra read from the transmit buffer after the null pointer has been read from the transmit buffer link-list; always cleared at the beginning of the transmit operation.

WCSS_A_BT_TX_STATUS

Bits	Name	Description
1	TXBUFERR	0x0: Null pointer has not been encountered, or only one extra read has been requested by the transmit logic 0x1: Transmit logic has requested two more reads from the transmit buffer since the null pointer was read from the transmit buffer link-list

WCSS_A_BT_TX_STATUS (cont.)

Bits	Name	Description
0	TXABORT	(Duplicated) Transmit abort status When channel avoidance coexistence is enabled this bit is updated after the hop calculator has completed when servicing a Tx LC command When packet traffic arbitration coexistence is enabled, this bit is updated when the Tx_Confirm input indicates an abort 0x0: Transmit operation was not aborted 0x1: Transmit operation was aborted because this Bluetooth device has low priority BtPriority = 0, and the calculated channel fell within the range of 802.11 channels LowChan calculated channel HighChan

0x0A3FF15C WCSS_A_BT_COEXISTENCE_RF_ACTIVE_DELAY_TIMER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Delays the falling edge of the external rf_active signal by the programmed value.

WCSS_A_BT_COEXISTENCE_RF_ACTIVE_DELAY_TIMER

Bits	Name	Description
6:0	COEXRFDELAY	Disabled if set to zero; only applies to Tx and is ignored during Rx Range = 0 to 0x7F (max 127 us, 1us increments)

0x0A3FF160 WCSS_A_BT_SOFTWARE_CAPTURE_CALCULATE_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_SOFTWARE_CAPTURE_CALCULATE_COMMAND**

Bits	Name	Description
2	SWCAPT	Capture field that controls the capture of the selected Bluetooth clock + 1 and the UAP portion of the BdAddr when this command is issued 0x0: Do not capture the clock and UAP 0x1: Capture the clock and UAP

WCSS_A_BT_SOFTWARE_CAPTURE_CALCULATE_COMMAND (cont.)

Bits	Name	Description
1:0	SWCALC	Calculate field that controls whether the hop calculator runs when this command is issued; bits do not match Cmd0 and Cmd1. AfhEn = 0: Hop calculator runs. AfhEn = 1: Hop calculator runs when bt_clk(1) = 1. 0x0: Do not run the hop cal_1 0x1: Force the hop calculator when this command is issued 0x2: Do not run the hop cal_2 0x3: Automatically runs the hop calculator

0x0A3FF164 WCSS_A_BT_COEXISTENCE_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Coexistence command register:

For writes, issues the coexistence command as programmed in the individual registers, and processed at the CoexCmdTo For reads, returns the last command that was issued.

WCSS_A_BT_COEXISTENCE_COMMAND

Bits	Name	Description
15	QTABTRESEND	Indicates the status of the QTA Bt bit 8, RESEND 0x0: Last WLAN hardware state resend not requested 0x1: Last WLAN hardware state resend requested
14	QTABTMODE	Controls QTA Bt character bit 7, MODE 0x0: Receive slot 0x1: Transmit slot
13	QTABTMOREDATA	Controls QTA Bt character bit 6, MORE_DATA. 0x0: ACL buffers empty 0x1: ACL buffers still contain data
12:10	QTABTPRIORITY	Controls QTA Bt character bits 5:3, PRIORITY 0x0: Priority 0 0x1: Priority 1 0x2: Priority 2 0x3: Priority 3 0x4: Priority 4 0x5: Priority 5 0x6: Priority 6 0x7: Priority 7
9	QTABTAIESYNC	Controls QTA Bt character bit 1, AIE_SYNC 0x0: Even anchor 0x1: Odd anchor

WCSS_A_BT_COEXISTENCE_COMMAND (cont.)

Bits	Name	Description
8	QTABTACTIVE	Controls QTA BT character bit 2, BT_ACTIVE ignored if QtaBypass bit is 0; generated by link controller hardware. 0x0: BT_ACTIVE = 0 0x1: BT_ACTIVE = 1
7	STOPSLOT2	Controls the capturing of the selected Bluetooth clock + 1 and the UAP portion of the BdAddr when this command is issued; occurs at the CoexCmdTo; not buffered and must be maintained until CoexStatTo. 0x0: Disable capturing 0x1: Enable capturing
6	COEXCAPT	Controls the behavior during the second slot when using the CoexCmd = 01,10 sequence (i.e., Coex is in the Slot2_Mode state) 0x0: Allow Slot2_Mode exit only if a link controller command is present in half slot 1 0x1: Allow Slot2_Mode exit after the next Tx or Rx command timeout expires; coex waits for the link controller to finish processing
5:4	COEXCALC	Controls whether the hop calculator runs when this command is issued; determination to run the hop calculator occurs at the CoexCmdTo; not buffered and must be maintained until CoexStatTo AfhEn = 0: Hop calculator runs AfhEn = 1: Hop calculator runs when bt_clk(1) = 1 0x0: Automatically runs the hop calculator 0x1: Force the hop calculator to run 0x2: Force disabling of the hop calculator
3	COEXPRI	Controls the priority signaling of the external coexistence interface and the internal channel avoidance mechanism; not buffered and must be maintained until CoexStatTo. 0x0: Low priority 0x1: High priority
2	COEXMODE	Controls the Tx/Rx signaling of the external coexistence interface; not buffered and must be maintained until CoexStatTo 0x0: Receive 0x1: Transmit

WCSS_A_BT_COEXISTENCE_COMMAND (cont.)

Bits	Name	Description
1:0	COEXCMD	Controls the activity on the external coexistence interface 0x0: Stop activity on the interface immediately but wait for hop calculator to finish 0x1: Start slot 1 activity, then hold the interface signals until a slot 2 command is issued; state machine must be in idle when issuing this command 0x2: Start and finish slot 2 activity; state machine should already be waiting for a slot 2 command 0x3: Start and finish slot 1 activity; state machine must be in Idle when issuing this command

0x0A3FF168 WCSS_A_BT_COEXISTENCE_CONTROL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_COEXISTENCE_CONTROL**

Bits	Name	Description
15	PTAABORTRX	Enable pta_rx_confx to abort Rx packets PTA interface uses the same signal (tx_confx) for both tx and rx 0x0: Disable 0x1: Enable
13	CXMABORTRXEN	Enable cxm_rx_grant to abort Rx packets 0x0: Disable 0x1: Enable
12	CXMABORTTXEN	Enable cxm_tx_grant to abort Tx packets 0x0: Disable 0x1: Enable
11	QTAABORTRXEN	Enable qta_rx_confx to abort Rx packets 0x0: Disable 0x1: Enable
10	QTAABORTTXEN	Enable qta_tx_confx to abort Tx packets 0x0: Disable 0x1: Enable
9	QTABYPASS	Controls QTA protocol timing; when set, the QtaBtn bits are forwarded to QTA transmit UART immediately, bypassing PTA timing logic 0x0: QTA Bt timing under hardware control 0x1: QTA Bt hardware timing bypassed

WCSS_A_BT_COEXISTENCE_CONTROL (cont.)

Bits	Name	Description
7	PTATXHIPRI	Packet traffic arbitration; controls the high priority transmit feature 0x0: Disable; a transmit aborted according to the PtaAbortTx and PtaAbortTxon control registers 0x1: Enable; Tx_Confx input ignored for an entire frame when a high priority transmit command has been issued
6	PTAABORTTXON	Controls a transmit abort that is already in progress (when tx_on=1) 0x0: Disable 0x1: Enable; abort occurs only if PtaAbortTx=1 and CoexEn=1 and Tx_Confx = 1
5	PTAABORTTX	Enable pta_tx_confx to abort Tx packets 0x0: Disable 0x1: Enable
4	PTAEN	Enables the generation of the external interface outputs: Rf_Active, Status and Freq 0x0: Disable 0x1: Enable
3	CAVPRIRX	Channel avoidance; controls the activity of the Bt_Priority output during a high priority receive that occurs on an 802.11x channel 0x0: A high priority Receive does not affect Bt_Priority 0x1: Set Bt_Priority for a high priority Receive that is in the 802.11x band
2	CAVPRITX	Controls the activity of the Bt_Priority output during a high priority transmit that occurs on an 802.11x channel 0x0: High priority transmit does not affect Bt_Priority 0x1: Set Bt_Priority for a high priority transmit
1	CAVABORTTX	Controls the aborting of a transmit 0x0: Disable the transmit abort 0x1: Enable the transmit abort; occurs only if CoexEn = 1 and CoexPri = 0, and HopAbort = 1 on 802.11x channel
0	CAVEN	Enables the generation of the external interface output Bt_Priority 0x0: Disable 0x1: Enable

0x0A3FF16C WCSS_A_BT_COEXISTENCE_ENABLE_AND_POLARITY**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_COEXISTENCE_ENABLE_AND_POLARITY

Bits	Name	Description
8	POLCXMGRANT	Sets the polarity of the CxM grant input 0x0: Normal; high input indicates that the Bluetooth should be prevented 0x1: Inverted; low input indicates that the Bluetooth should be prevented
7	COEXEN	Enables the clock to the coexistence logic 0x0: Disable by gating the clock 0x1: Enable by ungating the clock
6	QTAEN	Enables the QTA output signals. CoexEn must be active for QTA 0x0: Disable QTA 0x1: Enable QTA
5	POLCHDATA	Sets the polarity of the coexistence interface Chan_Data input 0x0: Normal; high input prevents Bt_Priority from updating 0x1: Inverted; low input prevents Bt_Priority from updating
4	POLBTPRI	Sets the polarity of the coexistence interface Bt_Priority output 0x0: Normal; high output indicates a high priority Bluetooth event 0x1: Inverted; low output indicates a high priority Bluetooth event
3	POLRFACT	Sets the polarity of the coexistence interface Rf_Active output 0x0: Normal; high output indicates that Bluetooth is active 0x1: Inverted; low output indicates that Bluetooth is active
2	POLSTAT	Sets the polarity of the coexistence interface Status output 0x0: Normal; high output indicates Bluetooth high priority or Bluetooth Tx 0x1: Inverted; low output indicates Bluetooth high priority or Bluetooth Tx
1	POLFREQ	Sets the polarity of the coexistence interface Freq output 0x0: Normal; high output indicates a frequency overlap 0x1: Inverted; low output indicates a frequency overlap
0	POLTXCNFX	Sets the polarity of the coexistence interface Tx_Confx input 0x0: Normal; high input indicates that the Bluetooth should be prevented 0x1: Inverted; low input indicates that the Bluetooth should be prevented

0x0A3FF170 WCSS_A_BT_COEXISTENCE_STATUS**Type:** R**Clock:** PCLK**Reset State:** 0x00000080

WCSS_A_BT_COEXISTENCE_STATUS

Bits	Name	Description
15	QTAWLRESEND	Indicates the status of the QTA WLAN bit 8 0x0: Last Bluetooth hardware state resend not requested 0x1: Last Bluetooth hardware state resend requested
14	QTAWL7	Reserved. Indicates the status of the QTA WLAN bit 7
13	QTAWL6	Reserved. Indicates the status of the QTA WLAN bit 6
12	QTAWL5	Reserved. Indicates the status of the QTA WLAN bit 5
11	QTAWL4	Reserved. Indicates the status of the QTA WLAN bit 4
10	QTAWL3	Reserved. Indicates the status of the QTA WLAN bit 3
9	QTAWL2	Reserved. Indicates the status of the QTA WLAN bit 2
8	QTAWLCNFX	Indicates the status of the QTA WLAN bit 1. Tx_confirm input signal as seen by the link controller in QTA mode. 0x0: Low signal is being received 0x1: High signal is being received
7	HOPABORT	Indicates the status of the calculated hop channel (LowChan channel HighChan) 0x0: Channel is outside of the 802.11x channel band 0x1: Channel is within the 802.11x channel band; does not mean Tx abort occurred
6	TXABORT	(Duplicated) Transmit abort status
5	COEXCHDATA	Indicates the level of the coexistence Chan_Data input signal as seen by the Bluetooth controller. Pin muxing must be set appropriately to connect this signal to a pin 0x0: Low signal is being received 0x1: High signal is being received
4	COEXBTPRI	Indicates the level of the coexistence Bt_Priority output signal as the Bluetooth controller generates it. Pin muxing must be set appropriately to drive this level to a pin 0x0: Low signal is being generated 0x1: High signal is being generated
3	COEXRFACT	Indicates the level of the coexistence Rf_Active output signal as the Bluetooth controller generates it Pin muxing must be set appropriately to drive this level to a pin 0x0: Low signal is being generated 0x1: High signal is being generated

WCSS_A_BT_COEXISTENCE_STATUS (cont.)

Bits	Name	Description
2	COEXSTAT	Indicates the level of the coexistence Status output signal as the Bluetooth controller generates it Pin muxing must be set appropriately to drive this level to a pin 0x0: Low signal is being generated 0x1: High signal is being generated
1	COEXFREQ	Indicates the level of the coexistence Freq output signal as the Bluetooth controller generates it Pin muxing must be set appropriately to drive this level to a pin 0x0: Low signal is being generated 0x1: High signal is being generated
0	COEXTXCNFX	Indicates the level of the coexistence Tx_Confx output signal as seen by the Bluetooth controller Pin muxing must be set appropriately to drive this level to a pin 0x0: Low signal is being received 0x1: High signal is being received

0x0A3FF184 WCSS_A_BT_HARDWARE_VERIFICATION_CONTROL_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HARDWARE_VERIFICATION_CONTROL_1**

Bits	Name	Description
2	BBIF_ENABLE	Enables BBIF interface when set to 1
1	PKTRPTEN	Enables the repeated packet Tx or Rx test mode; the number of packets must also be programmed using PktRptNum register
0	RESERVED	reserved

0x0A3FF188 WCSS_A_BT_HARDWARE_VERIFICATION_CONTROL_2**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

WCSS_A_BT_HARDWARE_VERIFICATION_CONTROL_2

Bits	Name	Description
5:4	LCCONT	Enables the continuous execution of LC commands by the link controller 0x0: Single overlaid execution on halfslot boundaries; normal 0x1: Continuous overlaid execution on halfslot boundaries; for testing 0x2: Continuous ping-ponged execution on slot boundaries; for testing 0x3: Continuous externally triggered execution on halfslot boundaries
3:2	BTCLKDIS	Disables the Bluetooth clock counters; can be used to save power when the device is not in use. Bt ClkA: Running freely (hard-align allowed) Integer portion is frozen (hard-align disabled) Fractional portion is running freely (allow hard-align) Integer portion is running freely (hard-align disabled) Fractional portion is running freely (allow hard-align) Integer portion is frozen (hard-align disabled) Fractional portion is frozen (allow hard-align) 0x0: Bt ClkN is running fre_1; normal 0x1: Bt ClkN is running fre_2; testing 0x2: Bt ClkN integer and fractional portion is frozen; used for BERT testing 0x3: Bt ClkN integer and fractional portion is frozen; testing
1	BERTPRBS	Selects the PRBS sequence to be used when BertPacket = 1 0x0: PRBS-9 pattern initialized with all ones 0x1: PRBS-15 pattern initialized with all ones
0	BTCLKSEL	Selects the integer and fractional Bluetooth clock that is used by the burst timers and link controller; also selects the input to the captured Bluetooth clock that is distributed to the hop calculator, encryption engine, Tx scramble, and Rx descramble 0x0: Select Bt ClkA 0x1: Select Bt ClkN

0x0A3FF18C WCSS_A_BT_HARDWARE_VERIFICATION_CONTROL_3**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Manual control over RM_CMD[2:0]

WCSS_A_BT_HARDWARE_VERIFICATION_CONTROL_3

Bits	Name	Description
2:0	RMIF_FORCE	Write: sets RM_CMD[2:0] = RMif_Force[2:0] Read: returns the current value of RM_CMD[2:0]

0x0A3FF190 WCSS_A_BT_HARDWARE_VERIFICATION_CLEAR_STATE_MACHINES**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_HARDWARE_VERIFICATION_CLEAR_STATE_MACHINES**

Bits	Name	Description
6	CLRCOEXFSM	Synchronous clear for the coexistence finite state machine 0x0: No change 0x1: Force the coexistence FSM and pending command back to idle
5	CLRBUFFSM	Synchronous clear for the buffer control finite state machine 0x0: No change 0x1: Force the buffer control FSM idle
4	CLRBBIFFSM	Synchronous clear for the BBIF finite state machine 0x0: No change 0x1: Force the BBIF FSM to idle
3	CLRHOPFSM	Synchronous clear for the hop calculator and modulo divider finite state machines 0x0: No change 0x1: Force the hop calculator and modulo divider FSM to idle; all other state machine outputs dividend, divisor, hop channel are forced to zero
2	CLRLCFSM	Synchronous clear for the LC finite state machine and its pending commands 0x0: No change 0x1: Force the LC FSM and pending commands to idle
1	CLRTXFSM	Synchronous clear for the Tx control finite state machine 0x0: No change 0x1: Force the Tx control FSM to idle
0	CLRRXFSM	Synchronous clear for the Rx control finite state machine and the Rx scan window 0x0: No change 0x1: Force the Rx control FSM to idle; disable Rx scan window

0x0A3FF194 WCSS_A_BT_HARDWARE_VERIFICATION_STATUS_1**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

Number of packet header bit errors (after 1/3 FEC decode) received during hardware verification modes.

Accumulates the number of packet header mismatches during continuous hardware verification receive bursts Expected packet header is programmed into EncrKey(31:0) during test mode Once this accumulator reaches its maximum value it does not roll over PyldCrc register is reused during hardware verification modes to generate this result

WCSS_A_BT_HARDWARE_VERIFICATION_STATUS_1

Bits	Name	Description
15:0	RXHDRERR	Range = 0 to 0xFFFF (65,535) bit errors

0x0A3FF198 WCSS_A_BT_HARDWARE_VERIFICATION_STATUS_2

Type: R

Clock: PCLK

Reset State: 0x00000000

Number of payload bit errors received during hardware verification modes Accumulates the number of Prbs-9 or Prbs-15 mismatches during a continuous receive test or during continuous hardware verification receive bursts Once this accumulator reaches its maximum value it does not roll over FecCorCnt and FecDetCnt registers are reused during hardware verification modes to generate this result.

WCSS_A_BT_HARDWARE_VERIFICATION_STATUS_2

Bits	Name	Description
15:0	RXPYLDERR	Range = 0 to 0xFFFF (65,535) bit errors

0x0A3FF1A0 WCSS_A_BT_PACKET_CONTROL

Type: RW

Clock: PCLK

Reset State: 0x00000000

WCSS_A_BT_PACKET_CONTROL

Bits	Name	Description
6	CMDABORTDIS	Disables the automatic aborting of late LC and coexistence commands 0x0: Enable 0x1: Disable

WCSS_A_BT_PACKET_CONTROL (cont.)

Bits	Name	Description
5	HECCRCCAPT	Controls the checking of the HEC and CRC bits for BR/EDR and the CRC bits for LE; reading the received HEC and CRC field requires that this bit is set 0x0: Timing of the HEC check is based on the HecAll control register; check the CRC on the fly as the bits are received and abort the receive immediately if a CRC mismatch is detected 0x1: Receive all the HEC and CRC bits before checking for possible mismatches
4	SCRDIS	Disables the scrambling of the packet header, extended header, and payload for both transmit and receive operations 0x0: Enable scrambling of packet header and payload 0x1: Disable all scrambling
2	SCO_CRCEN	Enables the appending (Tx) and checking (Rx) of the CRC at the end of the payload of the following Sco packets: (Hv3, Hv4, Hv5, 2-Hv3, 2-Hv5, 3-Hv1, 3-Hv3, 3-Hv5) 0x0: Enable 0x1: Disable
1	AUX1FECEN	Enables the encoding (Tx) and checking (Rx) of the 2/3 FEC coding during the payload portion of an Aux1 packet 0x0: Enable 0x1: Disable
0	AUX1CRCEN	Enables the appending (Tx) and checking (Rx) of the CRC at the end of the payload portion of an Aux1 packet 0x0: Enable 0x1: Disable

0x0A3FF1A8 WCSS_A_BT_LE_CONTROL_2**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_LE_CONTROL_2**

Bits	Name	Description
0	LESCANABORTMODE	Controls how a scan is aborted during LE mode 0x0: Stop scan only upon receiving a packet with a good CRC 0x1: Stop scan only upon receiving a packet with a good or bad CRC

0x0A3FF1AC WCSS_A_BT_BLUETOOTH_CLOCK_N_INTEGER_COMPARE_VALUE_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BLUETOOTH_CLOCK_N_INTEGER_COMPARE_VALUE_0**

Bits	Name	Description
27:0	CLKCMPINTGR_27_0	Integer compare value for Bluetooth clock N comparator interrupt

0x0A3FF1B0 WCSS_A_BT_BLUETOOTH_CLOCK_N_FRACTIONAL_COMPARE_VALUE_0**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BLUETOOTH_CLOCK_N_FRACTIONAL_COMPARE_VALUE_0**

Bits	Name	Description
12:0	CLKCMPFRACT_12_0	Fractional compare value for Bluetooth clock N comparator interrupt

0x0A3FF1B4 WCSS_A_BT_BLUETOOTH_CLOCK_N_INTEGER_COMPARE_VALUE_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BLUETOOTH_CLOCK_N_INTEGER_COMPARE_VALUE_1**

Bits	Name	Description
27:0	CLKCMPINTGR_27_0	Integer compare value for Bluetooth clock N comparator interrupt

0x0A3FF1B8 WCSS_A_BT_BLUETOOTH_CLOCK_N_FRACTIONAL_COMPARE_VALUE_1**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BLUETOOTH_CLOCK_N_FRACTIONAL_COMPARE_VALUE_1**

Bits	Name	Description
12:0	CLKCMPFRACT_12_0	Fractional compare value for Bluetooth clock N comparator interrupt

0x0A3FF1BC WCSS_A_BT_BURST_COEXISTENCE_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Compare value for generating the coexistence command burst timer (CoexCmdTo); coexistence state machine runs the hop calculator and starts the coexistence signaling at this burst timer if a coexistence command has been issued CoexCmdTo must occur at least 3.5 usec before the TxCmdTo and the RxCmdTo to prevent hop calculator contention (unless Calc0, Calc1 = CoexCalc) SlotTimer(13) determines which halfslot (0 or 1) to use; SlotTimer(12:0) indicates which fractional Bluetooth clock location is to fire the interrupt

WCSS_A_BT_BURST_COEXISTENCE_COMMAND

Bits	Name	Description
13:0	BRSTCOEXCMD	Time during slot = [312.5 usec * SlotTimer(13)] + [62.5 nsec * SlotTimer(12:0)] Fractional range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1C0 WCSS_A_BT_BURST_COEXISTENCE_STATUS**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Compare value for generating the coexistence command burst timer (CoexStatTo); coexistence state machine continues the coexistence signaling at this burst timer SlotTimer(12:0) indicates which fractional Bluetooth clock location is to fire the interrupt.

WCSS_A_BT_BURST_COEXISTENCE_STATUS

Bits	Name	Description
13:0	BRSTCOEXSTAT	Time during slot = [312.5 usec * SlotTimer(13)] + [62.5 nsec * SlotTimer(12:0)] Fractional range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1C4 WCSS_A_BT_BURST_PRE SLOT**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the preslot burst timer (PreslotTo) and the prehalfslot burst timer (PrehalfTo); can generate an Int0 at a specific time during a slot. Preslot burst timer is

generated during the second halfslot ($bt_clk(0) = 1$) Prehalfslot burst timer is generated during the first halfslot ($bt_clk(0) = 0$).

WCSS_A_BT_BURST_PRESLOT

Bits	Name	Description
12:0	BRSTPRESLOT	PreslotTo = Time before first halfslot = 312.5 usec - [62.5 nsec * BrstPreslot] PrehalfTo = Time before second halfslot = 312.5 usec - [62.5 nsec * BrstPreslot] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1C8 WCSS_A_BT_BURST_TX_COMMAND

Type: RW

Clock: PCLK

Reset State: 0x00000000

Fractional compare bits for generating the Tx command burst timer (TxCmdTo); link controller starts the transmit process at this burst timer if a Tx LC command has been issued; Tx command burst timer is generated every halfslot.

WCSS_A_BT_BURST_TX_COMMAND

Bits	Name	Description
12:0	BRSTTXCMD	TxCmdTo = Time before halfslot = 312.5 usec - [62.5 nsec * BrstTxCmd] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1CC WCSS_A_BT_BURST_TX_HOP_STROBE

Type: RW

Clock: PCLK

Reset State: 0x00000000

Fractional compare bits for generating the Tx hop strobe burst timer (TxHstbTo); link controller continues the transmit process at this burst timer by sending the Hop_Strobe_Tx RM command to the RM; Tx hop strobe burst timer is generated every halfslot.

WCSS_A_BT_BURST_TX_HOP_STROBE

Bits	Name	Description
12:0	BRSTTXHSTB	TxHstbTo = Time before halfslot = 312.5 usec - [62.5 nsec * BrstTxHstb] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1D0 WCSS_A_BT_BURST_TX_ON**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Tx on burst timer (TxOnTo); link controller continues the transmit process at this burst timer by activating the internal Tx On signal, which enables the baseband transmit logic and gated clock to activate Tx Enable with valid Tx Data exactly 3 usec after TxOnTo; Tx On burst timer is generated every halfslot.

WCSS_A_BT_BURST_TX_ON

Bits	Name	Description
12:0	BRSTTXON	TxOnTo = Time before halfslot = 312.5 usec - [62.5 nsec * BrstTxOn] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1D4 WCSS_A_BT_BURST_RX_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Rx command burst timer (RxCmdTo); link controller starts the receive process at this burst timer if an Rx LC command has been issued; Rx command burst timer is generated every halfslot.

WCSS_A_BT_BURST_RX_COMMAND

Bits	Name	Description
12:0	BRSTRXCMD	RxCmdTo = Time before halfslot = 312.5 usec - [62.5 nsec * BrstRxCmd] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1D8 WCSS_A_BT_BURST_RX_HOP_STROBE**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Rx hop strobe burst timer (RxHstbTo); link controller continues the receive process at this burst timer by sending the Hop_Strobe_Rx RM command to the RM; Rx hop strobe burst timer is generated every halfslot.

WCSS_A_BT_BURST_RX_HOP_STROBE

Bits	Name	Description
12:0	BRSTRXHSTB	RxHstbTo = Time before halfslot = 312.5 usec - [62.5 nsec * BrstRxHstb] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1DC WCSS_A_BT_BURST_RX_ON**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Rx On burst timer (RxOnTo); link controller continues the receive process at this burst timer by activating the internal Rx On signal, which enables the baseband receive logic and their gated clocks; Rx On burst timer is generated every halfslot.

WCSS_A_BT_BURST_RX_ON

Bits	Name	Description
12:0	BRSTRXON	RxOnTo = Time before halfslot = 312.5 usec - [62.5 nsec * BrstRxOn] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1E0 WCSS_A_BT_RX_ACCESS_CODE_DETECT_HARD_ALIGN**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional value for hard aligning on ID packets (enabled by AcdAlignEn); does not apply for LE.

WCSS_A_BT_RX_ACCESS_CODE_DETECT_HARD_ALIGN

Bits	Name	Description
12:0	RXACDALIGN	Time before halfslot = 312.5 usec - [62.5 nsec * [RxAccdAlign +1]] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1E4 WCSS_A_BT_RX_PACKET_HEADER_HARD_ALIGN**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional value for hard aligning on non-ID packets BR/EDR packets (enabled by HdrAlignEn)

WCSS_A_BT_RX_PACKET_HEADER_HARD_ALIGN

Bits	Name	Description
13:0	RXHDRALIGN	Time before halfslot = 312.5 usec - [62.5 nsec * [RxHdrAlign +1]] Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF1E8 WCSS_A_BT_TX_GUARD_SYNC_LENGTH

Type: RW

Clock: PCLK

Reset State: 0x00000000

Baseband transmit guard sync gap length for enhanced rate packets; during this time the RM switches to a modulator that may have a different latency.

WCSS_A_BT_TX_GUARD_SYNC_LENGTH

Bits	Name	Description
4:0	TXGSLNGTH	Range = 1 to 0x1F (31) usec

0x0A3FF1EC WCSS_A_BT_SOFTWARE_INTERRUPT_LATENCY

Type: RW

Clock: PCLK

Reset State: 0x00000000

Estimated latency of software interrupt service routine; setting this value to zero causes the Rx interrupt to fire exactly at the end of a packet; a non-zero value causes the Rx interrupt to fire SwIntLat usec earlier.

WCSS_A_BT_SOFTWARE_INTERRUPT_LATENCY

Bits	Name	Description
4:0	SWINTLAT	Range = 0 to 0x1D (29) usec

0x0A3FF1F0 WCSS_A_BT_RX_DEMODULATOR_DELAY

Type: RW

Clock: PCLK

Reset State: 0x00000000

Baseband receive demodulator delay; the receive logic issues the Rm_Idle, RM command RXDMDDLY usec before the last data symbol is sampled ID packets, 0-byte, 1-byte Aux1 (no FEC or CRC), and 0-byte 8DPSK (3Mbps) packets are not affected.

WCSS_A_BT_RX_DEMODULATOR_DELAY

Bits	Name	Description
3:0	RXDMDDLY	For basic rate packets, range = 0 to 0xC (12) usec For enhanced data rate packets, range = 0 to 0x5 (5) usec

0x0A3FF1F4 WCSS_A_BT_TX_PACKET_HEADER_HARD_ALIGN

Type: RW

Clock: PCLK

Reset State: 0x00000000

Fractional value for hard aligning on LE packets (enabled by TxHdrAlignEn) not used for BR/EDR packets When the alignment occurs, the fractional counter rollover value is forced to [Payload length*8*16) + TxHdrAlign] Value of the counter is forced to 56*16.

WCSS_A_BT_TX_PACKET_HEADER_HARD_ALIGN

Bits	Name	Description
13:0	TXHDRALIGN	Range = 0 to 0x3FFF (16383) resolution = 62.5 nsec

0x0A3FF1FC WCSS_A_BT_BT_TO_LPASS_AUDIO

Type: RW

Clock: PCLK

Reset State: 0x00000000

WCSS_A_BT_BT_TO_LPASS_AUDIO

Bits	Name	Description
0	BTLAPSSAUDIORXINTR	bt_lpass_audio_rx_intr signal to LPASS

0x0A3FF200 WCSS_A_BT_LC_RX_AGC_RSSI_OUT_0

Type: R

Clock: PCLK

Reset State: 0x00000000

WCSS_A_BT_LC_RX_AGC_RSSI_OUT_0

Bits	Name	Description
24	CORR_VALID	correlation valid
17:16	LNA_AGC_GAIN	LNA AGC gain for current packet 0x0: High 0x1: Nominal 0x3: Low
15:0	AGC_RSSI	Signal amplitude estimate for current packet

0x0A3FF204 WCSS_A_BT_LC_RX_AGC_RSSI_OUT_1

Type: R
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_LC_RX_AGC_RSSI_OUT_1

Bits	Name	Description
24	CORR_VALID	correlation valid
17:16	LNA_AGC_GAIN	LNA AGC Gain for previous packet 0x0: High 0x1: Nominal 0x3: Low
15:0	AGC_RSSI	Signal amplitude estimate for previous packet

0x0A3FF208 WCSS_A_BT_LC_SIF_CTRL

Type: RW
Clock: PCLK
Reset State: 0x00000000

WCSS_A_BT_LC_SIF_CTRL

Bits	Name	Description
0	LC_SIF_SW_RESET	Soft reset of two-wire serial interface which is combined with asynchronous reset_n during scan_mode, this reset has no effect

0x0A3FF320 WCSS_A_BT_MWS_CTRL**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Control the MWS TX ON signal

WCSS_A_BT_MWS_CTRL

Bits	Name	Description
16	ENABLE	Enable the BT_TX_ON.
15:8	TRAIL_DLY_CNT	DELAY the trailing edge of BT_TX_ON by the cnt value, in us
7:0	LEAD_DLY_CNT	DELAY the leading edge of BT_TX_ON by the cnt value, in us

0x0A3FF348 WCSS_A_BT_INT_0_LE_BTC_SLOT_BURST_TIMER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

LE Interrupt 0 programmable slot timer; generates an interrupt at a specific time during a slot; the timeout value is compared directly with no offset Time before halfslot = 312.5 usec - [62.5 nsec * [SlotTimer]].

WCSS_A_BT_INT_0_LE_BTC_SLOT_BURST_TIMER

Bits	Name	Description
13:0	SLOTTIMER	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF34C WCSS_A_BT_LE_BURST_COEXISTENCE_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Compare value for generating the coexistence command burst timer (CoexCmdTo); the coexistence state machine runs the hop calculator and starts the coexistence signaling at this burst timer if a coexistence command has been issued CoexCmdTo must occur at least 3.5 usec before the TxCmdTo and the RxCmdTo to prevent hop calculator contention (unless Calc0, Calc1 = CoexCalc) Time before halfslot = 312.5 usec - [62.5 nsec * [BrstCoexCmd]]

WCSS_A_BT_LE_BURST_COEXISTENCE_COMMAND

Bits	Name	Description
13:0	BRSTCOEXCMD	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF350 WCSS_A_BT_LE_BURST_COEXISTENCE_STATUS**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Compare value for generating the coexistence command burst timer (CoexStatTo); the coexistence state machine continues the coexistence signaling at this burst timer Time before halfslot = 312.5 usec - [62.5 nsec * [BrstCoexStat]].

WCSS_A_BT_LE_BURST_COEXISTENCE_STATUS

Bits	Name	Description
13:0	BRSTCOEXSTAT	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF354 WCSS_A_BT_LE_BURST_PRESLOT**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the preslot burst timer (PreslotTo) and the prehalfslot burst timer (PrehalfTo) for LE, these are the same these burst timers can generate an Int0 at a specific time during a slot. Time before halfslot = 312.5 usec - [62.5 nsec * [BrstPreSlot]]

WCSS_A_BT_LE_BURST_PRESLOT

Bits	Name	Description
13:0	BRSTPRESLOT	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF358 WCSS_A_BT_LE_BURST_TX_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Tx command burst timer (TxCmdTo); link controller starts the transmit process at this burst timer if a Tx LC command has been issued Tx command burst timer is generated every slot Time before halfslot = 312.5 usec - [62.5 nsec * [BrstTxCmd]].

WCSS_A_BT_LE_BURST_TX_COMMAND

Bits	Name	Description
13:0	BRSTTXCMD	Range = 0 to 0x1387 (4999) resolution = 62.5 nsec

0x0A3FF35C WCSS_A_BT_LE_BURST_TX_HOP_STROBE**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Tx hop strobe burst timer (TxHstbTo); link controller continues the transmit process at this burst timer by sending the Hop_Strobe_Tx RM command to the RM Tx hop strobe burst timer is generated every slot. Time before halfslot = 312.5 usec - [62.5 nsec * [BrstTxHstb]].

WCSS_A_BT_LE_BURST_TX_HOP_STROBE

Bits	Name	Description
13:0	BRSTTXHSTB	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF360 WCSS_A_BT_LE_BURST_TX_ON**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Tx on burst timer (TxOnTo) link controller continues the transmit process at this burst timer by activating the internal Tx On signal, which enables the baseband transmit logic and gated clock that activates Tx Enable with valid Tx Data exactly 3 usec after TxOnTo Tx On burst timer is generated every slot. Time before halfslot = 312.5 usec - [62.5 nsec * [TxOnTo]].

WCSS_A_BT_LE_BURST_TX_ON

Bits	Name	Description
13:0	BRSTTXON	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF364 WCSS_A_BT_LE_BURST_RX_COMMAND**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Rx command burst timer (RxCmdTo); link controller starts the receive process at this burst timer if a Rx LC command has been issued Rx command burst timer is generated every slot. Time before halfslot = 312.5 usec - [62.5 nsec * [BrstRxCmd]]

WCSS_A_BT_LE_BURST_RX_COMMAND

Bits	Name	Description
13:0	BRSTRXCMD	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF368 WCSS_A_BT_LE_BURST_RX_HOP_STROBE**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Rx hop strobe burst timer (RxHstbTo); link controller continues the receive process at this burst timer by sending the Hop_Strobe_Rx rm command to the Rm Rx hop strobe burst timer is generated every slot Time before halfslot = 312.5 usec - [62.5 nsec * [BrstRxHstb]]

WCSS_A_BT_LE_BURST_RX_HOP_STROBE

Bits	Name	Description
13:0	BRSTRXHSTB	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF36C WCSS_A_BT_LE_BURST_RX_ON**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional compare bits for generating the Rx on burst timer (RxOnTo) link controller continues the receive process at this burst timer by activating the internal Rx On signal, which enables the baseband receive logic and their gated clocks Rx On burst timer is generated every slot Time before halfslot = 312.5 usec - [62.5 nsec * [BrstRxOn]]

WCSS_A_BT_LE_BURST_RX_ON

Bits	Name	Description
13:0	BRSTRXON	Range = 0 to 0x1387 (4999); resolution = 62.5 nsec

0x0A3FF370 WCSS_A_BT_PACKET_REPEAT_NUMBER**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Number of packets to send or receive during continuous test mode if the programmed value is read prior to issuing an LC halfslot command, the value is unchanged; the next LC halfslot command initiates packet processing and the counter decrements must set the PktRptEn bit to enable this register. When the test is complete, reading this register should return a zero; a nonzero value indicates that not all packets were processed. Readback values do not reflect the programmed value.

WCSS_A_BT_PACKET_REPEAT_NUMBER

Bits	Name	Description
15:0	PKTRPTNUM	Range = 0 to 0xFFFF

0x0A3FF374 WCSS_A_BT_GOOD_CRC_COUNTER**Type:** R**Clock:** PCLK**Reset State:** 0x00000000

Number of good CRC values received during a repeated Rx test value is reset to zero when a PktRptNum is written. Must set the PktRptEn bit to enable this register.

WCSS_A_BT_GOOD_CRC_COUNTER

Bits	Name	Description
15:0	GOODCRCCTR	Range = 0 to 0xFFFF

0x0A3FF378 WCSS_A_BT_LE_RX_HARD_ALIGN**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

Fractional value for hard aligning on LE packets (enabled by HdrAlignEn); when the alignment occurs, the fractional counter rollover value is forced to $[(\text{Payload length} * 8 * 16) + \text{RxHdrAlign}]$ value of the counter is forced to $56 * 16$ Time before slot = $[(\text{Len} * 8 * 16) + \text{RxHdrAlign}] * 62.5\text{ns}$

WCSS_A_BT_LE_RX_HARD_ALIGN

Bits	Name	Description
13:0	RXHDRALIGN	Range = 0 to 0x3FFF (16383); resolution = 62.5 nsec

0x0A3FF37C WCSS_A_BT_LE_CONTROL

Type: RW

Clock: PCLK

Reset State: 0x00000000

WCSS_A_BT_LE_CONTROL

Bits	Name	Description
7	RESETFRACCLK	Writing a 1 to this bit forces an immediate alignment of the Bluetooth clock; causes a fractional clock rollover (reset to zero); increments CLKA 0x0: No effect 0x1: Reset fractional clock
6	SKIPCALC	Skip hop calculation 0x0: Process hop calculation even if it is not needed 0x1: Skip hop calculation state; HopStrobe burst timer is ignored
5	CMD0EN	Force LC command 0 processing 0x0: Use legacy command 0/1; processing based on Bluetooth clock 0x1: Always use command 0
4	LEMODMODE	LE modulation mode 0x0: Modulation mod is GFSK BR 0x1: Modulation mode is GMSK LE
3	LEMODBYP	Bypass LE modulation to the modem 0x0: Do not bypass; modulation is GMSK only during LE mode 0x1: Set modulation mode according to LEModMode bit

WCSS_A_BT_LE_CONTROL (cont.)

Bits	Name	Description
2	TXHDRALIGNEN	Enables slot alignment for LE Tx packets; slot alignment occurs when a LE Tx payload length has been captured; Bluetooth clock adjustments: [CLKA fractional counter rollover value = Payload length*8*16 + TxHdrAlign] Even if enabled, the fractional clock is initialized to 4999 at the beginning of a Tx operation and changes only if a packet is sent Preslot burst timer max value is also set at the same time the clock adjustment is made 0x0: Disable LE Tx header slot alignment 0x1: Enable LE Tx header slot alignment when a valid payload length has been captured
1	LECORRMODE	LE correlation mode 0x0: Correlate against 32-bit sync word default 0x1: Correlate against 32-bit sync word and 4 MSBs of preamble
0	LEEN	LE timer enable; setting can be written at any time and be latched at the next Bluetooth clock A rollover; burst timers from the corresponding domain only be in effect after the rollover 0x0: Enable Bluetooth time domain 0x1: Enable LE time domain

0x0A3FF380 WCSS_A_BT_LE_HOP_OFFSET**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000

To be used with LE and with setting OffsetOnly = 1 sent directly from the LC to the modem and represents the actual frequency to be tuned; hardware does not calculate the hop frequency for LE; this value is not the LE channel index

WCSS_A_BT_LE_HOP_OFFSET

Bits	Name	Description
6:0	HOPOFFSET	Valid range = 0x02 (2) to 0x50 (80) Mhz values out of range are not restricted

0x0A3FF388 WCSS_A_BT_BLUETOOTH_CLOCK_N_INTEGER_COMPARE_VALUE_2**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BLUETOOTH_CLOCK_N_INTEGER_COMPARE_VALUE_2**

Bits	Name	Description
27:0	CLKCMPINTGR_27_0	Integer compare value for Bluetooth Clock N Comparator output drives Tx audio interrupt to LPASS

0x0A3FF38C WCSS_A_BT_BLUETOOTH_CLOCK_N_FRACTIONAL_COMPARE_VALUE_2**Type:** RW**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_BLUETOOTH_CLOCK_N_FRACTIONAL_COMPARE_VALUE_2**

Bits	Name	Description
12:0	CLKCMPFRACT_12_0	Fractional compare value for Bluetooth Clock N Comparator output drives Tx audio interrupt to LPASS

00x0A3FF39 WCSS_A_BT_ERROR_STATUS_REGISTER**C****Type:** R**Clock:** PCLK**Reset State:** 0x00000000**WCSS_A_BT_ERROR_STATUS_REGISTER**

Bits	Name	Description
3	ERROR_CRPT_WR	Indicates link controller error access when gam_cmd_busy 0x1: btc_w_req_cc error from crypto_ahb_ctrl
2	ERROR_CRPT_RD	Indicates link controller error access when gam_cmd_busy 0x1: btc_r_req_cc error from crypto_ahb_ctrl
1	ERROR_CTRL_WR	Indicates link controller error access when gam_cmd_busy 0x1: btc_w_req error from buffer controller
0	ERROR_CTRL_RD	Indicates link controller error access when gam_cmd_busy 0x1: btc_r_req error from buffer controller

0x0A3FF3A0 WCSS_A_BT_CLOCK_GATING**Type:** RW**Clock:** PCLK**Reset State:** 0x00000001**WCSS_A_BT_CLOCK_GATING**

Bits	Name	Description
2	CRYPTO_SW_RESET	Resets Crypto block 0x0: Normal 0x1: Reset
1	SW_RESET	Resets link controller including Crypto interface logic (both AHB and 32M domain) 0x0: Normal 0x1: Reset
0	CRYPTO_CLK_GATING_EN	Enables clock gating for Crypto4 block 0x0: Disable 0x1: Enable

0x0A3FF3A4 WCSS_A_BT_GAM_GAS_CONFIG**Type:** RW**Clock:** PCLK**Reset State:** 0x0000000D

Configuration of the GAM/GAS bridges

WCSS_A_BT_GAM_GAS_CONFIG

Bits	Name	Description
25	GAM_CLK_GATING_DISABLE	0x0: allows hardware to clock gate for low power 0x1: forces clock on
24	GAS_CLK_GATING_DISABLE	0x0: allows hardware to clock gate for low power 0x1: forces clock on
23:20	GAM_CFG_BUSY_LIMIT	The maximum number of clock cycles the GAM should wait for the application to either present data to the GAM during writes or to deassert the read stall signal during reads, before the GAM will release the AHB.
19:12	GAS_CFG_HSPLIT_RESP_LIMIT	This configuration value specifies the maximum number of clocks that a master may be split for, before it will be unsplit. Units are in 1024 clock cycles

WCSS_A_BT_GAM_GAS_CONFIG (cont.)

Bits	Name	Description
11:4	GAS_CFG_HSPLIT_MST_RESP_LIMIT	This configuration value specifies the maximum number of clk cycles that a master has once it is unsplit, to return and complete the transaction. Units are in 1024 clock cycles
3:0	GAS_CFG_HREADY_LIMIT	This configuration value specifies the maximum number of clk cycles that the GAS may hold HREADY low for. If this limit is reached, the GAS will issue a split to the master and proceed to the SUSPENDED state (cmd_status=SUSPENDED)

10.3 WCSS_A_QTA_BT_BT_QTA_UART**0x0A4C0000 WCSS_A_QTA_BT_INTR****Type:** RW**Reset State:** 0x00000000

Interrupt status register.

WCSS_A_QTA_BT_INTR

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR	Receive FIFO Underflow interrupt status bit. Software must write a 1 to this bit to clear it.
25	RX_FIFO_OFLOW_INTR	Receive FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it.
24	RX_FIFO_RDY_INTR	Receive FIFO Ready interrupt status bit: Indicates when the Receive FIFO is ready to be drained of software characters. This interrupt is set every clock cycle while the FIFO fill level is greater than the Receive FIFO Trigger Level (rx_trig_level). Software must write a 1 to this bit to clear it.
17	TX_FIFO_OFLOW_INTR	Transmit FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it.
16	TX_FIFO_RDY_INTR	Transmit FIFO Ready interrupt status bit: Indicates when the Transmit FIFO is ready to accept more software characters for transmission. This interrupt is set every clock cycle while the FIFO fill level is less than or equal to the Transmit FIFO Trigger Level (tx_trig_level). Software must write a 1 to this bit to clear it.
8	RX_HW_CHAR_INTR	Received Hardware Character interrupt status bit. Software must write a 1 to this bit to clear it.
1	PARITY_ERR_INTR	UART Parity Error interrupt status bit. Software must write a 1 to this bit to clear it.

WCSS_A_QTA_BT_INTR (cont.)

Bits	Name	Description
0	FRAME_ERR_INTR	UART Frame Error interrupt status bit. Software must write a 1 to this bit to clear it.

0x0A4C0004 WCSS_A_QTA_BT_INTR_EN**Type:** RW**Reset State:** 0x00000000

Interrupt enable register.

WCSS_A_QTA_BT_INTR_EN

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR_EN	Interrupt enable for the Receive FIFO Underflow interrupt.
25	RX_FIFO_OFLOW_INTR_EN	Interrupt enable for the Receive FIFO Overflow interrupt.
24	RX_FIFO_RDY_INTR_EN	Interrupt enable for the Receive FIFO Ready interrupt.
17	TX_FIFO_OFLOW_INTR_EN	Interrupt enable for the Transmit FIFO Overflow interrupt.
16	TX_FIFO_RDY_INTR_EN	Interrupt enable for the Transmit FIFO Ready interrupt.
8	RX_HW_CHAR_INTR_EN	Interrupt enable for the Received Hardware Character interrupt.
1	PARITY_ERR_INTR_EN	Interrupt enable for the Parity Error interrupt.
0	FRAME_ERR_INTR_EN	Interrupt enable for the Frame Error interrupt.

0x0A4C0008 WCSS_A_QTA_BT_UART_CTRL**Type:** RW**Reset State:** 0x03280060

UART control register.

WCSS_A_QTA_BT_UART_CTRL

Bits	Name	Description
31:24	BAUD_RATE_NUMERATOR	Sets the numerator for the ratio of the system clock frequency to the baud rate.
23:16	BAUD_RATE_DENOMINATOR	Sets the denominator for the ratio of the system clock frequency to the baud rate.
6	TX_INV_EN	When set, enables the UART's serial TX output inverter.

WCSS_A_QTA_BT_UART_CTRL (cont.)

Bits	Name	Description
5	RX_INV_EN	When set, enables the UART's serial RX input inverter.
4	POWER_DOWN	When set, puts the UART into power-down mode. The UART transmitter will complete its current transmission and then disable all further transmissions. The UART receiver will discard the current character being received and then ignore all further receptions.
3	PARITY_EN	Enables parity bit generation in the UART transmitter, and parity checking in the UART receiver.
2	PARITY_ODD	When parity is enabled, this bit specifies whether the parity is odd or even. When 1, the parity is odd; when 0, it is even.
1:0	NUM_STOPS	Specifies the number of stop bits (1-4) at the end of each character. The number of stop bits per character = num_stops + 1.

0x0A4C000C WCSS_A_QTA_BT_HW_CTRL**Type:** RW**Reset State:** 0x00000014

Hardware layer control register.

WCSS_A_QTA_BT_HW_CTRL

Bits	Name	Type	Description
31:24	LAST_RX_HW_CHAR	R	This field captures the last received hardware character that was passed on to the Signaling layer.
15	TX_BUFFER_STATE	R	State of the 1-character-deep Hardware TX Buffer. When 1, the buffer is full; when 0, the buffer is empty.
14:8	TX_BUFFER_CONTENTS	R	This field captures the hardware character presently stored in the TX Buffer. Resend bit excluded as only non-Resend-Requests are stored in this buffer.
7	RESEND_REQ_FLAG	R	Indicates the present state of the Resend Request flag. When set, it indicates that a Resend Request is pending transmission.
4	EXCLUSIVE_RESEND_EN	RW	Exclusive Resend Enable: When set, the QTA module will treat Signal State bits within Resend Request characters as invalid. When clear, the Signal State bits are valid regardless of whether the character is a Resend Request.
3	RESEND_REQ_PASSTHRU_EN	RW	Resend Request Pass-Through Enable: When set, the QTA module will pass received Resend Request characters through to the Signaling layer for processing. NB: This feature is unsupported for the WLAN version of the QTA module, because the Signaling interface for the WLAN version does not support Resend signaling.

WCSS_A_QTA_BT_HW_CTRL (cont.)

Bits	Name	Type	Description
2	RESEND_RESP_EN	RW	Resend Response Enable: When this bit is set, the QTA module will automatically respond to received Resend Requests by resending its last (non-Resend-Request) hardware character. Otherwise, the QTA module will not respond to Resend Requests received from the peer device.
1	RETRANSMIT	W	Retransmit TX Buffer contents: Writing a 1 to this bit causes the last (non-Resend-Request) hardware character to be re-transmitted. This bit is self-clearing.
0	RESEND_REQUEST	W	Send a Resend Request: Writing a 1 to this bit causes a Resend Request character to be queued for transmission. This bit is self-clearing.

0x0A4C0010 WCSS_A_QTA_BT_HW_TX_BUFFER_MODIFY**Type:** W**Reset State:** 0x00000000

TX Buffer modify register.

WCSS_A_QTA_BT_HW_TX_BUFFER_MODIFY

Bits	Name	Description
6:0	DATA	Data to be written to the TX Buffer. Writing to this register causes the contents of the TX Buffer to be modified to the value of the data field, and causes the TX buffer state to be set to full.

0x0A4C0014 WCSS_A_QTA_BT_SW_CTRL**Type:** RW**Reset State:** 0x00000000

Software layer control register.

WCSS_A_QTA_BT_SW_CTRL

Bits	Name	Type	Description
29:24	RX_FILL	R	Indicates the number of software characters presently queued in the Receive FIFO.
21	RX_FLUSH	W	Receive FIFO Flush: Writing a 1 to this bit flushes the contents of the Receive FIFO. This bit is self-clearing.
20:16	RX_TRIG_LEVEL	RW	Receive FIFO Trigger Level. See the rx_fifo_rdy_int interrupt status register description.

WCSS_A_QTA_BT_SW_CTRL (cont.)

Bits	Name	Type	Description
13:8	TX_FILL	R	Indicates the number of software characters presently queued in the Transmit FIFO.
5	TX_FLUSH	W	Transmit FIFO Flush: Writing a 1 to this bit flushes the contents of the Transmit FIFO. This bit is self-clearing.
4:0	TX_TRIG_LEVEL	RW	Transmit FIFO Trigger Level. See the tx_fifo_rdy_int interrupt status register description.

0x0A4C0018 WCSS_A_QTA_BT_SW_TX_FIFO_IN**Type:** W**Reset State:** 0x00000000

Software Transmit FIFO write data register.

WCSS_A_QTA_BT_SW_TX_FIFO_IN

Bits	Name	Description
7:0	DATA	Software character to be transmitted.

0x0A4C001C WCSS_A_QTA_BT_SW_RX_FIFO_OUT**Type:** R**Reset State:** 0x00000000

Software Receive FIFO read data register.

WCSS_A_BT_SSB12_CFG_SSB12_PVC_FIFO

Bits	Name	Description
12:8	PVC_INDEX	
7:0	PVC_DATA	Sub-Section 2.2.1: Crystal calibration Stop Parsing at Section 2.3: Link controller registers Start Parsing at Section 1.2: SSB12 Configuration Micro ARM registers

10.5 WCSS_A_SSB12_CFG_SSB12_CFG**0x0A4A0000 WCSS_A_SSB12_CFG_SSB12_CTL****Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00083005

Specifies various generic SSB12 control information. Bits 19:13 comprising of fields SSB12_DATA_PDEN, FCLK_MODE, FCLK_SW_OVERRIDE and NUM_FCLK are either asynchronously reset or set. This is because they control the signals going directly to a pad. Remaining bits 12:0 are synchronously reset or set.

WCSS_A_SSB12_CFG_SSB12_CTL

Bits	Name	Description
19:16	NUM_FCLK	Indicates a programmable number of active forwarding clock cycles following a SSB12 'transaction done' for a corresponding SSB12 request. Unless there is a new SSB12 transaction request, the forwarding clock is shut off after toggling NUM_FCLK cycles at the PMIC SSB12 clock frequency. The suggested setting (also the default value) is 8 clock cycles.
15	FCLK_SW_OVERRIDE	This is a software override bit to control the CGC for forwarding clock. Set this bit to 1 to allow the SSB12 clock to continue as a forwarding clock through the CGC (provided FLCK_MODE = 1). This override bit is provided to allow continuous toggling clock to SSB12 slave irrespective of how the HW logic controls the CGC. Set this bit to 0 to enable pure HW control on the forwarding clock CGC.
14	FCLK_MODE	Set this bit to 1 to activate forwarding clock mode. When this bit is 0, the FCLK_SW_OVERRIDE field has no meaning. Out of reset, the mode is set to 0 indicating that the SSB12 slave does not work off the forwarding clock. When FCLK_MODE = 0; no forwarding clock. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 1; forwarding clock always toggles. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 0; forwarding clock is controlled by HW logic.
13	SSB12_DATA_PDEN	Pulldown enable for SSB12_DATA pad.

WCSS_A_SSB_I2_CFG_SSB_I2_CTL (cont.)

Bits	Name	Description
12	PA_CGC_CTRL	This is to control the SSB_I2 clock going to this PMIC arbiter. Set this bit to 1 when you want to allow the clock to flow through the CGC. Set this bit to 0 to shut off clock to PMIC arbiter. Out of reset, this bit is set to 1.
10:8	SSB_I2_ADDR_WIDTH	Specifies what is the addressing mode in SSB_I2 mode. This field is only applicable in SSB_I2 mode and not the old SSB_I1 mode. 0x0: ENUM_8_BIT_ADDRESSING_MODE (8-bit addressing mode) 0x1: ENUM_9_BIT_ADDRESSING_MODE_AND_SO_ON (9-bit addressing mode and so on)
7	SSB_I2_MODE	Set this bit to 1 when SW wants to switch to new SSB_I2 mode. Set this is 0 when in old SSB_I1 mode.
5:4	SEL_RD_DATA	Specifies which RD_DATA value to select out of four possible combinations. This signal allows the returned data from the slave to be captured inside the master, 1, 2, or 3 symbols late in order to accommodate a large range of routing delay. Based on this field, the entire read transaction length will increase by SEL_RD_DATA number of symbols.
3:2	SSB_I2_DATA_DEL	Specifies the number of 1/2 clock periods, SSB_I2_DATA will be delayed before sampling inside.
1:0	IDLE_SYMS	The master will ensure there are at least this number of idle symbol periods in between the accesses. The idle time is inserted at the end of the read or write transaction. This supported values are always between 1 - 3.

0x0A4A0004 WCSS_A_SSB_I2_CFG_SSB_I2_INT_ENABLE**Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

Provides control on whether the TRANSACTION-DONE interrupts can be generated or not (per SW master).

WCSS_A_SSB_I2_CFG_SSB_I2_INT_ENABLE

Bits	Name	Description
6:0	ENABLE_SSB_I2_INT	SSB_I2 transaction done interrupts for each SW master are generated only when the corresponding bits are set. The Interrupt mapping corresponds to the entries in the VIT. For e.g. if the VMID in VIT index 0 corresponds to the SW master RPM and VMID in index 1 of the VIT corresponds to SW master ARM 11, the bit 0 in the register will enable the interrupt corresponding to RPM, bit 1 will enable interrupt corresponding to ARM11.

0x0A4A0008 WCSS_A_SSBi2_CFG_SSBi2_PRIORITIES**Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

Specifies the priorities for SSBi2 arbiter ports. The SSBi2 block supports up to maximum of 8 ports for arbitration. Each port has 3 bits to denote its priority. The bits are synchronously reset.

CAUTION Since the reset state value of SSBi2_PRIORITIES is 0, only SW requests (hard-coded to port #0) can get through. SW has to program this register to allow hardware requests through the SSBi2 arbiter.

WCSS_A_SSBi2_CFG_SSBi2_PRIORITIES

Bits	Name	Description
11:9	PRIORITY3	Specifies the port number of host, with a priority that is 1 less than PRIORITY2.
8:6	PRIORITY2	Specifies the port number of host, with a priority that is 1 less than PRIORITY1.
5:3	PRIORITY1	Specifies the port number of host, with a priority that is 1 less than PRIORITY0.
2:0	PRIORITY0	Specifies the port number of the highest priority host.

0x0A4A000C WCSS_A_SSBi2_CFG_SSBi2_BANKS_2_3_CTL**Type:** RW**Clock:** AHB bus clock**Reset State:** 0xFFFFFFFF

This register specifies whether an access is allowed to banks 2 and 3 of PMIC. The access control to the banks 2 and 3 of PMIC is set per VMID. Bit 0 corresponds to access control for VMID 0 and bit 31 corresponds to access control for VMID 31.

WCSS_A_SSBi2_CFG_SSBi2_BANKS_2_3_CTL

Bits	Name	Description
31:0	ACCESS_CONTROL	Set each of the 32 bits to 1 if the master corresponding to that VMID wishes to initiate SW requests to banks 2 and 3 of PMIC.

0x0A4A0010 WCSS_A_SSBi2_CFG_SSBi2_ILLEGAL_STATUS**Type:** R**Clock:** AHB bus clock**Reset State:** 0x00000000

Returns status information of the software master that tried to access a SSBI2 command micro register, and failed **security** through the VIT table.

WCSS_A_SSBI2_CFG_SSBI2_ILLEGAL_STATUS

Bits	Name	Description
5:1	ILLEGAL_VMID	Indicates the VMID of the master that performed the most recent illegal access. The value in this field is only meaningful when the ILLEGAL_ACCESS bit is set. On software reads, the value is retained unless another illegal access with a different VMID happens. In that case, this field will have the VMID corresponding to the most recent illegal master.
0	ILLEGAL_ACCESS	When set (1) indicates an illegal access. An illegal access is defined as an access that does not find a matching VMID in the SSBI2_VITn registers. This bit is cleared on a software read provided there is no other illegal access in the same clock cycle that a software read happens.

**0x0A4A0020+WCSS_A_SSBI2_CFG_SSBI2_VITn, n=[0..6]
0x4*n**

Type: RW

Clock: AHB bus clock

Reset State: 0x00000000

This is the VMID index table(VIT) used for enabling concurrent SSBI2 SW requests among multiple SW masters. Secure entities are expected to assign a VMID for the SW master corresponding to an index. The SSBI2_VIT0 has the VMID associated with index 0, SSBI2_VIT1 has the VMID associated with index 1 and so on.

CAUTION By default, only the SW master with a VMID of '0' has access to registers in SSBI2 command micro space. SROT/RPM has to populate this table before valid SW masters can initiate SSBI2 SW transactions.

SSBI2_VITn, n=[0..6]

WCSS_A_SSBI2_CFG_SSBI2_VITn

Bits	Name	Description
4:0	VMID	VMID corresponding to index n.

0x0A4A00A0 WCSS_A_SSBI2_CFG_SSBI2_PVC_CTL

Type: RW

Clock: AHB bus clock

Reset State: 0x00000000

This register provides the global enable/disable for the PVC interface module, per PVC port enable/disable as well as captures PVC interface busy status.

WARNING In a PMIC arbiter wrapper system having more than 1 PMIC arbiter module; if a PVC port(x) is enabled in one of the PMIC arbiters, the corresponding PVC_port(x) in all the other PMIC arbiters shall be disabled. If multiple PVC_port(x)'s enabled simultaneously, the hardware does not guarantee correct operation.

WCSS_A_SSB_I2_CFG_SSB_I2_PVC_CTL

Bits	Name	Description
8	PVC_INTF_BUSY	This is a status bit. When set (1) indicates that the PVC interface module is busy (meaning there is atleast one PVC transaction being serviced). Busy line goes high when PVC interface detects a new request on one of the PVC ports and stays high until it samples a done from SSB_I2 arbiter. Writes to this bit will not have any effect and will be ignored.
3	PVC_PORT3_EN	Set this bit to 1 to enable PVC port 3. PVC port 3 maps to SMPSS CPU1 SAW.
2	PVC_PORT2_EN	Set this bit to 1 to enable PVC port 2. PVC port 2 maps to SMPSS CPU 0 SAW.
1	PVC_PORT1_EN	Set this bit to 1 to enable PVC port 1. PVC port 1 maps to LPASS Q6 SAW.
0	PVC_INTF_EN	Set this bit to 1 to enable PVC interface module.

0x0A4A00A4 WCSS_A_SSB_I2_CFG_SSB_I2_PVC_TABLEn, n=[0..31] +0x4*n

Type: RW

Clock: AHB bus clock

Reset State: 0x00000000

This set of registers indicates the full PVC table corresponding to all the PVC ports. For e.g.: there are 4 entries per PVC port(set by RTL generic) and there are 3 PVC ports (set by RTL generic) in 12 entries. Each entry is 15-bit address to the SSB_I2 slave registers. This indirect addressing from the PVC ports to the SSB_I2 slave registers provides a way to enforce **security** on hardware SSB_I2 requests.

NOTE Though this current document shows 12 entries, the number of entries should scale based on the GENERIC settings for the number of PVC ports and the address index width. Also though 15-bit addresses are supported, 10-bit addressing is all that is expected for current PMICs.

SSB_I2_PVC_TABLEn, n=[0...11]

WCSS_A_SSBi2_CFG_SSBi2_PVC_TABLEn

Bits	Name	Description
14:0	ADDR	15-bit address of the SSBi2 slave registers.

10.6 WCSS_A_SSBi2_CMD_SSBi2_CMD**0x0A480000 WCSS_A_SSBi2_CMD_SSBi2_CMD****Type:** W**Clock:** AHB bus clock**Reset State:** 0x00000000

The SW masters write to this register to initiate either a read or a write SSBi2 transaction. Through this register, the SW can address up to 32 kB of SSBi2 slave register space. However the PMICs only house a maximum of 1024 registers and hence the values on the most significant 5-bits of the REG_ADDR_14_8 field are ignored. The REG_DATA field is only applicable for write transaction and is ignored for reads. The read data returned back from the SSBi2 slave is directed to the SSBi2_RD_STATUS register. Bit 23 is left as a reserved bit to enable slave address to grow to 16-bits in the future.

WCSS_A_SSBi2_CMD_SSBi2_CMD

Bits	Name	Description
24	RDWRN	Denotes whether the command to perform is a register write (0) or read (1).
22:16	REG_ADDR_14_8	Specifies the upper 7 bits, 14:8, of SSBi slave register address.
15:8	REG_ADDR_7_0	Lower 8 bits, 7:0, of SSBi slave register address.
7:0	REG_DATA	Write data for a slave register.

0x0A480004 WCSS_A_SSBi2_CMD_SSBi2_RD_STATUS**Type:** R**Clock:** AHB bus clock**Reset State:** 0x00000000

This register provides the read data as well as the status of the transaction. This register also returns back information associated with the transaction such as the SSBi2 slave register address and the transaction access type. SW is expected to poll TRANS_DONE and TRANS_DENIED until either of these bits are set to 1.

- TRANS_DONE = 0, TRANS_DENIED = 1; indicates to SW that the current transaction was rejected because the master did not have permissions to access the corresponding SSBi2 slave register.

- TRANS_DONE = 1, TRANS_DENIED = 0; indicates to SW that the current transaction was completed successfully. For writes, it means that the write data was sent out on the SSBI wire and for reads, it means that the read data is returned back and is now in SSBI2_RD_STATUS[REG_DATA]. At this point, the SW is said to have completed one transaction.
- Both TRANS_DONE and TRANS_DENIED being either 0 or 1 does not happen and is not a valid combination after a transaction has been initiated.

WCSS_A_SSBI2_CMD_SSBI2_RD_STATUS

Bits	Name	Description
27	TRANS_DONE	When set (1), indicates that the SSBI2 has completed the transaction. If this was a write request, the write has completed. If this was a read request, the read data has returned back.. NOTE This bit is cleared on read.
26	TRANS_DENIED	When set (1), indicates that a SSBI2 transaction was denied because the master did not have access to the particular SSBI2 slave SW register to where the access was intended. For PM8058 banks 2 and 3, this bit is set based on the settings in SSBI2_BANKS_2_3_CTL register that blocked the transaction. NOTE This bit is cleared on read.
25	TRANS_PROG	When set (1), indicates that a SSBI2 transaction is in progress. This signal will be set for the duration from REQ assertion until DONE assertion.
24	RDWRN	Returns the access type of transaction. A value of 1 implies a read transaction and a value of 0 implies a write transaction.
22:8	REG_ADDR	Returns the address to which the SSBI2 transaction was performed.
7:0	REG_DATA	Returned read register data. NOTE The read data is not cleared on reads, however will return all zeroes for a SW master whose transaction was denied or was an illegal SW master.

0x0A21B1C4 WCSS_A_PMU_PLL_L_VAL**Type:** RW**Reset State:** 0x00000032

PLL L value

WCSS_A_PMU_PLL_L_VAL

Bits	Name	Description
7:0	L	PLL L value

0x0A21B1C8 WCSS_A_PMU_PLL_M_VAL**Type:** RW**Reset State:** 0x00000000

PLL M value

WCSS_A_PMU_PLL_M_VAL

Bits	Name	Description
18:0	M	PLL M value

0x0A21B1CC WCSS_A_PMU_PLL_N_VAL**Type:** RW**Reset State:** 0x00000000

PLL N value

WCSS_A_PMU_PLL_N_VAL

Bits	Name	Description
18:0	N	PLL M value

0x0A21B1D0 WCSS_A_PMU_PLL_USER_CTL**Type:** RW**Reset State:** 0x00000000

PLL user_ctl

WCSS_A_PMU_PLL_USER_CTL

Bits	Name	Description
31:0	PLL_USER_CTL	PLL test_ctl input

0x0A21B1D4 WCSS_A_PMU_PLL_CONFIG_CTL**Type:** RW**Reset State:** 0x00141200

PLL config_ctl

WCSS_A_PMU_PLL_CONFIG_CTL

Bits	Name	Description
31:0	PLL_CONFIG_CTL	PLL config_ctl input

0x0A21B1DC WCSS_A_PMU_PLL_STATUS**Type:** R**Reset State:** 0x00000000

pll status

WCSS_A_PMU_PLL_STATUS

Bits	Name	Description
16	PLL_LOCK_DET	pll lock_det output
15:0	PLL_STATUS	pll status output

0x0A21C004 WCSS_A_PMU_CFG**Type:** RW**Reset State:** 0x00400000

Configuration .

WCSS_A_PMU_CFG

Bits	Name	Type	Description
22	BW_CONFIG_VALID_BYPASS	RW	When this bit is set, bw_config_tx_valid, bw_config_rx_valid are not used, and PHY takes bw_config_rx and bw_config_tx as static signal, and doesn't synchronize them. Provided for riva backward compatibility.
21	BW_CONFIG_RX_VALID	RW	RX BW configuration valid. After changing bw_config_rx, SW should write '1' to this bit until PHY synchronizes bw_config_rx to proper clock domain. SW should clear this bit once PHY has done synchronization, usually after PHY configuration is complete.

WCSS_A_PMU_CFG (cont.)

Bits	Name	Type	Description
20	BW_CONFIG_TX_VALID	RW	TX BW configuration valid. After changing bw_config_tx, SW should write '1' to this bit until PHY synchronizes bw_config_tx to proper clock domain. SW should clear this bit once PHY has done synchronization, usually after PHY configuration is complete.
19:18	BW_CONFIG_RX	RW	RX BW configuration
17:16	BW_CONFIG_TX	RW	TX BW configuration
10	IRIS_REG_READ_STS	R	IRIS register read command status. 1 : in progress 0 : done or idle
9	IRIS_REG_READ	RW	send iris register read command to IRIS
8	IRIS_RESET_STS	R	IRIS reset command status. 1 : in progress 0 : done or idle
7	IRIS_RESET	RW	send reset command to IRIS
6	IRIS_XO_CFG_STS	R	IRIS XO configuration status. 1 : in progress 0 : done or idle
5	GC_BUS_MUX_SEL	RW	1 : GC bus is controlled by top 0 : GC bus is controlled by WLAN PHY
4	IRIS_XO_EN	RW	1 : enable XO during configuration 0 : disable XO during configuration
3	IRIS_XO_CFG	RW	start IRIS XO configuration
2:1	IRIS_XO_MODE	RW	IRIS XO mode. 2'b11 : 48MHz XO 2'b01 : 38.4MHz TCXO 2'b00 : 19.2MHz TCXO
0	WARM_BOOT	RW	warm/cold boot indication.

0x0A21C008 WCSS_A_PMU_OVRD_EN**Type:** RW**Reset State:** 0x00000002

enable override of controls

WCSS_A_PMU_OVRD_EN

Bits	Name	Description
1	CCU_PMU_DISABLE_CLK_GATING_OVRD_EN	override ccu_pmu_disable_clk_gating for PMU
0	DUMMY_OVRD_EN	override disable_clk_gating for PMU

0x0A21C00C WCSS_A_PMU_OVRD_VAL**Type:** RW**Reset State:** 0x00000002

override value of controls

WCSS_A_PMU_OVRD_VAL

Bits	Name	Description
1	CCU_PMU_DISABLE_CLK_GATING_OVRD_VAL	override value of ccu_pmu_disable_clk_gating for PMU
0	DUMMY_OVRD_VAL	override value of disable_clk_gating for PMU

0x0A21C010 WCSS_A_PMU_SLP_TMR_CTL**Type:** RW**Reset State:** 0x00000000

control for sleep timer

WCSS_A_PMU_SLP_TMR_CTL

Bits	Name	Description
8	ENABLE_SLP_TMR_CLK	enable clocks to slp_tmr
7	CLK_INT_CLR	Clear slp_clk_int.
6	TMR_EN_INT_CLR	Clear tmr_en_int.
5	CLK_INT_EN	Enable interrupt at the next rising edge of sleep clock. Due to synchronization, it may not be the very next rising edge, but could be 1~2 sleep clocks later.
4	TMR_EN_INT_EN	Enable interrupt when sleep timer is enabled. Interrupt will be asserted at the rising edge of sleep clock when sleep timer starts to increase or decrease.
3	TMR_ADD	add slp_tmr_val_wr[31:0] to the current sleep timer value.
2	TMR_LD	load sleep timer with slp_tmr_val_wr[31:0].
1	TMR_DEC	1 : Decrement sleep timer when tmr_en is set. 0 : increment sleep timer when tmr_en is set.
0	TMR_EN	Enable sleep timer increment or decrement.

0x0A21C014 WCSS_A_PMU_SLP_TMR_STS**Type:** R**Reset State:** 0x00000000

Status of sleep timer.

WCSS_A_PMU_SLP_TMR_STS

Bits	Name	Description
2	CLK_INT	Status of slp_clk_int.
1	TMR_EN_INT	Status of tmr_en_int.
0	TOGGLE	This bit toggles at the every rising edge of sleep clock.

0x0A21C018 WCSS_A_PMU_SLP_TMR_VAL_WR**Type:** RW**Reset State:** 0x00000000

sleep timer value to be written

WCSS_A_PMU_SLP_TMR_VAL_WR

Bits	Name	Description
31:0	SLP_TMR_WR	sleep timer value to be written .

0x0A21C01C WCSS_A_PMU_SLP_TMR_VAL**Type:** R**Reset State:** 0x00000000

current sleep timer value

WCSS_A_PMU_SLP_TMR_VAL

Bits	Name	Description
31:0	SLP_TMR	current sleep timer value

0x0A21C020 WCSS_A_PMU_WLAN_SLP_TMR_CTL**Type:** RW**Reset State:** 0x00000000

WLAN control of sleep timer

WCSS_A_PMU_WLAN_SLP_TMR_CTL

Bits	Name	Description
2	WLAN_SLP_TMR_INT_CLR	clear sleep timer interrupt for WLAN.
1	WLAN_SLP_TMR_INT_EN	enable sleep timer interrupt for WLAN.
0	WLAN_SLP_TMR_EN	enable sleep timer for WLAN.

0x0A21C024 WCSS_A_PMU_WLAN_SLP_TMR_STS

Type: R

Reset State: 0x00000000

sleep timer status for WLAN

WCSS_A_PMU_WLAN_SLP_TMR_STS

Bits	Name	Description
1	WLAN_SLP_TMR_INT	status of WLAN sleep timer interrupt
0	WLAN_SLP_TMR_INT_RAW	raw status of WLAN sleep timer interrupt

0x0A21C028 WCSS_A_PMU_WLAN_SLP_TMR_EXP

Type: RW

Reset State: 0x00000000

sleep timer expiration value for WLAN

WCSS_A_PMU_WLAN_SLP_TMR_EXP

Bits	Name	Description
31:0	WLAN_SLP_TMR_EXP	sleep timer expiration value for WLAN.

0x0A21C02C WCSS_A_PMU_BT_SLP_TMR_CTL

Type: RW

Reset State: 0x00000000

BT control of sleep timer

WCSS_A_PMU_BT_SLP_TMR_CTL

Bits	Name	Description
2	BT_SLP_TMR_INT_CLR	clear sleep timer interrupt for BT.
1	BT_SLP_TMR_INT_EN	enable sleep timer interrupt for BT.
0	BT_SLP_TMR_EN	enable sleep timer for BT.

0x0A21C030 WCSS_A_PMU_BT_SLP_TMR_STS**Type:** R**Reset State:** 0x00000000

sleep timer status for BT

WCSS_A_PMU_BT_SLP_TMR_STS

Bits	Name	Description
1	BT_SLP_TMR_INT	status of BT sleep timer interrupt
0	BT_SLP_TMR_INT_RAW	raw status of BT sleep timer interrupt

0x0A21C034 WCSS_A_PMU_BT_SLP_TMR_EXP**Type:** RW**Reset State:** 0x00000000

sleep timer expiration value for BT

WCSS_A_PMU_BT_SLP_TMR_EXP

Bits	Name	Description
31:0	BT_SLP_TMR_EXP	sleep timer expiration value for BT.

0x0A21C038 WCSS_A_PMU_PWR_CNTL_ADCDAC**Type:** RW**Reset State:** 0x00000000

power control to ADC/DAC block

WCSS_A_PMU_PWR_CNTL_ADCDAC

Bits	Name	Description
1	IDDQ_N_ADC	Freeze IO from ADC.
0	SHUTDOWN_N_ADC	shutdown ADC regulator.

0x0A21C03C WCSS_A_PMU_WMAC_CSR**Type:** RW**Reset State:** 0x00000600

control and status to WMAC modules

WCSS_A_PMU_WMAC_CSR

Bits	Name	Type	Description
31:24	RXP_RSSI_ANT1	R	RXP rssi ant1
23:16	RXP_RSSI_ANT0	R	RXP rssi ant0
10	MTU_TSF_TIMER_EN_SYNC	R	TSF timer enable synchronized to the rising edge of sleep clock and synchronized back to AHB clock. TSF timer will be enabled using this signal.
9	MTU_TSF_TIMER_EN	RW	TSF timer enable for TSF timer restoration. This signal will be synchronized to the rising edge of sleep clock and synchronized back to AHB clock to actually enable TSF timer.
8:7	RXP_WAKEUP_REASON	R	RXP wake up reason. May need to move it to common SS.
4	TPE_CONSIDER_PWRON_BT	RW	TPE consider poweron BT
3	MCU_QTA_VALID	RW	MCU qta_valid
2	MCU_QTA_SEL	RW	MCU qta_sel
1	MCU_GAS_CLKGATE_DISABLE	RW	clock gate disable to MCU GAS
0	MCU_CLKGATE_DISABLE	RW	clock gate disable to MCU

0x0A21C040 WCSS_A_PMU_COMMON_CSR**Type:** RW**Reset State:** 0x00000000

This register controls clock and soft reset of common SS and Pronto top

WCSS_A_PMU_COMMON_CSR

Bits	Name	Description
3	PMU_QGIC2_INVERT_LTE_ACTIVE	when set to 1, qgic2 will expect negedge of lte_active interrupt as active state
2	PMU_QTMR_NS_SELECT	TBD
1	PMU_QGIC2_NS_SELECT	TBD
0	A2XB_CFG_EN	Set to enable A2XB bridge

0x0A21C044 WCSS_A_PMU_ROOT_CLK_ENABLE**Type:** RW**Reset State:** 0x000007F7

This register controls root clock enable to common SS and Pronto top

WCSS_A_PMU_ROOT_CLK_ENABLE

Bits	Name	Description
10	PMU_SLP_ROOT_CLK_ENABLE	slp root clock enable to PMU module
9	PMU_XO_ROOT_CLK_ENABLE	XO root clock enable to PMU module
8	QGIC2_ROOT_CLK_ENABLE	root clock enable to QGIC2 module
7	QTIMER_AHB_ROOT_CLK_ENABLE	AHB root clock enable to QTIMER module
6	QTIMER_XO_ROOT_CLK_ENABLE	XO root clock enable to QTIMER module
5	AOA2AB_ROOT_CLK_ENABLE	root clock enable to AOA2AB module
4	AOAHB_ROOT_CLK_ENABLE	root clock enable to AOAHB module
2	ECAHB_ROOT_CLK_ENABLE	root clock enable to ECAHB module
1	RESERVED	Reserved
0	CRCM_CCU_ROOT_CLK_ENABLE	root clock enable to CCU module

0x0A21C048 WCSS_A_PMU_CLKGATE_DISABLE**Type:** RW**Reset State:** 0x000000B6**WCSS_A_PMU_CLKGATE_DISABLE**

Bits	Name	Description
14	PMU_SLP_TMR_CLKGATE_DISABLE	clock gate disable to PMU SLP_TMR module

WCSS_A_PMU_CLKGATE_DISABLE (cont.)

Bits	Name	Description
13	PMU_IRIS_CFG_CLKGATE_DISABLE	clock gate disable to PMU IRIS_CFG module
12	PMU_WDOG_CLKGATE_DISABLE	clock gate disable to PMU WDOG module
11	QGIC2_CLKGATE_DISABLE	clock gate disable to QGIC2 module
10	QTIMER_AHB_CLKGATE_DISABLE	AHB clock gate disable to QTIMER module
9	WLAN_GLOBAL_CLK_GATE_DISABLE	global clock gate disable for wlan
8	COMMON_GLOBAL_CLK_GATE_DISABLE	global clock gate disable for common_ss
7	PMU_XO_CLKGATE_DISABLE	XO clock gate disable to PMU module
6	QTIMER_XO_CLKGATE_DISABLE	XO clock gate disable to QTIMER module
5	AOA2AB_CLKGATE_DISABLE	clock gate disable to AOA2AB module
4	AOAHB_CLKGATE_DISABLE	clock gate disable to AOAHB module

0x0A21C04C WCSS_A_PMU_SOFT_RESET**Type:** RW**Reset State:** 0x00000400**WCSS_A_PMU_SOFT_RESET**

Bits	Name	Type	Description
10	CRCM_CCPU_SOFT_RESET	RW	soft reset to ARM9. ARM9 will be kept in reset until SW clears it during cold boot up. This is to make sure clk_ccpu and clk_ahb and hclken are all stabilized when reset to ARM9 is released.
9	PMU_SLP_SOFT_RESET	RW	soft reset to sleep clock related logic in PMU including sleep timer.
8	PMU_TCXO_SOFT_RESET	RW	soft reset to tcxo related logic in PMU including SAW2 and GDS controller.
7	QGIC2_SOFT_RESET	RW	soft reset to QGIC2 module
6	QTIMER_SOFT_RESET	RW	soft reset to QTIMER module
5	AOA2AB_SOFT_RESET	W	soft reset to AOA2AB module. It is self-clearing, and 1-clock pulse will be generated. Assertion happens after 4 clock cycles from writing to this register.
4	AOAHB_SOFT_RESET	W	soft reset to AOAHB module. It is self-clearing, and 1-clock pulse will be generated. Assertion happens after 4 clock cycles from writing to this register.

WCSS_A_PMU_SOFT_RESET (cont.)

Bits	Name	Type	Description
2	ECAHB_SOFT_RESET	W	soft reset to ECAHB module. It is self-clearing, and 1-clock pulse will be generated. Assertion happens after 4 clock cycles from writing to this register.
1	MCU_SOFT_RESET	RW	soft reset to MCU module
0	CRCM_CCU_SOFT_RESET	RW	soft reset to CCU module

0x0A21C060 WCSS_A_PMU_WLAN_POWER_MEASURE**Type:** RW**Reset State:** 0x00000000

wlan_power_measure_mask control: Used to generate a masked vector

WCSS_A_PMU_WLAN_POWER_MEASURE

Bits	Name	Description
12:8	WLAN_POWER_MEASURE_MATCH	bit match for wlan_power_tbusl
4:0	WLAN_POWER_MEASURE_MASK	bit mask for wlan_power_tbusl

0x0A21C064 WCSS_A_PMU_WCSS_IPC**Type:** W**Reset State:** 0x00000000

Interrupt output other subsystems.

WCSS_A_PMU_WCSS_IPC

Bits	Name	Description
23	WCSS_SPARE_SW_INTR_3	o_wcss_spare_sw_intr_3
22	WCSS_SPARE_SW_INTR_2	o_wcss_spare_sw_intr_2
21	WCSS_SPARE_SW_INTR_1	o_wcss_spare_sw_intr_1

0x0A21C068 WCSS_A_PMU_WDOG_CTL**Type:** RW**Reset State:** 0x00000000

control register for watchdog timer

WCSS_A_PMU_WDOG_CTL

Bits	Name	Type	Description
4	RESERVED		reserved
3	WDOG_UNMASKED_INT_ENABLE	RW	unmasked IRQ or FIQ will enable wdog timer
2	WDOG_ENABLE	RW	enables wdog timer.
1	WDOG_FREEZE	W	freezes the watchdog timer at count 0. The microprocessor should write this register before it goes to power-on sleep to avoid a watchdog timeout during sleep.
0	WDOG_RESET	W	resets the watch dog counter. In normal operation, the microprocessor should periodically write the register to reset watch dog. This bit also disables watchdog freeze.

0x0A21C06C WCSS_A_PMU_WDOG_STS**Type:** R**Reset State:** 0x00000000

watchdog status register

WCSS_A_PMU_WDOG_STS

Bits	Name	Description
3	RESERVED	reserved
2	WDOG_CNT_RESET_STATUS	show the status of wdog_res signal for test.
1	WDOG_FROZEN	1 : watchdog timer is frozen. 0 : watchdog timer is not frozen.
0	WDOG_EXPIRED_STATUS	1 : watchdog timer has expired. 0 : watchdog timer has not expired.

0x0A21C070 WCSS_A_PMU_WDOG_COUNT

Type: R

Reset State: 0x00000000

watchdog count register

WCSS_A_PMU_WDOG_COUNT

Bits	Name	Description
20:0	WDOG_COUNT	counter value of watchdog counter. Multiple reads are required to determine the value (assuming ahb clock is much faster than sleep clock)

0x0A21C074 WCSS_A_PMU_WDOG_BITE_SECURE

Type: W

Reset State: 0x00000000

this register needs to be written first to unlock write access to WDOG_BITE_TIME register.

WCSS_A_PMU_WDOG_BITE_SECURE

Bits	Name	Description
31:0	WDOG_BITE_SECURE	when this register is written to 0xA1A602E7, WDOG_BITE_TIME can up updated. Once WDOG_BITE_TIME is updated, write access to WDOG_BITE_TIME is blocked until this register is again written to the same pattern.

0x0A21C078 WCSS_A_PMU_WDOG_BARK_TIME**Type:** RW**Reset State:** 0x0003FFFF

defines the time in sleep_clk when to assert the wdog bark interrupt. The value can be between 1 and 0x1fffff (the time when the watchdog times out). The default value is 0x3ffff.

WCSS_A_PMU_WDOG_BARK_TIME

Bits	Name	Type	Description
31	SYNC_STATUS	R	when set(1) wdog bark time is synchronizing to sleep_clk. Data value is not guaranteed until this bit is clear(0).
20:0	WDOG_BARK_TIME	RW	wdog counter vale on which to trigger the bark interrupt

0x0A21C07C WCSS_A_PMU_WDOG_BITE_TIME**Type:** RW**Reset State:** 0x0007FFFF

defines the time in sleep_clk when to assert the wdog bite interrupt. The value can be between 1 and 21'h1ffff (the time when the watchdog times out). The default value is 0x7ffff.

WCSS_A_PMU_WDOG_BITE_TIME

Bits	Name	Type	Description
31	SYNC_STATUS	R	when set(1) wdog bark time is synchronizing to sleep_clk. Data value is not guaranteed until this bit is clear(0).
20:0	WDOG_BITE_TIME	RW	wdog counter vale on which to trigger the bite interrupt. wdog_bite_time should be greater than wdog_bark_time.

0x0A21C08C WCSS_A_PMU_AOA2AB_CTL**Type:** RW**Reset State:** 0x00000000

aoa2ab control register

WCSS_A_PMU_AOA2AB_CTL

Bits	Name	Description
20	AOA2AB_AHB_ERR_CLEAR	clear AOA2AB_AHB_ERR_ADDR
19:16	AOA2AB_CFG_BUSY_LIMIT	a2ab input config signal

WCSS_A_PMU_AOA2AB_CTL (cont.)

Bits	Name	Description
15:0	AOA2AB_TIMEOUT_VALUE	a2ab transaction timeout time in units of 0x1fff clock cycles. 0x0 means timeout timer is disabled.

0x0A21C090 WCSS_A_PMU_AOA2AB_WRAP_ADDR**Type:** R**Reset State:** 0x00000000

aoa2ab wrap address register

WCSS_A_PMU_AOA2AB_WRAP_ADDR

Bits	Name	Description
31:0	AOA2AB_WRAP_ADDR	aoa2ab wrap address.

0x0A21C094 WCSS_A_PMU_AOA2AB_AHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

aoa2ab ahb error address

WCSS_A_PMU_AOA2AB_AHB_ERR_ADDR

Bits	Name	Description
31:0	AOA2AB_AHB_ERR_ADDR	aoa2ab ahb error address. Cleared by writing to AOA2AB_CTL register

0x0A21C09C WCSS_A_PMU_DAC_CAL_CTL**Type:** RW**Reset State:** 0x00000000

control DAC calibration logic

WCSS_A_PMU_DAC_CAL_CTL

Bits	Name	Description
0	DAC_SM_SOFT_RESET	soft reset to DAC calibration state machine

0x0A21C0A0 WCSS_A_PMU_BT_SW_EVENT**Type:** RW**Reset State:** 0x00000000

scratch register that BT SW can write to indicate specific SW event happening

WCSS_A_PMU_BT_SW_EVENT

Bits	Name	Description
31:0	BT_SW_EVENT	Each bit indicates a specific SW event occurring.

0x0A21C124 WCSS_A_PMU_IRIS_XO_SETTLE_TIME**Type:** RW**Reset State:** 0x00000000

IRIS XO settle timer expiration value

WCSS_A_PMU_IRIS_XO_SETTLE_TIME

Bits	Name	Description
31:0	IRIS_XO_SETTLE_TIME	the expiration value of iris_xo_settle_timer in 19.2MHz tick.

0x0A21C128 WCSS_A_PMU_IRIS_XO_SETTLE_TIMER_CSR**Type:** RW**Reset State:** 0x00000000

IRIS XO settle timer control and status

WCSS_A_PMU_IRIS_XO_SETTLE_TIMER_CSR

Bits	Name	Type	Description
1	IRIS_XO_SETTLE_TIMER_EXP_CLR	W	When written 1, iris_xo_settle_timer_exp will be cleared to 0.
0	IRIS_XO_SETTLE_TIMER_EXP	R	the status of iris_xo_settle_timer expiration. The timer will start running when SPM enables it, and will assert iris_xo_settle_timer_exp when the value matches with iris_xo_settle_time register above.

0x0A21C12C WCSS_A_PMU_IRIS_XO_TIMER**Type:** R**Reset State:** 0x00000000

current value of iris_xo_timer

WCSS_A_PMU_IRIS_XO_TIMER

Bits	Name	Description
31:0	IRIS_XO_TIMER	The register shows the current value of iris xo timer. There is no synchronization done, so SW should ignore lower bits changing. It is only debug purpose.

0x0A21C130 WCSS_A_PMU_COMMON_SS_MEM_SLP_CTL**Type:** RW**Reset State:** 0x00000000

individual memory sleep control for common_ss. If SW wants to put common_ss memories in different sleep mode, SW should program this register, and keep COMMON_AHB_CBCR's force_mem_core_on=0, force_mem_periph_on=0.

WCSS_A_PMU_COMMON_SS_MEM_SLP_CTL

Bits	Name	Description
7	PATCH_RAM_FORCE_MEM_PERIPH_ON	when this bit is set to 1, ROM patch memory periph is forced to be on.
6	PATCH_RAM_FORCE_MEM_CORE_ON	when this bit is set to 1, ROM patch memory core is forced to be on. This bit is used to have ROM patch memory in retention mode.
5	CCPU_FORCE_MEM_PERIPH_ON	when this bit is set to 1, ccpu memory periph is forced to be on excpe the ROM patch memory.
4	CCPU_FORCE_MEM_CORE_ON	when this bit is set to 1, ccpu memory core is forced to be on excpe the ROM patch memory. This bit is used to have ccpu in retention mode.
3	DXE_FORCE_MEM_PERIPH_ON	when this bit is set to 1, dxe memory periph is forced to be on.
2	DXE_FORCE_MEM_CORE_ON	when this bit is set to 1, dxe memory core is forced to be on. This bit is used to have dxe in retention mode.
1	CMEM_FORCE_MEM_PERIPH_ON	when this bit is set to 1, cmem memory periph is forced to be on.
0	CMEM_FORCE_MEM_CORE_ON	when this bit is set to 1, cmem memory core is forced to be on. This bit is used to have cMEM in retention mode.

0x0A21C134 WCSS_A_PMU_IRIS_REG_READ**Type:** RW**Reset State:** 0x00000000

address and data for IRIS register read command

WCSS_A_PMU_IRIS_REG_READ

Bits	Name	Type	Description
31:16	IRIS_REG_RDATA	R	read data returned for iris_reg_addr. It is valid only when CFG.iris_reg_read_sts=0.
10:0	IRIS_REG_ADDR	RW	address of IRIS register to be read. After setting the address, CFG.iris_reg_read should be set to '1' to initiate the command through 5-wire interface.

0x0A21C138 WCSS_A_PMU_WLAN_COEX_CTL**Type:** RW**Reset State:** 0x00000000

Control register to generate wlan_tx_on in 5G/2.5G mode for Coex.

WCSS_A_PMU_WLAN_COEX_CTL

Bits	Name	Description
2	WLAN_IN_2G_TX_ON_EN	TX Enable for wlan in 2G
1	WLAN_IN_5G_TX_ON_EN	TX Enable for wlan in 5G
0	WLAN_IN_5G_MODE	wlan in 5G mode

0x0A21D000 WCSS_A_PMU_CCPU_CTL**Type:** RW**Reset State:** 0x00000000

This register represents Controls for CCPU.

WCSS_A_PMU_CCPU_CTL

Bits	Name	Type	Description
4	CCPU_STANDBYWFI	R	The status standbywfi signal from arm9.

WCSS_A_PMU_CCPU_CTL (cont.)

Bits	Name	Type	Description
2	CCPU_REMAP_EN	RW	Set to '1' to enable the boot address region to be re-mapped to a different 64K region in the memory map specified in ccpu_remap_addr reg.
1	CCPU_INSERT_WAIT_FOR_INTERRUPT_CMD_EN	RW	When set, cCPU logic returns a "wait for interrupt" command at boot address.
0	CCPU_HIGH_INTERRUPT_VECTOR_EN	RW	1: When set, cCPU fetches instructions from 0xFFFF_0000 0: When clear, cCPU fetches instructions from 0x0

0x0A21D004 WCSS_A_PMU_CCPU_BOOT_REMAP_ADDR**Type:** RW**Reset State:** 0x00000000

The base address for memory re-map the 64K boot address region.

WCSS_A_PMU_CCPU_BOOT_REMAP_ADDR

Bits	Name	Description
15:0	CCPU_BOOT_REMAP_ADDR	Base address of the 64K boot window onto the DAHB.

0x0A21D008 WCSS_A_PMU_CMEM_ACCESS_CTL**Type:** RW**Reset State:** 0x00000000

This register control the access to cmem address

WCSS_A_PMU_CMEM_ACCESS_CTL

Bits	Name	Description
0	ENABLE_FULL_CMEM_ACCESS	when set to '1', the lower 64KB address of CMEM will be accessible by all masters. when set to '0', ARM9 is the only master that can access the lower 64KB region of CMEM. Access from other masters will be returned by error response.

10.8 WCSS_A_AOAHB_AOAHB

0x0A21A000 WCSS_A_AOAHB_AOAHB_AOWBR_PL

Type: RW

Reset State: 0x00000001

aoahb Arbiter arbitration priority level for aowbr master. In the aoahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_AOAHB_AOAHB_AOWBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for aowbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the aoahb arbiter will prevent a master from disabling itself.

0x0A21A004 WCSS_A_AOAHB_AOAHB_AOA2AB_PL

Type: RW

Reset State: 0x00000001

aoahb Arbiter arbitration priority level for aoa2ab master. In the aoahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_AOAHB_AOAHB_AOA2AB_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for aoa2ab master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the aoahb arbiter will prevent a master from disabling itself.

0x0A21A048 WCSS_A_AOAHB_AOAHB_DFLT_MST

Type: RW

Reset State: 0x00000000

This register identifies the default master for the aoahb.

WCSS_A_AOAHB_AOAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY (Grant ownership to aoahb dummy master) 0x1: AOWBR (Grant ownership to aoahb aowbr master) 0x2: AOA2AB (Grant ownership to aoahb aoa2ab master)

10.9 WCSS_A_SAW2_SAW2**0x0A219000 WCSS_A_SAW2_SAW2_SECURE****Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Restricted

The SAW2_SECURE register is used to enable or disable non-secure bus transactions. The bus **security** status is signaled by ahb_saw_hprotns pin. When ahb_saw_hprotns is set to '0' the state of the SAW2_SECURE register is not considered - a secure transaction is always allowed. When ahb_saw_hprotns is set to '1', the SAW2_SECURE register **security** treatment bit of that register must be '1' for access to be granted. If the **security** treatment bit of the register is set to '0', the non-secure (ahb_saw_hprotns = '1') transactions are denied. When access is denied, a write is ignored, and a read will return '0'. No error is signaled.

When reading the SAW2_SECURE register, non secure agents will always read '0'. Secure agents will see the actual value of the register. The reset value is controlled by CFGNSINIT input pin.

WCSS_A_SAW2_SAW2_SECURE

Bits	Name	Description
2	SAW_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for SAW2 registers: SAW2_ID, SAW2_CFG, SAW2_STS_0, SAW2_STS_1, SAW2_RST, SAW2_VERSION)
1	PWR_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC) Controls security treatment for SPM registers: SAW2_SPM_CTL, SAW2_SPM_PMIC_DLY, SAW2_SPM_PMIC_DATA_0, SAW2_SPM_PMIC_DATA_1, SAW2_SPM_SLP_SEQ_ENTRY_n)
0	VLT_CTL	0x1: NSEC (NSEC) 0x0: SEC (SEC)

0x0A219004 WCSS_A_SAW2_SAW2_ID**Type:** R**Clock:** sys_ref_clk**Reset State:** 0x200B0811**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].

This read only register reports the revision and parameter information for the SAW2 core.

WCSS_A_SAW2_SAW2_ID

Bits	Name	Description
31:24	NUM_SPM_ENTRY	SAW2 parameter: Indicates number of SAW2_SPM_SLP_SEQ_ENTRY register implemented. Value can range from 1 - 128
21:16	NUM_PWR_CTL	SAW2 parameter: Indicates number of power control implemented. Value can range from 4 - 32
12:8	PMIC_DATA_WIDTH	SAW2 parameter: Indicate PMIC data bus width Values can range from 8-16
6:4	NUM_PMIC_DATA	SAW2 parameter: Indicates number of SAW2_SPM_PMIC_DATA_n register implemented. Value can range from 1-7
3	CFG_NS_ACCESS	SAW2 parameter: Reset value of SAW2_SECURE register
2	PMIC_ARB_INTF	SAW2 parameter: Indicates PMIC Arbiter Interface function is implemented
1	RESERVED	Reserved
0	SPM_PRESENT	SAW2 parameter: Indicates SPM function is implemented

0x0A219008 WCSS_A_SAW2_SAW2_CFG**Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].**WCSS_A_SAW2_SAW2_CFG**

Bits	Name	Description
9	RESERVED	reserved
8	FRC_REF_CLK_ON	Chicken bit to force saw_sys_ref_clk_on_req ON.
4:0	CLK_DIV	Divider ratio for clock. This is used to generate timer tick for the timer. Timer tick is asserted every (CLK_DIV + 1) sys_ref_clk period.

0x0A21900C WCSS_A_SAW2_SAW2_SPM_STS**Type:** R**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

WCSS_A_SAW2_SAW2_SPM_STS

Bits	Name	Description
31:16	CURR_PWR_CTL	Power Control Outputs.
15	SHTDWN_REQ	This bit reflects the shutdown request from the SPM(spm_rpm_shutdown_req) to RPM.
14	SHTDWN_ACK	This bit reflects the shutdown acknowledgement from the RPM(rpm_spm_shutdown_ack) to SPM.
13	BRNGUP_REQ	This bit reflects the bringup request from the SPM(spm_rpm_bringup_req) to RPM.
12	BRNGUP_ACK	This bit reflects the bringup acknowledgement from the RPM(rpm_spm_bringup_ack) to SPM.
11:10	RPM_STATE	State of the RPM FSM: 0x0: RUN (RUN(waiting for SPM request)) 0x1: STDNACK (STDNACK (waiting for shutdown ACK from RPM)) 0x2: BGUPACK (BGUPACK (waiting for bringup ACK from RPM)) 0x3: WAKEUP (WAKEUP (waiting for wakeup interrupt))
8:0	SPM_CMD_ADDR	Last SPM command executed.

0x0A219010 RESERVED**0x0A219014 WCSS_A_SAW2_SAW2_PMIC_STS****Type:** R**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SAW2 status.

WCSS_A_SAW2_SAW2_PMIC_STS

Bits	Name	Description
29:20	RESERVED	Reserved

WCSS_A_SAW2_SAW2_PMIC_STS (cont.)

Bits	Name	Description
18	CURR_PMIC_SIZE	Last PMIC VLVL Size sent to the PMIC Arbiter (and the PMIC).
17:16	PMIC_STATE	State of the PMIC FSM: 0x0: IDLE (IDLE) 0x1: DONE (DONE (waiting for DONE form PMIC Arb before transitions back to IDLE)) 0x2: DELAY (DELAY (waiting for delay count termination before transitions back to IDLE)) 0x3: DONEBAR (DONEBAR (waiting for DONE to deassert before another pending request is processed))
7:0	CURR_PMIC_DATA	Last PMIC DATA sent to the PMIC Arbiter (and the PMIC)

0x0A219018 WCSS_A_SAW2_SAW2_RST**Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].

The SAW2_RST register is used to reset the SAW logic. This register clear itself. It does not reset any SAW2 CSR's.

WCSS_A_SAW2_SAW2_RST

Bits	Name	Description
0	RESERVED	Reserved

0x0A219030 WCSS_A_SAW2_SAW2_SPM_CTL**Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_CTL register is used to control the subsystem power management system. This are parameters that controls the operation of SPM FSM.

WCSS_A_SAW2_SAW2_SPM_CTL

Bits	Name	Description
31:24	EVENT_SYNC	SPM Event input configuration. There is an individual bit for each sys_spm_event input
17	SLP_CMD_MODE	Sleep Command M0de

WCSS_A_SAW2_SAW2_SPM_CTL (cont.)

Bits	Name	Description
16	SPM_SYS_PC_MODE	Indication that we're in power collapse mode
12:4	SPM_START_ADR	Start address for the SPM sequence.
3	ISAR	Inhibit Start Address Reset 0x0: END_OF_PROGRAM_RESET_THE_SPM_START_ADR_TO_ZERO (End of program reset the SPM_START_ADR to zero.) 0x1: INHIBIT_END_OF_PROGRAM_TO_RESET_SPM_START_ADR (Inhibit End of program to reset SPM_START_ADR)
2:1	WAKEUP_CONFIG	Wakeup Configuration 0x0: SYS_SPM_WAKEUP (sys_spm_wakeup) 0x1: SYS_SPM_WAKEUP_OR_NOT_CPU_SPM_WAIT_REQ (sys_spm_wakeup or !cpu_spm_wait_req) 0x2: SYS_SPM_WAKEUP_OR_RISING_EDGE_OF_SYS_SPM_DBG_NOPWRDWN (sys_spm_wakeup or rising edge of sys_spm_dbg_nopwrdsn) 0x3: SYS_SPM_WAKEUP_OR_NOT_CPU_SPM_WAIT_REQ_OR_RISING_EDGE_OF_SYS_SPM_DBG_NOPWRDWN (sys_spm_wakeup or !cpu_spm_wait_req or rising edge of sys_spm_dbg_nopwrdsn)
0	SPM_EN	SPM En.

0x0A219034 WCSS_A_SAW2_SAW2_SPM_DLY**Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [PWR_CTL].

SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command.

WCSS_A_SAW2_SAW2_SPM_DLY

Bits	Name	Description
29:20	DLY3	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms
19:10	DLY2	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

WCSS_A_SAW2_SAW2_SPM_DLY (cont.)

Bits	Name	Description
9:0	DLY1	SPM Delay. Controls the time between SPM_SLP_SEQ SPM Delay and the next SPM_SLP_SEQ command. Time range: 52ns to 1.7ms

0x0A219038 WCSS_A_SAW2_SAW2_SPM_STS2**Type:** R**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [SAW_CTL].

This read only register provides SW with SPM power control status.

WCSS_A_SAW2_SAW2_SPM_STS2

Bits	Name	Description
10:0	CURR_PWR_CTL	Power control Outputs

**0x0A219400+ WCSS_A_SAW2_SAW2_SPM_SLP_SEQ_ENTRY_n, n=[0..31]
0x4*n****Type:** RW**Clock:** sys_ref_clk**Reset State:** 0x00000000**Security Treatment:** Controlled by SAW2_SECURE [PWR_CTL].

The SAW2_SPM_SLP_SEQ_ENTRY_n is an array used to sequence through the steps during various power mode. The register width is defined by CLOG_PWR_CTL parameter.

WCSS_A_SAW2_SAW2_SPM_SLP_SEQ_ENTRY_n

Bits	Name	Description
31:24	CMD3	SPM PWR CMD3
23:16	CMD2	SPM PWR CMD2
15:8	CMD1	SPM PWR CMD1

10.10 WCSS_QTMR_AC

QTMR AC Block

10.10.1 WCSS_A_QTMR_AC_QTMR_AC

QTMR AC Block

0x0A211000 WCSS_A_QTMR_AC_QTMR_AC_CNTFRQ

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Restricted

Counter Frequency register. Counter frequency in ticks per second

WCSS_A_QTMR_AC_QTMR_AC_CNTFRQ

Bits	Name	Description
31:0	CNTFRQ	

0x0A211004 WCSS_A_QTMR_AC_QTMR_AC_CNTSR

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Restricted

The Counter Secure Register (CNTSR) contains a bit for Secure access to each timer frame, including both views of the timer frame and the access to the associated CNTACR and CNTVOFF registers in the Access Control region.

WCSS_A_QTMR_AC_QTMR_AC_CNTSR

Bits	Name	Description
4:0	NSN	Non-secure access to frame N. N lies from 0 to \$NUM_FRAME-1 (# of configured frame) 0x0: SECURE_ONLY (Secure access only - non-secure access is RAZ/WI) 0x1: SECURE_OR_NONSECURE (Secure or Non-secure access)

0x0A211008 WCSS_A_QTMR_AC_QTMR_AC_CNTTID

Type: R

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Both

The Counter Timer ID (CNTTID) is 32-bit register that identifies the number of timer frames implemented, which frame have virtual offsets and timers, and which frames have second views.

WCSS_A_QTMR_AC_QTMR_AC_CNTTID

Bits	Name	Description
31:28	F7_CFG	Frame 7 configuration (same definition as Frame 0)
27:24	F6_CFG	Frame 6 configuration (same definition as Frame 0)
23:20	F5_CFG	Frame 5 configuration (same definition as Frame 0)
19:16	F4_CFG	Frame 4 configuration (same definition as Frame 0)
15:12	F3_CFG	Frame 3 configuration (same definition as Frame 0)
11:8	F2_CFG	Frame 2 configuration (same definition as Frame 0)
7:4	F1_CFG	Frame 1 configuration (same definition as Frame 0)
3:0	F0_CFG	Frame 0 configuration 0x3: RSVD (Reserved (Read as zero)) 0x2: FPLO (Frame has second view) 0x1: FVI (Virtual frame implemented) 0x0: FI (Frame implemented)

0x0A211040+ WCSS_A_QTMR_AC_QTMR_AC_CNTACR_n, n=[0..4] 0x4*n

Type: RW

Clock: SYS_AHB_CLK

Reset State: 0x00000000

Security Treatment: Controlled by QTMR_AC_CNTSR[n] The Counter Access Control Register (CNTACR) provide access control to the individual elements of timer frame n, including the second view of that timer frame n.

WCSS_A_QTMR_AC_QTMR_AC_CNTACR_n

Bits	Name	Description
5	RWPT	Read/Write access to CNTP_*register 0x0: ACCESS_DENIED (Access denied) 0x1: ACCESS_ALLOWED (Access allowed)
4	RWVT	Read/Write access to CNTV_*register 0x0: ACCESS_DENIED (Access denied) 0x1: ACCESS_ALLOWED (Access allowed)

Security Treatment: Controlled by QTMR_AC_CNTACR_n[RWPT] An alternative 32 bit TVAL view to provide read or write CVAL register.

The TVAL reads:

$$TVAL = (CVAL - CNTP)$$

The TVAL write CVAL with:

$$CVAL = (CNTP + \text{signExtend}(TVAL))$$
WCSS_A_QTMR_V1_T0_QTMR_V1_CNTP_TVAL

Bits	Name	Description
31:0	CNTP_TVAL	Timer Value in tick per second for Frame

0x0A21202C WCSS_A_QTMR_V1_T0_QTMR_V1_CNTP_CTL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000

Security Treatment: Controlled by QTMR_AC_CNTACR_n[RWPT] The Physical Timer Control Register which can disable the timer and can mask its interrupt. If the timer is disabled, interrupt are masked, but the timer value continue to count down.

WCSS_A_QTMR_V1_T0_QTMR_V1_CNTP_CTL

Bits	Name	Type	Description
2	ISTAT	R	Interrupt Status before masking (Read Only) 0x0: INTERRUPT_NOT_PENDING 0x1: INTERRUPT_PENDING
1	IMSK	RW	Mask Interrupt 0x0: UNMASK_INTERRUPT 0x1: MASK_INTERRUPT
0	EN	RW	Enable Timer 0x0: DISABLED 0x1: ENABLED

0x0A212030 WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_CVAL_LO**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Compare Value register is compare against the CNTVCT counter. The interrupt signal is asserted when the CNTVCT counter is greater than equal to CNTV_CVAL. This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_CVAL_LO

Bits	Name	Description
31:0	CNTV_CVAL_LO	Lower bits [31:0] of compare value for interrupt for Frame n

0x0A212034 WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_CVAL_HI**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Compare Value register is compare against the CNTVCT counter. The interrupt signal is asserted when the CNTVCT counter is greater than equal to CNTV_CVAL. This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_CVAL_HI

Bits	Name	Description
23:0	CNTV_CVAL_HI	Higher bits [31:0] of compare value for interrupt for Frame n

0x0A212038 WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_TVAL**Type:** RW**Clock:** SYS_TMR_CLK**Reset State:** 0x00000000**Security Treatment:** Controlled by QTMR_AC_CNTACR_n[RWVT]

An alternative 32 bit TVAL view to provide read or write CVAL register. The TVAL reads: $TVAL = (CVAL - (CNTP - CNTVOFF))$ The TVAL write CVAL with:

$$CVAL = (CNTP - CNTVOFF) + \text{signExtend}(TVAL)$$

This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_TVAL

Bits	Name	Description
31:0	CNTV_TVAL	Timer Value in tick per second for Frame

0x0A21203C WCSS_A_QTMR_V1_T0_QTMR_V1_CNTV_CTL

Type: RW

Clock: SYS_TMR_CLK

Reset State: 0x00000000

Security Treatment: Controlled by QTMR_AC_CNTACR_n[RWVT]

The Virtual Timer Control Register which can disable the timer and can mask its interrupt. If the timer is disabled, interrupt are masked, but the timer value continue to count down. This register is implemented if FVI (Virtual Frame implemented) for the Frame n is set in QTMR_AC_CNTTID register.

10.16 WCSS_A_QGIC2_QGIC2**0x0A20A000 WCSS_A_QGIC2_GICD_CTLR****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

The GICD_CTLR register controls if the Distributor responds to external interrupt stimulus changes. Non-secure access Distributor provides access to the enable_ns register in bit 0.

Secure access Distributor provides access to the enable_s register in bit 0, and the enable_ns register in bit 1.

WCSS_A_QGIC2_GICD_CTLR

Bits	Name	Description
1	ENABLE_NS	This bit is an alias of the enable_ns bit. This bit is only usable by Secure software. 0x0: CLR (CLR) 0x1: SET (SET)
0	ENABLE	This bit is the enable bit for both Secure and Non-secure software. Secure software accesses enable_s at this location. Non-secure software accesses enable_ns. 0x0: CLR (CLR) 0x1: SET (SET)

0x0A20A004 WCSS_A_QGIC2_GICD_TYPER**Type:** R**Clock:** CLK**Reset State:** Undefined**Security Treatment:** Common

The GICD_TYPER register provides information about the configuration of the QGIC2.

WCSS_A_QGIC2_GICD_TYPER

Bits	Name	Description
15:11	LSPI	Returns the number of Lockable Shared Peripheral Interrupts (LSPIs) that the QGIC2 contains. QGIC2 does not support lockable SPIs, always reads back 0x0.
10	TZ	TrustZone support. QGIC2 supports TrustZone, always reads back 0x1.
9:8	RESERVED_BITS9_TO_8	
7:5	CPU_NUM	Returns the number of CPU interfaces that the GIC provides. The GIC provides either: 0b 000 = one CPU interface 0b 001 = two CPU interfaces 0b 010 = three CPU interfaces 0b 011 = four CPU interfaces 0b 100 = five CPU interfaces 0b 101 = six CPU interfaces 0b 110 = seven CPU interfaces 0b 111 = eight CPU interfaces.

WCSS_A_QGIC2_GICD_TYPER (cont.)

Bits	Name	Description
4:0	IT_LINES	Returns the number of INTIDs, to the nearest 32, that the Distributor provides. Read as: 0b 00000 = the Distributor is configured for up to 32 INTIDs 0b 00001 = the Distributor is configured for up to 64 INTIDs 0b 00010 = the Distributor is configured for up to 96 INTIDs 0b 00011 = the Distributor is configured for up to 128 INTIDs 0b 11110 = the Distributor is configured for up to 992 INTIDs 0b 11111 = the Distributor is configured for up to 1020 INTIDs.

0x0A20A008 WCSS_A_QGIC2_GICD_IIDR**Type:** R**Clock:** CLK**Reset State:** 0x00001070**Security Treatment:** Common

The GICD_IIDR register provides the implementor of the Distributor and the revision of the Distributor.

WCSS_A_QGIC2_GICD_IIDR

Bits	Name	Description
15:12	REVISION	Returns the revision number of the Distributor, 0x1
11:0	IMPLEMENTOR	Returns Qualcomm's JEP106 ID number, 0b 01110000

0x0A20A020 WCSS_A_QGIC2_GICD_ANSACR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

The auxiliary non-secure access control register (GICD_ANSACR) is used to control non-secure access to GICD_CGCR.

WCSS_A_QGIC2_GICD_ANSACR

Bits	Name	Description
0	GICD_CGCR	0x0: SEC (SEC (Dis-allows non-secure access.)) 0x1: NS (NS (Allows non-secure access.))

0x0A20A024 WCSS_A_QGIC2_GICD_CGCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

The clock gate control register (GICD_CGCR) is used to control localized clock gating over-ride logic. Setting bits in GICD_CGCR disables the corresponding local clock gating logic. The local clock gating logic normally turns off a local (small subset) clock tree automatically if there is no need for the clock. If any error is found in the gating logic, these bits can be used to over-ride it.

WCSS_A_QGIC2_GICD_CGCR

Bits	Name	Description
31:17	RESERVED_31_TO_17	
16	TOP	0x1: DISABLE (DISABLE) 0x0: ENABLE (ENABLE) Controls the top level clock gate (which gates entire QGIC2.)
15:4	RESERVED_15_TO_4	
3	DI_SGI_STATE	0x1: DISABLE (DISABLE) 0x0: ENABLE (ENABLE) Controls the clock gate for Distributor interrupt state data base registers for SGI interrupts.)
2	DI_PPI_SPI_STATE	0x1: DISABLE (DISABLE) 0x0: ENABLE (ENABLE) Controls the clock gate for Distributor interrupt state data base registers for PPI and SPI interrupts.)
1	DI_DEMET	0x1: DISABLE (DISABLE) 0x0: ENABLE (ENABLE) Controls the clock gate for Distributor interrupt input demet registers.)
0	DI_RD	0x1: DISABLE (DISABLE) 0x0: ENABLE (ENABLE) Controls the clock gate for Distributor CRIF Read Data.)

**0x0A20A080+WCSS_A_QGIC2_GICD_ISRn, n=[0..8]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

Each bit in an GICD_ISR register controls the **security** state of an interrupt, to be either secure or non-secure. You can only access these registers with secure read or secure write accesses.

NOTE The GICD_ISR register at address offset 0x0080 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ISRn

Bits	Name	Description
31:0	INT_NS	0x0: SEC (SEC (Assigns INTID N to the Secure state.)) 0x1: NS (NS (Assigns INTID N to the Non-secure state.))

Type: RW

Clock: CLK

Reset State: 0x00000000

Security Treatment: NS-int Dependant

Each bit in an GICD_ISENABLER register controls the enabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int Dependant access rules.

NOTE The GICD_ISENABLER register at address offset 0x0100 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ISENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ICENABLER register.)) 0x1: SET (SET (Enables INTID N.))

0x0A20A180+WCSS_A_QGIC2_GICD_ICENABLERn, n=[0..8] 0x4*n

Type: RW

Clock: CLK

Reset State: 0x00000000

Security Treatment: NS-int Dependant

Each bit in an GICD_ICENABLER register controls the disabling of an interrupt.

Reading this register returns the currently enabled interrupts subject to NS-int Dependant access rules.

NOTE The GICD_ICENABLER register at address offset 0x0180 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ICENABLERn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ISENABLER register.)) 0x1: CLR (CLR (Disables INTID N.))

0x0A20A200+WCSS_A_QGIC2_GICD_ISPENDRn, n=[0..8]
0x4*n
Type: RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ISPENDR register provides the pending status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt to the Pending (or Active and Pending) state

NOTE The GICD_ISPENDR register at address offset 0x0200 is repeated once per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ISPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ICPENDR register.)) 0x1: SET (SET (Sets INTID N to the Pending state.))

0x0A20A280+WCSS_A_QGIC2_GICD_ICPENDRn, n=[0..8]
0x4*n
Type: RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ICPENDR register provides the pending status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt out of the Pending (or Active and Pending) state

NOTE The GICD_ICPENDR register at address offset 0x0280 is banked, that is there is one per CPU Interface. It is only accessible from the designated CPU and controls that CPU's PPI interrupts. SGI interrupt bits are read-only, however the distributor updates these using the GICD_SGIR register. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ICPENDRn

Bits	Name	Description
31:0	INT	0x0: NA (NA (No effect. Use GICD_ISPENDR register.)) 0x1: CLR (CLR (Clears INTID N. from the pending state.))

0x0A20A300+WCSS_A_QGIC2_GICD_ISACTIVERn, n=[0..8]**0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ISACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt to the Active (or Active and Pending) state

NOTE The GICD_ISACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ISACTIVERn

Bits	Name	Description
31:0	INT	0x0: DO_NOTHING (DO NOTHING) 0x1: SET (SET)

0x0A20A380+WCSS_A_QGIC2_GICD_ICACTIVERn, n=[0..8]**0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each bit in the GICD_ICACTIVER register provides the active status of an interrupt. Writing a 1 to any of these bits will transition the corresponding interrupt out of the Active (or Active and Pending) state

NOTE The GICD_ICACTIVER register at address offset 0x0300 is repeated once per CPU Interface. It is only accessible from the designated CPU and provides information for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

WCSS_A_QGIC2_GICD_ICACTIVERn

Bits	Name	Description
31:0	INT	0x1: CLR (CLR) 0x0: DO_NOTHING (DO NOTHING)

0x0A20A400+WCSS_A_QGIC2_GICD_IPRIORITYRn, n=[0..71]**0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each field in the GICD_IPRIORITYR registers controls the priority level of an interrupt.

NOTE The GICD_IPRIORITYR registers at address offsets 0x0400 to 0x41C are repeated once per CPU Interface. These are only accessible from the designated CPU and control the priority levels for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupt priority levels.

NOTE This register is byte addressable.

The GICD_IPRIORITYR register behaves differently depending on the **security** setting of interrupt associated with the address written (NS-int) and the **security** of the bus transaction (NS-prot). Figure 26-1 shows how these differences affect different types of access.

Figure 26-1 Summary of the secure and non-secure views of interrupt priority

WCSS_A_QGIC2_GICD_IPRIORITYRn

Bits	Name	Description
31:27	INT3	
23:19	INT2	
15:11	INT1	

WCSS_A_QGIC2_GICD_IPRIORITYRn (cont.)

Bits	Name	Description
7:3	INT0	All bits cleared (0x0) is the highest priority. All bits set (5'b11111) is the lowest priority. For non-secure write access, the MSB is always set (1). For non-secure read access, the MSB is always clear (0). Non-secure entities can't use the highest priorities without secure software setting such a priority. The highest priorities are typically reserved for secure software. On the other hand, secure software can, if needed, write and read the MSB. Secure entities have access to all priorities. Secure interrupts can use priority numbers 5'b10000-5'b11111 (the lower half of the priority spectrum) if needed. Due to strict 'less than' comparisons used in the CPU interface, setting an interrupt's priority to 5'b11111 effectively disables that interrupt. The number of priorities actually supported is 32. Software can determine this number by writing 0xFF and reading back the result.

**0x0A20A800+WCSS_A_QGIC2_GICD_ITARGETSRn, n=[0..71]
 0x4*n**
Type: RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** NS-int Dependant

Each field in the GICD_ITARGETSR registers controls the destination CPU(s) of an interrupt.

NOTE The GICD_ITARGETSR registers at address offsets 0x0800 to 0x81C are not actually implemented. (PPI interrupts, being private, only have one destination CPU. SGI interrupts are generated by the GICD_SGIR register only and do not need the GICD_ITARGETSR.) The remaining registers control the SPI interrupt destinations.

NOTE This register is byte addressable.

WCSS_A_QGIC2_GICD_ITARGETSRn

Bits	Name	Description
31:24	INT3	
23:16	INT2	
15:8	INT1	

WCSS_A_QGIC2_GICD_ITARGETSRn (cont.)

Bits	Name	Description
7:0	INT0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Setting this field to 0 will disable the interrupt as no CPU will see it set. For INTIDs < 32 (the SGI and PPI), reads return the bit corresponding to the CPU performing the read (i.e. CPU 0 reads back 0x01010101). Writes are ignored. The number of CPUs actually supported is determined by NUM_CPU generic. Software can determine this number by writing 0xFF and reading back the result.

**0x0A20AC00 WCSS_A_QGIC2_GICD_ICFGRn, n=[0..17]
+0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x55555555**Security Treatment:** NS-int Dependant

Each field in the GICD_ICFGR registers allows:

- control of type of an SPI:
- level-sensitive
- edge-sensitive
- reading the type of PPIs and SGIs

NOTE The GICD_ICFGR registers at address offsets 0x0C00 to 0xC04 are repeated once per CPU Interface. These are only accessible from the designated CPU and allow read access for that CPU's PPI and SGI interrupts. The remaining registers control the SPI interrupts.

NOTE PPI(0) is the maintenance interrupt and must be configured as level type.

NOTE This register is not byte addressable, interrupts should be disabled before configuring their type.

NOTE Reset state for GICD_ICFGR0 is 0xaaaaaaaa.

WCSS_A_QGIC2_GICD_ICFGRn

Bits	Name	Description
31:30	INT15	
29:28	INT14	
27:26	INT13	
25:24	INT12	
23:22	INT11	

WCSS_A_QGIC2_GICD_ICFGRn (cont.)

Bits	Name	Description
21:20	INT10	
19:18	INT9	
17:16	INT8	
15:14	INT7	
13:12	INT6	
11:10	INT5	
9:8	INT4	
7:6	INT3	
5:4	INT2	
3:2	INT1	
1:0	INT0	0x0: LVL_N_TO_N (LVL N to N) 0x1: LVL_1_TO_N (LVL 1 to N) 0x2: EDGE_N_TO_N (EDGE N to N) 0x3: EDGE_1_TO_N (EDGE 1 to N) These bits behave differently for each of the three interrupt types as follows: - For SGI, read back as 0b10 - SGI interrupts are edge-sensitive and use the N-N model. - For PPI/SPI, read/writable as 0b01 or 0b11 - PPI/SPI interrupts can be edge or level sensitive and use the 1-N model.)

0x0A20AF00 WCSS_A_QGIC2_GICD_SGIR**Type:** W**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

The GICD_SGIR register provides the method by which software may cause interrupts to become pending for designated target CPU(s). The QGIC2 maintains an internal database of all outstanding software interrupt requests pended to each CPU Interface and rotates through them in Round Robin fashion. Signaling the same interrupt a second time before it is serviced will result in only one interrupt from the source CPU to the target CPU(s).

WCSS_A_QGIC2_GICD_SGIR

Bits	Name	Description
31:26	RESERVED_BITS31_TO_26	

WCSS_A_QGIC2_GICD_SGIR (cont.)

Bits	Name	Description
25:24	T_FILTER	Target Filter 0x0: LIST (LIST (Use the T_LIST as is)) 0x1: OTHERS (OTHERS (Send to all CPUs accept the CPU MID making the request, ignoring T_LIST)) 0x2: MID (MID (Send to only the CPU MID making the request, ignoring T_LIST)) 0x3: NA (NA (Reserved))
23:16	T_LIST	Target List. Each bit set represents a CPU target for the INT_ID, subject to the T_FILTER field. 0x1: CPU0 (CPU0) 0x2: CPU1 (CPU1) 0x4: CPU2 (CPU2) 0x8: CPU3 (CPU3) 0x10: CPU4 (CPU4) 0x20: CPU5 (CPU5) 0x40: CPU6 (CPU6) 0x80: CPU7 (CPU7)
15	SATT	Security ATtribute. This bit is only programmable by secure Software. 0x0: SECURE (SECURE (Secure interrupt is issued)) 0x1: NONSECURE (NONSECURE (Non-secure interrupt is issued).)
14:4	RESERVED_BITS14_TO_4	
3:0	INT_ID	The INT ID number (0-15) of the SGI to be set as pending. See Table 26-3 SGI pending truth table for security (SATT vs. NS-prot) on page 14 for information on the conditions that allow an SGI to be set pending.

**0x0A20AF10+WCSS_A_QGIC2_GICD_CPENDSGIRn, n=[0..3]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

Each field in the GICD_CPENDSGIR register, when written as 1, clears the corresponding pending bit of the source CPU for the corresponding SGI.

NOTE If the SGI is marked secure, only a secure access can access that SGI's pending bits.

NOTE This register is byte addressable.

WCSS_A_QGIC2_GICD_CPENDSGIRn

Bits	Name	Description
31:24	SGI3	
23:16	SGI2	
15:8	SGI1	
7:0	SGI0	Each bit represents one of 8 CPUs. Bit 0 represents the zeroth CPU, bit 7 represents the seventh CPU. Writing a 1 to any bit clears the pending status bit from the CPU to the SGI.

Bits	Name	Description
7:0	RESRVD_BY_ARM	Reserved in the specification for future use.

0x0A20AFF0 WCSS_A_QGIC2_GICD_CIDR0**Type:** R**Clock:** CLK**Reset State:** 0x0000000D**Security Treatment:** Common

The GICD_CIDR0 provides access to QGIC2 component identification.

WCSS_A_QGIC2_GICD_CIDR0

Bits	Name	Description
7:0	COMP_ID_0	Reads back as 0x0D.

0x0A20AFF4 WCSS_A_QGIC2_GICD_CIDR1**Type:** R**Clock:** CLK**Reset State:** 0x000000F0**Security Treatment:** Common

The GICD_CIDR1 provides access to QGIC2 component identification.

WCSS_A_QGIC2_GICD_CIDR1

Bits	Name	Description
7:0	COMP_ID_1	Reads back as 0xF0.

0x0A20AFF8 WCSS_A_QGIC2_GICD_CIDR2**Type:** R**Clock:** CLK**Reset State:** 0x00000005**Security Treatment:** Common

The GICD_CIDR2 provides access to QGIC2 component identification.

WCSS_A_QGIC2_GICD_CIDR2

Bits	Name	Description
7:0	COMP_ID_2	Reads back as 0x05.

0x0A20AFFC WCSS_A_QGIC2_GICD_CIDR3**Type:** R**Clock:** CLK**Reset State:** 0x000000B1**Security Treatment:** Common

The GICD_CIDR3 provides access to QGIC2 component identification.

WCSS_A_QGIC2_GICD_CIDR3

Bits	Name	Description
7:0	COMP_ID_3	Reads back as 0xB1.

0x0A20B000 WCSS_A_QGIC2_GICH_HCR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICH_HCR configures the QGIC2 Hypervisor interface.

WCSS_A_QGIC2_GICH_HCR

Bits	Name	Description
31:27	EOICOUNT	Counts the number of EOIs which have been received without a corresponding entry being found among the list registers. Incremented automatically by the CPU Interface when such an EOI is received. EOIs which do not clear a bit in the Active Priorities register do not cause an increment. The maintenance interrupt is asserted whenever this field is non-zero and the SKIDIE bit is set (see below).
7	VDG1IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG1] is cleared. 0x0: CLR (CLR) 0x1: SET (SET)
6	VEG1IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG1] is set. 0x0: CLR (CLR) 0x1: SET (SET)
5	VDG0IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG0] is cleared. 0x0: CLR (CLR) 0x1: SET (SET)
4	VEG0IE	If this bit is set, the maintenance interrupt will be asserted whenever the GICV_CTLR[EnableG0] is set. 0x0: CLR (CLR) 0x1: SET (SET)
3	NPIE	No Pending Interrupt Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever no list registers contain an interrupt in PENDING state. 0x0: CLR (CLR) 0x1: SET (SET)
2	SKIDIE	SKID Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever GICH_HCR[EOICount] is non-zero. 0x0: CLR (CLR) 0x1: SET (SET)
1	UIE	Underflow Maintenance Interrupt Enable. If this bit is set, the maintenance interrupt will be asserted whenever zero or one of the list entries are marked as valid. 0x0: CLR (CLR) 0x1: SET (SET)
0	EN	Enable or Disable maintenance and by proxy Virtual CPU interface Interrupts 0x0: CLR (CLR) 0x1: SET (SET)

0x0A20B004 WCSS_A_QGIC2_GICH_VTR**Type:** R**Clock:** CLK**Reset State:** 0x90000003**Security Treatment:** Common

The GICH_VTR provides information about the configuration of the Hypervisor Interface (virtual GIC type register).

WCSS_A_QGIC2_GICH_VTR

Bits	Name	Description
31:29	PRIBITS	Indicates the number of priority bits implemented, minus one. For this version of the specification the only acceptable value is 100, indicating 5 bits of priority (32 levels)
28:26	PREBITS	Indicates the number of preemption bits implemented, minus one. For this version of the specification the only acceptable value is 100, indicating 5 bits of preemption (32 levels)
5:0	LISTREGS	Indicates the number of implemented List Registers, minus one. QGIC2 has 4 list registers. This is set to 0x3

0x0A20B008 WCSS_A_QGIC2_GICH_VMCR**Type:** RW**Clock:** CLK**Reset State:** 0x004C0000**Security Treatment:** Common

The GICH_VMCR contains read/write aliases of all the Virtual Machine accessible state (aliases from the GICV_* registers). This alias allows the Hypervisor to easily save and restore this state with a single read or write, and without needing to map in the Virtual Machine registers.

Note: Various bits of this register include the terms group 0 or group 1 in their names. This is purely for compatibility with the physical GIC interface and does not pertain to actual TrustZone security.

WCSS_A_QGIC2_GICH_VMCR

Bits	Name	Description
31:27	VMPMR	Alias of the GICV_PMR bits 7:3 in GICV
23:21	VMG0BP	Alias of the group0 GICV_BPR bit in GICV
20:18	VMG1BP	Alias of the group1 GICV_ABPR bit in GICV
9	VEM	Alias of the GICV_CTLR[EOIMode] bit in GICV
4	VMGBPR	Alias of the GICV_CTLR[GBPR] bit in GICV

WCSS_A_QGIC2_GICH_VMCR (cont.)

Bits	Name	Description
3	VMFIQEN	Alias of the GICV_CTLR[FIQen] bit in QGICV.
2	VMACKCTL	Alias of the GICV_CTLR[ActCt] bit in QGICV.
1	VMENABLE_G1	Alias of the GICV_CTLR[ENABLE_G1] bit in QGICV.
0	VMENABLE_G0	Alias of the GICV_CTLR[ENABLE_G0] bit in QGICV.

0x0A20B010 WCSS_A_QGIC2_GICH_MISR**Type:** R**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICH_MISR is the Maintenance interrupt syndrome register in the Hypervisor Interface. This register indicates which Maintenance Interrupts are currently asserted. This takes into account the individual Maintenance Interrupt Enable bits in GICH_HCR. However, the global enable in GICH_HCR (EN) is not factored in to these bits. Therefore the maintenance interrupt is asserted if and only if at least one bit is set in this register and the EN bit in GICH_HCR is set.

WCSS_A_QGIC2_GICH_MISR

0	EI	

0x0A20B020 WCSS_A_QGIC2_GICH_EISR**Type:** R**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICH_EISR provides EOI interrupt status in the Hypervisor Interface - which Software interrupts in the LRn registers that have EI set and are currently in the Invalid state.

WCSS_A_QGIC2_GICH_EISR

Bits	Name	Description
3:0	LR	0x0: NOT_EOI (NOT_EOI) 0x1: EOI (EOI)

0x0A20B030 WCSS_A_QGIC2_GICH_ELRSR**Type:** R**Clock:** CLK**Reset State:** 0x0000000F**Security Treatment:** Common

The GICH_ELRSR provides Empty List Register Status in the Hypervisor Interface.

WCSS_A_QGIC2_GICH_ELRSR

Bits	Name	Description
3:0	LR	0x0: NOT_EMPTY (NOT_EMPTY) 0x1: EMPTY (EMPTY)

0x0A20B0F0 WCSS_A_QGIC2_GICH_APR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICH_APR provides information about the priorities currently active in the Hypervisor Interface.

WCSS_A_QGIC2_GICH_APR

Bits	Name	Description
31:0	PRI	0x0: INACTIVE (INACTIVE) 0x1: ACTIVE (ACTIVE)

**0x0A20B100+WCSS_A_QGIC2_GICH_LRn, n=[0..3]
0x4*n****Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICH_LRn provides access to each of the list registers in the Hypervisor Interface.

WCSS_A_QGIC2_GICH_LRn

Bits	Name	Description
31	HW	Indicates that this is a Hardware interrupt. When this bit is set, bits 19:10 contain the Physical interrupt number, and when this interrupt is subject to an EOI request, a Deactivate Interrupt request will be sent to the Interrupt Distributor.
30	GRP	Indicates that this interrupt should be treated as Group1. This means that the interrupt will present as an IRQ if GICV_CTLR[EnableG1] bit is set. If the GRP bit is clear, the interrupt is put into Group0 and will present as either IRQ or FIQ depending on the setting of the GICV_CTLR[FIQen] but only if GICV_CTLR[EnableG0] bit is also set. This bit is also used with GICV_CTLR[CBPR] to determine which Binary Point register is used in GICV for preemption calculations.
29:28	STATE	0x0: IDL (IDL (INVALID)) 0x1: PNA (PNA (PENDING, NOT ACTIVE)) 0x2: A (A (ACTIVE)) 0x3: PA (PA (PENDING and ACTIVE)) NOTE: for hardware interrupts, the PENDING+ACTIVE state is held in the physical Distributor rather than the VCPUIF. The PENDING+ACTIVE state (11) should only be used for software originated interrupts (Virtual Devices) or SGIs.)
27:23	PRI	Indicates the priority of this interrupt. This is converted to a traditional 8 bit QGIC priority value by appending three zero bits.
19:10	PHY_ID	The physical ID of the interrupt (which SGI/PPI/SPI is it?). When the HW bit is set this field indicates the physical interrupt ID, which is forwarded to the Distributor when this interrupt is subject to an EOI request. See below for details when the HW bit is clear. If the Physical ID is between 16 and 31 inclusive (PPI space), the Deactivation will apply to the PPI associated with the same physical CPU as the VCPUIF making the request. If the Physical ID is between 0 and 15 inclusive (SGI space), the Deactivation will still apply to SGI associated with the same physical CPU as the VCPUIF making the request but it is expected that the HW bit and Physical ID will NOT be used for SGIs.
9:0	VIRTL_ID	Indicates the Virtual ID. This ID is returned to the Guest OS when this interrupt is acknowledged via the GICV_IAR (Interrupt Acknowledge register).

0x0A20B120 WCSS_A_QGIC2_GICH_SW_LR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

This register is not a real physical register or address in the design. It is placed here in the Software Manual to describe the alternate meanings for bits 19:10 in the LRn registers. Adding it here allows SW to pick up defines for these alternate meanings and use them in LRn accesses.

The HW uses these alternate definitions when bit 31 (HW) is set to 0 - indicating a (a pure virtual interrupt) written directly to this Hypervisor interface or an interrupt generated due to an SGI that originated in the Distributor. Bits 31:20 and 9:0 retain the normal GICH_LRn meanings.

WCSS_A_QGIC2_GICH_SW_LR

Bits	Name	Description
19	EI	Indicates that this interrupt should trigger an EOI Interrupt. When this bit is set, a maintenance interrupt will be asserted whenever this interrupt becomes INVALID.
12:10	CPUID	If this interrupt is an SGI, indicates the requesting CPU ID. This will appear in the relevant field of the VM Interrupt Acknowledge register. If the interrupt is not an SGI, software must set this field to 0.

0x0A20C000 WCSS_A_QGIC2_GICC_CTLR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

The GICC_CTLR configures the QGIC2 CPU interface.

Non-secure access Access is granted only to bits 0, 5,6 and 9.

Secure access Access is granted to all register bits. Non-secure bits 0,5,6, and 9 are aliased into bits 1, 7, 8, and 10 for access by secure software.Modifying these aliased bits will modify the non-secure settings. Bits 0, 5, 6, 9 are physically banked into Secure and Non-secure space.

WCSS_A_QGIC2_GICC_CTLR

Bits	Name	Description
10	EOIMODENS	For secure software, a read/writable alias of Non-Secure EOImode.

WCSS_A_QGIC2_GICC_CTLR (cont.)

Bits	Name	Description
9	EOIMODE	For secure software, controls the behavior of secure access to GICC_EOI and GICC_DIR. For non-secure software, controls the behavior of non-secure access to GICC_EOI and GICC_DIR. 0x0: PD_AND_DI (PD_AND_DI (Both Priority Drop and Deactivate Interrupt, GICC_DIR does not function)) 0x1: PD (PD(GICC_EOI performs Priority Drop, GICC_DIR performs deactivate interrupt function))
8	IRQBYPDISABLENS	For secure software, a read/writable alias of Non-secure version of IRQBypDisable.
7	FIQBYPDISABLENS	For secure software, a read/writable alias of Non-secure version of FIQBypDisable
6	IRQBYPDISABLE	For Non-secure software, when CPU Interface is disabled, prevents the legacy bypass IRQ signal from being forwarded to the CPU (if IRQ is under Non-secure control). For secure software, prevents bypass if FIQ is under secure control. 0x0: CLR (CLR) 0x1: SET (SET)
5	FIQBYPDISABLE	For Non-secure software, when CPU Interface is disabled, prevents the legacy bypass FIQ signal from being forwarded to the CPU (if FIQ is under Non-secure control). For secure software, prevents bypass if FIQ is under secure control. 0x0: CLR (CLR) 0x1: SET (SET)
4	SBPR	Controls which binary point register is used to calculate preemption. 0x0: BANKED (BANKED (secure interrupts use the secure Binary Point Register, non-secure interrupts use the non-secure Binary Point Register)) 0x1: RESTRICTED (RESTRICTED (all interrupts use the secure Binary Point Register))
3	S_DEST	Controls destination of secure interrupts. 0x0: IRQ (IRQ) 0x1: FIQ (FIQ)

WCSS_A_QGIC2_GICC_CTLR (cont.)

Bits	Name	Description
2	ACKCTL	Controls the side effect behavior of a secure read request to the Interrupt Acknowledge Register in the case where the highest priority pending interrupt is non-secure. If AckCtl is set to 0, a secure read request to the Interrupt Acknowledge Register returns an Interrupt ID value of 1022, and the read request does not cause the interrupt to be acknowledged (that is the Pending status of the interrupt remains unchanged). If AckCtl is set to 1, a secure read request to the Interrupt Acknowledge Register returns the Interrupt ID value of the non-secure interrupt, and causes the interrupt to be acknowledged (that is the interrupt becomes Active, or Active and Pending). 0x0: DISABLE_ACK_OF_NS_PENDING (DISABLE ACK OF NS PENDING) 0x1: ENABLE_ACK_OF_NS_PENDING (ENABLE ACK OF NS PENDING)
1	ENABLE_NS	For secure software, a read/writable alias of non secure software's enable bit (bit 0 of this same register in non secure space). 0x0: CLR (CLR) 0x1: SET (SET)
0	ENABLE	For non-secure software, this bit enables/disables non secure interrupts. For secure software, this bit enables/disables secure interrupts. 0x0: CLR (CLR) 0x1: SET (SET)

0x0A20C004 WCSS_A_QGIC2_GICC_PMR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

The GICC_PMR register configures the QGIC2 CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

Non-secure access Write access is granted only if bit 7 is 0x1, writes are ignored otherwise. Reads are always granted, however, bit 7 is always set in the data returned. Bit 0 is always zero.

Secure access Access is granted to all register bits.

WCSS_A_QGIC2_GICC_PMR

Bits	Name	Description
7:3	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.

0x0A20C008 WCSS_A_QGIC2_GICC_BPR**Type:** RW**Clock:** CLK**Reset State:** 0x00000002**Security Treatment:** Banked

The GICC_BPR register configures the QGIC2 CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

Non-secure access Provides access to the non-secure Binary Point register.

Secure access Provides access to the secure Binary Point register. Secure software may access the non secure Binary Point register at offset 0x001C

WCSS_A_QGIC2_GICC_BPR

Bits	Name	Description
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 26-6.

0x0A20C00C WCSS_A_QGIC2_GICC_IAR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Banked

The GICC_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state according the description below:

Using three bits defined by AHB bus **security** state (1=non-secure), **security** of the HPPI(1=non-secure) and the value of GICC_CTLR[AckCtl]:

00x - respond with the true interrupt number, transitioning to active (secure request to secure interrupt, ACKCTL is don't care)

010 - respond with 1022 (secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

011 - respond with the true interrupt number, transitioning to active (secure request to non-secure interrupt with ACKCTL=1)

10x - respond with 1023 (non-secure request to secure interrupt)

11x - respond with the true interrupt number, transitioning to active (non-secure request to non-secure interrupt)

WCSS_A_QGIC2_GICC_IAR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, the security state of any outstanding interrupts, the value of GICC_CTLR[AckCtl] as defined in the description above.

0x0A20C010 WCSS_A_QGIC2_GICC_EOIR

Type: W

Clock: CLK

Reset State: 0x00000000

Security Treatment: Banked

Unlike QGIC1, GICC_EOIR (End Of Interrupt) register has two possible behaviors. By default it acts as it did in QGIC1, that is, it can be written to indicate when software has finished handling an interrupt.

In QGIC2, if GICC_CTLR[EOImode] is set (1), writing this register has the 'priority drop' (PD) effect. The PD effect is when the active priority bit for the highest priority active interrupt is cleared. The key difference, when EOImode is one, is that the Distributor is not notified that this happened - that is, the interrupt itself does not become inactive.

When EOImode is zero, writing to this register will, in addition to the PD effect described above, set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending it becomes just pending) in the Distributor.

In either case, the value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed.

The **security** status of the write to this register (NS-prot) must match the **security** status (NS-int) of the interrupt ID, according to Table 26-7 for the interrupt to be successfully cleared.

WCSS_A_QGIC2_GICC_EOIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. As described in Table 26-7, the CPU Source ID must match an active interrupt in order for the GICC_EOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. If the security settings match (see Table 26-7) a write will cause the priority drop effect and if EOImode=0, the Active state in the Distributor for the corresponding interrupt will also be cleared.

0x0A20C014 WCSS_A_QGIC2_GICC_RPR

Type: R

Clock: CLK

Reset State: 0x000000F8

Security Treatment: Banked

The GICC_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this CPU. The priority value returned is sensitive to the **security** status (NS-int) of the interrupt currently running and the NS-prot

Non-secure access If the currently interrupt is secure (NS-int = 0), and a non-secure read of the Running Priority register is attempted (NS-prot = 1), then the value 0 (maximum priority) is returned.

Secure access Returns the true value in the register.

WCSS_A_QGIC2_GICC_RPR

Bits	Name	Description
7:3	VAL	Running Priority

0x0A20C018 WCSS_A_QGIC2_GICC_HPIR

Type: R

Clock: CLK

Reset State: 0x000003FF

Security Treatment: Banked

The GICC_HPPIR register provides access to the highest priority pending interrupt to the CPU Interface.

NOTE Interrupts that are Active and Pending in the Distributor are not considered candidates to become the highest priority pending interrupt.

Using three bits defined by AHB bus **security** state (1=non-secure), **security** of the HPPI(1=non-secure) and the value of GICC_CTLR[AckCtl]:

00x - respond with the true interrupt number (secure request to secure interrupt, ACKCTL is don't care)

010 - respond with 1022 (secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

011 - respond with the true interrupt number (secure request to non-secure interrupt with ACKCTL=1)

10x - respond with 1023 (non-secure request to secure interrupt)

11x - respond with the true interrupt number (non-secure request to non-secure interrupt).

WCSS_A_QGIC2_GICC_HPPIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described above.

0x0A20C01C WCSS_A_QGIC2_GICC_ABPR

Type: RW

Clock: CLK

Reset State: 0x00000003

Security Treatment: Restricted

The GICC_ABPR register provides a copy of the non-secure binary point register for use by secure software. See the definition of the GICC_BPR register for details on the use of this register.

Non-secure access No access.

Secure access Access granted, updates are reflected to non-secure software at the GICC_BPR register at address offset 0x08.

WCSS_A_QGIC2_GICC_ABPR

Bits	Name	Description
2:0	VAL	Same as the GICC_BPR register - affects only non-secure interrupts.

0x0A20C020 WCSS_A_QGIC2_GICC_AIAR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Restricted

The GICC_AIAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn. This is a secure only register used to read non-secure interrupts by Secure Software.

Performing this read has the side effect of causing the Distributor to change the interrupt from the Pending state to the Active or Active and Pending state.

Non-secure access No access. Read as zero.

Secure access See description below.

Based on the 2 bits defined by the AHB **Security** of the request (1=non-secure) and the **security** of the interrupt (1=non-secure):

00 - respond with 1023 (secure request that behaves as if it is a non-secure request, to secure interrupt)

01 - respond with the true interrupt number, transitioning to active (secure request that behaves as if it is a non-secure request, to non-secure interrupt)

1x - RAZ/WI (non-secure request cannot access this register)

WCSS_A_QGIC2_GICC_AIAR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x0A20C024 WCSS_A_QGIC2_GICC_AEOIR**Type:** W**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

A secure write to this register has an identical effect to a non-secure write to GICC_EOIR, with the exception of the EOImode bit; the value of the secure EOImode bit (bit 9) in GICC_CTLR is used to determine whether the interrupt is deactivated or just priority dropped rather than the non-secure EOImode bit (bit 10).

This register must be used by secure software to signal completion of non-secure interrupts when GICC_CTLR AckCtl bit is set to 0; GICC_EOIR cannot be used for this purpose since it would affect GICC_APRn rather than GICC_NSAPRn.

Non-secure access ignored

Secure access signal completion of non-secure interrupt

WCSS_A_QGIC2_GICC_AEOIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU Source ID must match an active interrupt in order for the GICC_AEOIR to take effect. The CPU_ID is written must match that delivered to software when GICC_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICC_IAR register. Interrupt Identifier. A write will cause the priority drop effect and if EOImode=0, the Active state in the Distributor for the corresponding interrupt will also be cleared.

0x0A20C028 WCSS_A_QGIC2_GICC_AHPPIR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Restricted

This is a Secure-Only register.

A read from this register has an identical effect to a Non-Secure read from GICC_HPPIR. It can therefore be used to check for a pending Non-Secure interrupt without the possibility of returning a Secure Interrupt ID value.

Interrupts that are Active and Pending in the Distributor are not considered candidates to become the highest priority pending interrupt.

Non-secure access No access. Read as zero.

Secure access See description below.

NOTE

Using three bits defined by AHB bus **security** state (1=non-secure), **security** of the HPPI(1=non-secure) and the value of GICC_CTLR[AckCtl]:

00x - respond with 1023 (hppi is a secure interrupt)

01x - respond with the true interrupt number (hppi is a non-secure interrupt)

1xx - RAZ/WI (non-secure request cannot access this register).

WCSS_A_QGIC2_GICC_AHPPIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. The value returned in this field is dependent on the security state of the access to the register, and the security state of any outstanding interrupts, as described above.

0x0A20C0D0 WCSS_A_QGIC2_GICC_APR

Type: RW

Clock: CLK

Reset State: 0x00000000

Security Treatment: Banked

Each bit in the GICC_APR register provides the active status of priorities in the CPU Interface. Non-secure access Bits 15-0 represent priorities 31 to 16 of the non-secure active priorities. Secure access Bits 31-0 represent priorities 31 to 0 of the active secure priorities.

WCSS_A_QGIC2_GICC_APR

Bits	Name	Description
31:0	PRI	0x1: A (A (ACTIVE)) 0x0: NA (NA (NOT ACTIVE))

0x0A20C0E0 WCSS_A_QGIC2_GICC_NSAPR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Restricted

Each bit in the GICC_NSAPR register provides the active status of non-secure priorities in the CPU Interface. Non-secure access None - write ignore, read-as-zero. Secure access Bits 31-0 represent priorities 31 to 0 of the active non-secure priorities.

WCSS_A_QGIC2_GICC_NSAPR

Bits	Name	Description
31:0	PRI	0x1: A (A (ACTIVE)) 0x0: NA (NA (NOT ACTIVE))

0x0A20C0FC WCSS_A_QGIC2_GICC_IIDR**Type:** R**Clock:** CLK**Reset State:** 0x00020070**Security Treatment:** Common

The GICC_IIDR register provides information about the QGIC2 CPU Interface version and device implementation information.

WCSS_A_QGIC2_GICC_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x0
19:16	ARCH_VERSION	Architecture Version : 0x2
15:12	REVISION	Revision number: 0x0
11:0	IMPLEMENTOR	Bits[11:8] contain the implementor's JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementor's JEP106 code,

0x0A20D000 WCSS_A_QGIC2_GICC_DIR**Type:** W**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

The GICC_DIR register provides the mechanism by which Software can Deactivate a specific interrupt.

Secure writes can deactivate secure and non-secure interrupts.

Non-secure writes can only deactivate non-secure interrupts.

Note that unlike GICC_EOIR and GICC_IAR, there is no restriction of the Deactivation of Non-Secure interrupts with Secure accesses. The AckCtl bit does not affect the behaviour of GICC_DIR. This is because unlike GICC_IAR there is no chance of the access affecting an interrupt from an unexpected **security** state, and unlike GICC_EOIR there is no effect on GICC_APRn or GICC_NSAPRn, so there is no need to indicate which register should be affected.

WCSS_A_QGIC2_GICC_DIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier. INT_ID written should match value returned from GICC_IAR read.

0x0A20E000 WCSS_A_QGIC2_GICV_CTLR

Type: RW

0x0A20E004 WCSS_A_QGIC2_GICV_PMR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

The GICV_PMR register configures the QGIC2 Virtual CPU interface Priority Mask. The Priority Mask can be used to limit the interrupts that can cause an interrupt request to the CPU based on priority levels.

WCSS_A_QGIC2_GICV_PMR

Bits	Name	Description
7:3	LEVEL	Set the Priority Mask Level. The CPU interface asserts an interrupt request to CPU if the priority of the highest Pending interrupt sent by the interrupt Distributor is strictly higher than at least the mask set in Priority Mask Register.

0x0A20E008 WCSS_A_QGIC2_GICV_BPR**Type:** RW**Clock:** CLK**Reset State:** 0x00000002**Security Treatment:** Common

The GICV_BPR register configures the QGIC2 Virtual CPU interface Binary Point. The Binary Point is used to limit interrupts that can cause an interrupt request to the CPU based on the interrupt's priority and the interrupt priority that currently being serviced by the CPU (if there is one). If the CPU is not servicing an interrupt, the Binary Point register is not used.

WCSS_A_QGIC2_GICV_BPR

Bits	Name	Description
2:0	VAL	The VAL setting is used to determine the priority bits used for preemption according to Table 26-6.

0x0A20E00C WCSS_A_QGIC2_GICV_IAR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Common

The GICV_IAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the GICH to change the interrupt from the Pending state to the Active or Active and Pending state according to the rules below:

Using the 2 bits defined by **Security** of the HPPI(1=non-secure) and the value of GICV_CTLR[AckCtl]:

0x - respond with the true interrupt number, transitioning to active (ignore APROTNS and consider as a secure request to secure interrupt, ACKCTL is don't care)

10 - respond with 1022 (ignore APROTNS and consider as secure request to non-secure interrupt but ACKCTL=0 disabling secure handling of non-secure interrupts)

11 - respond with the true interrupt number, transitioning to active (ignore APROTNS and consider as secure request to non-secure interrupt with ACKCTL=1)

WCSS_A_QGIC2_GICV_IAR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier - a virtual interrupt number determined by the Hypervisor SW.

0x0A20E010 WCSS_A_QGIC2_GICV_EOIR**Type:** W**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

GICV_EOIR (End Of Interrupt) register has two possible behaviors. By default it can be written to to indicate when software has finished handling an interrupt.

If GICV_CTLR[EOImode] is set (1), writing this register has the 'priority drop' (PD) effect. The PD effect is when the active priority bit for the highest priority active interrupt is cleared. The key difference, when EOImode is (1), is the interrupt itself does not become inactive.

When EOImode is (0), writing to this register will, in addition to the PD effect described above, set the interrupt to Inactive or Pending (if prior to writing to this register, the interrupt was both Active and Pending it becomes just pending). However, if GICV_CTLR[EOImode] is (0), then the CPU_ID and INT_ID must match an active interrupt for a state change to occur.

In either case, the value written must be the interrupt ID, and the CPU Source ID for SGIs, of the interrupt that is being completed.

WCSS_A_QGIC2_GICV_EOIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU_ID is written must match that delivered to software when GICV_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICV_IAR register.

0x0A20E014 WCSS_A_QGIC2_GICV_RPR**Type:** R**Clock:** CLK**Reset State:** 0x000000F8**Security Treatment:** Common

The GICV_RPR (Running Priority) register provides access to the highest priority of all the Active interrupts on this Virtual CPU.

WCSS_A_QGIC2_GICV_RPR

Bits	Name	Description
7:3	VAL	Running Priority

0x0A20E018 WCSS_A_QGIC2_GICV_HPPIR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Common

The GICV_HPPIR register provides access to the highest priority pending interrupt to the Virtual CPU Interface. If no interrupt is pending, responds with 0x3FF.

NOTE Interrupts that are Active and Pending in the GICH (hypervisor) are not considered candidates to be come the highest priority pending interrupt.

Using 2 bits defined by the value of GICV_CTLR[AckCtl] and the NS bit of the HPPI(1=non-secure):

1x - respond with the virtual interrupt number

00 - respond with the virtual interrupt number

01 - respond with 1022

WCSS_A_QGIC2_GICV_HPPIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x0A20E01C WCSS_A_QGIC2_GICV_ABPR**Type:** RW**Clock:** CLK**Reset State:** 0x00000003**Security Treatment:** Common

The GICV_ABPR register provides access to the non-secure binary point register used by non-secure interrupts when GICV_CTRL[GBPR]=0. See the definition of the GICV_BPR register for details on the use of this register.

WCSS_A_QGIC2_GICV_ABPR

Bits	Name	Description
2:0	VAL	Same as the GICV_BPR register - affects only non-secure interrupts.

0x0A20E020 WCSS_A_QGIC2_GICV_AIAR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Common

The GICV_AIAR register is used by the CPU to obtain the ID of the interrupt which caused the assertion if IRQn or FIQn.

Performing this read has the side effect of causing the GICH to change the interrupt from the Pending state to the Active or Active and Pending state according to the rules below:

Using the **security** state of the pending interrupt:

- 0 - respond with 1023

- 1 - respond with the true interrupt number, transitioning to active

WCSS_A_QGIC2_GICV_AIAR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier - a virtual interrupt number determined by the Hypervisor SW.

0x0A20E024 WCSS_A_QGIC2_GICV_AEOIR**Type:** W**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

This register presents the same programmers model as GICC_AEOIR.

The effect of writing to this register is identical to the effect of writing the same value to the GICV_EOIR register. This alias is provided for compatibility with the Physical CPU Interface, where the two registers have a different effect due to the provision of separate Secure and Non-Secure Active Priority Registers.

WCSS_A_QGIC2_GICV_AEOIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it must match the ID of the CPU which requested the Interrupt. The CPU_ID is written must match that delivered to software when GICV_IAR is read. For PPIs and SPIs the CPU source ID field is ignored.
9:0	INT_ID	Interrupt Identifier. The value must match the interrupt ID that software received when reading the GICV_IAR register.

0x0A20E028 WCSS_A_QGIC2_GICV_AHPPIR**Type:** R**Clock:** CLK**Reset State:** 0x000003FF**Security Treatment:** Common

This register presents the same programmers model as GICC_AHPPIR.

This register returns the interrupt ID of the highest priority PENDING interrupt if it has an NS value of 1. Reading this interrupt has no side effects and simply returns the highest priority PENDING interrupt among the list registers or a status code according to the following table:

Using the NS bit of the HPPI(1=non-secure):

0 - 1023

1 - respond with the virtual interrupt number

Note that in some cases the returned value may not be strictly accurate if interrupts are currently paged out in software.

WCSS_A_QGIC2_GICV_AHPPIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt. For PPIs and SPIs the CPU source ID field is read as zero and should be ignored.
9:0	INT_ID	Interrupt Identifier.

0x0A20E0D0 WCSS_A_QGIC2_GICV_APR**Type:** RW**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Common

Each bit in the GICV_APR is an alias of GICH_APR. The data and access control are one and the same.

WCSS_A_QGIC2_GICV_APR

Bits	Name	Description
31:0	PRI	0x1: A (A (ACTIVE)) 0x0: NA (NA (NOT ACTIVE))

0x0A20E0FC WCSS_A_QGIC2_GICV_IIDR**Type:** R**Clock:** CLK**Reset State:** 0x00020070**Security Treatment:** Common

The GICV_IIDR register provides information about the QGIC2 Virtual CPU Interface version and device implementor information.

WCSS_A_QGIC2_GICV_IIDR

Bits	Name	Description
31:20	PART_NUM	Part Number: 0x390
19:16	ARCH_VERSION	Architecture Version : 0x2
15:12	REVISION	Revision number: 0x0

WCSS_A_QGIC2_GICV_IIDR (cont.)

Bits	Name	Description
11:0	IMPLEMENTOR	Bits[11:8] contain the implementor's JEP106 continuation code, 0x0 Bit[7] is always 0 Bits[6:0] contain bits [6:0] of the implementor's JEP106 code,

0x0A20F000 WCSS_A_QGIC2_GICV_DIR**Type:** W**Clock:** CLK**Reset State:** 0x00000000**Security Treatment:** Banked

The GICV_DIR register provides the mechanism by which Software can Deactivate a specific interrupt.

WCSS_A_QGIC2_GICV_DIR

Bits	Name	Description
12:10	CPU_ID	CPU Source ID value is only valid if the interrupt is a Software Interrupt, in which case it contains the ID of the CPU which requested the Interrupt.
9:0	INT_ID	Interrupt Identifier. The value should match the INT_ID returned from the read of GICV_IAR.

WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_3_START_COUNT

Bits	Name	Description
31:0	CXM_INTERRUPT_STOBE_3_START_COUNT	When Strobe i is in one-shot mode, stobe i shall generate a one-shot pulse when the CxM_Timer_Counter is equal to CxM_Interrupt_Stobe_i_Start_Count . When Strobe i is in periodic mode, stobe i shall generate a periodic pulse that starts when the CxM_Timer_Counter is equal to CxM_Interrupt_Stobe_i_Start_Count , which the periodicity defined by the following register. S/R by CxM-SW.

0x0A2080A8 WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_0_PERIODICITY**Type:** RW**Reset State:** 0x00000000

CxM_Interrupt_Stobe_0_Periodicity

WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_0_PERIODICITY

Bits	Name	Description
23:0	CXM_INTERRUPT_STOBE_0_PERIODICITY	When Strobe i is in periodic mode, stobe i should generate a strobe with periodicity defined by CxM_Interrupt_Stobe_i_Periodicity. The same clock as the CxM-Timer is used here. S/R by CxM-SW.

0x0A2080AC WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_1_PERIODICITY**Type:** RW**Reset State:** 0x00000000

CxM_Interrupt_Strobe_1_Periodicity

WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_1_PERIODICITY

Bits	Name	Description
23:0	CXM_INTERRUPT_STROBE_1_PERIODICITY	When Strobe i is in periodic mode, stobe i should generate a strobe with periodicity defined by CxM_Interrupt_Strobe_i_Periodicity. The same clock as the CxM-Timer is used here. S/R by CxM-SW.

0x0A2080B0 WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_2_PERIODICITY**Type:** RW**Reset State:** 0x00000000

CxM_Interrupt_Strobe_2_Periodicity

WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_2_PERIODICITY

Bits	Name	Description
23:0	CXM_INTERRUPT_STROBE_2_PERIODICITY	When Strobe i is in periodic mode, stobe i should generate a strobe with periodicity defined by CxM_Interrupt_Strobe_i_Periodicity. The same clock as the CxM-Timer is used here. S/R by CxM-SW.

0x0A2080B4 WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_3_PERIODICITY**Type:** RW**Reset State:** 0x00000000

CxM_Interrupt_Strobe_3_Periodicity

WCSS_A_LTE_CXM_CXM_CP_INTERRUPT_STROBE_3_PERIODICITY

Bits	Name	Description
23:0	CXM_INTERRUPT_STROBE_3_PERIODICITY	When Strobe i is in periodic mode, stobe i should generate a strobe with periodicity defined by CxM_Interrupt_Strobe_i_Periodicity. The same clock as the CxM-Timer is used here. S/R by CxM-SW.

0x0A2080B8 WCSS_A_LTE_CXM_CXM_WCN_PRIORITY_ENABLES**Type:** RW**Reset State:** 0x00000010

Following registers are related to WCN_PRIORITY

WCSS_A_LTE_CXM_CXM_WCN_PRIORITY_ENABLES

Bits	Name	Description
6	CXM_FRAME_SYNC_SEL	CxM_frame_sync_sel
5	CXM_WCN_PRIORITY_OVE RWRITE_VALUE	CxM_WCN_Priority_overwrite_value
4	CXM_WCN_PRIORITY_OVE RWRITE_ENABLE	CxM_WCN_Priority_overwrite_enable
3	CXM_WCN_PRIORITY_VAL UE2	CxM_WCN_Priority_Value2
2	CXM_WCN_PRIORITY_ENA BLE2	CxM_WCN_Priority_Enable2
1	CXM_WCN_PRIORITY_VAL UE1	CxM_WCN_Priority_Value1
0	CXM_WCN_PRIORITY_ENA BLE1	CxM_WCN_Priority_Enable1

0x0A2080BC WCSS_A_LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD1**Type:** RW**Reset State:** 0x00000000

CXM_WCN_Priority_Threshold1

WCSS_A_LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD1

Bits	Name	Description
31:0	CXM_WCN_PRIORITY_THR ESHOLD1	This register is used together with CxM_WCN_Priority_Enable1, CxM_WCN_Priority_Enable2, CxM_WCN_Priority_Value1, CxM_WCN_Priority_Value2, etc.

0x0A2080C0 WCSS_A_LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD2**Type:** RW**Reset State:** 0x00000000

CXM_WCN_Priority_Threshold2

WCSS_A_LTE_CXM_CXM_WCN_PRIORITY_THRESHOLD2

Bits	Name	Description
31:0	CXM_WCN_PRIORITY_THR ESHOLD2	This register is used together with CxM_WCN_Priority_Enable1, CxM_WCN_Priority_Enable2, CxM_WCN_Priority_Value1, CxM_WCN_Priority_Value2, etc.

0x0A2080C4 WCSS_A_LTE_CXM_CXM_LTE_ACTIVE_FRAME_SYNC_VALUE**Type:** R**Reset State:** 0x00000000

This register "polls" the frame_sync input and LTE_active input values.

WCSS_A_LTE_CXM_CXM_LTE_ACTIVE_FRAME_SYNC_VALUE

Bits	Name	Description
1	I_RIVA_LTE_ACTIVE	This register captures the i_riva_lte_active input signal value.
0	I_RIVA_LTE_FRAME_SYNC	This register captures the i_riva_lte_frame_sync input signal value.

10.18 WCSS_A_SPDM_AHBTM**0x0A203000 WCSS_A_SPDM_AHBTM_CFG****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_CFG register configures the following:

WCSS_A_SPDM_AHBTM_CFG

Bits	Name	Description
0	CGC_CLK_ENA	0x0: NO_CLOCK_RUNNING (No clock running) 0x1: CLOCK_ENABLED (Clock enabled)

**0x0A203020+ WCSS_A_SPDM_AHBTM_Cn_CFG0, n=[0..7]
0x20*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_Cn_CFG0 register configures the following:

AHBTM_Cn_CFG0, n=[0,7]]

WCSS_A_SPDM_AHBTM_Cn_CFG0

Bits	Name	Description
31:28	PORT_SELECT	Identifies which AHB port the monitor should be observing

0x0A203024+ WCSS_A_SPDM_AHBTM_Cn_CFG1, n=[0..7] 0x20*n

Type: RW

Clock: HCLK

Reset State: 0x00000000

The AHBTM_Cn_CFG1 register configures the following:

AHBTM_Cn_CFG1, n=[0,7] (Continued)

WCSS_A_SPDM_AHBTM_Cn_CFG1

Bits	Name	Description
20	SEQ_ADDR_ENA	Setting (1) this bit enables the Sequential Address state checking in the enable logic of the counter. On reset this bit is initialized to 0.
18	HMASTLOCK_ENA	Setting (1) this bit enables the HMASTLOCK state checking in the enable logic of the counter. On reset this bit is initialized to 0.
17	HWRITE_ENA	Setting (1) this bit enables the HWRITE state checking in the enable logic of the counter. On reset this bit is initialized to 0.
16	HREADY_ENA	Setting (1) this bit enables the HREADY state checking in the enable logic of the counter. On reset this bit is initialized to 0.
15	HBURST_ENA	Setting (1) this bit enables the HBURST state checking in the enable logic of the counter. On reset this bit is initialized to 0.
14	HTRANS_ENA	Setting (1) this bit enables the HTRANS state checking in the enable logic of the counter. On reset this bit is initialized to 0.
13	HSIZE_ENA	Setting (1) this bit enables the HSIZE state checking in the enable logic of the counter. On reset this bit is initialized to 0.
12	HRESP_ENA	Setting (1) this bit enables the HRESP state checking in the enable logic of the counter. On reset this bit is initialized to 0.

WCSS_A_SPDM_AHBTM_Cn_CFG1 (cont.)

Bits	Name	Description
9	HPROT_ENA	Setting (1) this bit enables the HPROT state checking in the enable logic of the counter. On reset this bit is initialized to 0.
8	HSEL_ENA	Setting (1) this bit enables the HSEL state checking in the enable logic of the counter. On reset this bit is initialized to 0.
4	HADDR_ENA	Setting (1) this bit enables the HADDR state checking in the enable logic of the counter. On reset this bit is initialized to 0.
1	MSTR_GNT_ENA	Setting (1) this bit enables the MSTR_GNTstate checking in the enable logic of the counter. On reset this bit is initialized to 0.
0	ARB_LAT_ENA	Setting (1) this bit enables the ARB_LAT state checking in the enable logic of the counter. On reset this bit is initialized to 0.

**0x0A203028+ WCSS_A_SPDM_AHBTM_Cn_CFG2, n=[0..7]
0x20*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_Cn_CFG2 register configures the following:

AHBTM_Cn_CFG2, n=[0,7]

WCSS_A_SPDM_AHBTM_Cn_CFG2

Bits	Name	Description
8	HMASTLOCK_VAL	Value used in the match circuit.
4	HWRITE_VAL	Value used in the match circuit.
0	HREADY_VAL	Value used in the match circuit.

**0x0A20302C+ WCSS_A_SPDM_AHBTM_Cn_CFG3, n=[0..7]
0x20*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_Cn_CFG3 register configures the following:

AHBTM_Cn_CFG3, n=[0,7]

WCSS_A_SPDM_AHBTM_Cn_CFG3

Bits	Name	Description
30:28	HBURST_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
27	HBURST_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
26:24	HBURST_VAL	Value used in the match circuit.
22:20	HTRANS_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
19	HTRANS_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
18:16	HTRANS_VAL	Value used in the match circuit.
14:12	HSIZE_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
11	HSIZE_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
10:8	HSIZE_VAL	Value used in the match circuit.
6:4	HRESP_MASK	Setting (1) these bits masks off the corresponding bit in the VAL register prior to being used in the match circuit.
3	HRESP_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
2:0	HRESP_VAL	Value used in the match circuit.

**0x0A203030+ WCSS_A_SPDM_AHBTM_Cn_CFG4, n=[0..7]
0x20*n**
Type: RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_Cn_CFG4 register configures the following:

AHBTM_Cn_CFG4, n=[0,7]

WCSS_A_SPDM_AHBTM_Cn_CFG4

Bits	Name	Description
27:24	HPROT_MASK	Setting (1) this bit masks off the corresponding bit in the VAL register prior to being used in the match circuit.
20	HPROT_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
19:16	HPROT_VAL	Value used in the match circuit.

WCSS_A_SPDM_AHBTM_Cn_CFG4 (cont.)

Bits	Name	Description
11:4	HSEL_MASK	Setting (1) this bit masks off the corresponding bit in the VAL register prior to being used in the match circuit.
0	HSEL_VAL	Value used in the match circuit.

**0x0A203034+ WCSS_A_SPDM_AHBTM_Cn_CFG5, n=[0..7]
0x20*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_Cn_CFG5 register configures the following:

AHBTM_Cn_CFG5, n=[0,7]

WCSS_A_SPDM_AHBTM_Cn_CFG5

Bits	Name	Description
28	HADDR_INV	Setting (1) this bit inverts the match circuit output to provide the ability to disable the counter when a match occurs.
27:8	HADDR_VAL	Value used in the match circuit.
7:0	HADDR_MASK	Setting (1) this bit masks off the corresponding bit (7->15...0->8) in the VAL register prior to being used in the match circuit.

**0x0A203038+ WCSS_A_SPDM_AHBTM_Cn_CFG6, n=[0..7]
0x20*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

The AHBTM_Cn_CFG6 register configures the following:

AHBTM_Cn_CFG6, n=[0,7]

WCSS_A_SPDM_AHBTM_Cn_CFG6

Bits	Name	Description
27:20	MSTR_GNT_MASK	Setting (1) these bits masks off the corresponding bits being used in the match circuit. When set = 0xFF this disables the MSTR_GNT state checking from the enable logic of the counter
16	MSTR_GNT_VAL	Value used in the match circuit.

WCSS_A_SPDM_AHBTM_Cn_CFG6 (cont.)

Bits	Name	Description
11:4	ARB_LAT_MASK	Setting (1) these bits masks off the corresponding bits being used in the match circuit. When set = 0xFF this disables the ARB_LAT state checking from the enable logic of the counter
0	ARB_LAT_VAL	Value used in the match circuit.

10.19 WCSS_A_DXE_0_DXE_0**0x0A202000 WCSS_A_DXE_0_DMA_CSR****Type:** RW**Reset State:** 0x00002728

The DMA Control and status Register (DMA_CSR) is used for configuration settings that, in general, apply to all the DMA channels.

WCSS_A_DXE_0_DMA_CSR

Bits	Name	Type	Description
31:24	RESERVED	R	Reserved. Writes ignored, reads will return 0.
23:16	SPARE	RW	Spare bits to be used as necessary for possible ECO bug fixes.
15	H2H_SYNC_EN	RW	When set, DXE will wait for confirmation from MIF that H2H written data has made it all the way out to memory before continuing with the transfers. This will slow things down but guarantee that the data is always consistent no matter what MIF port is used to write it or read it back. When clear, as long as the data is read from the same MIF port from which it was written, MIF will guarantee that data coherency without the need to wait.
14	PAUSED	R	This status bit will be set when as a result of setting the pause request bit (PAUSE), the state machine has completed any ongoing chunk transfer, released the AHB interfaces, and entered the pause state. This will bit be cleared when as a result of clearing the pause request bit (PAUSE), the state machine has gone back to processing any outstanding transfers or else it has gone back to the IDLE state to wait for new transfer requests.
13	ECTR_EN	RW	Event Counter Enable. When set the event counters will be enabled.
12:8	B2H_TSTMP_OFF	RW	Timestamp Offset. This bitfield specifies the offset (multiple of 4 bytes) to be used for writing the start and end timestamps in the BD for B2H type transfers

WCSS_A_DXE_0_DMA_CSR (cont.)

Bits	Name	Type	Description
7:3	H2B_TSTMP_OFF	RW	Timestamp Offset. This bitfield specifies the offset (multiple of 4 bytes) to be used for writing the start and end timestamps in the BD for H2B transfers.
2	TSTMP_EN	RW	Timestamp Enable. When set, this bit enables the writing of start and end timestamps for H2B and B2H transfers. The timestamps will be written in the BD at the offset specified by the setting of the TMSTMP_OFF bitfield as two consecutive 32-bit starting with the start timestamp. When this bit is cleared no timestamps will be written to the BD.
1	PAUSE	RW	Pause the DMA engine. The engine will stop as soon as the next chunk transfer is complete so no data will be lost. It will also release the AHB interfaces. No progress will be made until software clears this bit.
0	EN	RW	Enables the DMA engine

0x0A202004 WCSS_A_DXE_0_DMA_ENCH**Type:** RW**Reset State:** 0x00000000

This register is write-only and provides a convenient way for software to enable one or more channels with a single register write. When writing to this register, each data bit set HIGH causes the corresponding CH_CSR[EN] bit in the channel to be set thereby enabling the channel. Data bits that are low have no effect in their corresponding channel CSR[EN] bits.

WCSS_A_DXE_0_DMA_ENCH
