Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CH7_EN	W	Enable channel 7.
6	CH6_EN	W	Enable channel 6.
5	CH5_EN	W	Enable channel 5.
4	CH4_EN	W	Enable channel 4.
3	CH3_EN	W	Enable channel 3.
2	CH2_EN	W	Enable channel 2.
1	CH1_EN	W	Enable channel 1.
0	CH0_EN	W	Enable channel 0.

0x0A202008 WCSS_A_DXE_0_DMA_CH_EN**Type:** R**Reset State:** 0x00000000

This register is read-only and indicates which DMA channels are enabled. Each bit in this register reflects the status of the corresponding EN bit in each of the channels' CHn_CSRs. As such, used in combination with DMA_DONE, it provides a convenient way for software to determine which channels are available for a new DMA operation.

WCSS_A_DXE_0_DMA_CH_EN

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_EN	Enable (EN) bit status for DMA Channel 7 in CH7_CSR.
6	CH6_EN	Enable (EN) bit status for DMA Channel 6 in CH6_CSR.
5	CH5_EN	Enable (EN) bit status for DMA Channel 5 in CH5_CSR.
4	CH4_EN	Enable (EN) bit status for DMA Channel 4 in CH4_CSR.
3	CH3_EN	Enable (EN) bit status for DMA Channel 3 in CH3_CSR.
2	CH2_EN	Enable (EN) bit status for DMA Channel 2 in CH2_CSR.
1	CH1_EN	Enable (EN) bit status for DMA Channel 1 in CH1_CSR.
0	CH0_EN	Enable (EN) bit status for DMA Channel 0 in CH0_CSR.

0x0A20200C WCSS_A_DXE_0_DMA_CH_DONE**Type:** R**Reset State:** 0x00000000

This register is read-only and indicates which DMA channels are done with their programmed transfer, each bit in this register reflects the status of the corresponding DONE bit in each of the channels' CHn_CSRs. As such, it provides a convenient way for software to determine which channels have finished their programmed DMA operation.

WCSS_A_DXE_0_DMA_CH_DONE

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_DONE	Done (DONE) bit for DMA Channel 7 in CH7_CSR.
6	CH6_DONE	Done (DONE) bit for DMA Channel 6 in CH6_CSR.
5	CH5_DONE	Done (DONE) bit for DMA Channel 5 in CH5_CSR.
4	CH4_DONE	Done (DONE) bit for DMA Channel 4 in CH4_CSR.

WCSS_A_DXE_0_DMA_CH_DONE (cont.)

Bits	Name	Description
3	CH3_DONE	Done (DONE) bit for DMA Channel 3 in CH3_CSR.
2	CH2_DONE	Done (DONE) bit for DMA Channel 2 in CH2_CSR.
1	CH1_DONE	Done (DONE) bit for DMA Channel 1 in CH1_CSR.
0	CH0_DONE	Done (DONE) bit for DMA Channel 0 in CH0_CSR.

0x0A202010 WCSS_A_DXE_0_DMA_CH_ERR**Type:** R**Reset State:** 0x00000000

This register is read-only and indicates which DMA channels have errors, each bit in this register reflects the status of the corresponding ERR bit in each of the channels' CHn_CSRs. As such, it provides a convenient way for software to determine which channels have incurred errors during operation.

WCSS_A_DXE_0_DMA_CH_ERR

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_ERR	Error (ERR) bit for DMA Channel 7 in CH7_CSR.
6	CH6_ERR	Error (ERR) bit for DMA Channel 6 in CH6_CSR.
5	CH5_ERR	Error (ERR) bit for DMA Channel 5 in CH5_CSR.
4	CH4_ERR	Error (ERR) bit for DMA Channel 4 in CH4_CSR.
3	CH3_ERR	Error (ERR) bit for DMA Channel 3 in CH3_CSR.
2	CH2_ERR	Error (ERR) bit for DMA Channel 2 in CH2_CSR.
1	CH1_ERR	Error (ERR) bit for DMA Channel 1 in CH1_CSR.
0	CH0_ERR	Error (ERR) bit for DMA Channel 0 in CH0_CSR.

0x0A202014 WCSS_A_DXE_0_DMA_CH_STOP**Type:** R**Reset State:** 0x00000000

This register is read-only and indicates which DMA channels have been stopped by software request, each bit in this register reflects the status of the corresponding STOP bit in each of the channels' CHn_CSRs. As such, it provides a convenient way for software to determine which channels have incurred stops during operation.

WCSS_A_DXE_0_DMA_CH_STOP

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_STOP	Stop (STOP) bit for DMA Channel 7 in CH7_CSR.
6	CH6_STOP	Stop (STOP) bit for DMA Channel 6 in CH6_CSR.
5	CH5_STOP	Stop (STOP) bit for DMA Channel 5 in CH5_CSR.
4	CH4_STOP	Stop (STOP) bit for DMA Channel 4 in CH4_CSR.
3	CH3_STOP	Stop (STOP) bit for DMA Channel 3 in CH3_CSR.
2	CH2_STOP	Stop (STOP) bit for DMA Channel 2 in CH2_CSR.
1	CH1_STOP	Stop (STOP) bit for DMA Channel 1 in CH1_CSR.
0	CH0_STOP	Stop (STOP) bit for DMA Channel 0 in CH0_CSR.

0x0A202018 WCSS_A_DXE_0_INT_MSK**Type:** RW**Reset State:** 0x00000000

The Interrupt Mask register defines the functionality of DXE's all-channel combined interrupt output. A bit set to one in the mask enables the generation of the interrupt for that source channel, a zero disables the generation of an interrupt.

WCSS_A_DXE_0_INT_MSK

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CH7_INTEN	RW	Interrupt Enable. Enable DMA Channel 7 Interrupts.
6	CH6_INTEN	RW	Interrupt Enable. Enable DMA Channel 6 Interrupts.
5	CH5_INTEN	RW	Interrupt Enable. Enable DMA Channel 5 Interrupts.
4	CH4_INTEN	RW	Interrupt Enable. Enable DMA Channel 4 Interrupts.
3	CH3_INTEN	RW	Interrupt Enable. Enable DMA Channel 3 Interrupts.
2	CH2_INTEN	RW	Interrupt Enable. Enable DMA Channel 2 Interrupts.
1	CH1_INTEN	RW	Interrupt Enable. Enable DMA Channel 1 Interrupts.
0	CH0_INTEN	RW	Interrupt Enable. Enable DMA Channel 0 Interrupts.

0x0A20201C WCSS_A_DXE_0_INT_SRC_MSKD**Type:** R**Reset State:** 0x00000000

This read-only register is the bitwise AND of INT_SRC_RAW with INT_MSK. If any of its bits is a one, the DXE will generate an interrupt request to the interrupt controller.

WCSS_A_DXE_0_INT_SRC_MSKD

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_INT	ED, Done or Error interrupt request by CH7 after masking with INT_MSK[7].
6	CH6_INT	ED, Done or Error interrupt request by CH6 after masking with INT_MSK[6].
5	CH5_INT	ED, Done or Error interrupt request by CH5 after masking with INT_MSK[5].
4	CH4_INT	ED, Done or Error interrupt request by CH4 after masking with INT_MSK[4].
3	CH3_INT	ED, Done or Error interrupt request by CH3 after masking with INT_MSK[3].
2	CH2_INT	ED, Done or Error interrupt request by CH2 after masking with INT_MSK[2].
1	CH1_INT	ED, Done or Error interrupt request by CH1 after masking with INT_MSK[1].
0	CH0_INT	ED, Done or Error interrupt request by CH0 after masking with INT_MSK[0].

0x0A202020 WCSS_A_DXE_0_INT_SRC_RAW**Type:** R**Reset State:** 0x00000000

This read-only register combines the sources of all types of error interrupt requests: descriptor, done and error types. It is basically the bitwise OR of INT_ED_SRC, INT_DONE_SRC and INT_ERR_SRC

WCSS_A_DXE_0_INT_SRC_RAW

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_INT	ED, Done or Error interrupt requested by CH7.

WCSS_A_DXE_0_INT_SRC_RAW (cont.)

Bits	Name	Description
6	CH6_INT	ED, Done or Error interrupt requested by CH6.
5	CH5_INT	ED, Done or Error interrupt requested by CH5.
4	CH4_INT	ED, Done or Error interrupt requested by CH4.
3	CH3_INT	ED, Done or Error interrupt requested by CH3.
2	CH2_INT	ED, Done or Error interrupt requested by CH2.
1	CH1_INT	ED, Done or Error interrupt requested by CH1.
0	CH0_INT	ED Done or Error interrupt requested by CH0.

0x0A202024 WCSS_A_DXE_0_INT_ED_SRC**Type:** R**Reset State:** 0x00000000

This read-only register combines the sources of all external descriptor requested interrupts. It is the "raw" unmasked value from the channel registers.

WCSS_A_DXE_0_INT_ED_SRC

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_ED_INT	External descriptor interrupt requested by CH7.
6	CH6_ED_INT	External descriptor interrupt requested by CH6.
5	CH5_ED_INT	External descriptor interrupt requested by CH5.
4	CH4_ED_INT	External descriptor interrupt requested by CH4.
3	CH3_ED_INT	External descriptor interrupt requested by CH3.
2	CH2_ED_INT	External descriptor interrupt requested by CH2.
1	CH1_ED_INT	External descriptor interrupt requested by CH1.
0	CH0_ED_INT	External descriptor interrupt requested by CH0.

0x0A202028 WCSS_A_DXE_0_INT_DONE_SRC**Type:** R**Reset State:** 0x00000000

This read-only register combines the sources of all done interrupt requests. It is the "raw" unmasked value from the channel registers.

WCSS_A_DXE_0_INT_DONE_SRC

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_DONE_INT	Done interrupt requested by CH7.
6	CH6_DONE_INT	Done interrupt requested by CH6.
5	CH5_DONE_INT	Done interrupt requested by CH5.
4	CH4_DONE_INT	Done interrupt requested by CH4.
3	CH3_DONE_INT	Done interrupt requested by CH3.
2	CH2_DONE_INT	Done interrupt requested by CH2.
1	CH1_DONE_INT	Done interrupt requested by CH1.
0	CH0_DONE_INT	Done interrupt requested by CH0.

0x0A20202C WCSS_A_DXE_0_INT_ERR_SRC**Type:** R**Reset State:** 0x00000000

This read-only register combines the sources of all error interrupt requests. It is the "raw" unmasked value from the channel registers.

WCSS_A_DXE_0_INT_ERR_SRC

Bits	Name	Description
31:8	RSVD	Reserved. Writes ignored, reads return 0
7	CH7_ERR_INT	Error interrupt requested by CH7.
6	CH6_ERR_INT	Error interrupt requested by CH6.
5	CH5_ERR_INT	Error interrupt requested by CH5.
4	CH4_ERR_INT	Error interrupt requested by CH4.
3	CH3_ERR_INT	Error interrupt requested by CH3.
2	CH2_ERR_INT	Error interrupt requested by CH2.
1	CH1_ERR_INT	Error interrupt requested by CH1.
0	CH0_ERR_INT	Error interrupt requested by CH0.

0x0A202030 WCSS_A_DXE_0_INT_CLR**Type:** RW**Reset State:** 0x00000000

This register is write-only and is used to clear interrupt request from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. All ED, DONE and ERROR source will be cleared at once. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

WCSS_A_DXE_0_INT_CLR

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CH7_INT_CLR	W	Clear all interrupt sources in CH7.
6	CH6_INT_CLR	W	Clear all interrupt sources in CH6.
5	CH5_INT_CLR	W	Clear all interrupt sources in CH5.
4	CH4_INT_CLR	W	Clear all interrupt sources in CH4.
3	CH3_INT_CLR	W	Clear all interrupt sources in CH3.
2	CH2_INT_CLR	W	Clear all interrupt sources in CH2.
1	CH1_INT_CLR	W	Clear all interrupt sources in CH1.
0	CH0_INT_CLR	W	Clear all interrupt sources in CH0.

0x0A202034 WCSS_A_DXE_0_INT_ED_CLR**Type:** RW**Reset State:** 0x00000000

This register is write-only and is used to clear external descriptor interrupt requests simultaneously from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

WCSS_A_DXE_0_INT_ED_CLR

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CH7_INT_ED_CLR	W	Clear ED interrupt source in CH7.
6	CH6_INT_ED_CLR	W	Clear ED interrupt source in CH6.
5	CH5_INT_ED_CLR	W	Clear ED interrupt source in CH5.

WCSS_A_DXE_0_INT_ED_CLR (cont.)

Bits	Name	Type	Description
4	CH4_INT_ED_CLR	W	Clear ED interrupt source in CH4.
3	CH3_INT_ED_CLR	W	Clear ED interrupt source in CH3.
2	CH2_INT_ED_CLR	W	Clear ED interrupt source in CH2.
1	CH1_INT_ED_CLR	W	Clear ED interrupt source in CH1.
0	CH0_INT_ED_CLR	W	Clear ED interrupt source in CH0.

0x0A202038 WCSS_A_DXE_0_INT_DONE_CLR**Type:** RW**Reset State:** 0x00000000

This register is write-only and is used to clear DONE interrupt requests simultaneously from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

WCSS_A_DXE_0_INT_DONE_CLR

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CH7_INT_DONE_CLR	W	Clear DONE interrupt source in CH7.
6	CH6_INT_DONE_CLR	W	Clear DONE interrupt source in CH6.
5	CH5_INT_DONE_CLR	W	Clear DONE interrupt source in CH5.
4	CH4_INT_DONE_CLR	W	Clear DONE interrupt source in CH4.
3	CH3_INT_DONE_CLR	W	Clear DONE interrupt source in CH3.
2	CH2_INT_DONE_CLR	W	Clear DONE interrupt source in CH2.
1	CH1_INT_DONE_CLR	W	Clear DONE interrupt source in CH1.
0	CH0_INT_DONE_CLR	W	Clear DONE interrupt source in CH0.

0x0A20203C WCSS_A_DXE_0_INT_ERR_CLR**Type:** RW**Reset State:** 0x00000000

This register is write-only and is used to clear ERROR interrupt requests simultaneously from either all or specific individual channels. When writing to this register, each data bit set HIGH causes the corresponding bits in the channel CSR to be cleared. Data bits that are low have no effect on the corresponding bit in the channel CSR register.

WCSS_A_DXE_0_INT_ERR_CLR

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CH7_INT_ERR_CLR	W	Clear ERROR interrupt source in CH7.
6	CH6_INT_ERR_CLR	W	Clear ERROR interrupt source in CH6.
5	CH5_INT_ERR_CLR	W	Clear ERROR interrupt source in CH5.
4	CH4_INT_ERR_CLR	W	Clear ERROR interrupt source in CH4.
3	CH3_INT_ERR_CLR	W	Clear ERROR interrupt source in CH3.
2	CH2_INT_ERR_CLR	W	Clear ERROR interrupt source in CH2.
1	CH1_INT_ERR_CLR	W	Clear ERROR interrupt source in CH1.
0	CH0_INT_ERR_CLR	W	Clear ERROR interrupt source in CH0.

0x0A202040 WCSS_A_DXE_0_DMA_CH_PRES**Type:** R**Reset State:** 0x000000FF

This register is read-only and indicates which DMA channels exist in the hardware.

WCSS_A_DXE_0_DMA_CH_PRES

Bits	Name	Description
31	CH31_PRES	Channel 31 Present. When high signifies that the channel exists in this implementation of the HW.
30	CH30_PRES	Channel 30 Present. When high signifies that the channel exists in this implementation of the HW.
29	CH29_PRES	Channel 29 Present. When high signifies that the channel exists in this implementation of the HW.
28	CH28_PRES	Channel 28 Present. When high signifies that the channel exists in this implementation of the HW.
27	CH27_PRES	Channel 27 Present. When high signifies that the channel exists in this implementation of the HW.
26	CH26_PRES	Channel 26 Present. When high signifies that the channel exists in this implementation of the HW.
25	CH25_PRES	Channel 25 Present. When high signifies that the channel exists in this implementation of the HW.
24	CH24_PRES	Channel 24 Present. When high signifies that the channel exists in this implementation of the HW.
23	CH23_PRES	Channel 23 Present. When high signifies that the channel exists in this implementation of the HW.

WCSS_A_DXE_0_DMA_CH_PRES (cont.)

Bits	Name	Description
22	CH22_PRES	Channel 22 Present. When high signifies that the channel exists in this implementation of the HW.
21	CH21_PRES	Channel 21 Present. When high signifies that the channel exists in this implementation of the HW.
20	CH20_PRES	Channel 20 Present. When high signifies that the channel exists in this implementation of the HW.
19	CH19_PRES	Channel 19 Present. When high signifies that the channel exists in this implementation of the HW.
18	CH18_PRES	Channel 18 Present. When high signifies that the channel exists in this implementation of the HW.
17	CH17_PRES	Channel 17 Present. When high signifies that the channel exists in this implementation of the HW.
16	CH16_PRES	Channel 16 Present. When high signifies that the channel exists in this implementation of the HW.
15	CH15_PRES	Channel 15 Present. When high signifies that the channel exists in this implementation of the HW.
14	CH14_PRES	Channel 14 Present. When high signifies that the channel exists in this implementation of the HW.
13	CH13_PRES	Channel 13 Present. When high signifies that the channel exists in this implementation of the HW.
12	CH12_PRES	Channel 12 Present. When high signifies that the channel exists in this implementation of the HW.
11	CH11_PRES	Channel 11 Present. When high signifies that the channel exists in this implementation of the HW.
10	CH10_PRES	Channel 10 Present. When high signifies that the channel exists in this implementation of the HW.
9	CH9_PRES	Channel 9 Present. When high signifies that the channel exists in this implementation of the HW.
8	CH8_PRES	Channel 8 Present. When high signifies that the channel exists in this implementation of the HW.
7	CH7_PRES	Channel 7 Present. When high signifies that the channel exists in this implementation of the HW.
6	CH6_PRES	Channel 6 Present. When high signifies that the channel exists in this implementation of the HW.
5	CH5_PRES	Channel 5 Present. When high signifies that the channel exists in this implementation of the HW.
4	CH4_PRES	Channel 4 Present. When high signifies that the channel exists in this implementation of the HW.
3	CH3_PRES	Channel 3 Present. When high signifies that the channel exists in this implementation of the HW.

WCSS_A_DXE_0_DMA_CH_PRES (cont.)

Bits	Name	Description
2	CH2_PRES	Channel 2 Present. When high signifies that the channel exists in this implementation of the HW.
1	CH1_PRES	Channel 1 Present. When high signifies that the channel exists in this implementation of the HW.
0	CH0_PRES	Channel 0 Present. When high signifies that the channel exists in this implementation of the HW.

0x0A202050 WCSS_A_DXE_0_PF_BD**Type:** R**Reset State:** 0x00000000

This read-only register contains the index of any prefetched BD index. The index is only meaningful if the accompanying valid bit is set.

WCSS_A_DXE_0_PF_BD

Bits	Name	Description
31:17	RESERVED	Reserved. Writes ignored, reads will return 0.
16	VALID	Valid. When set indicates that the INDEX bitfield contains a valid BD index pointer.
15:0	INDEX	BD Index.

0x0A202054 WCSS_A_DXE_0_PF_PDU**Type:** R**Reset State:** 0x00000000

This read-only register contains the index of any prefetched PDU index. The index is only meaningful if the accompanying valid bit is set.

WCSS_A_DXE_0_PF_PDU

Bits	Name	Description
31:17	RESERVED	Reserved. Reads will return 0.
16	VALID	Valid. When set indicates that the INDEX bitfield contains a valid PDU index pointer.
15:0	INDEX	PDU Index.

0x0A202058 WCSS_A_DXE_0_REVISION**Type:** R**Reset State:** 0x0000001D

This register's value represents the DXE RTL revision present in the hardware.

WCSS_A_DXE_0_REVISION

Bits	Name	Description
31:0	REVID	Revision ID. Corresponds to the label number of DXE (revision of .info file)

0x0A20205C WCSS_A_DXE_0_BMU_SB_QDAT_AVAIL**Type:** R**Reset State:** 0x00000000

This read-only register provides the status of BMU WQ dataavailable sideband signals as seen by DXE.

WCSS_A_DXE_0_BMU_SB_QDAT_AVAIL

Bits	Name	Description
31:25	RSVD1	Reserved.
24:2	QDAT_AV	BMU WQ Data Aavailable.
1:0	RSVD	Reserved. BMU WQs 1 and 0 are notavailable for general use.

0x0A202060 WCSS_A_DXE_0_BMU_SB_PDU_AVAIL**Type:** R**Reset State:** 0x00000000

This read-only register provides the status of BMU PDUavailable sideband signals as seen by DXE.

WCSS_A_DXE_0_BMU_SB_PDU_AVAIL

Bits	Name	Description
31:11	RSVD1	Reserved.
10:2	PDU_AV	BMU BD/PDU Aavailable.
1:0	RSVD	Reserved. BMU thresholds 0 and 1 are notavailable for general use.

0x0A202064 WCSS_A_DXE_0_STATE**Type:** R**Reset State:** 0x00000000

This read-only register provides key DXE state machine status to help debug.

WCSS_A_DXE_0_STATE

Bits	Name	Description
31	RX_SPAVAIL	Space isavailable in one or more of the UIF RX endpoints
30	TX_MGMT_DAVAIL	Data isavailable in the UIF TX management endpoint
29	TX_DAT_DAVAIL	Data isavailable in the UIF TX data endpoint
28	WQ_DAVAIL	Data isavailable in selected BMU WQ
27	PDU_AVAIL	PDUs areavailable for current threshold
26:25	XFER_IDX	Id of the transfer size source that turned out to be the minimum and therefore picked as size of current transfer
24:17	XFER_SZ	Calculated max transfer size from minimum of chunk size and space or dataavailable in either source PDU, destination PDU, or UIF endpoint.
16:12	SEL_CH	Currently Selected Channel.
11:10	PFSM	State of prefetch engine state machine
9:8	DFSM	State of DPDMA state machine
7:6	SFSM	State of SPDMA state machine

WCSS_A_DXE_0_STATE (cont.)

Bits	Name	Description
5:0	MFSM	State of main state machine 0x0: IDLE (Idle state) 0x1: H2H_START (Preparing to start a H2H type transfer) 0x2: H2H_RD (Read transfer) 0x3: H2H_WR (Write transfer) 0x4: H2H_UPDATE (Update channel register values) 0x5: LD_DESC (Load external descriptor) 0x6: CKEDVAL (Check descriptor valid bit) 0x7: CLREDVAL (Clear descriptor valid bit) 0x8: WB_CTRL (Update CH_CTRL with value in DESC_CTRL word of descriptor) 0x9: WB_SZ (Update CH_SZ with value in DESC_SZ word of descriptor) 0xA: WB_SADR (Update CH_SADR with value in DESC_SADRL and DESC_SADRH words of descriptor) 0xB: WB_DADR (Update CH_DADR with value in DESC_DADRL and DESC_DADRH words of descriptor) 0xC: WB_DESC (Update CH_DESC with value in DESC_NXTL and DESC_NXTH words of descriptor) 0xD: PAUSE (State machine paused due to SW pause request) 0xE: B2H_START (Preparing to start a B2H type transfer) 0xF: B2H_POPWQ (Popping BMU work queue) 0x10: B2H_GET_BD_INFO (Read in head, tail, mpdu length, num pdus, etc) 0x11: B2H_RD_BD (Reading BD data contents from BD index) 0x12: B2H_WR_BD (Writing out BD contents) 0x13: B2H_RD_PDU (Read transfer) 0x14: B2H_WR_PDU (Write transfer) 0x15: B2H_NXT_PDU (Get index of next PDU in the chain) 0x16: B2H_UPNCK_PDU (Check that next PDU index is valid) 0x17: B2H_WR_TSTMP (Update start and end timestamps for B2H transfers) 0x18: B2H_REL_PKT (Release BD and linked PDUs) 0x19: H2B_START (Preparing to start a H2B type transfer) 0x1A: H2B_GET_PDU (Obtain a new BD or PDU index) 0x1B: H2B_RD_PDU (Read transfer) 0x1C: H2B_WR_PDU (Write transfer) 0x1D: H2B_LNK_PDU (Link current PDU with new PDU) 0x1E: H2B_UPDT_BD1 (Prepare to update BD fields)

WCSS_A_DXE_0_STATE (cont.)

Bits	Name	Description
		0x1F: H2B_UPDT_BD2 (Update head, tail, pdu_count, etc fields of BD) 0x20: H2B_PUSHWQ (Push BMU work queue) 0x21: ABORT (SW requested transfer abort) 0x22: ERROR (Error detected in transfer) 0x23: H2B_WR_TSTMP (Update start and end timestamps for H2B transfers) 0x24: WR_TOT_XFER_LEN (write total xfer length to SIF at the start of every new H2H or B2H transfer) 0x25: H2B_BD_TMPLT_RD (Read BD template data) 0x26: H2B_BD_TMPLT_WR (Write BD template data to allocated BD)

0x0A202068 WCSS_A_DXE_0_ARB_CH_MSK**Type:** R**Reset State:** 0x00000000

This register is read-only and indicates which enabled DMA channels have been masked from active arbitration by some blocking condition

WCSS_A_DXE_0_ARB_CH_MSK

Bits	Name	Description
31:8	RSVD	Reserved. Reads return 0
7	CH7_MSKD	When set indicates that CH7 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.
6	CH6_MSKD	When set indicates that CH6 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.
5	CH5_MSKD	When set indicates that CH5 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.
4	CH4_MSKD	When set indicates that CH4 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.
3	CH3_MSKD	When set indicates that CH3 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.

WCSS_A_DXE_0_ARB_CH_MSK (cont.)

Bits	Name	Description
2	CH2_MSKD	When set indicates that CH2 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.
1	CH1_MSKD	When set indicates that CH1 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.
0	CH0_MSKD	When set indicates that CH0 is masked by the arbiter and is therefore currently not actively participating in the arbitration because of some blocking condition that would prevent it from making progress.

0x0A20206C WCSS_A_DXE_0_UIF_SB**Type:** R**Reset State:** 0x00000000

This read-only register provides the status of important UIF sideband signals

WCSS_A_DXE_0_UIF_SB

Bits	Name	Description
31:22	RSVD	Reserved. Writes ignored, reads will return 0.
21:14	RX_SPACE_REM_DAT_REM	Provides the number of dwords that can be written to the active Rx endpoint
13	RX4_SPAVAIL	When high means that there is spaceavailable in the Rx1 endpoint
12	RX3_SPAVAIL	When high means that there is spaceavailable in the Rx1 endpoint
11	RX2_SPAVAIL	When high means that there is spaceavailable in the Rx1 endpoint
10	RX1_SPAVAIL	When high means that there is spaceavailable in the Rx1 endpoint
9:2	TX_DAT_REM	Provides the number of dwordsavailable in the active Tx endpoint
1	TX_MGMT_DAVAIL	When high means that there is dataavailable in the Tx management endpoint
0	TX_DAT_DAVAIL	When high means that there is dataavailable in the Tx data endpoint

0x0A202070 WCSS_A_DXE_0_TIMESTAMP**Type:** R**Reset State:** 0x00000046

This read-only register provides the current value of the MTU timestamp

WCSS_A_DXE_0_TIMESTAMP

Bits	Name	Description
31:0	TSTMP	

0x0A202074 WCSS_A_DXE_0_ARB_CH_MSK_CLR

Type: RW

Reset State: 0x00000000

This write-only register provides for a way to forcibly unmask currently masked channels and return them to active participation in the arbitration

WCSS_A_DXE_0_ARB_CH_MSK_CLR

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored. Reads return 0
7	CH7_MSK_CLR	W	Writing a one clears the arbiter mask for channel 7 there by returning the channel to active arbitration. Reads always return 0.
6	CH6_MSK_CLR	W	Writing a one clears the arbiter mask for channel 6 there by returning the channel to active arbitration. Reads always return 0.
5	CH5_MSK_CLR	W	Writing a one clears the arbiter mask for channel 5 there by returning the channel to active arbitration. Reads always return 0.
4	CH4_MSK_CLR	W	Writing a one clears the arbiter mask for channel 4 there by returning the channel to active arbitration. Reads always return 0.
3	CH3_MSK_CLR	W	Writing a one clears the arbiter mask for channel 3 there by returning the channel to active arbitration. Reads always return 0.
2	CH2_MSK_CLR	W	Writing a one clears the arbiter mask for channel 2 there by returning the channel to active arbitration. Reads always return 0.
1	CH1_MSK_CLR	W	Writing a one clears the arbiter mask for channel 1 there by returning the channel to active arbitration. Reads always return 0.
0	CH0_MSK_CLR	W	Writing a one clears the arbiter mask for channel 0 there by returning the channel to active arbitration. Reads always return 0.

0x0A202078 WCSS_A_DXE_0_CTR_PRES**Type:** R**Reset State:** 0x000000FF

This register is read-only and indicates how many counters actually exist in this implementation of the hardware.

WCSS_A_DXE_0_CTR_PRES

Bits	Name	Description
31	CTR31_PRES	Counter 31 Present. When high signifies that the counter exists in this implementation of the HW.
30	CTR30_PRES	Counter 30 Present. When high signifies that the counter exists in this implementation of the HW.
29	CTR29_PRES	Counter 29 Present. When high signifies that the counter exists in this implementation of the HW.
28	CTR28_PRES	Counter 28 Present. When high signifies that the counter exists in this implementation of the HW.
27	CTR27_PRES	Counter 27 Present. When high signifies that the counter exists in this implementation of the HW.
26	CTR26_PRES	Counter 26 Present. When high signifies that the counter exists in this implementation of the HW.
25	CTR25_PRES	Counter 25 Present. When high signifies that the counter exists in this implementation of the HW.
24	CTR24_PRES	Counter 24 Present. When high signifies that the counter exists in this implementation of the HW.
23	CTR23_PRES	Counter 23 Present. When high signifies that the counter exists in this implementation of the HW.
22	CTR22_PRES	Counter 22 Present. When high signifies that the counter exists in this implementation of the HW.
21	CTR21_PRES	Counter 21 Present. When high signifies that the counter exists in this implementation of the HW.
20	CTR20_PRES	Counter 20 Present. When high signifies that the counter exists in this implementation of the HW.
19	CTR19_PRES	Counter 19 Present. When high signifies that the counter exists in this implementation of the HW.
18	CTR18_PRES	Counter 18 Present. When high signifies that the counter exists in this implementation of the HW.
17	CTR17_PRES	Counter 17 Present. When high signifies that the counter exists in this implementation of the HW.
16	CTR16_PRES	Counter 16 Present. When high signifies that the counter exists in this implementation of the HW.

WCSS_A_DXE_0_CTR_PRES (cont.)

Bits	Name	Description
15	CTR15_PRES	Counter 15 Present. When high signifies that the counter exists in this implementation of the HW.
14	CTR14_PRES	Counter 14 Present. When high signifies that the counter exists in this implementation of the HW.
13	CTR13_PRES	Counter 13 Present. When high signifies that the counter exists in this implementation of the HW.
12	CTR12_PRES	Counter 12 Present. When high signifies that the counter exists in this implementation of the HW.
11	CTR11_PRES	Counter 11 Present. When high signifies that the counter exists in this implementation of the HW.
10	CTR10_PRES	Counter 10 Present. When high signifies that the counter exists in this implementation of the HW.
9	CTR9_PRES	Counter 9 Present. When high signifies that the counter exists in this implementation of the HW.
8	CTR8_PRES	Counter 8 Present. When high signifies that the counter exists in this implementation of the HW.
7	CTR7_PRES	Counter 7 Present. When high signifies that the counter exists in this implementation of the HW.
6	CTR6_PRES	Counter 6 Present. When high signifies that the counter exists in this implementation of the HW.
5	CTR5_PRES	Counter 5 Present. When high signifies that the counter exists in this implementation of the HW.
4	CTR4_PRES	Counter 4 Present. When high signifies that the counter exists in this implementation of the HW.
3	CTR3_PRES	Counter 3 Present. When high signifies that the counter exists in this implementation of the HW.
2	CTR2_PRES	Counter 2 Present. When high signifies that the counter exists in this implementation of the HW.
1	CTR1_PRES	Counter 1 Present. When high signifies that the counter exists in this implementation of the HW.
0	CTR0_PRES	Counter 0 Present. When high signifies that the counter exists in this implementation of the HW.

0x0A20207C WCSS_A_DXE_0_CTR_CLR**Type:** RW**Reset State:** 0x00000000

This register is write-only and is used to reset the count from one or more specific event counters. When writing to this register, each data bit set HIGH causes the count value in the corresponding counter to be cleared. Data bits that are low have no effect on the corresponding counter.

WCSS_A_DXE_0_CTR_CLR

Bits	Name	Type	Description
31:8	RSVD	R	Reserved. Writes ignored, reads return 0
7	CTR7_CLR	W	Zero the count value in CTR7.
6	CTR6_CLR	W	Zero the count value in CTR6.
5	CTR5_CLR	W	Zero the count value in CTR5.
4	CTR4_CLR	W	Zero the count value in CTR4.
3	CTR3_CLR	W	Zero the count value in CTR3.
2	CTR2_CLR	W	Zero the count value in CTR2.
1	CTR1_CLR	W	Zero the count value in CTR1.
0	CTR0_CLR	W	Zero the count value in CTR0.

0x0A202080 WCSS_A_DXE_0_BD_TMPLTL**Type:** RW**Reset State:** 0x00000000

The BD template base address high register holds the low bits of the base address for the BD templates store. DXE supports up to 4 templates and automatically calculates the address of the selected template based on the base address and the values programmed in CHn_CTRL[BDT_IDX] as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CHn_CTRL[BDT_IDX])$

WCSS_A_DXE_0_BD_TMPLTL

Bits	Name	Description
31:0	BASEL	BD Template Base Low Address.

0x0A202084 WCSS_A_DXE_0_BD_TMPLTH**Type:** RW**Reset State:** 0x00000000

The BD template base address high register holds the high bits of the base address for the BD templates store. See the description of CH_SADRL for more information.

WCSS_A_DXE_0_BD_TMPLTH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.

WCSS_A_DXE_0_BD_TMPLTH (cont.)

Bits	Name	Type	Description
1:0	BASEH	RW	Base Address High. This bitfield holds bits 33 and 32 of the BD template base address. With the current address mapping in Virgo these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in BD_TMPLTL) go untranslated through the target interface or if they use the interface's address translation windows. This applies only to PCI and PCIe interfaces. Since the BD templates should in almost all cases be stored in internal chip memory (MIF) this bitfield should almost always be set to zero. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202088 WCSS_A_DXE_0_BDT_DAT_START**Type:** RW**Reset State:** 0x00000040

The BD template data start offset register holds the offset used to start writing payload data when the DXE is in H2B mode and the BD template feature has been enabled. In this mode, at the start of every new packet transfer, DXE will copy only enough bytes from the BD template to fill the space between byte 0 of the BD and the data start offset. Once this much of the BD template has been transferred, DXE will start reading data from the programmed source address and writing it into the BD starting at the programmed offset. Due to limitations of other modules in the chip, it's imperative that the value in this register allow for any header data to fit completely within the BD of the packet. That is, the total of adding the value contained in the BD template field "MPDU Header length" to the value in this register needs to be less than or equal to 127 in order to avoid problems. Further, it is necessary that the value of this register match the "MPDU Header Offset" field programmed in the BD template. DXE makes no attempt to check this is really the case.

WCSS_A_DXE_0_BDT_DAT_START

Bits	Name	Type	Description
31:7	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
6:0	OFFSET	RW	Data start offset.

0x0A202200 WCSS_A_DXE_0_COUNTER0**Type:** RW**Reset State:** 0x00000000

This register can be configured to count whole packets in the H2B or B2H direction or to count the number of transfers (descriptors) for H2H transactions. For now this counter is hardwired to always count all transfers completing on channel 0, but will eventually be able to count events happening on any channel and also only count transfers with the INC bit set in the CH_CSR (Not implemented yet)

The value gets cleared at reset and the counter can also be cleared or preset to any starting value by directly writing to it. As a convenience to the programmer the CTR_CLR register has been provided to quickly clear the value in one or more of the event counters.

WCSS_A_DXE_0_COUNTER0

Bits	Name	Type	Description
31:24	RSVD	R	
23:0	CNT	RW	

0x0A202204 WCSS_A_DXE_0_COUNTER1**Type:** RW**Reset State:** 0x00000000

This register can be configured to count whole packets in the H2B or B2H direction or to count the number of transfers (descriptors) for H2H transactions. For now this counter is hardwired to always count all transfers completing on channel 1, but will eventually be able to count events happening on any channel and also only count transfers with the INC bit set in the CH_CSR (Not implemented yet)

The value gets cleared at reset and the counter can also be cleared or preset to any starting value by directly writing to it. As a convenience to the programmer the CTR_CLR register has been provided to quickly clear the value in one or more of the event counters.

WCSS_A_DXE_0_COUNTER1

23:0	CNT	RW	

0x0A20221C WCSS_A_DXE_0_COUNTER7**Type:** RW**Reset State:** 0x00000000

This register can be configured to count whole packets in the H2B or B2H direction or to count the number of transfers (descriptors) for H2H transactions. For now this counter is hardwired to always count all transfers completing on channel 7, but will eventually be able to count events happening on any channel and also only count transfers with the INC bit set in the CH_CSR (Not implemented yet)

The value gets cleared at reset and the counter can also be cleared or preset to any starting value by directly writing to it. As a convenience to the programmer the CTR_CLR register has been provided to quickly clear the value in one or more of the event counters.

WCSS_A_DXE_0_COUNTER7

Bits	Name	Type	Description
31:24	RSVD	R	
23:0	CNT	RW	

0x0A202400 WCSS_A_DXE_0_CH0_CTRL**Type:** RW**Reset State:** 0x10000708

Serves to configure channel 0 operation

WCSS_A_DXE_0_CH0_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.

WCSS_A_DXE_0_CH0_CTRL (cont.)

Bits	Name	Type	Description
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.

WCSS_A_DXE_0_CH0_CTRL (cont.)

Bits	Name	Type	Description
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH0_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH0_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see description for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH0_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A202404 WCSS_A_DXE_0_CH0_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH0_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH0_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH0_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A202408 WCSS_A_DXE_0_CH0_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and re-arbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH0_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH0_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A20240C WCSS_A_DXE_0_CH0_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0):

ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH0_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH0_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

The channel source address high register holds the high bits of the source address for a transfer. Refer to the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH0_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202414 WCSS_A_DXE_0_CH0_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH0_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

0x0A20241C WCSS_A_DXE_0_CH0_DESCL

Type: RW

Reset State: 0x00000000

The Channel 0 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH0_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100 >> 7 = 0x1C_04A2
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x0A202430 WCSS_A_DXE_0_CH0_HEAD**Type:** R**Reset State:** 0x00000000

Address of head of packet.

WCSS_A_DXE_0_CH0_HEAD

Bits	Name	Description
31:27	RSVD	Reserved.
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor.

WCSS_A_DXE_0_CH0_HEAD (cont.)

Bits	Name	Description
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x0A202434 WCSS_A_DXE_0_CH0_TAIL**Type:** R**Reset State:** 0x00000000

Address of tail of packet.

WCSS_A_DXE_0_CH0_TAIL

Bits	Name	Description
31:16	RSVD	Reserved.
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x0A202438 WCSS_A_DXE_0_CH0_PDU**Type:** R**Reset State:** 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

WCSS_A_DXE_0_CH0_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read.
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x0A20243C WCSS_A_DXE_0_CH0_TSTMP**Type:** R**Reset State:** 0x00000000

Contains last sampled value of the system timestamp

WCSS_A_DXE_0_CH0_TSTMP

Bits	Name	Description
31:0	VALUE	

0x0A202440 WCSS_A_DXE_0_CH1_CTRL**Type:** RW**Reset State:** 0x10400708

Serves to configure channel 1 operation

WCSS_A_DXE_0_CH1_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH1_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH1_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH1_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH1_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH1_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A202444 WCSS_A_DXE_0_CH1_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH1_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH1_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH1_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A202448 WCSS_A_DXE_0_CH1_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH1_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH1_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A20244C WCSS_A_DXE_0_CH1_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH1_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH1_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

0x0A202450 WCSS_A_DXE_0_CH1_SADRH**Type:** RW**Reset State:** 0x00000000

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH1_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202454 WCSS_A_DXE_0_CH1_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH1_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH1_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 (Reserved) 0x1: RSVD_1 (Reserved) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: BMU_25 (BMU Work Queue 25) 0x1A: BMU_26 (BMU Work Queue 26) 0x1B: BMU_SINK_WQ (BMU_SINK (WQ255)) 0x1C: UIF_RX_1_EP (UIF RX 1 endpoint) 0x1D: UIF_RX_2_EP (UIF RX 2 endpoint) 0x1E: UIF_RX_3_EP (UIF RX 3 endpoint) 0x1F: UIF_RX_4_EP (UIF RX 4 endpoint)

The channel destination address high register holds the high bits of the destination address for a transfer. See the description of CH_DADRL for more info.

WCSS_A_DXE_0_CH1_DADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_DADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_DADRL goes through XIF untranslated) 0x3: RSVD (Reserved. Maps to default slave. Reads return error, writes are ignored)

0x0A20245C WCSS_A_DXE_0_CH1_DESCL

Type: RW

Reset State: 0x00000000

The Channel 1 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH1_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100>>7 = 0x1C_04A2
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Serves to configure channel 2 operation

WCSS_A_DXE_0_CH2_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH2_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH2_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH2_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH2_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH2_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A202484 WCSS_A_DXE_0_CH2_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH2_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH2_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH2_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A202488 WCSS_A_DXE_0_CH2_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH2_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH2_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A20248C WCSS_A_DXE_0_CH2_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH2_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH2_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

0x0A202490 WCSS_A_DXE_0_CH2_SADRH**Type:** RW**Reset State:** 0x00000000

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH2_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202494 WCSS_A_DXE_0_CH2_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH2_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH2_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 (Reserved) 0x1: RSVD_1 (Reserved) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: BMU_25 (BMU Work Queue 25) 0x1A: BMU_26 (BMU Work Queue 26) 0x1B: BMU_SINK_WQ (BMU_SINK (WQ255)) 0x1C: UIF_RX_1_EP (UIF RX 1 endpoint) 0x1D: UIF_RX_2_EP (UIF RX 2 endpoint) 0x1E: UIF_RX_3_EP (UIF RX 3 endpoint) 0x1F: UIF_RX_4_EP (UIF RX 4 endpoint)

Type: RW

Reset State: 0x00000000

The Channel 2 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH2_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: $\text{base} = \text{UIF base} + \text{TD_and_TM_offset} = 0x0E02_5000 + x100 = 0x0E02_5100 \gg 7 = 0x1C_04A2$
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Serves to configure channel 3 operation

WCSS_A_DXE_0_CH3_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH3_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH3_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH3_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH3_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH3_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A2024C4 WCSS_A_DXE_0_CH3_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH3_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH3_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH3_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A2024C8 WCSS_A_DXE_0_CH3_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and re-arbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH3_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH3_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A2024CC WCSS_A_DXE_0_CH3_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH3_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH3_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH3_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A2024D4 WCSS_A_DXE_0_CH3_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH3_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

Type: RW

Reset State: 0x00000000

The Channel 3 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH3_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: $\text{base} = \text{UIF base} + \text{TD_and_TM_offset} = 0x0E02_5000 + x100 = 0x0E02_5100 \gg 7 = 0x1C_04A2$
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

0x0A2024E0 WCSS_A_DXE_0_CH3_DESCH**Type:** RW**Reset State:** 0x00000000

The channel destination address high register holds the high bits of the the address of the next descriptor to be loaded in the linked list.

WCSS_A_DXE_0_CH3_DESCH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.

WCSS_A_DXE_0_CH3_DESCH (cont.)

Bits	Name	Type	Description
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. Note that if the source of the descriptor is either of the UIF endpoints (CH_CTRL[PIQ]=1) then the value in ADDRH has to be 0 or else the descriptor read could end up mapping to the XIF or PIF. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_DADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_DADRL goes through XIF untranslated) 0x3: RSVD (Reserved. Maps to default slave. Reads return error, writes are ignored)

0x0A2024E4 WCSS_A_DXE_0_CH3_LST_DESCL**Type:** R**Reset State:** 0x00000000

The read-only Channel 3 Current/last Linked List Descriptor Pointer register contains the low 32-bits of the address of the descriptor currently being processed or of the last descriptor processed if the channel is disabled.

The meaning of the value and bitfields with regards to CH_CTRL[PIQ] is the same as was explained for the CH_DESCL register.

WCSS_A_DXE_0_CH3_LST_DESCL

Contains last sampled value of the system timestamp

WCSS_A_DXE_0_CH3_TSTMP

Bits	Name	Description
31:0	VALUE	

0x0A202500 WCSS_A_DXE_0_CH4_CTRL**Type:** RW**Reset State:** 0x11000708

Serves to configure channel 4 operation

WCSS_A_DXE_0_CH4_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH4_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH4_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH4_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH4_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH4_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A202504 WCSS_A_DXE_0_CH4_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH4_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH4_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH4_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A202508 WCSS_A_DXE_0_CH4_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH4_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH4_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A20250C WCSS_A_DXE_0_CH4_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH4_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH4_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

0x0A202510 WCSS_A_DXE_0_CH4_SADRH**Type:** RW**Reset State:** 0x00000000

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH4_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202514 WCSS_A_DXE_0_CH4_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH4_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH4_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 (Reserved) 0x1: RSVD_1 (Reserved) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: BMU_25 (BMU Work Queue 25) 0x1A: BMU_26 (BMU Work Queue 26) 0x1B: BMU_SINK_WQ (BMU_SINK (WQ255)) 0x1C: UIF_RX_1_EP (UIF RX 1 endpoint) 0x1D: UIF_RX_2_EP (UIF RX 2 endpoint) 0x1E: UIF_RX_3_EP (UIF RX 3 endpoint) 0x1F: UIF_RX_4_EP (UIF RX 4 endpoint)

Type: RW

Reset State: 0x00000000

The Channel 4 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH4_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: $\text{base} = \text{UIF base} + \text{TD_and_TM_offset} = 0x0E02_5000 + x100 = 0x0E02_5100 \gg 7 = 0x1C_04A2$
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Serves to configure channel 5 operation

WCSS_A_DXE_0_CH5_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH5_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH5_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH5_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH5_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH5_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A202544 WCSS_A_DXE_0_CH5_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH5_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH5_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH5_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A202548 WCSS_A_DXE_0_CH5_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and re-arbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH5_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH5_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A20254C WCSS_A_DXE_0_CH5_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH5_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH5_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH5_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202554 WCSS_A_DXE_0_CH5_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH5_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

Type: RW

Reset State: 0x00000000

The Channel 5 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH5_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: base = UIF base + TD_and_TM_offset = 0x0E02_5000 + x100 = 0x0E02_5100 >> 7 = 0x1C_04A2
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Bits	Name	Description
31:24	RSVD	Reserved. Always returns 0 when read.
23	VAL	Valid. BD has been loaded and is valid.
22:16	PDU_CNT	PDU count of packet.
15:0	IDX	Index of BD. To get actual physical address must be added to BD/PDU base.

0x0A202570 WCSS_A_DXE_0_CH5_HEAD**Type:** R**Reset State:** 0x00000000

Address of head of packet.

WCSS_A_DXE_0_CH5_HEAD

Bits	Name	Description
31:27	RSVD	Reserved.
26	DESCVAL	Descriptor valid. Signifies descriptor has already been loaded. Used to prevent reloading of a descriptor.

WCSS_A_DXE_0_CH5_HEAD (cont.)

Bits	Name	Description
25:21	DWQID	Destination WQ ID. Original BMU, UIF or EIF destination queue. Valid only when CH_CSR[DIQ]=1
20:16	SWQID	Source WQ ID. Original BMU, UIF or EIF source queue. Valid only when CH_CSR[SIQ]=1
15:0	IDX	Index of Head. Must be added to BD/PDU base for actual physical address.

0x0A202574 WCSS_A_DXE_0_CH5_TAIL**Type:** R**Reset State:** 0x00000000

Address of tail of packet.

WCSS_A_DXE_0_CH5_TAIL

Bits	Name	Description
31:16	RSVD	Reserved.
15:0	IDX	Index of Tail. Must be added to BD/PDU base for actual physical address

0x0A202578 WCSS_A_DXE_0_CH5_PDU**Type:** R**Reset State:** 0x00000000

PDU info register.

All its fields are working fields that get modified as the programmed operation progresses.

WCSS_A_DXE_0_CH5_PDU

Bits	Name	Description
31	RSVD	Reserved. Always returns 0 when read.
30:24	PDU_CNT	Current PDU count.
23:8	IDX	Index of current PDU. Must be added to BD/PDU base for actual physical address
7:0	FST_OFF	First PDU offset.

0x0A20257C WCSS_A_DXE_0_CH5_TSTMP**Type:** R**Reset State:** 0x00000000

Contains last sampled value of the system timestamp

WCSS_A_DXE_0_CH5_TSTMP

Bits	Name	Description
31:0	VALUE	

0x0A202580 WCSS_A_DXE_0_CH6_CTRL**Type:** RW**Reset State:** 0x11800708

Serves to configure channel 6 operation

WCSS_A_DXE_0_CH6_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH6_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH6_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH6_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH6_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH6_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A202584 WCSS_A_DXE_0_CH6_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH6_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH6_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH6_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A202588 WCSS_A_DXE_0_CH6_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and rearbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH6_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH6_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A20258C WCSS_A_DXE_0_CH6_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical address to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH6_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH6_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

0x0A202590 WCSS_A_DXE_0_CH6_SADRH**Type:** RW**Reset State:** 0x00000000

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH6_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A202594 WCSS_A_DXE_0_CH6_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH6_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH6_DADRL (cont.)

Bits	Name	Description
6:0	DQID	Destination Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the destination BMU WQ, UIF RX endpoint or EIF outbound queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: RSVD_0 (Reserved) 0x1: RSVD_1 (Reserved) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: BMU_25 (BMU Work Queue 25) 0x1A: BMU_26 (BMU Work Queue 26) 0x1B: BMU_SINK_WQ (BMU_SINK (WQ255)) 0x1C: UIF_RX_1_EP (UIF RX 1 endpoint) 0x1D: UIF_RX_2_EP (UIF RX 2 endpoint) 0x1E: UIF_RX_3_EP (UIF RX 3 endpoint) 0x1F: UIF_RX_4_EP (UIF RX 4 endpoint)

The channel destination address high register holds the high bits of the destination address for a transfer. See the description of CH_DADRL for more info.

WCSS_A_DXE_0_CH6_DADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	This register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_DADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_DADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_DADRL goes through XIF untranslated) 0x3: RSVD (Reserved. Maps to default slave. Reads return error, writes are ignored)

0x0A20259C WCSS_A_DXE_0_CH6_DESCL

Type: RW

Reset State: 0x00000000

The Channel 6 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH6_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: $\text{base} = \text{UIF base} + \text{TD_and_TM_offset} = 0x0E02_5000 + x100 = 0x0E02_5100 \gg 7 = 0x1C_04A2$
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Bits	Name	Description
31:0	VALUE	

0x0A2025C0 WCSS_A_DXE_0_CH7_CTRL**Type:** RW**Reset State:** 0x11C00708

Serves to configure channel 7 operation

WCSS_A_DXE_0_CH7_CTRL

Bits	Name	Type	Description
31	SWAP	RW	Endian Byte Swap Enable. When high instructs DXE to perform an endian swap of the incoming byte stream. The corresponding bitfield in the DXE descriptor control word is located at DXE_DESC_CTRL[20]
30:29	BDT_IDX	RW	BD Template Index. When XTYPE=H2B and BDH=1, DXE supports creating a BD by using template data from one of up to 4 different BD templates. The BD template base store is pointed at by the DXE BD_TMPLT(H/L) registers and the address used to read the template data is calculated as follows: $BD_TMPLT_ADDR = BD_TMPLT_BASE + (128 * CH_CTRL[BDT_IDX])$ The corresponding bitfield in the control word of the external descriptor is mapped to bits[19:18]
28	DFMT	RW	Descriptor Format. This bitfield is used to select between long and short descriptor formats. When using the short descriptor format, the high part of the source, destination and descriptor addresses will be taken from the SADDRH_DFLT, DADDRH_DFLT or DESCH_DFLT registers respectively. Default is to use the long descriptor format 0x0: SHORT (Short descriptor format (5 dwords)) 0x1: LONG (Long descriptor format (8 dwords))

WCSS_A_DXE_0_CH7_CTRL (cont.)

Bits	Name	Type	Description
27	ABORT	RW	Writing a one to this bit will cause the channel to stop its current transfer and set the ERR bit and ERR_CODE fields in CH_STATUS. Note that if the channel is currently disabled or if it is about to be disabled because it has just finished its programmed transfer, then the abort request will be ignored and the error bit and error codes won't be set. If the channel is currently masked by the arbiter then setting this bit will forcibly unmask it so that the transfer can be aborted the next time the channel is selected by the internal arbiter. The abort request is automatically cleared by hw once the channel has aborted the transfer. Also note that since the DXE will not attempt to do any cleanup when a transfer is aborted, software might need to do so. For example, for H2B transfers, SW should manually release the BD and any PDUs currently in use by the partial transfer or else a BD/PDU leak will result.
26	ENDIANNESS	RW	Specifies the endianness of the master generating the data. Affects alignment of valid bytes for non-dword aligned reads/writes. The corresponding field in the DXE descriptor control word is located in DXE_DESC_CTRL[21] 0x0: BIGEND (System is Big-Endian) 0x1: LTLEND (System is Little-Endian)
25:22	CTR_SEL	RW	Counter Select. If the event counters are enabled (DMA_CSR[ECTR_EN]=1) then this bitfield selects the counter that will be incremented at the end of the transfer. By default the value in this bitfield is the same as the channel number so that after reset channel 0 increments counter 0, channel 1 increments counter 1 and so on.
21	EDVEN	RW	When set, the DMA engine will clear the VAL bit in the DESC_CSR word of the current descriptor once it has completed processing it. This is useful for implementing a descriptor "ring" (see the description of the VALID bit in Table 3.1)
20	EDEN	RW	External Descriptor Enable. Use External Descriptor Linked List
19	INE_DONE	RW	Enable Channel Interrupt when Channel is Done. The corresponding interrupt source bit is INT_DONE
18	INE_ERR	RW	Enable Channel Interrupt on Errors. The corresponding interrupt source bit is INT_ERR
17	INE_ED	RW	Enable External Descriptor Interrupt. When this bit is set, an interrupt will be generated after processing a descriptor item that has the INT bit set in its DESC_CTRL word (see Table 3.1). The corresponding interrupt source bit is INT_ED

WCSS_A_DXE_0_CH7_CTRL (cont.)

Bits	Name	Type	Description
16	STOP	R	Channel processing stopped due to a request in the last processed linked list descriptor (see the STOP bit in the definition of the DESC_CSR word in Table 3.1). This bit will be automatically cleared when the channel is restarted.
15:13	PRIO	RW	This field sets the channel priority. 7: Highest Priority. 0: Lowest Priority.
12:9	BTHLD_SEL	RW	BMU Threshold Select. This value tells DXE which of the BMU BD/PDU thresholds to check before issuing BMU commands that reserve, or get BDs or PDUs. It also specifies the module index value that will be used to issue any required BMU commands (see BMU spec for details). The value of this bitfield is only meaningful for transfer types that involve the BMU and therefore its value will be ignored for H2H transfers. 0x0: RSVD0 (Reserved) 0x1: RSVD1 (Reserved) 0x2: THLD2 (Use BD/PDU threshold 2) 0x3: THLD3 (Use BD/PDU threshold 3) 0x4: THLD4 (Use BD/PDU threshold 4) 0x5: THLD5 (Use BD/PDU threshold 5) 0x6: THLD6 (Use BD/PDU threshold 6) 0x7: THLD7 (Use BD/PDU threshold 7) 0x8: THLD8 (Use BD/PDU threshold 8) 0x9: THLD9 (Use BD/PDU threshold 9) 0xA: THLD10 (Use BD/PDU threshold 10) 0xB: RSVD11 (Reserved) 0xC: RSVD12 (Reserved) 0xD: RSVD13 (Reserved) 0xE: RSVD14 (Reserved) 0xF: RSVD15 (Reserved)
8	PDU_REL	RW	0: Don't release BD and PDUs when done. 1: Release BD and PDUs when done. 0x0: KEEP (Don) 0x1: RELEASE (Release BD and payload PDUs)

WCSS_A_DXE_0_CH7_CTRL (cont.)

Bits	Name	Type	Description
7	PIQ	RW	next descriptor Pointer address Is Queue. When set the source of the descriptor address is interpreted as a queue ID instead of just the address of a flat memory location. The only valid source queues for descriptors are the UIF Tx data and Tx management endpoints. Any other IDs will result the channel aborting the transfer with an invalid source queue error. Therefore, when this bit is set, SW must ensure that the CH_DESCCL[QID] bitfield is set to a valid queue ID and that the CH_DESCCL[BASE] bitfield is set to the base address of the source UIF endpoint. This base address is formed by taking the base address for the UIF block in the SAHB bus which can be found in the Nova address map document and then adding the internal UIF offset for the correct source endpoint. This offsets can be obtained from the UIF specification document. For convenience, the current internal UIF offsets are provided in the description of the QID bitfield in the CH_DESCCL register description. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to FIFO type memory (UIF Tx endpoints))
6	DIQ	RW	Destination Is Queue. When set the destination address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF RX endpoints or and EIF outbound FIFO. When this bit is set, SW must ensure that the DADR[QID] bitfield is set to a valid queue ID and that the DADR[BASE] bitfield is set to the base address of the destination queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Destination address maps to regular flat memory) 0x1: QUEUE (Destination address maps to a BMU queue or FIFO type memory)
5	SIQ	RW	Source Is Queue. When set the source address is interpreted as a queue ID instead of just the address of a flat memory location. The queue could be either a BMU queue, one of the UIF TX endpoints or and EIF inbound FIFO. When this bit is set, SW must ensure that the SADR[QID] bitfield is set to a valid queue ID and that the SADR[BASE] bitfield is set to the base address of the source queue for UIF or EIF, or to zero for a BMU queue. endpoint. 0x0: FLAT (Source address maps to regular flat memory) 0x1: QUEUE (Source address maps to a BMU queue or FIFO type memory)

WCSS_A_DXE_0_CH7_CTRL (cont.)

Bits	Name	Type	Description
4	BDH	RW	BD Handling bit. The behavior depends on the setting of XTYPE. If XTYPE is: H2B: Then if BDH is: 0: Use first 128 bytes of packet as BD. 1: Create BD from BD template (Up to 4 supported. Also see desc for BDT_IDX). B2H: Then if BDH is: 0: Insert BD in front of payload. 1: Discard BD. For XTYPE values of H2H and B2B the value of this bit is ignored.
3	EOP	RW	End of Packet bit. For H2B transfers marks the end of a packet Note that when not using external descriptors DXE cannot support the gather functionality and therefore the EOP bit must be set. For XTYPE values of H2H, B2B and B2H the value of this bit is ignored.
2:1	XTYPE	RW	Transfer Type. Specifies the type of transfer to perform: 00: H2H. Host space to Host space transfer. 01: B2B. BMU space to BMU space transfer. 10: H2B. Host space to BMU translation. 11: B2H. BMU space to Host space translation. For cross-space transfers (H2B and B2H) the DMA engine will also perform the required data format translation. The format translation behavior can be modified by the setting of the BDH and PAD bits. 0x0: H2H (Host space to Host space transfer) 0x1: B2B (BMU space to BMU space transfer) 0x2: H2B (Host space to BMU space transfer) 0x3: B2H (BMU space to Host space transfer)

WCSS_A_DXE_0_CH7_CTRL (cont.)

Bits	Name	Type	Description
0	EN	RW	Channel Enable or Restart. Writing this bit with a one either starts a new DMA transfer according to the parameters programmed in the channel's configuration registers and clears the DONE bit or, if the channel is already enabled but the STOP bit is set, then it restarts channel processing and also clears the STOP bit. This bit is automatically cleared when a single transfer completes or, if the channel is configured to use linked list descriptors, when the last transfer in the descriptor linked list completes (DESC_NXT is NULL or/and DESC_CSR[VALID]=0). The channel is also disabled and this bit cleared if a channel error is encountered. Reading this bit indicates whether a channel is currently enabled or disabled: 0: Channel Disabled. 1: Channel Enabled. The Channel Enable bit status can also be found by reading the DMA_ENCH register which aggregates the EN bits of all channels. Note: Software must take care to not disable the channel while it is busy or data could be lost.

0x0A2025C4 WCSS_A_DXE_0_CH7_STATUS**Type:** RW**Reset State:** 0x00000000

Serves to report the status of the programmed channel operation.

WCSS_A_DXE_0_CH7_STATUS

Bits	Name	Type	Description
31:16	RSVD	R	Reserved. Reads always return 0. Writes are ignored.
15	INT_DONE	R	Interrupt Source: Asserted when the channel has finished all processing.
14	INT_ERR	R	Interrupt Source: Asserted when a channel error has occurred. Masked by the INE_ERR
13	INT_ED	R	Interrupt Source. Descriptor Done and INT requested
12	ABORT_REQ	R	Abort Request. Software has requested that the current operation be aborted. However, if CH_STATUS[EN] is still set then the channel has registered the request but is not yet in a position to abort the transfer "safely". Once the channel finishes its current operation it will abort the transfer and set the error flag and error code bitfields accordingly.

WCSS_A_DXE_0_CH7_STATUS (cont.)

Bits	Name	Type	Description
11	STOP_REQ	R	Stop Request. Software has requested that the channel stop its operation after the current descriptor has been processed. Once this happens the STOPD bitfield will be set to one and the channel will be disabled.
10:6	ERR_CODE	R	Used to identify the source or cause of an error. 0x0: NONE (No Errors) 0x1: SAHB_ERR (DXE received Error response while performing a transfer on the SAHB) 0x2: H2H_RD_BUS_ERR (SAHB bus error encountered during H2H read operation) 0x3: H2H_WR_BUS_ERR (SAHB bus error encountered during H2H write operation) 0x4: PRG_INV_XTYPE (B2B not yet supported) 0x5: BERR_POPWQ (BMU error on POP WQ command) 0x6: BERR_PUSHWQ (BMU error on PUSH WQ command) 0x7: BERR_RLSS (BMU error on Release BD and attached PDUs command) 0x8: BERR_GETPDU (BMU error on Get PDU command) 0x9: PRG_INV_WQ (Programming error: Unsupported BMU Work Queue) 0xA: PRG_INV_H2H_SRC_QID (Programming error: Invalid H2H source queue ID) 0xB: PRG_INV_H2H_DST_QID (Programming error: Invalid H2H destination queue ID) 0xC: PRG_INV_B2H_SRC_QID (Programming error: Invalid B2H BMU source work queue ID) 0xD: PRG_INV_B2H_DST_QID (Programming error: Invalid B2H destination queue ID) 0xE: PRG_INV_B2H_SRC_IDX (Programming error: Invalid B2H source BD index) 0xF: PRG_INV_H2B_SRC_QID (Programming error: Invalid H2B source queue ID) 0x10: PRG_INV_H2B_DST_QID (Programming error: Invalid H2B BMU destination work queue ID) 0x11: PRG_INV_H2B_DST_IDX (Programming error: Invalid H2B destination BD index) 0x12: PRG_INV_H2B_SZ (Programming error: Invalid H2B transfer size of 0 when BDH=1) 0x13: PRG_INV_SADR (Programming error: Invalid Source Address) 0x14: PRG_INV_DADR (Programming error: Invalid Destination Address) 0x15: PRG_INV_EDADR (Programming error: Invalid Descriptor Address) 0x16: PRG_INV_SRC_WQID (Programming error: Invalid Destination WQ ID)

WCSS_A_DXE_0_CH7_STATUS (cont.)

Bits	Name	Type	Description
			0x17: PRG_INV_DST_WQID (Programming error: Invalid Destination WQ ID) 0x18: PRG_XTYPE_MSM TCH (Programming error: XTYPE mismatch during H2B gather transfer) 0x19: PKT_ERR (Malformed packet) 0x1A: ABORT (Aborted transfer due to SW request) 0x1B: PDU_CNT_OVFL (PDU count field overflow)
5	ERR	RW	DMA channel stopped due to error. To clear the error status it is necessary to write a 1 into this bit position.
4	STOPD	R	Channel Stopped. The channel has stopped further processing and disabled itself due to a stop request in the last processed descriptor.
3	MSKD	R	Channel Masked. The channel has been automatically masked out from arbitration due to a blocking condition.
2	DONE	R	DMA channel Done. This bit will be automatically cleared the next time the channel is enabled.
1	BUSY	R	Channel busy. High when the channel is enabled and currently active (won internal arbitration)
0	EN	R	Channel Enabled. Copy of CH_CTRL[EN].

0x0A2025C8 WCSS_A_DXE_0_CH7_SZ**Type:** RW**Reset State:** 0x00000000

The transfer size register specifies the total, remaining, and burst or 'chunk' transfer sizes for each channel. The maximum total transfer size is 16K-1 bytes. The chunk size control can be useful to control the relative bandwidth used by each channel as the dma engine will change channels, release the AHB bus, and re-arbitrate for access after transferring chunk size bytes.

WCSS_A_DXE_0_CH7_SZ

Bits	Name	Type	Description
31:28	CHK_SZ	RW	Chunk transfer size. Specifies the number of bytes (in multiples of 8) to be transferred at one given time (not implying they are buffered but that they will be transferred for each start event in one bus request cycle). If chunk size is zero the DMA engine will always perform maximum chunk size transfers. Maximum chunk size is 128 bytes.
27:14	REM_SZ	R	Remaining transfer size. Specifies the number of bytes that remain to be transferred to complete the current operation.

WCSS_A_DXE_0_CH7_SZ (cont.)

Bits	Name	Type	Description
13:0	TOT_SZ	RW	Total Transfer Size. Specifies the number of bytes to be transferred. Maximum total transfer size is (4K-1) bytes. Note: This field is unnecessary and will be ignored for B2H or B2B transfers, when the source of the transfer is in BMU space (either BMU queue or direct pointer to BD). This is because the size of the transfer will be the packet length encoded in the BD at offset 0x0c bits [11:0].

0x0A2025CC WCSS_A_DXE_0_CH7_SADRL**Type:** RW**Reset State:** 0x00000000

The channel source address register specifies either the source address in flat internal or external memory, or else the BMU queue ID, UIF TX endpoint ID, or EIF inbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the source, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a source, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[SIQ] bit. When CH_CSR[SIQ] is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when it is set this register has two bitfields: The SQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF source endpoint/FIFO.

For B2H or B2B transfers, when the source is a BMU Queue ID (CH_CSR[SIQ] = 1 and SWQID matches BMU), the DXE will issue a BMU POPWQ command to pop the specified queue and obtain the BD index of the source packet. Else, when the source is an address (CH_CSR[SIQ] = 0), the DXE will interpret the address as the index of the packet BD and will add it to the BMU_BASE to obtain the physical addresses to use to fetch it directly from memory.

For H2B or H2H transfers, if the source is a UIF endpoint or EIF FIFO (CH_CSR[SIQ] = 1 and SQID matches UIF/EIF), SW should program the SAHB base address of the UIF source endpoint in the BASE bitfield and the queue ID to match in the SWQID bitfield, then the DXE will use the base address given to generate the physical address and read the data over the SAHB bus and also use the appropriate sideband signals as specified by the SQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and SQID fields are consistent and refer to the same endpoint or else hangs or unpredictable behavior might occur. Else, when the source is just a location in flat memory space, (CH_CSR[SIQ] = 0), the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the physical address to use to fetch the data. For this case, SW should make sure that the provided address maps to the intended source interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus.

To summarize, for B2H and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[SIQ] = 0):

ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[SIQ] = 1 & SQID matching one of the BMU queues):

ADDR[31:7] = Any value will do but zero preferred

ADDR[6:0] = Any BMU Queue ID as specified in description of SQID field

For H2B and H2H transfers the address must conform to the following format:

For sources in flat memory space (CH_CSR[SIQ] = 0): ADDR[31:0] = address mapping to source interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[SIQ] = 1 & QID matching UIF or EIF):

ADDR[31:7] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[6:0] = Queue ID matching UIF or EIF as specified in description of SQID field

WCSS_A_DXE_0_CH7_SADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the base address of the source UIF TX endpoint or EIF inbound FIFO. Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

WCSS_A_DXE_0_CH7_SADRL (cont.)

Bits	Name	Description
6:0	SQID	Source Queue ID. Valid only when the CH_CSR[SIQ] bit is set. For this case, this bitfield provides the ID for the source BMU, UIF or EIF queue to be used for the transfer. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address. 0x0: UIF_TX_DATA_EP (UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (UIF TX Management Endpoint) 0x2: BMU_2 (BMU Work Queue 2) 0x3: BMU_3 (BMU Work Queue 3) 0x4: BMU_4 (BMU Work Queue 4) 0x5: BMU_5 (BMU Work Queue 5) 0x6: BMU_6 (BMU Work Queue 6) 0x7: BMU_7 (BMU Work Queue 7) 0x8: BMU_8 (BMU Work Queue 8) 0x9: BMU_9 (BMU Work Queue 9) 0xA: BMU_10 (BMU Work Queue 10) 0xB: BMU_11 (BMU Work Queue 11) 0xC: BMU_12 (BMU Work Queue 12) 0xD: BMU_13 (BMU Work Queue 13) 0xE: BMU_14 (BMU Work Queue 14) 0xF: BMU_15 (BMU Work Queue 15) 0x10: BMU_16 (BMU Work Queue 16) 0x11: BMU_17 (BMU Work Queue 17) 0x12: BMU_18 (BMU Work Queue 18) 0x13: BMU_19 (BMU Work Queue 19) 0x14: BMU_20 (BMU Work Queue 20) 0x15: BMU_21 (BMU Work Queue 21) 0x16: BMU_22 (BMU Work Queue 22) 0x17: BMU_23 (BMU Work Queue 23) 0x18: BMU_24 (BMU Work Queue 24) 0x19: RSVD_25 (Reserved) 0x1A: RSVD_26 (Reserved) 0x1B: RSVD_27 (Reserved) 0x1C: RSVD_28 (Reserved) 0x1D: RSVD_29 (Reserved) 0x1E: RSVD_30 (Reserved) 0x1F: RSVD_31 (Reserved)

The channel source address high register holds the high bits of the source address for a transfer. See the description of CH_SADRL for more info.

WCSS_A_DXE_0_CH7_SADRH

Bits	Name	Type	Description
31:2	RSVD	R	Reserved. Writes ignored. Reads always return zeroes.
1:0	ADDRH	RW	For taurus, this register holds bits 33 and 32 of the address. With the current address mapping these high order bits determine where the transfer is routed and whether the lower 32 bits of the address (the ones held in CH_SADRL) go untranslated through PIF or XIF or if they use the PIF and XIF address translation windows. See the bitfield encoding descriptions for an explanation. 0x0: ADDR_XTLN (If address in PIF or XIF address space then address goes through translation in PIF or XIF) 0x1: PIF_NO_XTLN (Always maps to PIF and full 32-bits in CH_SADRL goes through PIF untranslated) 0x2: XIF_NO_XTLN (Always maps to XIF and full 32-bits in CH_SADRL goes through XIF untranslated) 0x3: RSVD (Reserved)

0x0A2025D4 WCSS_A_DXE_0_CH7_DADRL**Type:** RW**Reset State:** 0x00000000

The channel destination address register specifies either the destination address in flat internal or external memory, or else the BMU queue ID, UIF RX endpoint ID, or EIF outbound FIFO ID for the transfer. The register must be programmed directly by software before the channel is enabled, then, once the DMA channel is enabled, the register is updated after each atomic chunk transfer (read+write) with the number of bytes transferred. (except when using a UIF/EIF queue) and also after loading a new descriptor. When using flat memory as the destination, addresses can have arbitrary byte-alignment. When using a BMU queue, UIF endpoint or EIF fifo as a destination, the software is responsible for programming a valid queue ID and correct base address for the queue. The layout of bitfields in this register depends on the setting of the CH_CSR[DIQ] bit. When this bit is clear then the register has no bitfields and the full 32-bits are interpreted as the physical address of a location in flat memory, and when the bit is set this register has two bitfields: The DQID bitfield used to specify the queue ID, and the BASE bitfield used to provide the base address for the UIF or EIF destination endpoint/FIFO.

For H2B or B2B transfers, when using a BMU queue as the destination (CH_CSR[DIQ] = 1 and DQID matches BMU), the DXE will push the index of the BD of the packet into the specified queue at the end of the packet transfer. Therefore, software is responsible for programming a valid BMU Queue ID.

Else, when the destination is an index (CH_CSR[DIQ] = 0), the BD will be written to the address obtained by adding the provided index to the BMU_BASE, again, the software must ensure that said address is legal and known to BMU. That is, software must preallocate the BD (get the BD from BMU via GET BD/PDU cmd) for the BD before starting the transfer. For B2H or H2H transfers, if the destination is a UIF endpoint or EIF FIFO (CH_CSR[DIQ] = 1 and DQID matches UIF/EIF), SW should program the SAHB base address of the UIF destination endpoint in the

BASE bitfield and the queue ID to match in the DQID bitfield, then the DXE will use the base address given to generate the physical address and write the data over the SAHB bus and also use the appropriate sideband signals as specified by the DQID field to communicate with the selected UIF endpoint. SW should make sure that the BASE and DQID fields are consistent and refer to the same endpoint else hangs or unpredictable behavior might occur. On the other hand, when the destination is just a location in flat memory space, (CH_CSR[DIQ] = 0), be it internal or external, the bitfields lose their special meaning and DXE will just use the full 32-bits programmed into the register as the address to write the data. For this case, SW should make sure that the address maps to the intended destination interface (Internal memory, USB, PCI, PCIe) by conforming to the address map specified for the SAHB bus. To summarize, for H2B and B2B transfers the address must conform to the following format:

For index of BD mode (CH_CSR[DIQ] = 0): ADDR[31:7] = BMU_BASE + BD_INDEX[15:0]

ADDR[6:0] = 7'd0

For BMU Queue ID mode (CH_CSR[DIQ] = 1 & DQID matching one of the BMU queues):

ADDR[31:5] = Any value will do but zero preferred

ADDR[4:0] = Any BMU Queue ID as specified in description of QID field

For B2H and H2H transfers the address must conform to the following format:

For destinations in flat memory space (CH_CSR[DIQ] = 0): ADDR[31:0] = address mapping to destination interface

For UIF RX endpoints or EIF FIFOs (CH_CSR[DIQ] = 1 & DQID matching UIF or EIF):

ADDR[31:5] = UIF RX endpoint base or EIF inbound FIFO base

ADDR[4:0] = Queue ID matching UIF or EIF as specified in description of DQID field

WCSS_A_DXE_0_CH7_DADRL

Bits	Name	Description
31:7	BASE	Base Address. Valid only when the CH_CSR[DIQ] bit is set. For this case, this bitfield provides the base address of the destination UIF RX endpoint or EIF outbound FIFO (for BMU SW may use any value can be used but zero is suggested). Consult the appropriate interface uarch for the offset within the interface's address space. When CH_CSR[SIQ] bit is not set this field loses its special meaning and is interpreted only as part of the full 32-bit source address.

Type: RW

Reset State: 0x00000000

The Channel 7 Linked List Descriptor Pointer register contains the 32 lower bits of the address of the next descriptor to be loaded in the linked list. This address must be dword (32-bit) aligned (addr[1:0]=0 if CH_CTRL[PIQ]=0). Each complete transfer descriptor consists of 7 32-bit values arranged contiguously in memory. The value of this register will be overwritten with the address of the start of the next descriptor set in the list after the current descriptor has been fetched. The meaning of the value in this register depends on the value of the CH_CTRL[PIQ] bitfield similar to the way in which SADRL and DADRL are depending in SIQ and DIQ respectively. For CH_CTRL[PIQ]=0 then this register has no bitfields and the value is just interpreted as an address in flat memory space. When CH_CTRL[PIQ] is set then the descriptor will be read from FIFO type memory in UIF and the register has 2 bitfields: BASE, and SQID. BASE specifies the base address of the UIF Tx queue (derived from the start of the UIF address space in SAHB plus the internal UIF offset).

WCSS_A_DXE_0_CH7_DESCL

Bits	Name	Description
31:7	BASE	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify the base address of the UIF endpoint to use as the source of the descriptor. Refer to the Nova address map document and to the UIF architecture document for guaranteed correct values to use here. For convenience but without a guarantee of accuracy, the base value to use for both the Tx data and management endpoints is the following: $\text{base} = \text{UIF base} + \text{TD_and_TM_offset} = 0x0E02_5000 + x100 = 0x0E02_5100 \gg 7 = 0x1C_04A2$
6:0	SQID	This bitfield only exists and has meaning when the descriptor needs to be read from a UIF TX queue (and therefore CH_CTRL[PIQ]=1), then it serves to specify which of the two UIF TX queues to use. Note that in this case SW also needs to program the correct base address of the source UIF endpoint in the BASE bitfield. 0x0: UIF_TX_DATA_EP (Descriptor to be read from UIF TX Data Endpoint) 0x1: UIF_TX_MGMT_EP (Descriptor to be read from UIF TX Management Endpoint)

Bits	Name	Description
31:10	CMEM_TRANSBLK_START_ADDR	starting address of transfer block region in kbytes

0x0A201018 WCSS_A_CMEM_CMEM_TRANSBLK_END_ADDR**Type:** RW**Reset State:** 0x00000000

Ending address of transfer block region in memory.

WCSS_A_CMEM_CMEM_TRANSBLK_END_ADDR

Bits	Name	Description
31:10	CMEM_TRANSBLK_END_A DDR	ending address of transfer block region in kbytes

0x0A20101C WCSS_A_CMEM_CMEM_TRANSBLK_PORT_EN**Type:** RW**Reset State:** 0x00000000

transfer block enable for each port.

WCSS_A_CMEM_CMEM_TRANSBLK_PORT_EN

Bits	Name	Description
23:20	CMEM_TRANSBLK_MSTID1	second AHB master ID blocked from accessing blocked region. valid only when cmem_transblk_mstid1_vld is set to 1.
19:16	CMEM_TRANSBLK_MSTID0	first AHB master ID blocked from accessing blocked region. valid only when cmem_transblk_mstid0_vld is set to 1.
3	CMEM_TRANSBLK_MSTID1_VLD	cmem_transblk_mstid1 is valid
2	CMEM_TRANSBLK_MSTID0_VLD	cmem_transblk_mstid0 is valid
1:0	CMEM_TRANSBLK_PORT_EN	transfer block enable for each port

0x0A201020 WCSS_A_CMEM_CMEM_ARB_POLICY**Type:** RW**Reset State:** 0x00000000

Arbitration policy when two AHB ports are active

WCSS_A_CMEM_CMEM_ARB_POLICY

Bits	Name	Description
24:16	CMEM_CAHB_PRTY	CAHB port priority for each 9 SRAM block.Bit n corresponds to SRAM_n.
9:1	CMEM_LRAM_ARB_POLICY	Arbitration for each 9 SRAM block. Bit n corresponds to SRAM_n.
0	CMEM_AHB_ARB_POLICY	Arbitration policy. 0x0: PRR (Prioritized Round-Robin) 0x1: Reserved

0x0A201024 WCSS_A_CMEM_CMEM_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority setting of dahb, and cpu.

WCSS_A_CMEM_CMEM_PRIORITY

Bits	Name	Description
24:16	CMEM_ACPU_PRTY	CPU port priority for each 9 SRAM block.Bit n corresponds to SRAM_n.
8:0	CMEM_DAHB_PRTY	DAHB port priority for each 9 SRAM block.Bit n corresponds to SRAM_n.

0x0A20102C WCSS_A_CMEM_CMEM_INVALID_HISTORY**Type:** R**Reset State:** 0x00000000

history of up to first 4 invalid address access

WCSS_A_CMEM_CMEM_INVALID_HISTORY

Bits	Name	Description
31:28	ACC_TYPE3	access type for the forth invalid access. bit[0] - read or write. 0 : read, 1 : write bit[1] - access is from CAHB bit[2] - access is from DAHB bit[3] - access is from CPU
27:24	MST_ID3	master ID that the forth invalid access has occurred if the access is from CAHB or DAHB
23:20	ACC_TYPE2	access type for the third invalid access. bit[0] - read or write. 0 : read, 1 : write bit[1] - access is from CAHB bit[2] - access is from DAHB bit[3] - access is from CPU
19:16	MST_ID2	master ID that the third invalid access has occurred if the access is from CAHB or DAHB
15:12	ACC_TYPE1	access type for the second invalid access. bit[0] - read or write. 0 : read, 1 : write bit[1] - access is from CAHB bit[2] - access is from DAHB bit[3] - access is from CPU
11:8	MST_ID1	master ID that the second invalid access has occurred if the access is from CAHB or DAHB
7:4	ACC_TYPE0	access type for the first invalid access. bit[0] - read or write. 0 : read, 1 : write bit[1] - access is from CAHB bit[2] - access is from DAHB bit[3] - access is from CPU
3:0	MST_ID0	master ID that the first invalid access has occurred if the access is from CAHB or DAHB

0x0A201030 WCSS_A_CMEM_CMEM_INVALID_ADDR0**Type:** R**Reset State:** 0x00000000

address that the first invalid access has happened.

WCSS_A_CMEM_CMEM_INVALID_ADDR0

Bits	Name	Description
31:0	CMEM_INVALID_ADDR0	address that the first invalid access has happened.

0x0A201034 WCSS_A_CMEM_CMEM_INVALID_ADDR1**Type:** R**Reset State:** 0x00000000

address that the second invalid access has happened.

WCSS_A_CMEM_CMEM_INVALID_ADDR1

Bits	Name	Description
31:0	CMEM_INVALID_ADDR1	address that the second invalid access has happened.

0x0A201038 WCSS_A_CMEM_CMEM_INVALID_ADDR2**Type:** R**Reset State:** 0x00000000

address that the third invalid access has happened.

WCSS_A_CMEM_CMEM_INVALID_ADDR2

Bits	Name	Description
31:0	CMEM_INVALID_ADDR2	address that the third invalid access has happened.

0x0A20103C WCSS_A_CMEM_CMEM_INVALID_ADDR3**Type:** R**Reset State:** 0x00000000

address that the forth invalid access has happened.

WCSS_A_CMEM_CMEM_INVALID_ADDR3

Bits	Name	Description
31:0	CMEM_INVALID_ADDR3	address that the forth invalid access has happened.

0x0A201040 WCSS_A_CMEM_CMEM_INVALID_CTL**Type:** RW**Reset State:** 0x00000000

control register for clearing invalid history and enabling error response.

WCSS_A_CMEM_CMEM_INVALID_CTL

Bits	Name	Description
1	CMEM_BUS_ERROR_ON_INVALID	when enabled, AHB error will be returned when invalid access occurs.
0	CMEM_INVALID_CLR	clear invalid history including id, type and address

0x0A201048 WCSS_A_CMEM_CMEM_CNT_CTRL

Type: RW

Reset State: 0x00000000

This register controls the cmem counters

WCSS_A_CMEM_CMEM_CNT_CTRL

Bits	Name	Description
1	CMEM_CNT_CLR	Clear the cmem counters to 0.
0	CMEM_CNT_EN	Enable the cmem counters to increment.

0x0A20104C WCSS_A_CMEM_CMEM_CAHB_BUSY_CNT

Type: R

Reset State: 0x00000000

32-bit of cmem_cahb_busy_cnt

WCSS_A_CMEM_CMEM_CAHB_BUSY_CNT

Bits	Name	Description
31:0	CMEM_CAHB_BUSY_CNT	Number of AHB clock cycle while CAHB port is busy.

0x0A201050 WCSS_A_CMEM_CMEM_CAHB_IDLE_CNT**Type:** R**Reset State:** 0x00000000

32-bit of cmem_cahb_idle_cnt

WCSS_A_CMEM_CMEM_CAHB_IDLE_CNT

Bits	Name	Description
31:0	CMEM_CAHB_IDLE_CNT	Number of AHB clock cycle while CAHB port is idle.

0x0A201054 WCSS_A_CMEM_CMEM_CAHB_ACTIVE_CNT**Type:** R**Reset State:** 0x00000000

32-bit of cmem_cahb_active_cnt

WCSS_A_CMEM_CMEM_CAHB_ACTIVE_CNT

Bits	Name	Description
31:0	CMEM_CAHB_ACTIVE_CNT	Number of AHB clock cycle while CAHB port is busy and active.

0x0A201058 WCSS_A_CMEM_CMEM_DAHB_BUSY_CNT**Type:** R**Reset State:** 0x00000000

32-bit of cmem_dahb_busy_cnt

WCSS_A_CMEM_CMEM_DAHB_BUSY_CNT

Bits	Name	Description
31:0	CMEM_DAHB_BUSY_CNT	Number of AHB clock cycle while DAHB port is busy.

32-bit of cmem_dahb_idle_cnt

WCSS_A_CMEM_CMEM_DAHB_IDLE_CNT

Bits	Name	Description
31:0	CMEM_DAHB_IDLE_CNT	Number of AHB clock cycle while DAHB port is idle.

0x0A201060 WCSS_A_CMEM_CMEM_DAHB_ACTIVE_CNT

Type: R

Reset State: 0x00000000

32-bit of cmem_dahb_active_cnt

WCSS_A_CMEM_CMEM_DAHB_ACTIVE_CNT

Bits	Name	Description
31:0	CMEM_DAHB_ACTIVE_CNT	Number of AHB clock cycle while DAHB port is busy and active.

0x0A201064 WCSS_A_CMEM_CMEM_ACPU_BUSY_CNT

Type: R

Reset State: 0x00000000

32-bit of cmem_acpu_busy_cnt

WCSS_A_CMEM_CMEM_ACPU_BUSY_CNT

Bits	Name	Description
31:0	CMEM_ACPU_BUSY_CNT	Number of ACPU clock cycle while CPU memory port is busy.

0x0A201068 WCSS_A_CMEM_CMEM_ACPU_IDLE_CNT

Type: R

Reset State: 0x00000000

32-bit of cmem_acpu_idle_cnt

WCSS_A_CMEM_CMEM_ACPU_IDLE_CNT

Bits	Name	Description
31:0	CMEM_ACPU_IDLE_CNT	Number of ACPU clock cycle while CPU memory port is busy.

0x0A20106C WCSS_A_CMEM_CMEM_ACPU_ACTIVE_CNT**Type:** R**Reset State:** 0x00000000

32-bit of cmem_acpu_active_cnt

WCSS_A_CMEM_CMEM_ACPU_ACTIVE_CNT

Bits	Name	Description
31:0	CMEM_ACPU_ACTIVE_CNT	Number of ACPU clock cycle while CPU memory port is busy and active.

0x0A201078 WCSS_A_CMEM_CMEM_CLK_GATE**Type:** RW**Reset State:** 0x00010104

disable control for top cmem clock gates

WCSS_A_CMEM_CMEM_CLK_GATE

Bits	Name	Type	Description
26	CPU_MEM_CLK_DISABLE	RW	when set, cpu clock to the memories will be blocked. The bit should be set to 1 before changing mem_cfg to avoid clock glitch to memories.
25	TRC_MEM_CLK_DISABLE	RW	when set, trc clock to the memories will be blocked. The bit should be set to 1 before changing mem_cfg to avoid clock glitch to memories.
24	PHYDBG_MEM_CLK_DISABLE	RW	when set, phydbg clock to the memories will be blocked. The bit should be set to 1 before changing mem_cfg to avoid clock glitch to memories.
23:16	GAS_BUSY_MSK	RW	number of cycles that gas_busy enables the clock after it is de-asserted.

WCSS_A_CMEM_CMEM_CLK_GATE (cont.)

Bits	Name	Type	Description
15:8	AHB_BUSY_MSK	RW	number of cycles that ahb_busy enables the clock after it is de-asserted.
7	DAHB_ABORT_HAPPENED	R	indication of abort happened.
6	DAHB_ABORT_CLR	RW	clear abort_happened
5	CAHB_ABORT_HAPPENED	R	indication of abort happened.
4	CAHB_ABORT_CLR	RW	clear abort_happened
3	CMEM_RD_CLK_GATE_DISABLE	RW	Disable read path clock gate.
2	CMEM_MEM_CLK_GATE_DISABLE	RW	Disable top clock gate for memory clock.
1	CMEM_ACPU_CLK_GATE_DISABLE	RW	Disable top clock gate for 40/80MHz ACPU clock.
0	CMEM_AHB_CLK_GATE_DISABLE	RW	Disable top clock gate for 40MHz AHB clock.

0x0A20107C WCSS_A_CMEM_CMEM_CAHB_RX_CTL**Type:** RW**Reset State:** 0x00000000

various control for CAHB rx fifo and data path

WCSS_A_CMEM_CMEM_CAHB_RX_CTL

Bits	Name	Description
2	CMEM_RX_CLR_ON_CMD_EN	when the bit is set, rx path is cleared when new transaction starts.
1	CMEM_RX_CLR	clear the RX FIFO and the read data path
0	CMEM_RX_FIFO_CLR	clear the RX FIFO

0x0A201080 WCSS_A_CMEM_CMEM_DAHB_RX_CTL**Type:** RW**Reset State:** 0x00000000

various control for DAHB rx fifo and data path

WCSS_A_CMEM_CMEM_DAHB_RX_CTL

Bits	Name	Description
2	CMEM_RX_CLR_ON_CMD_EN	when the bit is set, rx path is cleared when new transaction starts.
1	CMEM_RX_CLR	clear the RX FIFO and the read data path
0	CMEM_RX_FIFO_CLR	clear the RX FIFO

10.21 WCSS_A_CCAHB_CCAHB**0x0A200000 WCSS_A_CCAHB_CCAHB_BT_PL****Type:** RW**Reset State:** 0x00000005

ccahb Arbiter arbitration priority level for bt master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_BT_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for bt master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A200004 WCSS_A_CCAHB_CCAHB_FM_PL**Type:** RW**Reset State:** 0x00000005

ccahb Arbiter arbitration priority level for fm master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_FM_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for fm master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A200008 WCSS_A_CCAHB_CCAHB_RRI_PL**Type:** RW**Reset State:** 0x00000001

ccahb Arbiter arbitration priority level for rri master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_RRI_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rri master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A20000C WCSS_A_CCAHB_CCAHB_DXE_PL**Type:** RW**Reset State:** 0x00000001

ccahb Arbiter arbitration priority level for dxm master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_DXE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dxm master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A200010 WCSS_A_CCAHB_CCAHB_CCPU_PL**Type:** RW**Reset State:** 0x00000004

ccahb Arbiter arbitration priority level for ccpu master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_CCPU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for ccpu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A200014 WCSS_A_CCAHB_CCAHB_A2AB_PL**Type:** RW**Reset State:** 0x00000001

ccahb Arbiter arbitration priority level for a2ab master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_A2AB_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for a2ab master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A200018 WCSS_A_CCAHB_CCAHB_CBR_PL**Type:** RW**Reset State:** 0x00000005

ccahb Arbiter arbitration priority level for cbr master. In the ccahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CCAHB_CCAHB_CBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for cbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the ccahb arbiter will prevent a master from disabling itself.

0x0A200048 WCSS_A_CCAHB_CCAHB_DFLT_MST**Type:** RW**Reset State:** 0x00000000

This register identifies the default master for the ccahb

WCSS_A_CCAHB_CCAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY (Grant ownership to ccahb dummy master) 0x1: BT (Grant ownership to ccahb bt master) 0x2: FM (Grant ownership to ccahb fm master) 0x3: RRI (Grant ownership to ccahb rri master) 0x4: DXE (Grant ownership to ccahb dxe master) 0x5: CCPU (Grant ownership to ccahb ccpu master) 0x6: A2AB (Grant ownership to ccahb a2ab master) 0x7: CBR (Grant ownership to ccahb cbr master)

10.22 WCSS_A_FM_SSB_I2_CFG_SSB_I2_CFG**0x0A1E0000 WCSS_A_FM_SSB_I2_CFG_SSB_I2_CTL****Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00083005

Specifies various generic SSB_I2 control information. Bits 19:13 comprising of fields SSB_I2_DATA_PDEN, FCLK_MODE, FCLK_SW_OVERRIDE and NUM_FCLK are either

asynchronously reset or set. This is because they control the signals going directly to a pad. Remaining bits 12:0 are synchronously reset or set.

WCSS_A_FM_SSB12_CFG_SSB12_CTL

Bits	Name	Description
19:16	NUM_FCLK	Indicates a programmable number of active forwarding clock cycles following a SSB12 'transaction done' for a corresponding SSB12 request. Unless there is a new SSB12 transaction request, the forwarding clock is shut off after toggling NUM_FCLK cycles at the PMIC SSB12 clock frequency. The suggested setting (also the default value) is 8 clock cycles.
15	FCLK_SW_OVERRIDE	This is a software override bit to control the CGC for forwarding clock. Set this bit to 1 to allow the SSB12 clock to continue as a forwarding clock through the CGC (provided FCLK_MODE = 1). This override bit is provided to allow continuous toggling clock to SSB12 slave irrespective of how the HW logic controls the CGC. Set this bit to 0 to enable pure HW control on the forwarding clock CGC.
14	FCLK_MODE	Set this bit to 1 to activate forwarding clock mode. When this bit is 0, the FCLK_SW_OVERRIDE field has no meaning. Out of reset, the mode is set to 0 indicating that the SSB12 slave does not work off the forwarding clock. When FCLK_MODE = 0; no forwarding clock. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 1; forwarding clock always toggles. When FCLK_MODE = 1; FCLK_SW_OVERRIDE = 0; forwarding clock is controlled by HW logic.
13	SSB12_DATA_PDEN	Pulldown enable for SSB12_DATA pad.
12	PA_CGC_CTRL	This is to control the SSB12 clock going to this PMIC arbiter. Set this bit to 1 when you want to allow the clock to flow through the CGC. Set this bit to 0 to shut off clock to PMIC arbiter. Out of reset, this bit is set to 1.
10:8	SSB12_ADDR_WIDTH	Specifies what is the addressing mode in SSB12 mode. This field is only applicable in SSB12 mode and not the old SSB11 mode. 0x0: ENUM_8_BIT_ADDRESSING_MODE (8-bit addressing mode) 0x1: ENUM_9_BIT_ADDRESSING_MODE_AND_SO_ON (9-bit addressing mode and so on)
7	SSB12_MODE	Set this bit to 1 when SW wants to switch to new SSB12 mode. Set this to 0 when in old SSB11 mode.
5:4	SEL_RD_DATA	Specifies which RD_DATA value to select out of four possible combinations. This signal allows the returned data from the slave to be captured inside the master, 1, 2, or 3 symbols late in order to accommodate a large range of routing delay. Based on this field, the entire read transaction length will increase by SEL_RD_DATA number of symbols.
3:2	SSB12_DATA_DEL	Specifies the number of 1/2 clock periods, SSB12_DATA will be delayed before sampling inside.

WCSS_A_FM_SSBi2_CFG_SSBi2_CTL (cont.)

Bits	Name	Description
1:0	IDLE_SYMS	The master will ensure there are at least this number of idle symbol periods in between the accesses. The idle time is inserted at the end of the read or write transaction. This supported values are always between 1 - 3.

0x0A1E0004 WCSS_A_FM_SSBi2_CFG_SSBi2_INT_ENABLE**Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

Provides control on whether the TRANSACTION-DONE interrupts can be generated or not (per SW master).

WCSS_A_FM_SSBi2_CFG_SSBi2_INT_ENABLE

Bits	Name	Description
6:0	ENABLE_SSBi2_INT	SSBi2 transaction done interrupts for each SW master are generated only when the corresponding bits are set. The Interrupt mapping corresponds to the entries in the VIT . For e.g. if the VMID in VIT index 0 corresponds to the SW master RPM and VMID in index 1 of the VIT corresponds to SW master ARM 11, the bit 0 in the register will enable the interrupt corresponding to RPM , bit 1 will enable interrupt corresponding to ARM11.

0x0A1E0008 WCSS_A_FM_SSBi2_CFG_SSBi2_PRIORITIES**Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

Specifies the priorities for SSBi2 arbiter ports. The SSBi2 block supports up to maximum of 8 ports for arbitration. Each port has 3 bits to denote its priority. The bits are synchronously reset.

CAUTION Since the reset state value of SSBi2_PRIORITIES is 0, only SW requests (hard-coded to port #0) can get through. SW has to program this register to allow hardware requests through the SSBi2 arbiter.

WCSS_A_FM_SSBi2_CFG_SSBi2_PRIORITIES

Bits	Name	Description
11:9	PRIORITY3	Specifies the port number of host, with a priority that is 1 less then PRIORITY2.

WCSS_A_FM_SSB_I2_CFG_SSB_I2_PRIORITIES (cont.)

Bits	Name	Description
8:6	PRIORITY2	Specifies the port number of host, with a priority that is 1 less than PRIORITY1.
5:3	PRIORITY1	Specifies the port number of host, with a priority that is 1 less than PRIORITY0.
2:0	PRIORITY0	Specifies the port number of the highest priority host.

0x0A1E000C WCSS_A_FM_SSB_I2_CFG_SSB_I2_BANKS_2_3_CTL**Type:** RW**Clock:** AHB bus clock**Reset State:** 0xFFFFFFFF

This register specifies whether an access is allowed to banks 2 and 3 of PMIC. The access control to the banks 2 and 3 of PMIC is set per VMID. Bit 0 corresponds to access control for VMID 0 and bit 31 corresponds to access control for VMID 31.

WCSS_A_FM_SSB_I2_CFG_SSB_I2_BANKS_2_3_CTL

Bits	Name	Description
31:0	ACCESS_CONTROL	Set each of the 32 bits to 1 if the master corresponding to that VMID wishes to initiate SW requests to banks 2 and 3 of PMIC.

0x0A1E0010 WCSS_A_FM_SSB_I2_CFG_SSB_I2_ILLEGAL_STATUS**Type:** R**Clock:** AHB bus clock**Reset State:** 0x00000000

Returns status information of the software master that tried to access a SSB_I2 command micro register, and failed **security** through the VIT table.

WCSS_A_FM_SSB_I2_CFG_SSB_I2_ILLEGAL_STATUS

Bits	Name	Description
5:1	ILLEGAL_VMID	Indicates the VMID of the master that performed the most recent illegal access. The value in this field is only meaningful when the ILLEGAL_ACCESS bit is set. On software reads, the value is retained unless another illegal access with a different VMID happens. In that case, this field will have the VMID corresponding to the most recent illegal master.

WCSS_A_FM_SSBi2_CFG_SSBi2_ILLEGAL_STATUS (cont.)

Bits	Name	Description
0	ILLEGAL_ACCESS	When set (1) indicates an illegal access. An illegal access is defined as an access that does not find a matching VMID in the SSBi2_VITn registers. This bit is cleared on a software read provided there is no other illegal access in the same clock cycle that a software read happens.

0x0A1E0020+ WCSS_A_FM_SSBi2_CFG_SSBi2_VITn, n=[0..6]**0x4*n****Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

This is the VMID index table (VIT) used for enabling concurrent SSBi2 SW requests among multiple SW masters. Secure entities are expected to assign a VMID for the SW master corresponding to an index. The SSBi2_VIT0 has the VMID associated with index 0, SSBi2_VIT1 has the VMID associated with index 1 and so on.

CAUTION By default, only the SW master with a VMID of '0' has access to registers in SSBi2 command micro space. SROT/RPM has to populate this table before valid SW masters can initiate SSBi2 SW transactions.

SSBi2_VITn, n=[0..6]

WCSS_A_FM_SSBi2_CFG_SSBi2_VITn

Bits	Name	Description
4:0	VMID	VMID corresponding to index n.

0x0A1E00A0 WCSS_A_FM_SSBi2_CFG_SSBi2_PVC_CTL**Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

This register provides the global enable/disable for the PVC interface module, per PVC port enable/disable as well as captures PVC interface busy status.

WARNING In a PMIC arbiter wrapper system having more than 1 PMIC arbiter module; if a PVC port(x) is enabled in one of the PMIC arbiters, the corresponding PVC_port(x) in all the other PMIC arbiters shall be disabled. If multiple PVC_port(x)'s enabled simultaneously, the hardware does not guarantee correct operation.

WCSS_A_FM_SSBi2_CFG_SSBi2_PVC_CTL

Bits	Name	Description
8	PVC_INTF_BUSY	This is a status bit. When set (1) indicates that the PVC interface module is busy (meaning there is atleast one PVC transaction being serviced). Busy line goes high when PVC interface detects a new request on one of the PVC ports and stays high until it samples a done from SSBi2 arbiter. Writes to this bit will not have any effect and will be ignored.
3	PVC_PORT3_EN	Set this bit to 1 to enable PVC port 3. PVC port 3 maps to SMPSS CPU1 SAW.
2	PVC_PORT2_EN	Set this bit to 1 to enable PVC port 2. PVC port 2 maps to SMPSS CPU 0 SAW.
1	PVC_PORT1_EN	Set this bit to 1 to enable PVC port 1. PVC port 1 maps to LPASS Q6 SAW.
0	PVC_INTF_EN	Set this bit to 1 to enable PVC interface module.

**0x0A1E00A4 WCSS_A_FM_SSBi2_CFG_SSBi2_PVC_TABLEn, n=[0..31]
+0x4*n****Type:** RW**Clock:** AHB bus clock**Reset State:** 0x00000000

This set of registers indicates the full PVC table corresponding to all the PVC ports. For e.g.: there are 4 entries per PVC port(set by RTL generic) and there are 3 PVC ports (set by RTL generic). Each entry is 15-bit address to the SSBi2 slave registers. This indirect addressing from the PVC ports to the SSBi2 slave registers provides a way to enforce **security** on hardware SSBi2 requests.

NOTE Though this current document shows 12 entries, the number of entries should scale based on the GENERIC settings for the number of PVC ports and the address index width. Also though 15-bit addresses are supported, 10-bit addressing is all that is expected for current PMICs.

SSBi2_PVC_TABLEn, n=[0...11]

WCSS_A_FM_SSBi2_CFG_SSBi2_PVC_TABLEn

Bits	Name	Description
14:0	ADDR	15-bit address of the SSBi2 slave registers.

10.23 WCSS_A_FM_SSBi2_CMD_SSBi2_CMD

0x0A1C0000 WCSS_A_FM_SSBi2_CMD_SSBi2_CMD

Type: W

Clock: AHB bus clock

Reset State: 0x00000000

The SW masters write to this register to initiate either a read or a write SSBi2 transaction. Through this register, the SW can address up to 32 kB of SSBi2 slave register space. However the PMICs only house a maximum of 1024 registers and hence the values on the most significant 5-bits of the REG_ADDR_14_8 field are ignored. The REG_DATA field is only applicable for write transaction and is ignored for reads. The read data returned back from the SSBi2 slave is directed to the SSBi2_RD_STATUS register. Bit 23 is left as a reserved bit to enable slave address to grow to 16-bits in the future.

WCSS_A_FM_SSBi2_CMD_SSBi2_CMD

Bits	Name	Description
24	RDWRN	Denotes whether the command to perform is a register write (0) or read (1).
22:16	REG_ADDR_14_8	Specifies the upper 7 bits, 14:8, of SSBi slave register address.
15:8	REG_ADDR_7_0	Lower 8 bits, 7:0, of SSBi slave register address.
7:0	REG_DATA	Write data for a slave register.

0x0A1C0004 WCSS_A_FM_SSBi2_CMD_SSBi2_RD_STATUS

Type: R

Clock: AHB bus clock

Reset State: 0x00000000

This register provides the read data as well as the status of the transaction. This register also returns back information associated with the transaction such as the SSBi2 slave register address and the transaction access type. SW is expected to poll TRANS_DONE and TRANS_DENIED until either of these bits are set to 1.

- TRANS_DONE = 0, TRANS_DENIED = 1; indicates to SW that the current transaction was rejected because the master did not have permissions to access the corresponding SSBi2 slave register.
- TRANS_DONE = 1, TRANS_DENIED = 0; indicates to SW that the current transaction was completed successfully. For writes, it means that the write data was sent out on the SSBi wire and for reads, it means that the read data is returned back and is now in SSBi2_RD_STATUS[REG_DATA]. At this point, the SW is said to have completed one transaction.

- Both TRANS_DONE and TRANS_DENIED being either 0 or 1 does not happen and is not a valid combination after a transaction has been initiated.

WCSS_A_FM_SSB_I2_CMD_SSB_I2_RD_STATUS

Bits	Name	Description
27	TRANS_DONE	When set (1), indicates that the SSB_I2 has completed the transaction. If this was a write request, the write has completed. If this was a read request, the read data has returned back.. NOTE This bit is cleared on read.
26	TRANS_DENIED	When set (1), indicates that a SSB_I2 transaction was denied because the master did not have access to the particular SSB_I2 slave SW register to where the access was intended.
25	TRANS_PROG	When set (1), indicates that a SSB_I2 transaction is in progress. This signal will be set for the duration from REQ assertion until DONE assertion.
24	RDWRN	Returns the access type of transaction. A value of 1 implies a read transaction and a value of 0 implies a write transaction.
22:8	REG_ADDR	Returns the address to which the SSB_I2 transaction was performed.
7:0	REG_DATA	Returned read register data. NOTE The read data is not cleared on reads, however will return all zeroes for a SW master whose transaction was denied or was an illegal SW master.

10.24 WCSS_A_FM_RIVA_FM**0x0A180000 WCSS_A_FM_TX_CONTROL****Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_EN register is to control Riva-FM TX functionality.

WCSS_A_FM_TX_CONTROL

Bits	Name	Description
11:10	AUDIO_IN_SHIFT_CTRL	Used for rounding the left and right audio input. The TX_AUDIO_IN_SHIFT_CTRL register is used for controlling the rounding operation of the audio input data stream. 0x0: ROUND_2 (2 bit round) 0x1: ROUND_3 (3 bit round) 0x2: ROUND_4 (4 bit round) 0x3: ROUND_5 (5 bit round)

WCSS_A_FM_TX_CONTROL (cont.)

Bits	Name	Description
9:5	PRE_EMPH_CONST	0x13 for 50u pre-emph 0x1D for 75u pre-emph The PRE_EMPH_CONST is to set the TX pre-emphasis value.
4:3	DC_BLOCK	# of bits to truncate from the DC blocking accumulator. The TX_DC_BLOCK register is used to select the number of bits for dc blocking feedback. The DC Blocking accumulation registers are AUDIO_D+9 bits wide, and the 2-bit DC_BLOCK_SEL input is used to select 1-of-4 truncation bit sizes (no-feedback, 9-bit, 10-bit and 11-bit truncation), for selectable AUDIO_D-2-bit-width feedback data 0x0: DISABLE (no DC blocking) 0x1: TRUNC_9 (truncate 9 bit from feedback) 0x2: TRUNC_10 (truncate 10 bit from feedback) 0x3: TRUNC_11 (truncate 11 bit from feedback)
2	PRE_EMPH_EN	This is a debugging mode register only. For normal operation should be set to 1 at all times. 0x1: ENABLE (ENABLE (Enables pre-emphasis)) 0x0: DISABLE (DISABLE (Disables pre-emphasis))
1	STEREO	0x1: STEREO (STEREO (Enables Tx Stereo Mode)) 0x0: MONO (MONO (The TX_STEREO register is to enable the stereo mode. Incase of disable the stereo mode mono modulation should be increased. Mono mode modulation mono should be increased.))
0	TX_EN	Active high 0x1: ENABLE (ENABLE (Enables TX. For proper operation, this register should be set as the last programmed register for TX.)) 0x0: DISABLE (DISABLE (Disables TX and gates off all clocks, except for Tx Registers.))

0x0A180004 WCSS_A_FM_TX_MODULATION**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_MOD register is to set the modulation percentage for Mono, Stereo, RDS, and Pilot.

WCSS_A_FM_TX_MODULATION

Bits	Name	Description
31:24	MOD_RDS	Modulation multiplier for RDS, 0x80=9.5% Value = (% modulation/9.5%) * 128
23:16	MOD_PILOT	Modulation multiplier for 19 kHz pilot, 0x80=9.5% Value = (% modulation/9.5%) * 128

WCSS_A_FM_TX_MODULATION (cont.)

Bits	Name	Description
15:8	MOD_STEREO	Modulation multiplier for L-R, 0x80=42.75% Values = (% modulation/42.75%) * 128
7:0	MOD_MONO	Modulation multiplier for L+R, 0x80=42.75% Values = (% modulation/42.75%) * 128 the modulation percentage for Mono

0x0A180008 WCSS_A_FM_TX_AUDIO_LIMIT**Type:** RW**Clock:** APB**Reset State:** 0x00000000**WCSS_A_FM_TX_AUDIO_LIMIT**

Bits	Name	Description
27:14	AUDIO_LIMIT_2	The TX_AUDIO_LIMIT_2 field is used for controlling Audio limiting (saturation) level. This register should be set to 0x1B58 = 7000 for normal operation. This register is used to saturate the audio output of the 4x up-sampler (48 kHz to 192 kHz up-sampler)
13:0	AUDIO_LIMIT_1	The TX_AUDIO_LIMIT_1 fields used for controlling Audio limiting (saturation) level. This register should be set to 0x1B58 = 7000 for normal operation. This register is used to saturate the audio input to the 4x up-sampler (48 kHz to 192 kHz up-sampler). Value = % Modulation * (214)

0x0A18000C WCSS_A_FM_TX_RDS_CONTROL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_RDS_EN register is used to enable and control the RDS functionalists.

WCSS_A_FM_TX_RDS_CONTROL

Bits	Name	Description
1	INV_RDS_SYMBOL	0x1: INVERT (INVERT (Invert RDS digital waveform data)) 0x0: NORMAL (NORMAL (Normal RDS digital waveform)) The TX_INV_RDS_SYMBOL register is used to invert RDS digital waveform. This is a debugging mode only register
0	RDS_EN	0x1: ENABLE (ENABLE (Enables RDS)) 0x0: DISABLE (DISABLE (Disables RDS))

0x0A180010 WCSS_A_FM_TX_RDS_BLK_DATA_A_B**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_RDS_BLK_DATA_A register is used to hold 16-bit RDS block A.

The TX_RDS_BLK_DATA_B register is used to hold 16-bit RDS block B

WCSS_A_FM_TX_RDS_BLK_DATA_A_B

Bits	Name	Description
31:16	RDS_BLK_DATA_A	RDS block data A
15:0	RDS_BLK_DATA_B	RDS block data B

0x0A180014 WCSS_A_FM_TX_RDS_BLK_DATA_C_D**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_RDS_BLK_DATA_C register is used to hold 16-bit RDS block C.

The TX_RDS_BLK_DATA_D register is used to hold 16-bit RDS block D.

WCSS_A_FM_TX_RDS_BLK_DATA_C_D

Bits	Name	Description
31:16	RDS_BLK_DATA_C	RDS block data C
15:0	RDS_BLK_DATA_D	RDS block data D

0x0A180018 WCSS_A_FM_TX_SOFT_RESET**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_SOFT_RESET register controls resetting the Tx data path under SW control.

WCSS_A_FM_TX_SOFT_RESET

Bits	Name	Description
0	SOFT_RESET	0x0: OPERATION (OPERATION) 0x1: RESET (SW can write this field to 1 to reset the entire Tx Data path. TX Registers are not affected. SW must, however, write a 0 back to this register to bring the Tx Data path out of reset.)

0x0A18001C WCSS_A_FM_TX_TMUX_SEL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The TX_TMUX_SEL register is to control the Tx testmux to bring out internal signals on core-level pins for debug.

WCSS_A_FM_TX_TMUX_SEL

Bits	Name	Description
4:0	TMUX_CNTL	Controls the Tx testmux to bring out internal signals on core-level pins for debug. Refer 2.1 Tx Testmux for a table of signals selected on different select values.

0x0A190000 WCSS_A_FM_RX_CONTROL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_CNTRL register is control main functions in Riva-FM RX.

WCSS_A_FM_RX_CONTROL

Bits	Name	Description
0	RX_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (When 1, the RX modem is enabled. Clocks are enabled, and the logic is enabled for the RX, except for RX_RDS. There register RX_RDS_EN is used to enable RX_RDS separately.)

0x0A190004 WCSS_A_FM_RX_SOFT_RESET**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_SOFT_RESET register controls resetting the RX data path under SW control.

WCSS_A_FM_RX_SOFT_RESET

Bits	Name	Description
0	SOFT_RESET	0x0: OPERATION (OPERATION) 0x1: RESET (SW can write this field to 1 to reset the entire RX Data path including RDS. RX Registers are not affected. SW must, however, write a 0 back to this register to bring FM_RX out of reset.)

0x0A190024 WCSS_A_FM_RX_TMUX_SEL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_TMUX_SEL register selects among the different internal signals that can be brought out on the testmux output for debug.

WCSS_A_FM_RX_TMUX_SEL

Bits	Name	Description
11:6	TMUX_CNTL_1	select 16 bit debug for bit[31:16] of RX debug mux. Selects combinations of signals to make visible for debug. Refer 2.2 RX Testmux for a table of signals selected on different select values.
5:0	TMUX_CNTL_0	select 16 bit debug for bit [15:0] of RX debug mux. Selects combinations of signals to make visible for debug. RX Testmux for a table of signals selected on different select values.

0x0A190028 WCSS_A_FM_RX_DEMOD_GLITCH_THRESHOLD**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_DEMOD_GLITCH_THRESHOLD register is used to control the value to compare against by FM DEMOD phase to determine if a phase glitch was detected.

WCSS_A_FM_RX_DEMOD_GLITCH_THRESHOLD

Bits	Name	Description
14:0	DEMOD_GLITCH_THRESH_OLD	The values computed for FM DEMOD Phase are compared against this value. If the FM DEMOD Phase exceeds this value, a phase glitch is detected

0x0A19002C WCSS_A_FM_RX_GLITCH_STOP_search_CNT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_GLITCH_STOP_search_CNT register is used to control the end of glitch search window in 240 kHz clock counts.

WCSS_A_FM_RX_GLITCH_STOP_search_CNT

Bits	Name	Description
6:0	STOP_SEARCH_CNT	End of glitch search window in 240 kHz clock count.

0x0A190030 WCSS_A_FM_RX_GLITCH_START_search_CNT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_GLITCH_START_search_CNT register is used to control the start of glitch search window in 240 kHz clock counts.

WCSS_A_FM_RX_GLITCH_START_search_CNT

Bits	Name	Description
6:0	GLITCH_START_SEARCH_CNT	Start of glitch search window in 240 kHz clock count.

0x0A190034 WCSS_A_FM_RX_GLITCH_BLANK_CNT_TH**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_GLITCH_BLANK_CNT_TH register is used to control the threshold used to limit the duration of phase compensation.

WCSS_A_FM_RX_GLITCH_BLANK_CNT_TH

Bits	Name	Description
3:0	BLANK_CNT_TH	Threshold used to limit the duration of phase compensation. This register should be set to any value larger than 1. setting it to 1 is equivalent to set it to 0.

0x0A190038 WCSS_A_FM_RX_PLL_BANK_CHG_STB**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_PLL_BANK_CHG_STB register is used to control the change in PLL bank.

WCSS_A_FM_RX_PLL_BANK_CHG_STB

Bits	Name	Description
0	PLL_BANK_CHG_STB	0x0: NOT_START (NOT_START) 0x1: START (When 1, indicates that the radio has performed a bank change. SW must first write a 1, followed by writing a 0 to produce a pulse to HW. This register is used by FM DEMOD for Phase Glitch Detection.)

0x0A19003C WCSS_A_FM_RX_PHASE_COMP_BYPASS**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_PHASE_COMP_BYPASS register is used to bypass the FM DEMOD Phase Compensation.

WCSS_A_FM_RX_PHASE_COMP_BYPASS

Bits	Name	Description
0	PHASE_COMP_BYPASS	0x0: ENABLE (ENABLE) 0x1: BYPASS (When set to 1, the FM DEMOD would bypass phase compensation operation.)

0x0A190040 WCSS_A_FM_RX_MPX_DCC_CTRL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

to control the functionality of MPX DCC

The RX_MPX_DCC_BYPASS register is used to bypass the MPX_DCC module.

The RX_MPX_DCC_SEL register is used to control the Symmetric Rounding of second Symmetric Saturation in the MPX_DCC data path.

WCSS_A_FM_RX_MPX_DCC_CTRL

Bits	Name	Description
2:1	MPX_DCC_SEL	Selects how many bits to Symmetric Round the result of second Symmetric Saturation in the MPX_DCC data path. This register directly controls the M parameter passed to SROUND function used in the design. 0x0: ROUND_3 (Round by 3-bits) 0x1: ROUND_4 (Round by 4-bits) 0x2: ROUND_5 (Round by 5-bits)
0	MPX_DCC_BYPASS	0x0: ENABLE (ENABLE) 0x1: BYPASS (When 1, the MPX_DCC module is bypassed)

0x0A190044 WCSS_A_FM_RX_MPX_DCC_Z_DELAY_REGISTER**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_MPX_DCC_Z_M1 field is used to hold the value of the 20-bit delay element in MPX_DCC.

WCSS_A_FM_RX_MPX_DCC_Z_DELAY_REGISTER

Bits	Name	Description
19:0	MPX_DCC_Z_M1	There is a 20 bit delay element that is part of the normal data path, so it will be updated by the HW. Also, on SW reset, the hooks are provided for the SW to update this register

0x0A190048 WCSS_A_FM_RX_PILOT_DET_THRESHOLD**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_PDET_HI_THRESHOLD field is used to control the pilot amplitude threshold for turning pilot detection flag on.

The RX_PDET_LO_THRESHOLD field is used to control the pilot amplitude threshold for turning pilot detection flag off.

WCSS_A_FM_RX_PILOT_DET_THRESHOLD

Bits	Name	Description
19:10	PDET_LO_THRESHOLD	Pilot amplitude threshold for turning pilot detection flag from on to off.
9:0	PDET_HI_THRESHOLD	Pilot amplitude threshold for turning pilot detection flag from off to on. PDET_HI_THRESHOLD should be higher in value than PDET_LO_THRESHOLD. Setting this register to lower than PDET_LO_THRESHOLD could cause unstable Pilot detection for stereo channels.

0x0A19004C WCSS_A_FM_RX_DELTA_R57K_PHASE_ADJUST**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is used to control the phase adjustment for the R57I and R57Q subcarrier to account for RDS BPF group delay.

WCSS_A_FM_RX_DELTA_R57K_PHASE_ADJUST

Bits	Name	Description
12:0	DELTA_IDX3	Phase adjustment for the R57I and R57Q sub carrier to account for RDS BPF group delay.

0x0A190050 WCSS_A_FM_RX_BLEND_WEIGHT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_BLEND_WEIGHT register is used to control the blending weight.

WCSS_A_FM_RX_BLEND_WEIGHT

Bits	Name	Description
9:0	BLEND_WEIGHT	Blending weight determined by the audio control unit in SW. should have max vlaue of 0x280 for best stable operation. any higher value than 0x280 could cause audio saturation issues may lead to audio quality

0x0A190054 WCSS_A_FM_RX_SOFTMUTE_WEIGHT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_SOFTMUTE_WEIGHT register is used to control the soft mute weight.

WCSS_A_FM_RX_SOFTMUTE_WEIGHT

Bits	Name	Description
8:0	SOFTMUTE_WEIGHT	Soft mute weight determined by the audio control unit in SW

0x0A190058 WCSS_A_FM_RX_BLEND_SOFTMUTE_LPF_M_SEL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_BLEND_SOFTMUTE_LPF_M_SEL register is used to select the blending weight LPF and soft mute LPF.

WCSS_A_FM_RX_BLEND_SOFTMUTE_LPF_M_SEL

Bits	Name	Description
5:4	SF_WGHT_M	Soft mute LPF M select
1:0	BLEND_WGHT_M	Blending weight LPF M select

0x0A19005C WCSS_A_FM_RX_MS_DECODER_CNTL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_MS_DECODER_CNTL register is used to control various aspects of MS_DECODER.

WCSS_A_FM_RX_MS_DECODER_CNTL

Bits	Name	Description
5	R_HARD_MUTE	0x0: NO_MUTE (NO_MUTE 10b: MUTE when set to 1 by SW, turn on hard mute for the right channel)
4	L_HARD_MUTE	0x0: NO_MUTE (NO_MUTE) 0x1: MUTE (When set to 1 by SW, turn on hard mute for the left channel.)
1	DE_EMPS_TC	De-emphasis filter time constant select. 0x0: TC_50US (TC_50US) 0x1: TC_75US (TC_75US)
0	MONO_DEC	0x0: NORMAL (NORMAL) 0x1: FORCE_MONO (FORCE_MONO when set to 1, force mono decode.)

0x0A190060 WCSS_A_FM_RX_MS_DECODER_STEREO_ON**Type:** R**Clock:** APB**Reset State:** 0x00000000**WCSS_A_FM_RX_MS_DECODER_STEREO_ON**

Bits	Name	Description
0	STEREO_ON	a read-only bit for SW (output from mono-stereo decoder)

0x0A190064 WCSS_A_FM_RX_RDS_CTRL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_EN register is used to enable the RX_RDS block, IQ Analyzer and also to soft reset the RX_RDS block.

WCSS_A_FM_RX_RDS_CTRL

Bits	Name	Description
2	RDS_SOFT_RESET	0x0: OPERATION (OPERATION) 0x1: RESET (RESET SW can write this field to 1 to reset the entire RX RDS. SW must, however, write a 0 back to this field to bring RX_RDS out of reset.)
1	IQ_AN_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE When 1, enables IQ signal analyzer.)

WCSS_A_FM_RX_RDS_CTRL (cont.)

Bits	Name	Description
0	RDS_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE When 1, enables RDS reception.)

0x0A190068 WCSS_A_FM_RX_RDS_IQ_DET_CTRL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_IQ_INT_DUR register is used to control the IQ signal detector integration duration in bit intervals.

The RX_RDS_IQ_DET_THRESH register is used to control the IQ signal detector threshold for qualifying SIG_DET and SIG_NOT_DET conditions

WCSS_A_FM_RX_RDS_IQ_DET_CTRL

Bits	Name	Description
21:4	IQ_DET_THRESH	IQ_DET_THRESH
3:0	IQ_INT_DUR	IQ signal detector integration duration in bit intervals. The value specified should be one less than the number of bit intervals desired.

0x0A19006C WCSS_A_FM_RX_RDS_ACQ_MODE**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_ACQ_MODE register is used to specify the averaging duration for acquisition of RDS signal.

WCSS_A_FM_RX_RDS_ACQ_MODE

Bits	Name	Description
1:0	ACQ_MODE	Identifies Bit Synchronizer averaging duration for acquisition of RDS signal. 0x0: AVG_16 (4, 8, 16-bit averaging stepped acquisition.) 0x1: AVG_32 (8, 16, 32-bit averaging stepped acquisition.) 0x2: AVG_64 (16, 32, 64-bit averaging stepped acquisition)

0x0A190070 WCSS_A_FM_RX_RDS_TRK_MODE**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_TRK_MODE register is used to specify averaging duration for RDS signal tracking.

WCSS_A_FM_RX_RDS_TRK_MODE

Bits	Name	Description
1:0	TRK_MODE	Identifies Bit Synchronizer averaging duration for tracking of RDS signal. 0x0: AVG_32 (32-bit averaging tracking, valid only with ACQ_MODE = 0) 0x1: AVG_64 (64-bit averaging tracking, valid only with ACQ_MODE = 0 or 1) 0x2: AVG_128 (128-bit averaging tracking)

0x0A190074 WCSS_A_FM_RX_RDS_STROBE_MARGIN**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_STROBE_MARGIN register is used to specify the number of consecutive negative values that are required prior to a positive value when detecting the negative-to-positive transition of R19 for generating the C19 signal.

WCSS_A_FM_RX_RDS_STROBE_MARGIN

Bits	Name	Description
1:0	STROBE_MARGIN	Specifies the number of consecutive negative values that are required prior to a positive value when detecting the negative-to-positive transition of R19 for generating the C19 signal (19 kHz strobe). 0d0: NEGATIVE_1 (1 negative value) 0d1: NEGATIVE_2 (2 negative values) 0d2: NEGATIVE_3 (3 negative values) 0d3: NEGATIVE_4 (4 negative values)

0x0A190078 WCSS_A_FM_RX_RDS_MF_LPF_CNT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_MF_LPF_CNT register is used to control the delay count to allow matched filter and low pass filter to settle.

WCSS_A_FM_RX_RDS_MF_LPF_CNT

Bits	Name	Description
7:4	MF_CNT	Delay count to allow matched filter to settle.
3:0	LPF_CNT	Delay count for allowing RDS BPF, down converter and LPF to settle. Only values 1 to 15 are valid.

0x0A19007C WCSS_A_FM_RX_RDS_IQ_AN_INT_DUR_SEL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_IQ_AN_INT_DUR_SEL register is used to select the IQ signal analyzer integration duration.

WCSS_A_FM_RX_RDS_IQ_AN_INT_DUR_SEL

Bits	Name	Description
2:0	IQ_AN_INT_DUR_SEL	Selects IQ signal analyzer integration duration.

0x0A190080 WCSS_A_FM_RX_RDS_IQ_ANALYZER_SELECT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

1-bit register to enable IQ analyzer. Both IQ detector and analyzer are running regardless of the setting of this bit. This register is to select which block controls the RDS PHY state machine.

This register controls which block to do the following

- Select the IQ arm
- Start the match filters

Both blocks can generate interrupts. IQ analyzer generates energy level for both channels regardless of the setting of this bit.

WCSS_A_FM_RX_RDS_IQ_ANALYZER_SELECT

Bits	Name	Description
1	IQ_ANA_SIG_DET_SEL	0x0: SELECT_SIG_DET_FROM_IQ_DETECTOR (select sig det from IQ detector) 0x1: SELECT_SIG_DET_FROM_IQ_ANALYZER (select sig det from IQ analyzer - this is legacy register should set as bit 0)

0x0A190084 WCSS_A_FM_RX_RDS_IQ_AN_DET_THRESH**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_IQ_AN_DET_THRESH register is used to control the IQ signal analyzer threshold for qualifying IQ_AN_SIG_DET condition.

WCSS_A_FM_RX_RDS_IQ_AN_DET_THRESH

Bits	Name	Description
13:0	IQ_AN_DET_THRESH	LSBs of IQ signal analyzer threshold for qualifying IQ_AN_SIG_DET condition.

0x0A190088 WCSS_A_FM_RX_RDS_RECEIVE_MODE_SELECT**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the RDS receive mode. Two modes are supported by FM65 2.0

- Coherent mode, 19K pilot and 57K RDS tone are locked
- Non Coherent mode, 19K pilot and 57K RDS tone are not locked, also this mode is used in case of missing 19k pilot or mono mode with RDS.

WCSS_A_FM_RX_RDS_RECEIVE_MODE_SELECT

Bits	Name	Description
0	RDS_MODE_SELECT	0x0: COHERENT (COHERENT (Coherent mode legacy mode)) 0x1: NON_COHERENT (NON_COHERENT (Non Coherent))

0x0A19008C WCSS_A_FM_RX_RDS_STATUS**Type:** R**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_STATUS register is used to indicate to SW several status bits.

WCSS_A_FM_RX_RDS_STATUS

Bits	Name	Description
2	IQ_AN_SIG_DET	0x0: NOT_DETECTED (NOT_DETECTED) 0x1: DETECTED (DETECTED Indicates (when 1) that the IQ analyzer detected a signal that meets or exceeds IQ_AN_DET_THRESH value.)
1	IQ_AN_SELECT	0x0: I_ARM (I_ARM) 0x1: Q_ARM (Q_ARM Indicates whether the IQ signal analyzer selected I (when 0) or Q (when 1) arm of the RDS signal.)
0	IQ_DET_SELECT	0x0: I_ARM (I_ARM) 0x1: Q_ARM (Q_ARM Indicates whether the IQ detector selected I (when 0) or Q (when 1) arm of the RDS signal.)

0x0A190090 WCSS_A_FM_RX_RDS_IQ_BUFFER**Type:** R**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_I_BUFFER field is used to indicate to SW the I arm signal level measurement results from IQ Signal Analyzer.

The RX_RDS_Q_BUFFER field is used to indicate to SW the Q arm signal level measurement results from IQ Signal Analyzer.

WCSS_A_FM_RX_RDS_IQ_BUFFER

Bits	Name	Description
27:14	RX_RDS_Q_BUFFER	RDS Q arm signal level measurement results from I/Q Signal Analyzer.
13:0	RX_RDS_I_BUFFER	LSBs of RDS I arm signal level measurement results from I/Q Signal Analyzer

0x0A190094 WCSS_A_FM_RX_RDS_TIME_TRACKING_THRESHOLD**Type:** RW**Clock:** APB**Reset State:** 0x00000000**WCSS_A_FM_RX_RDS_TIME_TRACKING_THRESHOLD**

Bits	Name	Description
9:5	DROP_THRESHOLD	Peak index difference threshold to drop bit. This is 5 bit signed value. This register is used only in non-coherent mode. The register is used to set the peak index difference threshold to drop bits. If the current peak index minus previous peak index is less than RX_RDS_DROP_BIT_THRESHOLD value the current received bit will be dropped
4:0	REPEAT_THRESHOLD	Peak index difference threshold to add bit. This is 5 bit signed value. This register is used only in non-coherent mode. The register is used to set the peak index difference threshold to add bits. So if the current peak index minus previous index is greater than RX_RDS_REPEAT_BIT_THRESHOLD value the current received bit will be repeated.

0x0A190098 WCSS_A_FM_RX_RDS_PEAK_INDEX**Type:** R**Clock:** APB**Reset State:** 0x00000000

16 bit RDS peak index output from the bit synchronizer. In case of detection of repeat/drop demod bit inside the rds physical layer this register will reflect the peak indexes that cause the repeat/drop to happen. This register stores the last 4 peak indexes that cause repeat/drop to happen. This register could be considered as 4 deep FIFO for the peak index but only store values at the event of adding or dropping bits

WCSS_A_FM_RX_RDS_PEAK_INDEX

Bits	Name	Description
15:0	RDS_PEAK_INDEX	bit 15 - 12 PEAK_INDEX_3 same as PEAK_INDEX_1 bit 11 - 8 PEAK_INDEX_2 same as PEAK_INDEX_0 bit 7 - 4 PEAK_INDEX_1 bit 3 - 0 PEAK_INDEX_0

0x0A19009C WCSS_A_FM_RX_RDS_DL_CONFIG**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_DL_CONFIG register is used to configure SYSTEM_TYPE, C_CP_TYPE and C_CP_ADAPT for RDS Data Link.

WCSS_A_FM_RX_RDS_DL_CONFIG

Bits	Name	Description
2	C_CP_ADAPT	Identifies whether the DL receiver will adaptive identify Type A or Type B reception (C or Cp Type offsets for third block of groups). 0x0: NO_ADAPT (NO_ADAPT) 0x1: ADAPT (ADAPT)
1	C_CP_TYPE	Identifies Type A or Type B RDS reception to be used by the DL receiver. 0x0: A_TYPE (A_TYPE (Type A, C offset for third block of group)) 0x1: B_TYPE (B_TYPE (Type B, C offset for third block of group))
0	SYSTEM_TYPE	0x0: RBDS (RBDS) 0x1: RDS (RDS Configures receiver for RDS (if set to 1) or RBDS (if set to 0) reception.)

0x0A1900A0 WCSS_A_FM_RX_RDS_T1Q1E**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_T1Q1E register is used to control the exponential representation of the threshold value for loss of synchronization in acquisition mode.

WCSS_A_FM_RX_RDS_T1Q1E

Bits	Name	Description
3:0	T1Q1E	Exponential representation of the threshold value for loss of synchronization in acquisition mode.

0x0A1900A4 WCSS_A_FM_RX_RDS_T1Q2E**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_T1Q2E register is used to control the exponential representation of the threshold value for loss of synchronization in tracking mode.

WCSS_A_FM_RX_RDS_T1Q2E

Bits	Name	Description
3:0	T1Q2E	Exponential representation of the threshold value for loss of synchronization in tracking mode.

0x0A1900A8 WCSS_A_FM_RX_RDS_BLOCK_DATA_0_1

Type: R

Clock: APB

Reset State: 0x00000000

The RX_RDS_BLOCK_DATA_0 field is used to store the received RDS BLOCK DATA 0.

The RX_RDS_BLOCK_DATA_1 fields used to store the received RDS BLOCK DATA 1

WCSS_A_FM_RX_RDS_BLOCK_DATA_0_1

Bits	Name	Description
31:16	RDS_BLOCK_DATA_0	RDS receive block data 0
15:0	RDS_BLOCK_DATA_1	RDS receive block data 1

0x0A1900AC WCSS_A_FM_RX_RDS_BLOCK_DATA_2_3

Type: R

Clock: APB

Reset State: 0x00000000

The RX_RDS_BLOCK_DATA_2 field is used to store the received RDS BLOCK DATA 2.

The RX_RDS_BLOCK_DATA_3 field is used to store the received RDS BLOCK DATA 3

WCSS_A_FM_RX_RDS_BLOCK_DATA_2_3

Bits	Name	Description
31:16	RDS_BLOCK_DATA_2	RDS receive block data 2,
15:0	RDS_BLOCK_DATA_3	RDS receive block data 3

0x0A1900B0 WCSS_A_FM_RX_RDS_BLOCK_STATUS

Type: R
Clock: APB
Reset State: 0x00000000

The RX_RDS_BLOCK_STATUS_0 field is used to store the status associated with RDS BLOCK DATA 0.

The RX_RDS_BLOCK_STATUS_1 field is used to store the status associated with RDS BLOCK DATA 1.

The RX_RDS_BLOCK_STATUS_2 field is used to store the status associated with RDS BLOCK DATA 2.

The RX_RDS_BLOCK_STATUS_3 field is used to store the status associated with RDS BLOCK DATA 3.

WCSS_A_FM_RX_RDS_BLOCK_STATUS

Bits	Name	Description
30:24	RDS_BLOCK_STATUS_0	RDS receive data block 0 status
22:16	RDS_BLOCK_STATUS_1	RDS receive data block 1 status
14:8	RDS_BLOCK_STATUS_2	RDS receive data block 2 status
6:0	RDS_BLOCK_STATUS_3	RDS receive data block 3 status

0x0A1900B4 WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_0

Type: R
Clock: APB
Reset State: 0x00000000

The RX_RDS_BLOCK_DATA_RAW_0 register is used to store the raw received RDS BLOCK DATA 0 and BLOCK OFFSET 0 before any correction is done.

WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_0

Bits	Name	Description
25:16	RDS_BLOCK_OFFSET_0	RDS receive raw block offset 0,
15:0	RDS_BLOCK_DATA_RAW_0	RDS receive raw block data 0,

0x0A1900B8 WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_1

Type: R
Clock: APB
Reset State: 0x00000000

The RX_RDS_BLOCK_DATA_RAW_1 register is used to store the raw received RDS BLOCK DATA 1 and BLOCK OFFSET 1 before any correction is done.

WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_1

Bits	Name	Description
25:16	RDS_BLOCK_OFFSET_1	RDS receive raw block offset 1,
15:0	RDS_BLOCK_DATA_RAW_1	RDS receive raw block data 1,

0x0A1900BC WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_2

Type: R
Clock: APB
Reset State: 0x00000000

The RX_RDS_BLOCK_DATA_RAW_2 register is used to store the raw received RDS BLOCK DATA 2 and BLOCK OFFSET 2 before any correction is done.

WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_2

Bits	Name	Description
25:16	RDS_BLOCK_OFFSET_2	RDS receive raw block offset 2,
15:0	RDS_BLOCK_DATA_RAW_2	RDS receive raw block data 2,

0x0A1900C0 WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_3

Type: R
Clock: APB
Reset State: 0x00000000

The RX_RDS_BLOCK_DATA_RAW_3 register is used to store the raw received RDS BLOCK DATA 3 and BLOCK OFFSET 3 before any correction is done.

WCSS_A_FM_RX_RDS_BLOCK_DATA_RAW_3

Bits	Name	Description
25:16	RDS_BLOCK_OFFSET_3	RDS receive raw block offset 3,
15:0	RDS_BLOCK_DATA_RAW_3	RDS receive raw block data 3,

0x0A1900C4 WCSS_A_FM_RX_RDS_TMUX_SEL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

The RX_RDS_TMUX_CNTL register is used to select one of several debug selections available for bringing out internal signals on testmux for lab debug.

WCSS_A_FM_RX_RDS_TMUX_SEL

Bits	Name	Description
18:0	RESERVED	reserved

0x0A1900C8 WCSS_A_FM_RX_BLENDING_READBACK**Type:** R**Clock:** APB**Reset State:** 0x00000000

10-bit read only debug register for blending value. This register should read back the same value as RX_BLEND_WEIGHT after settling time.

WCSS_A_FM_RX_BLENDING_READBACK

Bits	Name	Description
9:0	BLEND_WEIGHT_RB	Blending

0x0A1900CC WCSS_A_FM_RX_MUTE_READBACK**Type:** R**Clock:** APB**Reset State:** 0x00000000

9 bit debugging read back register for reading back the soft mute read. This register should read back the same value as RX_SOFTMUTE_WEIGHT after conversion time.

WCSS_A_FM_RX_MUTE_READBACK

Bits	Name	Description
8:0	SOFT_MUTE_WEIGHT_RB	For RX_SOFTMUTE_WEIGHT

0x0A1900D0 WCSS_A_FM_RX_PLL_FREERUN_EN**Type:** RW**Clock:** APB**Reset State:** 0x00000000

1-bit to enable PLL free run mode. In this mode the PLL generates 19k tone regardless of the existence of pilot tone from the received channel.

WCSS_A_FM_RX_PLL_FREERUN_EN

Bits	Name	Description
0	FREE_RUN_ENABLE	0x0: DISABLE (DISABLE (disable free run)) 0x1: ENABLE (ENABLE (enable free run, should only be used with Mono RX stations))

0x0A1900D4 WCSS_A_FM_RX_ROT_CTRL_0**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to control the spur rotator and removal block.

The idea behind the spur removal block is to rotate the signal such that the spur will move to DC. The Then you remove a DC value representing the level of the spur. There are two options for that DC value. The first is to use a DC tracking filter to estimate it. The second is to use a predetermined value in spur_comp_i/q registers.

To use this register, the ROT3_SEL bit must be managed properly. The first write to this register must set ROT3_SEL=1, to select new rotator and to activate the fields defined in this register. Subsequent writes must be used to set the other fields in this register.

For legacy mode, set ROT3_SEL=0 and the register fields will be as defined as in legacy register RX_ROT_CTRL, where the field definitions are different than in RX_ROT_CTRL_0.

WCSS_A_FM_RX_ROT_CTRL_0

Bits	Name	Description
31	ROT3_SEL	Select for legacy(LUT-based) or new(CORDIC-based) rotator. 0x0: LEGACY (One Spur Removal block with a LUT based rotator and 1kHz resolution) 0x1: CORDIC (Up to 3 Spur Removal blocks with CORDIC based Rotators and 0.228 Hz resolution in 240kHz sampling rate)

WCSS_A_FM_RX_ROT_CTRL_0 (cont.)

Bits	Name	Description
27	BYPASS_IN_G1G2G3	When Legacy_based Rotator is selected, this field is located at bit 15. 0x0: NORMAL (NORMAL) 0x1: BYPASS_IN_G1G2G3 (BYPASS_IN_G1G2G3 (bypass in any non zero gain state))
26:7	ROT_FREQ	Rotation Frequency. When Legacy_based Rotator is selected, this field is located at bits [14:7] and has 1kHz resolution. When CORDIC_based Rotator is selected, the 20 bits [26:7] represents the spur frequency normalized by the sampling rate (240kHz). The resolution is 0.228 Hz.
6	FORCE_DC_TRACK	0x0: USE_DC (USE_DC (enable built in DC tracking logic in spur rotator)) 0x1: USE_SPUR (USE_SPUR (use spur_comp_I/Q registers value as dc level to be subtracted from signal after rotation))
5	SPUR_DC_DELAY	0x0: DELAY_2048 (DELAY_2048 (enable dc tracking circuit after 2048 240kHz cycles)) 0x1: DELAY_4096 (DELAY_4096 (enable dc tracking circuit after 4096 240kHz cycles))
4	SPUR_1K_ROT_ENABLE	0x0: DISABLE (DISABLE (disable and bypass spur rotator)) 0x1: ENABLE (ENABLE (enable spur rotator))
3:2	SPUR_DC_IIR_RND	Set the rounding position for DC tracking. 0x0: ROUND_3 (Recommended) 0x1: ROUND_4 0x2: ROUND_5 0x3: ROUND_6
1:0	SPUR_INT_SETTING	Set the DC tracking integration period. Number of cycles below in 240kHz period 0x0: INTEGRATE_256 (Recommended) 0x1: INTEGRATE_512 0x2: INTEGRATE_1024 0x3: INTEGRATE_2048

0x0A1900D8 WCSS_A_FM_SPUR_COMP_FIXED_VALUE_0**Type:** RW**Clock:** APB**Reset State:** 0x00000000

16 bit register for Spur comp value. The value programmed into this register will be subtracted from the I or Q arm after rotation. For details please refer to the HLD and system docs.

WCSS_A_FM_SPUR_COMP_FIXED_VALUE_0

Bits	Name	Description
31:16	SPUR_COMP_Q	for spur comp Q 16 bit register for Spur comp value. The value programmed into this register will be subtracted from the Q arm after rotation. For details please refer to the HLD and system docs
15:0	SPUR_COMP_I	or spur comp I

0x0A1900E0 WCSS_A_FM_DEMOD_DC_IF_OFFSET**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This is 16bit register contains fm_demod 16 bit dc offset. This register should be calculated based on the rotator freq. This register is used by fm_demod value to subtract FM DC offset after demodulation

$$\text{DEMOD_DC_IF_OFFSET} = (429 * (-\text{rot_freq} + 100)) / 4$$

WCSS_A_FM_DEMOD_DC_IF_OFFSET

Bits	Name	Description
15:0	DEMOD_DC_IF_OFFSET	DEMOD_DC_IF_OFFSET Note this register should be set according to ROT_FREQ setting. The max rotation freq supported by the design is 200KHz.

0x0A1900E4 WCSS_A_FM_SPUR_COMP_DC_VALUE_RD_BACK_0**Type:** R**Clock:** APB**Reset State:** 0x00000000

2x12 bit register for spur DC estimation read back value. this value could be used to estimate spur power.

WCSS_A_FM_SPUR_COMP_DC_VALUE_RD_BACK_0

Bits	Name	Description
27:16	SPUR_DC_COMP_Q	dc value estimation for Q
11:0	SPUR_DC_COMP_I	dc value estimation for I

0x0A190118 WCSS_A_FM_SPUR_TRACK_INPUT_SEL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This selects which spur removal stage the spur tracking block takes input from.

WCSS_A_FM_SPUR_TRACK_INPUT_SEL

Bits	Name	Description
1:0	SEL	00: first spur removal; 01: second spur removal; 10: third spur removal

0x0A19011C WCSS_A_FM_SPUR_TRACK_CMD_STATUS**Type:** R**Clock:** APB**Reset State:** 0x00000001

Write to this address will trigger spur tracking operation, and clearing the status bit. When spur tracking operation is done, status bit will be set to 1.

WCSS_A_FM_SPUR_TRACK_CMD_STATUS

Bits	Name	Description
0	DONE	Spur tracking done

0x0A190120 WCSS_A_FM_RX_ROT_CTRL_1**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to control the second spur removal block.

The idea behind the spur removal block is to rotate the signal such that the spur will move to DC. Then you remove a DC value representing the level of the spur. There are two options for that DC value. The first is to use a DC tracking filter to estimate it. The second is to use a predetermined value in spur_comp_i/q registers.

The second spur removal block should only be enabled when first spur removal block is enabled.

WCSS_A_FM_RX_ROT_CTRL_1

Bits	Name	Description
27	BYPASS_IN_G1G2G3	0x0: NORMAL (NORMAL) 0x1: BYPASS_IN_G1G2G3 (BYPASS_IN_G1G2G3 (bypass in any non zero gain state))
26:7	ROT_FREQ	Rotation Frequency. Available only when CORDIC_based Rotator is selected. The 20 bits [26:7] represents the spur frequency normalized by the sampling rate (240kHz). The resolution is 0.228 Hz.
6	FORCE_DC_TRACK	0x0: USE_DC (USE_DC (enable built in DC tracking logic in spur rotator)) 0x1: USE_SPUR (USE_SPUR (use spur_comp_I/Q registers value as dc level to be subtracted from signal after rotation))
5	SPUR_DC_DELAY	0x0: DELAY_2048 (DELAY_2048 (enable dc tracking circuit after 2048 240kHz cycles)) 0x1: DELAY_4096 (DELAY_4096 (enable dc tracking circuit after 4096 240kHz cycles))
4	SPUR_1K_ROT_ENABLE	0x0: DISABLE (DISABLE (disable and bypass spur rotator)) 0x1: ENABLE (ENABLE (enable spur rotator))
3:2	SPUR_DC_IIR_RND	Set the rounding position for DC tracking. 0x0: ROUND_3 (Recommended) 0x1: ROUND_4 0x2: ROUND_5 0x3: ROUND_6
1:0	SPUR_INT_SETTING	Set the DC tracking integration period. Number of cycles below in 240kHz period. 0x0: INTEGRATE_256 (Recommended) 0x1: INTEGRATE_512 0x2: INTEGRATE_1024 0x3: INTEGRATE_2048

0x0A190124 WCSS_A_FM_SPUR_COMP_FIXED_VALUE_1**Type:** RW**Clock:** APB**Reset State:** 0x00000000

16 bit register for Spur comp value. The value programmed into this register will be subtracted from the I or Q arm after rotation. For details please refer to the HLD and system docs.

WCSS_A_FM_SPUR_COMP_FIXED_VALUE_1

Bits	Name	Description
27:16	SPUR_COMP_Q	for spur comp Q 16 bit register for Spur comp value. The value programmed into this register will be subtracted from the Q arm after rotation. For details please refer to the HLD and system docs
11:0	SPUR_COMP_I	or spur comp I

0x0A190128 WCSS_A_FM_SPUR_COMP_DC_VALUE_RD_BACK_1**Type:** R**Clock:** APB**Reset State:** 0x00000000

2x12 bit register for spur DC estimation read back value. this value could be used to estimate spur power.

WCSS_A_FM_SPUR_COMP_DC_VALUE_RD_BACK_1

Bits	Name	Description
27:16	SPUR_DC_COMP_Q	dc value estimation for Q
11:0	SPUR_DC_COMP_I	dc value estimation for I

0x0A19012C WCSS_A_FM_RX_ROT_CTRL_2**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to control the third spur removal block.

The idea behind the spur removal block is to rotate the signal such that the spur will move to DC. The Then you remove a DC value representing the level of the spur. There are two options for that DC value. The first is to use a DC tracking filter to estimate it. The second is to use a predetermined value in spur_comp_i/q registers.

The third spur removal block should only be enabled when the first 2 spur removal blocks are enabled.

WCSS_A_FM_RX_ROT_CTRL_2

Bits	Name	Description
27	BYPASS_IN_G1G2G3	0x0: NORMAL (NORMAL) 0x1: BYPASS_IN_G1G2G3 (BYPASS_IN_G1G2G3 (bypass in any non zero gain state))
26:7	ROT_FREQ	Rotation Frequency. Available only when CORDIC_based Rotator is selected. The 20 bits [26:7] represents the spur frequency normalized by the sampling rate (240kHz). The resolution is 0.228 Hz.
6	FORCE_DC_TRACK	0x0: USE_DC (USE_DC (enable built in DC tracking logic in spur rotator)) 0x1: USE_SPUR (USE_SPUR (use spur_comp_I/Q registers value as dc level to be subtracted from signal after rotation))
5	SPUR_DC_DELAY	0x0: DELAY_2048 (DELAY_2048 (enable dc tracking circuit after 2048 240kHz cycles)) 0x1: DELAY_4096 (DELAY_4096 (enable dc tracking circuit after 4096 240kHz cycles))
4	SPUR_1K_ROT_ENABLE	0x0: DISABLE (DISABLE (disable and bypass spur rotator)) 0x1: ENABLE (ENABLE (enable spur rotator))
3:2	SPUR_DC_IIR_RND	Set the rounding position for DC tracking. 0x0: ROUND_3 (Recommended) 0x1: ROUND_4 0x2: ROUND_5 0x3: ROUND_6
1:0	SPUR_INT_SETTING	Set the DC tracking integration period. Number of cycles below in 240kHz period. 0x0: INTEGRATE_256 (Recommended) 0x1: INTEGRATE_512 0x2: INTEGRATE_1024 0x3: INTEGRATE_2048

0x0A190130 WCSS_A_FM_SPUR_COMP_FIXED_VALUE_2**Type:** RW**Clock:** APB**Reset State:** 0x00000000

16 bit register for Spur comp value. The value programmed into this register will be subtracted from the I or Q arm after rotation. For details refer to the HLD and system docs.

WCSS_A_FM_SPUR_COMP_FIXED_VALUE_2

Bits	Name	Description
27:16	SPUR_COMP_Q	for spur comp Q 16 bit register for Spur comp value. The value programmed into this register will be subtracted from the Q arm after rotation. For details refer to the HLD and system docs
11:0	SPUR_COMP_I	or spur comp I

0x0A190134 WCSS_A_FM_SPUR_COMP_DC_VALUE_RD_BACK_2**Type:** R**Clock:** APB**Reset State:** 0x00000000

2x12 bit register for spur DC estimation read back value. this value could be used to estimate spur power.

WCSS_A_FM_SPUR_COMP_DC_VALUE_RD_BACK_2

Bits	Name	Description
27:16	SPUR_DC_COMP_Q	dc value estimation for Q
11:0	SPUR_DC_COMP_I	dc value estimation for I

0x0A1A0000 WCSS_A_FM_GAS_GAM_CTRL**Type:** RW**Clock:** HCLK**Reset State:** 0x0000000D

GAS/GAM control register

WCSS_A_FM_GAS_GAM_CTRL

Bits	Name	Description
25	DISABLE_GAM_CLK_GATE	0x0: ENABLE (ENABLE (enable GAM clock gating)) 0x1: DISABLE (DISABLE (disable GAM clock gating))
24	DISABLE_GAS_CLK_GATE	0x0: ENABLE (ENABLE (enable GAS clock gating)) 0x1: DISABLE (DISABLE (disable GAS clock gating))
23:20	GAM_CFG_BUSY_LIMIT	The maximum number of clock cycles the GAM should wait for the application to either present data to the GAM during writes or to deassert the read stall signal during reads, before the GAM will release the AHB

WCSS_A_FM_GAS_GAM_CTRL (cont.)

Bits	Name	Description
19:12	CFG_HSPLIT_RESP_LIMIT	GAS HSPLIT limit, should be set to 0
11:4	CFG_SPLIT_MST_RESP_LIMIT	GAS split, should be set to 0
3:0	CFG_HREADY_LIMIT	GAS slave H Ready limit. should be set to zero for Prima 1.0

0x0A1A0004 WCSS_A_FM_FM_INTR_EVENT**Type:** R**Clock:** APB**Reset State:** 0x00000000

Reading this register will clear all the status bits

WCSS_A_FM_FM_INTR_EVENT

Bits	Name	Description
19	SLV_BYTE_EN_ERROR	slave byte enable error, if byte enable is not all 1. FM slave interface assume all access are 32 bit registers write
18	SSBI_INTR	caused by FM SSBI read/write completion
17	AHB_ACESS_ERROR	caused by FM is not able to read or write AHB
16	UNDER_FLOW	this bit is set if FM TX mode is enabled and BUFFER_TAIL is equal BUFFER_HEAD
15	OVER_FLOW	this bit is set if FM RX mode is enabled and BUFFER_HEAD is equal BUFFER_TAIL
14	AUDIO_SAMPLES_RDY	interrupt event caused by n-samples of FM audio are written or read from cMEM
13	TX_RDS_INTR	Interrupt event caused by RDS buffer is empty. SW should write the entire group (4 blocks) to prevent under flow. The TX_RDS_INTR field holds the interrupt status event bits for all RDS interrupt sources in TX. This bit is cleared on a read by SW.
12	PILOT_DET_DEASSERT_INTR	Interrupt event caused by signal PILOT_DET de-asserted after previously having been asserted
11	PILOT_DET_INTR	Interrupt event caused by signal PILOT_DET asserted
10	IQ_AN_SEGMENT_DONE_INTR	Interrupt event caused by completion of integration of a segment by IQ signal analyzer.
9	C_CP_CHANGE_INTR	Interrupt event caused by change from Type A to Type B reception and vice-versa.
8	RDS_SYNCH_LOSS_INTR	Interrupt event caused by loss of group synchronization.
7	RDS_NOT_SYNCH_INTR	Interrupt event caused by failure to achieve group synchronization.

WCSS_A_FM_FM_INTR_EVENT (cont.)

Bits	Name	Description
6	RDS_SYNCH_INTR	Interrupt event caused by achievement of group synchronization.
5	SIG_NOT_DET_INTR	Interrupt event caused by failure to detect signal
4	SIG_DET_INTR	Interrupt event caused by detection of signal when it meets or exceeds the RX_RDS_IQ_DET_THRESH.
3	RDS_BLOCK_3_INTR	Interrupt event caused by valid data in block register 3
2	RDS_BLOCK_2_INTR	Interrupt event caused by valid data in block register 2
1	RDS_BLOCK_1_INTR	Interrupt event caused by valid data in block register 1
0	RDS_BLOCK_0_INTR	Interrupt event caused by valid data in block register 0

0x0A1A0008 WCSS_A_FM_FM_INTR_ENABLE**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register has individual interrupt enable bits for each interrupt event. When an FM_INTR_EVENT is 1 and the corresponding INTR_ENABLE bit is set, an interrupt is generated to SW.

WCSS_A_FM_FM_INTR_ENABLE

Bits	Name	Description
19	SLV_BYTE_EN_ERROR_EN	0x0: DISBALE (DISABLE) 0x1: ENABLE (ENABLE slave byte enable error, if byte enable is not all 1. FM slave interface assume all access are 32 bit registers write)
18	SSBI_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE caused by FM SSBI read/write completion)
17	AHB_ACESS_ERROR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE caused by FM is not able to read or write AHB)
16	UNDER_FLOW_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE caused by FM TX is reading from empty buffer)
15	OVER_FLOW_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE caused by FM RX is writing to full buffer)
14	AUDIO_SAMPLES_RDY_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE interrupt event caused by n-samples of FM audio are written or read from cMEM)

WCSS_A_FM_FM_INTR_ENABLE (cont.)

Bits	Name	Description
13	TX_RDS_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by RDS buffer is empty. SW should write the entire group (4 blocks) to prevent under flow. The TX_RDS_INTR field holds the interrupt status event bits for all RDS interrupt sources in TX. This bit is cleared on a read by SW.)
12	PILOT_DET_DEASSERT_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by signal PILOT_DET de-asserted after previously having been asserted)
11	PILOT_DET_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by signal PILOT_DET asserted)
10	IQ_AN_SEGMENT_DONE_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by completion of integration of a segment by IQ signal analyzer.)
9	C_CP_CHANGE_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by change from Type A to Type B reception and vice-versa.)
8	RDS_SYNCH_LOSS_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by loss of group synchronization.)
7	RDS_NOT_SYNCH_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by failure to achieve group synchronization.)
6	RDS_SYNCH_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by achievement of group synchronization.)
5	SIG_NOT_DET_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by failure to detect signal)
4	SIG_DET_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by detection of signal when it meets or exceeds the RX_RDS_IQ_DET_THRESH.)
3	RDS_BLOCK_3_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by valid data in block register 3)
2	RDS_BLOCK_2_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by valid data in block register 2)
1	RDS_BLOCK_1_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by valid data in block register 1)

WCSS_A_FM_FM_INTR_ENABLE (cont.)

Bits	Name	Description
0	RDS_BLOCK_0_INTR_EN	0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE Interrupt event caused by valid data in block register 0)

0x0A1A000C WCSS_A_FM_FM_BUFFER_START_ADDRESS**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the FM buffer inside cMEM start address. Note that bit 0&1 are set to 0

WCSS_A_FM_FM_BUFFER_START_ADDRESS

Bits	Name	Description
31:2	BUFFER_START	Start address of FM buffer inside Riva cMEM

0x0A1A0010 WCSS_A_FM_FM_BUFFER_LENGTH**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the FM buffer length inside cMEM.

WCSS_A_FM_FM_BUFFER_LENGTH

Bits	Name	Description
14:0	BUFFER_LENGTH	buffer length in dwords

0x0A1A0014 WCSS_A_FM_FM_BUFFER_HEAD**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the buffer head.

WCSS_A_FM_FM_BUFFER_HEAD

Bits	Name	Description
14:0	BUFFER_HEAD	buffer head relative to start in dwords. for FM RX this register is updated by FM HW for FM TX this register should be updated by Audio driver

0x0A1A0018 WCSS_A_FM_FM_BUFFER_TAIL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the buffer tail

WCSS_A_FM_FM_BUFFER_TAIL

Bits	Name	Description
14:0	BUFFER_TAIL	buffer tail relative to start in dwords for FM TX this register is updated by FM HW for FM RX this register should be updated by Audio driver

0x0A1A001C WCSS_A_FM_AUDIO_INTR_CONTROL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the number of FM audio samples to generate interrupt. also this register is to select pulse or level audio interrupts to LPASS.

WCSS_A_FM_AUDIO_INTR_CONTROL

Bits	Name	Description
18	PULSE_LEVEL_SEL	0x0: LEVEL (LEVEL (active high, will be cleared by setting CLR_AUDIO_INTR)) 0x1: PULSE (PULSE (1 us interrupt pulse to LPASS is generated))
17	CLR_AUDIO_SAMPLE_COUNTER	0x0: RUNNING (RUNNING) 0x1: REST (REST toggle between 0 and 1 are required to reset the audio samples counters)
14:0	AUDIO_INTR_INTERVAL	number of audio samples to generates interrupts to the audio sub system

0x0A1A0020 WCSS_A_FM_CLR_AUDIO_LEVEL_INTR

Type: R
Clock: APB
Reset State: 0x00000000

Read this register will cause LPASS interrupt to clear if it is set to level.

WCSS_A_FM_CLR_AUDIO_LEVEL_INTR

Bits	Name	Description
0	CLR_AUDIO_INTR	Reading this register will clear the LPASS interrupts

0x0A1A0024 WCSS_A_FM_AUDIO_SAMPLES_COUNTER_VFR_SNAP_READBACK

Type: R
Clock: APB
Reset State: 0x00000000

Snap of FM samples counter based on the pos edge of VFR signal.

WCSS_A_FM_AUDIO_SAMPLES_COUNTER_VFR_SNAP_READBACK

Bits	Name	Description
31:0	AUDIO_SAMPLES_VFR_COUNT	sampled AUDIO_SAMPLES_COUNT based on VFR

0x0A1A0028 WCSS_A_FM_AUDIO_SAMPLES_COUNTER_READBACK

Type: R
Clock: APB
Reset State: 0x00000000

counts the number of FM samples, this is free running counter, it roll over to 0.

WCSS_A_FM_AUDIO_SAMPLES_COUNTER_READBACK

Bits	Name	Description
31:0	AUDIO_SAMPLES_COUNT	number of audio samples. this register is used to check for sample-slipping in the audio sub system

0x0A1A002C WCSS_A_FM_SW_RESET**Type:** RW**Clock:** APB**Reset State:** 0x00000000

Software reset

WCSS_A_FM_SW_RESET

Bits	Name	Description
2	SLV_SW_RESET	0x0: NORMAL (NORMAL (normal mode)) 0x1: RESET (RESET (reset Slave block) slave will not recover from this reset until power up)
1	MSTR_SW_RESET	0x0: NORMAL (NORMAL (normal)) 0x1: RESET (RESET (reset slave block))
0	SDI_SW_RESET	0x0: NORMAL (NORMAL (normal mode)) 0x1: RESET (RESET (reset serial data interface))

0x0A1A0034 WCSS_A_FM_SDI_CTRL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

Serial Data Interface control register

WCSS_A_FM_SDI_CTRL

Bits	Name	Description
0	SDI_EN	0x0: DISABLE (DISABLE (disable SDI)) 0x1: ENABLE (ENABLE (Enable SDI))

0x0A1A0038 WCSS_A_FM_SCRAMBLER_CTRL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

.Control the scrambler/descrambler block.

WCSS_A_FM_SCRAMBLER_CTRL

Bits	Name	Description
2	SCRM_TYPE	0x0: ADDITIVE (ADDITIVE) 0x1: MULTIPLICATIVE (MULTIPLICATIVE)
1	SCRM_DESCRM_SEL	0x0: SCRAMBLER_ENABLED (SCRAMBLER_ENABLED) 0x1: DE_SCRAMBLER_ENABLED (DE_SCRAMBLER_ENABLED)
0	SCRM_EN	0x1: RUNNING (RUNNING) 0x0: BYPASS (BYPASS)

0x0A1A003C WCSS_A_FM_SCRAMBLER_POLY**Type:** RW**Clock:** APB**Reset State:** 0x00000000

.bit [16:0] of Scrambler poly.

WCSS_A_FM_SCRAMBLER_POLY

Bits	Name	Description
16:0	SCRM_POLY	Specify LFSR polynomial

0x0A1A0040 WCSS_A_FM_FM_INTR_CTRL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

.

WCSS_A_FM_FM_INTR_CTRL

Bits	Name	Description
0	FM_INTR_PULSE_LVL_SEL	0x0: PULSE (PULSE) 0x1: LEVEL (LEVEL)

0x0A1A0044 WCSS_A_FM_AUDIO_DATA_CONTROL**Type:** RW**Clock:** APB**Reset State:** 0x00000000

.

WCSS_A_FM_AUDIO_DATA_CONTROL

Bits	Name	Description
1	SWAP_AUDIO_BYTES	0x0: NORMAL (NORMAL (NO Swap)) 0x1: SWAP (SWAP (swap bytes for 16 bit left and right audio channels))
0	SWAP_AUDIO	0x0: NORMAL (NORMAL (Left right)) 0x1: SWAP (SWAP (right left))

0x0A1A0090 WCSS_A_FM_SPUR_TRK_START_ADDRESS**Type:** RW**Clock:** APB**Reset State:** 0x00000000

This register is to set the buffer starting address for storing spur tracking data. Note that bit 0&1 are set to 0. The buffer length is 256 words.

WCSS_A_FM_SPUR_TRK_START_ADDRESS

Bits	Name	Description
31:2	BUFFER_START	Start address of spur tracking buffer inside cMEM

0x0A1A0094 WCSS_A_FM_RX_AHB_ACCESS_ERROR_STATUS**Type:** R**Clock:** APB**Reset State:** 0x00000000

When interrupt event RX_AHB_ACCESS_ERROR happens, this register shows the source of the error.

WCSS_A_FM_RX_AHB_ACCESS_ERROR_STATUS

Bits	Name	Description
1	SPUR_TRK_ERROR	error happened when writing to spur tracking buffer inside cMEM

WCSS_A_FM_RX_AHB_ACCESS_ERROR_STATUS (cont.)

Bits	Name	Description
0	RX_AUDIO_ERROR	error happened when writing to audio data buffer inside cMEM

10.25 WCSS_A_A2XB_A2XB**0x0A100400 WCSS_A_A2XB_A2XB_CFG****Type:** RW**Reset State:** 0x00000020

This register's value configures general A2XB features.

WCSS_A_A2XB_A2XB_CFG

Bits	Name	Type	Description
21:16	MSTR_SPLIT_TIMEOUT	R	Shows the split timeout status of each of the CDAHB masters (one bit per master). When set signifies that the master has been split for longer than the timeout limit and therefore has seen a split timeout. The bits are sticky so that if more than one timeout happen the new timed out masters get OR-ed in with the previous value.
15:10	MSTR_SPLIT_STAT	R	Shows the split status of each of the CDAHB masters (one bit per master). When set signifies that the master has been split by A2XB. There are four reasons for a master being split: 1. Command Queue is full so request could not be accepted 2. Write data Queue is full so write data could not be accepted 3. Read request is pending and A2XB is waiting on AXI read completion 4. A write by another master is pending due to <2> so a new write command cannot be accepted
9:2	SPLIT_LIMIT	RW	configures the split timeout limit in the AHB slave in thousands of cycles. If a master is split for more than the configured limit a split timeout error interrupt will be generated.

WCSS_A_A2XB_A2XB_CFG (cont.)

Bits	Name	Type	Description
1	BUSY_OFF	RW	Purely a debug feature. A bug in the busy generation logic has the potential to hang every master in Riva. Should this type of bug be encountered, setting this bit to 1 will ensure that busy is always low, thereby preventing masters from getting hung waiting for completion of writes. Note that this will likely cause data coherency issues between masters.
0	ENABLE	R	Set to enable the A2XB bridge functionality. This register is actually on the PMU and this read only bit just reflects the status of the corresponding PMU register. When set to zero all rd/wr requests not destined to internal A2XB registers will generate an AHB error response.

0x0A100404 WCSS_A_A2XB_INT_MSK**Type:** RW**Reset State:** 0x0000000F

The value of this register is used to mask interrupt sources.

WCSS_A_A2XB_INT_MSK

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT_MSK	When clear it masks off the a2xb_axi_halt_req_set interrupt request.
2	A2XB_SPLIT_TIMEOUT_ERR_INT_MSK	When clear it masks off the a2xb_split_timeout_err interrupt request.
1	A2XB_RD_ERR_INT_MSK	When clear it masks off the a2xb_rd_err interrupt request.
0	A2XB_WR_ERR_INT_MSK	When clear it masks off the a2xb_wr_err interrupt request.

0x0A100408 WCSS_A_A2XB_INT_SRC_MSKD**Type:** R**Reset State:** 0x00000000

The value of this register is the masked interrupt source. It is the logical AND of the INT_SRC with INT_MSK

WCSS_A_A2XB_INT_SRC_MSKD

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT_MSKD	This field is the masked a2xb_axi_halt_req_set_int
2	A2XB_SPLIT_TIMEOUT_ERR_INT_MSKD	This field is the masked a2xb_split_timeout_err_int
1	A2XB_RD_ERR_INT_MSKD	This field is the masked a2xb_rd_err_int
0	A2XB_WR_ERR_INT_MSKD	This field is the masked a2xb_wr_err_int

0x0A10040C WCSS_A_A2XB_INT_SRC**Type:** R**Reset State:** 0x00000000

The value of this register is the interrupt source.

WCSS_A_A2XB_INT_SRC

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT	This field is only set when A2XB receives a halt request from the AXI NOC (visible through halt[haltreq_external]=1) It is NOT set for internally driven halt requests (halt[haltreq_internal]=1) Upon receiving the halt request, the A2XB will complete all pending AXI transfers but will from then on return error responses to any AHB transaction destined to the AXI master port. Local access to A2XB CSRs will still work normally.
2	A2XB_SPLIT_TIMEOUT_ERR_INT	This field is set when the A2XB GAS detects that a master has been split for longer than the timeout limit. This is a fatal error that will require at least a full A2XB reset to recover. On occurrence, A2XB will immediately unsplit any split masters, will flush all its buffers, will discard any data incoming on its AXI port side and will from then on return error responses to any AHB transaction destined to the fabric. Local access to A2XB CSRs will still work normally.
1	A2XB_RD_ERR_INT	This field is set when A2XB receives an error response from the AXI fabric on any data beat of a read transaction. Data following the first beat with an error and belonging to the same transfer will be discarded and when the AHB master returns to complete its read it will be able to complete only as many beats as completed without an AXI error (if any) and will then receive an AHB error response on the beat that incurred the AXI error.

WCSS_A_A2XB_INT_SRC (cont.)

Bits	Name	Description
0	A2XB_WR_ERR_INT	This field is set when A2XB receives an error response from the AXI fabric for a write transaction. Since the AHB protocol provides no way to notify the originating master of errors incurred on posted writes, this interrupt will be the only indication that a write error occurred.

0x0A100410 WCSS_A_A2XB_INT_CLR**Type:** W**Reset State:** 0x00000000

The value of this register is used to clear interrupt sources.

WCSS_A_A2XB_INT_CLR

Bits	Name	Description
3	A2XB_AXI_HALT_REQ_SET_INT_CLR	This field when set will clear the halt request set interrupt indication. This only clears the interrupt request, A2XB reset will be required to return to normal operation.
2	A2XB_SPLIT_TIMEOUT_ERR_INT_CLR	This field when set will clear the split timeout error interrupt. This only clears the interrupt request, A2XB reset will be required to return to normal operation.
1	AXI_RD_ERR_INT_CLR	This field when set will clear the AXI read error interrupt.
0	AXI_WR_ERR_INT_CLR	This field when set will clear the AXI write error interrupt.

0x0A10041C WCSS_A_A2XB_ERR_INFO**Type:** R**Reset State:** 0x00000000

Records which AHB master IDs have received AXI write or read error responses for any of their transfers. Once set, the bit can only be cleared by resetting the A2XB.

WCSS_A_A2XB_ERR_INFO

Bits	Name	Description
11	MID_6_RD_ERR	Set if AHB MID 6 got an AXI read error response in any of its transfers.
10	MID_5_RD_ERR	Set if AHB MID 5 got an AXI read error response in any of its transfers.
9	MID_4_RD_ERR	Set if AHB MID 4 got an AXI read error response in any of its transfers.
8	MID_3_RD_ERR	Set if AHB MID 3 got an AXI read error response in any of its transfers.
7	MID_2_RD_ERR	Set if AHB MID 2 got an AXI read error response in any of its transfers.
6	MID_1_RD_ERR	Set if AHB MID 1 got an AXI read error response in any of its transfers.
5	MID_6_WR_ERR	Set if AHB MID 6 got an AXI write error response in any of its transfers.
4	MID_5_WR_ERR	Set if AHB MID 5 got an AXI write error response in any of its transfers.
3	MID_4_WR_ERR	Set if AHB MID 4 got an AXI write error response in any of its transfers.
2	MID_3_WR_ERR	Set if AHB MID 3 got an AXI write error response in any of its transfers.
1	MID_2_WR_ERR	Set if AHB MID 2 got an AXI write error response in any of its transfers.
0	MID_1_WR_ERR	Set if AHB MID 1 got an AXI write error response in any of its transfers.

0x0A100420 WCSS_A_A2XB_REVISION**Type:** R**Reset State:** 0x00000045

This register's value represents the A2XB RTL revision present in the hardware.

WCSS_A_A2XB_REVISION

Bits	Name	Description
31:0	REVID	Revision ID. Corresponds to the label number of A2XB (revision of .info file)

0x0A100428 WCSS_A_A2XB_HALT**Type:** RW**Reset State:** 0x00000008

This register contains control and status bits related to the haltreq/haltack interface.

WCSS_A_A2XB_HALT

Bits	Name	Type	Description
3	MASTER_IDLE	R	This bit is only set when there are no pending AXI transfers so the AXI master interface is idle.
2	HALTACK	R	Reflects the status of the haltack WCSS output signal. This bit can be set if either internal or external halt requests are asserted and only after the interface has completed all pending AXI transfers and is idle.
1	HALTREQ_EXTERNAL	R	Reflects the status of the external haltreq input signal to the WCSS subsystem. The triggered behavior when set is identical to the one described for the haltreq_internal bit.
0	HALTREQ_INTERNAL	RW	Internal haltreq request. When set this bit triggers the haltreq/haltack protocol. When set, the A2XB interface will finish all pending AXI transfers but will not accept any new AXI-bound requests from any master returning an AHB error response instead. Once set this bit is set it can only be cleared by resetting the A2XB interface. Accesses to A2XB csr registers are not affected by this bit.

0x0A10042C WCSS_A_A2XB_AXI_SB_CFG**Type:** RW**Reset State:** 0x000000DB

This register serves to configure the values used to drive the AXI sideband signals that are not used within WCSS and for which otherwise constant values would be driven.

WCSS_A_A2XB_AXI_SB_CFG

Bits	Name	Description
8:6	AMEMTYPE_HW_MASTER S	This bitfield contains the value that will be used to drive the AXI amemtype[2:0] signal for ALL transfers originated by (non-cpu) all other hardware masters. HW modules only access packet memory in DDR and so its default value should not be changed.
5:3	AMEMTYPE_CPU_BURST	This bitfield contains the value that will be used to drive the AXI amemtype[2:0] signal for burst transfers originated by the internal WCSS cpu, such accesses are always used for cacheable regions (HPROT[3]=1)
2:0	AMEMTYPE_CPU_SINGLE	This bitfield contains the value that will be used to drive the AXI amemtype[2:0] signal for single beat transfers originated by the internal WCSS cpu. The concern was that using a memtype of NORMAL to access locations with potential sideeffects (FIFOs, registers) could result in corruption in certain scenarios. This field provides a way to use a type of strongly-ordered or device for this type of transfers. This is because cacheable access always use burst transfers while non-cacheable accesses will always be mapped to single transfers. So, HPROT[3:2]=01 (non-cacheable, bufferable) which is roughly equivalent to AMEMTYPE=DEVICE, can be inferred when the bridge sees a cpu initiated single-beat 32-bit transfer.<CR> Also, Note that HPROT[3:2]=01 (non-cacheable, bufferable), even if available to the bridge and used to automatically set amemtype=DEVICE, would not guarantee the requirement of the NOC team that a DEVICE type never go to the DDR. This is because DDR memory locations shared or used by WCSS ARM9 SW to communicate with other processors need to be marked as non-cacheable because no mechanism exists to synchronize the Pronto ARM9 caches when the contents of the shared memory are changed by other processors in the system. I really don't see a way to simultaneously guarantee the dual requirement that CSR accesses always use DEVICE while DDR accesses always use NORMAL without building a non-portable (if hardwired) or expensive (if programmable) linkage of the WCSS subsystem to a target MSM 's memory map simply to map to the required amemtype. This is not a failure of the WCSS subsystem but rather a consequence of the system using non-standard ARM signals which our stock ARM9 CPU obviously does not support

10.26 WCSS_A_ADU_ADU

0x0A082800 WCSS_A_ADU_CONTROL

Type: RW

Reset State: 0x0BFF0002

Contains configuration information for the adu

WCSS_A_ADU_CONTROL

Bits	Name	Type	Description
31:24	NEXT_WQ	RW	This field indicates the WQ that the ADU will push the frames to after they have been processed. This field is only used when 'push_wq_selection_mode' is set to '1'.
23:16	WOW_WQ	RW	This field indicates the WQ that the ADU will push the frames during WOW mode. This field is only used when 'push_wq_selection_mode' is set to '1'.
15	REG_REINIT_ERR_STATE_CFG	RW	When set, ADU reg reinit FSM will go back to idle instead of staying in error state.
13	REG_REINIT_GOTO_IDLE	RW	When set, ADU reg reinit FSM (BPS, MIMO) will go to idle.
8	CLEAR_TIMEOUT_CNT	W	Writing a '1' will reset the timeout counter and clear timeout error interrupt. Always read 0.
7	DISABLE_LENGTH_CHECK	RW	When set, the ADU will not check the subframe length error
6	PUSH_WQ_SELECTION_WOW_MODE	RW	This field controls where the ADU finds the index for the WQ to which the processed frames need to be pushed to in WOW mode. This bit should be set (a 0->1 transition) prior to WOW mode to select the WOW_WQ. Upon the assertion of dpu_wakeuphost, ADU will push to the normal WQ. 0: ADU will push the frame to the WQ that is selected by the push_wq_selection_mode 1: ADU will push the frame to the WQ that is indicate in the 'WOW_WQ' field in this register
5	ADU_ERROR_EXIT	W	Writing a '1' will clear the interrupts and ADU will go back to IDLE from ERROR_STATE. Always read 0

WCSS_A_ADU_CONTROL (cont.)

Bits	Name	Type	Description
4	ADU_BYPASS_OPTION_ENABLE	RW	When set, ADU will immediately forward the frame and NOT check if the frame is AMSDU
3	CLEAR_COUNTERS	RW	When set, the ADU packet counters are cleared To re-enable the counters, this bit needs to be cleared again
2	DISABLE_HT_FIELD_DETECTION	RW	When set, the ADU will NOT check for the presence of the HT control field
1	PUSH_WQ_SELECTION_MODE	RW	This field controls where the ADU finds the index for the WQ to which the processed frames need to be pushed to. 0: ADU will push the frame to the WQ that is indicated in the 'ADU/DPU routing flag' in the BD descriptor. 1: ADU will push the frame to the WQ that is indicate in the 'Next WQ' field in this register
0	ADU_ENABLE	RW	When set, the ADU is enabled. When the adu gets disabled in the middle of a transfer, it will finish the ongoing transfer.

0x0A082804 WCSS_A_ADU_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

Contains status information on what interrupt has been generated Note that the interrupt is only passed on to the mCPU when the error interrupt has been enabled in the 'ADU interrupt enable' register.

WCSS_A_ADU_INTERRUPT_STATUS

Bits	Name	Type	Description
15:14	RESERVED		The two bits are reserved.
13	ADU_POLL_CMD_ERROR	R	When set, adu poll cmd reached retry timeout error occurred
12	UMA_WRONG_WQ_ERROR	R	When set, adu uma tx push to its own WQ error occurred
11	TIMEOUT_ERROR	R	When set, timeout error occurred

WCSS_A_ADU_INTERRUPT_STATUS (cont.)

Bits	Name	Type	Description
10	WRONG_WQ_ERROR	R	When set, adu push to its own WQ error occurred
9	INCORRECT_LINK_ERROR	R	When set, an incorrect BD/PDU link error occurred
8	BAD_BD_TYPE_ERROR	R	When set, a bad bd type error occurred
7	GAM_WRITE_ERROR	R	When set, a gam write error occurred
6	SW_REG_REINIT_DONE	R	When set, the sw triggered reg reinit is done
5	DELIMITER_LENGTH_NOT_AVAIL_ERROR	R	When set, the adu was not able to extract the delimiter length from the frame
4	GAM_READ_ERROR	R	When set, the gam reported a read error
3	GBI_PUSH_ERROR	R	When set, the gbi reported an error while a push operation was ongoing
2	MPDU_HEADER_NOT_IN_BD_ERROR	R	When set, the mpdu header was not located fully within the BD
1	GBI_POP_ZERO_ERROR	R	When set, the gbi returned a NULL BD pointer when the BMU was indicating DA in its WQ.
0	GBI_POP_ERROR	R	When set, the gbi reported an error while a pop operation was ongoing

0x0A082808 WCSS_A_ADU_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

Contains the enable bits for which interrupt has to be generated

WCSS_A_ADU_INTERRUPT_ENABLE

Bits	Name	Description
15:14	ADU_RESERVED	The two bits are reserved

WCSS_A_ADU_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
13	ADU_POLL_CMD_ERROR_ENABLE	When set, adu poll cmd reach retry timeout error will generate error interrupt
12	UMA_WRONG_WQ_ERROR_ENABLE	When set, adu uma tx push its own WQ error will generate error interrupt
11	TIMEOUT_ERROR_ENABLE	When set, timeout error will generate error interrupt
10	WRONG_WQ_ERROR_ENABLE	When set, adu push its own WQ error will generate error interrupt
9	INCORRECT_LINK_ERROR_ENABLE	When set, an incorrect BD/PDU link error will generate error interrupt
8	BAD_BD_TYPE_ERROR_ENABLE	When set, a bad bd type error will generate error interrupt
7	GAM_WRITE_ERROR_ENABLE	When set, a gam write error will generate an adu error interrupt
6	SW_REG_REINIT_DONE_ENABLE	When set, when the sw triggered reg reinit is done the interrupt will be generated
5	DELIMITER_LENGTH_NOT_AVAIL_ERROR_ENABLE	When set, and the adu was not able to extract the delimiter length from the frame an adu error interrupt will be generated
4	GAM_READ_ERROR_ENABLE	When set, and the gam reported a read error an adu error interrupt will be generated
3	GBI_PUSH_ERROR_ENABLE	When set, and the gbi reported an error while a push operation was ongoing, an adu error interrupt will be generated
2	MPDU_HEADER_NOT_IN_BD_ERROR_ENABLE	When set, and the mpdu header was not located fully within the BD an adu error interrupt will be generated
1	GBI_POP_ZERO_ERROR_ENABLE	When set, and the gbi returned a NULL BD pointer when the BMU was indicating DA in its WQ, an adu error interrupt will be generated
0	GBI_POP_ERROR_ENABLE	When set, and the gbi reported an error while a pop operation was ongoing, an adu error interrupt will be generated

0x0A082810 WCSS_A_ADU_ADU_STATUS**Type:** R**Reset State:** 0x00000000

Provides status information about the ADU

WCSS_A_ADU_ADU_STATUS

Bits	Name	Description
28:24	ENCODED_ADU_REINIT_FSM	The FSM status of adu reinit
23	ADU_SM_STATE_MSB	The MSB of statemachine state of the ADU controller
22	BMU_UMA_TX_WQ_DA	The status of the bmu_uma_tx_wq_da
21	ENCODED_GAS_INTERFACE_SM_STATE	The status of the gas interface.
20	UMA_TX_STATUS	The status of the uma tx. 0 means uma tx is idle
19:15	UMA_TX_SM_STATE	The statemachine state of the uma tx
13	ADU_MULTIPLE_RX_UPDATE_ONGOING	shows the status of adu_multiple_rx_update_ongoing
12:8	ADU_SM_STATE	The 5LSB of statemachine state of the ADU controller
5	ADU_FIXED_WQ_PUSH_MODE_WOW_ENABLED	Shows the status of adu_fixed_wq_push_mode_wow_enabled signal. It's set to 1 when control[6] is set to 1, and clear to 0 when control[6] is cleared or when dpu_wakuphost assert
4	DPU_WAKEUPHOST	Shows the status of dpu_wakuphost
3	ADU_STATUS	When set, the ADU controller is NOT in it's IDLE state
2	ADU_MCU_ERR_INT	shows the status of the ADU error interrupt signal going to the mcu
1	DATA_AVAIL	shows the data_aavailable signal from the bmu
0	BD_PDU_AVAIL	shows the bd_pdu_avail signal from the bmu

0x0A082814 RESERVED**0x0A082818 RESERVED****0x0A08281C RESERVED****0x0A082820 WCSS_A_ADU_ADU_COUNTERS1****Type:** R**Reset State:** 0x00000000

gives information on the number of frames processed

WCSS_A_ADU_ADU_COUNTERS1

Bits	Name	Description
23:16	NUMBER_OF_AMSDU_FRAMES_PROCESSED	Indicates the number of amsdu frames processed by the ADU
7:0	NUMBER_OF_FRAMES_POPPED	Indicates the number of frames that were popped by the ADU

0x0A082824 WCSS_A_ADU_ADU_COUNTERS2**Type:** R**Reset State:** 0x00000000

gives information on the number of frames processed

WCSS_A_ADU_ADU_COUNTERS2

Bits	Name	Description
23:16	NUMBER_OF_NON_AMSDU_FRAMES_PROCESSED	Indicates the number of non amsdu frames processed by the ADU
7:0	NUMBER_OF_BYPASS_FRAMES_PROCESSED	Indicates the number of frames for which the 'ADU bypass' bit in the BD was set

0x0A082828 WCSS_A_ADU_ADU_COUNTERS3**Type:** R**Reset State:** 0x00000000

gives information on the number of frames processed

WCSS_A_ADU_ADU_COUNTERS3

Bits	Name	Description
23:16	NR_OF_ERROR_FRAMES	Indicates the number of error frames which has been pushed to error wq.
7:0	NR_OF_MISCONFIGURED_AMSDU_FRAMES	Indicates the number of amsdu frames processed that were not correctly configured

0x0A08282C WCSS_A_ADU_CONTROL2**Type:** RW**Reset State:** 0x03FFF92A

Contains configuration information for the adu

WCSS_A_ADU_CONTROL2

Bits	Name	Description
31:26	SPARE_BIT	Spare register bits for ECOs
25:12	TIMEOUT_CNT	This field specify the timeout value in unit of 1 us when adu fsm doesn't return to IDLE.
11:0	MAX_LENGTH	This field specify the max subframe length is allowed.

0x0A082830 WCSS_A_ADU_TIMEOUT_READ**Type:** R**Reset State:** 0x00000000

Contains timeout counter information for the adu

WCSS_A_ADU_TIMEOUT_READ

Bits	Name	Description
19:0	TIMEOUT_CNT_REG	This field read the timeout counter value

0x0A08283C WCSS_A_ADU_UMA_CONFIG**Type:** RW**Reset State:** 0xA0106000

This register is to config the UMA function

WCSS_A_ADU_UMA_CONFIG

Bits	Name	Description
31	UMA_TX_MCUSEBC_EN	When set, mc address will use bc addr for da search.
30:26	UMA_TX_QID_FOR_NONQOS	The Queueid to fill the BD when the packet is non QoS frame.
25	UMA_TX_EATRACT_TID	When set, uma tx extract the tid from 802.1Q/IP header.
24	UMA_RX_LLC_EN	When set and bit 21 is set, enables LLC removal.
23	UMA_RX_CHECKSUM_EN	When set and bit 21 is set, enables the TCP checksum validation in RX direction
22	UMA_RX_FT_EN	When set and bit 21 is set, enables the frame translation in RX direction
21	UMA_RX_EN	When set, enables the data path enhancement in RX direction. When clear, UMA RX simply forward the frame to the specified WQ.
20	UMA_TX_PUSH_WQ_SEL	When set, UMA will push the frame to the WQ specified in bit [19:12] When clear, UMA will push the frame to the WQ specified in the routing flag in BD
19:12	UMA_TX_PUSH_WQ	Specify the WQ that UMA should push to in TX direction if bit 20 is set.
11:4	TX_DEFAULT_STAID	The default descriptor index used for frame translation in TX direction when there's no DA match in the search table.
3	UMA_TX_LLC_EN	When set and bit 0 is set, enables LLC insertion in TX direction
2	UMA_TX_CHECKSUM_EN	When set and bit 0 is set, enables TCO checksum computation in TX direction

WCSS_A_ADU_UMA_CONFIG (cont.)

Bits	Name	Description
1	UMA_TX_FT_EN	When set and bit 0 is set, enables frame translation in TX direction.
0	UMA_TX_EN	When set, enables data path enhancement in TX direction. When clear, UMA simply forward the incoming frame to the specified WQ.

0x0A082840 WCSS_A_ADU_UMA_CTRL**Type:** RW**Reset State:** 0x0000FF03

This register is to control the UMA function

WCSS_A_ADU_UMA_CTRL

Bits	Name	Type	Description
31:24	UMA_TX_AP_WQ	RW	The WQ UMA will push when there's no match.
23:16	UMA_RX_MC_WQ	RW	The WQ UMA will push when DA is a mc/bc address.
15:8	UMA_RX_ERROR_WQ	RW	The Error WQ UMA will forward when exception occurs, such as payload size less than 8 bytes.
7	UMA_RX_MCWQ_EN	RW	When set, enable UMA RX push the frame to uma_rx_mc_wq when DA is a mc/bc address
6	UMA_TX_APWQ_EN	RW	When set, enable UMA TX push the frame to uma_tx_ap_wq when there's no match
5	UMA_DISABLE_MIN_PAYLOAD_CHECK	RW	When set, disable the min payload check
4	UMA_COUNTER_CLEAR	W	Write a '1' to clear the UMA TX Counters. Always read '0'.
3	UMA_TX_QID_FROM_BD	RW	When set, UMA won't update the queue id in BD. When clear, queue id will be a 1-1 mapping from tid(QoS) or register (non-QoS)
2	UMA_TX_ERROR_EXIT	W	Write a '1' to clear the UMA TX interrupts and UMA TX FSM goes back to IDLE. Always read '0'.

WCSS_A_ADU_UMA_CTRL (cont.)

Bits	Name	Type	Description
1	UMA_RX_ENABLE	RW	When set, UMA RX is enabled. When clear, UMA RX is off. adu_ctrl will push the processed frame to the specified WQ.
0	UMA_TX_ENABLE	RW	When set, UMA TX is enabled. When clear, UMA TX is off. No frame will be popped from BMU.

0x0A082844 WCSS_A_ADU_UMA_DESP_TABLE_ADDR**Type:** RW**Reset State:** 0x00000000

This register contains the base address of uma's descriptor table

WCSS_A_ADU_UMA_DESP_TABLE_ADDR

Bits	Name	Description
31:0	UMA_DESP_TABLE_BASE_ADDR	Base address of UMA's descriptor table

0x0A082848 WCSS_A_ADU_UMA_TX_ETHERTYPE_TABLE1**Type:** RW**Reset State:** 0x00000000

This register contains 2 entries of the ethernet table for uma tx

WCSS_A_ADU_UMA_TX_ETHERTYPE_TABLE1

Bits	Name	Description
31:16	UMA_TX_ETHERTYPE_ENTRY2	One of the entries of uma tx ethernet table
15:0	UMA_TX_ETHERTYPE_ENTRY1	One of the entries of uma tx ethernet table

0x0A08284C WCSS_A_ADU_UMA_TX_ETHERTYPE_TABLE2**Type:** RW**Reset State:** 0x00000000

This register contains 2 entries of the ethertype table for uma tx

WCSS_A_ADU_UMA_TX_ETHERTYPE_TABLE2

Bits	Name	Description
31:16	UMA_TX_ETHERTYPE_ENTRY4	One of the entries of uma tx ethertype table
15:0	UMA_TX_ETHERTYPE_ENTRY3	One of the entries of uma tx ethertype table

0x0A082850 WCSS_A_ADU_UMA_RX_ETHERTYPE_TABLE1

Type: RW

Reset State: 0x00000000

This register contains 2 entries of the ethertype table for uma rx

WCSS_A_ADU_UMA_RX_ETHERTYPE_TABLE1

Bits	Name	Description
31:16	UMA_RX_ETHERTYPE_ENTRY2	One of the entries of uma rx ethertype table
15:0	UMA_RX_ETHERTYPE_ENTRY1	One of the entries of uma rx ethertype table

0x0A082854 WCSS_A_ADU_UMA_RX_ETHERTYPE_TABLE2

Type: RW

Reset State: 0x00000000

This register contains 2 entries of the ethertype table for uma rx

WCSS_A_ADU_UMA_RX_ETHERTYPE_TABLE2

Bits	Name	Description
31:16	UMA_RX_ETHERTYPE_ENTRY4	One of the entries of uma rx ethertype table
15:0	UMA_RX_ETHERTYPE_ENTRY3	One of the entries of uma rx ethertype table

0x0A082858 WCSS_A_ADU_UMA_TX_COUNTERS1**Type:** R**Reset State:** 0x00000000

This register contains counters information of uma tx

WCSS_A_ADU_UMA_TX_COUNTERS1

Bits	Name	Description
23:16	UMA_TX_PUSHED_COUNTER	Counters of the frame uma tx pushed
7:0	UMA_TX_POPPED_COUNTER	Counters of the frame uma tx popped

0x0A08285C WCSS_A_ADU_UMA_TX_COUNTERS2**Type:** R**Reset State:** 0x00000000

This register contains counters information of uma tx

WCSS_A_ADU_UMA_TX_COUNTERS2

Bits	Name	Description
23:16	UMA_TX_ERROR_COUNTER	Counters of the frames forwarded to error wq by UMA TX
7:0	UMA_TX_FT_COUNTER	Counters of the frame translated by uma tx

0x0A082860 WCSS_A_ADU_UMA_LLC_COUNTERS**Type:** R**Reset State:** 0x00000000

This register contains counters information of uma llc insertion/removal

WCSS_A_ADU_UMA_LLC_COUNTERS

Bits	Name	Description
23:16	UMA_RX_LLC_COUNTER	Counters of the LLC removal done by uma rx
7:0	UMA_TX_LLC_COUNTER	Counters of the LLC insertion done by uma tx

0x0A082864 WCSS_A_ADU_UMA_INDEX_TABLE_WDATA_U**Type:** RW**Reset State:** 0x00000000

This register contains the upper bits of the entry of index table

WCSS_A_ADU_UMA_INDEX_TABLE_WDATA_U

Bits	Name	Description
23:16	UMA_SEARCHTABLE_INDEX	index (in unit of 3 words) to the descriptor table
15:0	UMA_SEARCHTABLE_WDATA_U	Upper bits of the entry of index table

0x0A082868 WCSS_A_ADU_UMA_INDEX_TABLE_WDATA_L**Type:** RW**Reset State:** 0x00000000

This register contains the lower bits of the entry of index table

WCSS_A_ADU_UMA_INDEX_TABLE_WDATA_L

Bits	Name	Description
31:0	UMA_SEARCHTABLE_WDATA_L	Lower bits of the 1st entry of index table

0x0A08286C WCSS_A_ADU_UMA_INDEX_TABLE_ADDR_CTRL**Type:** RW**Reset State:** 0x00000000

This register contains the address of index table the data to be written to/read from

WCSS_A_ADU_UMA_INDEX_TABLE_ADDR_CTRL

Bits	Name	Type	Description
8	UMA_SEARCHTABLE_RW	W	Always read '0' Write '1' to write the data {uma_index_data_u, uma_index_data_l} to the address uma_index_addr Write '0' to load the contents of the index table addressed by uma_index_addr to uma_index_table_data_l[u] registers.
7:0	UMA_SEARCHTABLE_ADDR	RW	address of the index table to be written to/read from

0x0A082870 WCSS_A_ADU_UMA_INDEX_TABLE_RDATA_U**Type:** R**Reset State:** 0x00000000

This register contains the upper bits of the entry of index table for read

WCSS_A_ADU_UMA_INDEX_TABLE_RDATA_U

Bits	Name	Description
23:16	UMA_SEARCHTABLE_RDATA_INDEX	Index of the index table for read
15:0	UMA_SEARCHTABLE_RDATA_U	Upper bits of the entry of index table for read

0x0A082874 WCSS_A_ADU_UMA_INDEX_TABLE_RDATA_L**Type:** R**Reset State:** 0x00000000

This register contains the lower bits of the entry of index table for read

WCSS_A_ADU_UMA_INDEX_TABLE_RDATA_L

Bits	Name	Description
31:0	UMA_SEARCHTABLE_RDATA_L	Lower bits of the 1st entry of index table for read

0x0A082878 WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U**Type:** RW**Reset State:** 0x00000000

This register contains the upper bits of the default wmac addr to be used when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U

Bits	Name	Description
15:0	UMA_DEFAULT_WMACADDR_U	Upper bits of the default wmac addr

0x0A08287C WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L**Type:** RW**Reset State:** 0x00000000

This register contains the lower bits of the default wmac addr to be used when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L

Bits	Name	Description
31:0	UMA_DEFAULT_WMACADDR_L	Lower bits of the default wmac addr

0x0A082880 WCSS_A_ADU_UMA_CTRL2**Type:** RW**Reset State:** 0x001104FF

This register is to control the UMA function

WCSS_A_ADU_UMA_CTRL2

Bits	Name	Description
31:24	ADU_FORWARD_AMSDU_WQ	When adu_amsdu_en (bit20) is cleared to 0, the amsdu pkt will be pushed to this WQ.
20	ADU_AMSDU_EN	When set, adu will deaggregate the amsdu frame into MSDUs. When disable, the amsdu pkt will be forward to the adu_forward_amsdu WQ (bit[31:24]).
19	UMA_TX_HTC_EN	When set, htc field insertion will be enabled. When the bit in sta descriptor is set, the htc field will be inserted into wmac frame header.
18	UMA_TX_BD_EN	When set, uma tx will fill queueid(based on the configuration), sta index, dpu index, dpu sig in the BD when there's no frame translation. Ignored when FT is enabled
17	WOW_WAKEUP_SEL	When set, adu will check the BD for wow wakeup indication. When clear, adu will check the sideband signal from dpu for wow wakeup.
16	RX_PRIORITY_ROUTING_WQ_EN	When set, adu will push to the rx_priority_routing_wq when the rx dxe priority routing bit is set in BD
15:8	RX_PRIORITY_ROUTING_WQ	The WQ adu will push to when the rx dxe priority routing bit is set in BD
7:0	UMA_TX_ERROR_WQ	The WQ uma tx will push the frame when there's error

0x0A082884 WCSS_A_ADU_UMA_TX_COUNTERS3**Type:** R**Reset State:** 0x00000000

This register contains counters information of uma tx

WCSS_A_ADU_UMA_TX_COUNTERS3

Bits	Name	Description
23:16	UMA_TX_SYNC_WQ_COUNTER	Counters of the uma tx push to sync wq
7:0	UMA_TX_BYPASS_COUNTER	Counters of the uma tx bypass

0x0A0828B8 WCSS_A_ADU_UMA_TX_WQ_QID_CTRL**Type:** RW**Reset State:** 0x00000000

This register contains the control signals to enable/disable whether or not checking the threshold value for mcpu/btqm wq push

WCSS_A_ADU_UMA_TX_WQ_QID_CTRL

Bits	Name	Description
24	UMA_TX_BD_FILL_EN	When set, UMA TX fill the extra fields in BD.

0x0A0828C0 WCSS_A_ADU_ADU_POLL_CMD_ERROR_ADDR**Type:** R**Reset State:** 0x00000000

This register contains the poll cmd address when it reaches retry timeout error

WCSS_A_ADU_ADU_POLL_CMD_ERROR_ADDR

Bits	Name	Description
31:0	ADU_POLL_CMD_ERROR_ADDR	The poll cmd address when adu_poll_cmd_error is generated

0x0A0828C4 WCSS_A_ADU_ADU_SW_REG_REINIT_ADDR**Type:** RW**Reset State:** 0x00000000

This register contains the sw triggered reg reinit table address

WCSS_A_ADU_ADU_SW_REG_REINIT_ADDR

Bits	Name	Description
31:2	SW_REG_REINIT_ADDR	The sw triggered reg reinit table address. always word address

0x0A0828C8 WCSS_A_ADU_ADU_SW_REG_REINIT_TRIGGER**Type:** R**Reset State:** 0x00000000

This register to trigger the reg reinit

WCSS_A_ADU_ADU_SW_REG_REINIT_TRIGGER

Bits	Name	Description
0	SW_REG_REINIT_P	Write '1' to trigger the reg reinit. Always read 0.

0x0A0828CC WCSS_A_ADU_UMA_TX_HTC_HT**Type:** RW**Reset State:** 0x0000FFC0

This register contains the htc field in ht format to be filled in frame translation

WCSS_A_ADU_UMA_TX_HTC_HT

Bits	Name	Description
31:0	UMA_TX_HTC_HT	htc field in ht format to be filled in frame translation

0x0A0828D0 WCSS_A_ADU_UMA_TX_HTC_VHT**Type:** RW**Reset State:** 0x0000FFE1

This register contains the htc field in vht format to be filled in frame translation

WCSS_A_ADU_UMA_TX_HTC_VHT

Bits	Name	Description
31:0	UMA_TX_HTC_VHT	htc field in vht format to be filled in frame translation

0x0A0828D4 WCSS_A_ADU_UMA_TX_TID_TO_QID**Type:** RW**Reset State:** 0x76543210

This register contains the tid to queueid mapping

WCSS_A_ADU_UMA_TX_TID_TO_QID

Bits	Name	Description
31:28	QUEUEID_FOR_TID7	queueid for tid 7
27:24	QUEUEID_FOR_TID6	queueid for tid 6
23:20	QUEUEID_FOR_TID5	queueid for tid 5
19:16	QUEUEID_FOR_TID4	queueid for tid 4
15:12	QUEUEID_FOR_TID3	queueid for tid 3
11:8	QUEUEID_FOR_TID2	queueid for tid 2
7:4	QUEUEID_FOR_TID1	queueid for tid 1
3:0	QUEUEID_FOR_TID0	queueid for tid 0

0x0A0828D8 WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U_1**Type:** RW**Reset State:** 0x00000000

This register contains the upper bits of the default wmac addr to be used for BSSID1 when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U_1

Bits	Name	Description
15:0	UMA_DEFAULT_WMACADDR_U	Upper bits of the default wmac addr for BSSID1

0x0A0828DC WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L_1**Type:** RW**Reset State:** 0x00000000

This register contains the lower bits of the default wmac addr to be used for BSSID1 when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L_1

Bits	Name	Description
31:0	UMA_DEFAULT_WMACADDR_L	Lower bits of the default wmac addr for BSSID1

0x0A0828E0 WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U_2**Type:** RW**Reset State:** 0x00000000

This register contains the upper bits of the default wmac addr to be used for BSSID2 when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U_2

Bits	Name	Description
15:0	UMA_DEFAULT_WMACADDR_U	Upper bits of the default wmac addr for BSSID2

0x0A0828E4 WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L_2**Type:** RW**Reset State:** 0x00000000

This register contains the lower bits of the default wmac addr to be used for BSSID2 when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L_2

Bits	Name	Description
31:0	UMA_DEFAULT_WMACADDR_L	Lower bits of the default wmac addr for BSSID2

0x0A0828E8 WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U_3**Type:** RW**Reset State:** 0x00000000

This register contains the upper bits of the default wmac addr to be used for BSSID3 when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_U_3

Bits	Name	Description
15:0	UMA_DEFAULT_WMACADDR_U	Upper bits of the default wmac addr for BSSID3

0x0A0828EC WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L_3**Type:** RW**Reset State:** 0x00000000

This register contains the lower bits of the default wmac addr to be used for BSSID3 when there's no DA match

WCSS_A_ADU_UMA_TX_DEFAULT_WMACADDR_L_3

Bits	Name	Description
31:0	UMA_DEFAULT_WMACADDR_L	Lower bits of the default wmac addr for BSSID3

0x0A0828F0 WCSS_A_ADU_UMA_TX_DEFAULT_STAID**Type:** RW**Reset State:** 0x00000000

This register contains the default staid for bssid1-3 for descriptor

WCSS_A_ADU_UMA_TX_DEFAULT_STAID

Bits	Name	Description
23:16	TX_DEFAULT_STAID_3	The default descriptor index of bssid3 used for frame translation in TX direction when there's no DA match in the search table.
15:8	TX_DEFAULT_STAID_2	The default descriptor index of bssid2 used for frame translation in TX direction when there's no DA match in the search table.
7:0	TX_DEFAULT_STAID_1	The default descriptor index of bssid1 used for frame translation in TX direction when there's no DA match in the search table..

0x0A0828F4 WCSS_A_ADU_ADU_REINIT_CONFIG**Type:** RW**Reset State:** 0x00000A00

This register configs the additional info of the adu reinit command to access external addr space

WCSS_A_ADU_ADU_REINIT_CONFIG

Bits	Name	Type	Description
15:8	I_WCSS_CFG_BASE_ADD RESS	R	The base address of the internal address space
7:0	SW_REG_REINIT_CMD_EX T_BASE_ADDR	RW	When the feature is enabled, the upper bits of the register address when bit24 of the command line is set to 1

10.27 WCSS_A_AGC_AGC**0x0A013C00 WCSS_A_AGC_AGC_RESET****Type:** RW**Reset State:** 0x0001

Soft reset of the AGC state machine.

WCSS_A_AGC_AGC_RESET

Bits	Name	Description
0	RESET	Reset bit. 0x0: NORMAL (Normal operation) 0x1: RESET (Reset AGC state machine)

0x0A013C04 WCSS_A_AGC_DIS_MODE**Type:** RW**Reset State:** 0x0000

Disables detection of OFDM (11a,11g)/OFDM-MIMO, Barker/CCK (11b) packets or double bandwidth 11a/MIMO packets. Useful to reduce misdetect probability in a pure 11a or 11b environment.

WCSS_A_AGC_DIS_MODE

Bits	Name	Description
3	DISABLE_11AC80	Disable quadruple bandwidth bit for 11ac80 MHz packets. 0x0: ENABLE (Enable 11ac 80MHz detection.) 0x1: DISABLE (Disable 11ac 80MHz packet detection.)
2	DISABLE_11N40	Disable double bandwidth bit for 11n40 MHz packets. 0x0: ENABLE (Enable 11n 40MHz detection.) 0x1: DISABLE (Disable 11n 40MHz packet detection.)
1	DISABLE_11B	Disable 11b bit. 0x0: ENABLE (Enable 11b packet detection.) 0x1: DISABLE (Disable 11b packet detection.)
0	DISABLE_11AG	Disable 11a/g bit. 0x0: ENABLE (Enable 11a/g packet detection.) 0x1: DISABLE (Disable 11a/g packet detection.)

0x0A013C08 WCSS_A_AGC_RX_OVERRIDE**Type:** RW**Reset State:** 0x0000

This register allows the EN_RX (Receive Enable) outputs of the BBIC, the standby input and the powerdown inputs of the built-in ADC to be software- controlled. These outputs are used to enable the AD converters and RF ASICs for debugging and calibration purposes. The power down bits are used to put all of the ADCs in power down mode (for instance in beacon power save mode) or part of its ADCs to be powered down (for instance a product not using all of the antenna).

WCSS_A_AGC_RX_OVERRIDE

Bits	Name	Description
4	ENRX_VAL	Enable values for receive chain 0 to 0. For these values to take effect, the corresponding override bits should be set.
0	STBY_VAL	ADC standby values for receive chain 0 to 0. Note that the standby values are asserted low, and de-asserted high. For these values to take effect, the corresponding override bits should be set.

0x0A013C0C WCSS_A_AGC_PHY_LOOPBACK**Type:** RW**Reset State:** 0x0008

Configures support for PHY loopback.

WCSS_A_AGC_PHY_LOOPBACK

Bits	Name	Description
3	DIG_LOOPBACK	Enables the loopback digitally.
2	PMI_EN	Enables loop backed data to go out the PMI to the MAC.
1:0	MODE	Sets the PHY loopback mode. PHY loopback can be enabled statically, where it is always in loopback mode, or dynamically where it only enters loopback mode when we're transmitting. 0x0: DISABLED (Disabled) 0x1: STATIC_EN (Always enabled) 0x2: DYN_EN (Only enabled during packet transmission)

0x0A013C10 WCSS_A_AGC_CONFIG_XBAR**Type:** RW**Reset State:** 0x0000

Sets the configuration for the digital / analog crossbar. This will configure how a particular analog receive chain is mapped to a particular digital RX processing chain. In addition, it will also configure how a particular digital TX processing chain is connected to a particular analog transmit chain. An analog chain includes the baseband analog + the corresponding RF chain. Although there are separate controls for txxbar and rxxbar, for normal mode of operation, they should be set the same. Refer to the System Engineering Specification on the edge portal for the configuration and connectivity of xbar. Note that no analog chain other than analog chain 2 can feed the digital chain 2 and hence there is no xbar functionality on digital chain 2

WCSS_A_AGC_CONFIG_XBAR

Bits	Name	Description
15	PHYDBG_SEL	PHYDBG input select. Used for playing PHYDBG data into RX ADC path.
14	IQSWAP_EN	Enables swapping of the I and Q rails of the ADC.

0x0A013C14 WCSS_A_AGC_CW_DETECT**Type:** RW**Reset State:** 0x000B

At packet detection, the PHY detects narrowband interference to avoid false alarms caused by narrowband interference. This type of interference could arise as the result of LO leakage, LO interference of other IEEE802.11 devices in the vicinity of the receiver and other, intentional radiators, such as Bluetooth devices. of factors the explanation of which is beyond the scope of this guide. When CW is found the packet detection is ignored since it is most likely that the packet detectors triggered on the CW interference. The CW frequency is used to set a CW notchfilter

inside the RXFIR to cancel out that interferer in the future, until a different CW interferer is found or until a timer expires.

WCSS_A_AGC_CW_DETECT

Bits	Name	Description
7	TXLO_DIS	Disables the use of the Rxfir with a TX LO notch. 0x0: ENABLE (Enable TX LO Notch Filter.) 0x1: DISABLE (Disable TX LO Notch Filter.)
6	CW_EN_RXB_DATA	Enables CW notch processing when the AGC is in states 9 or 11. 0x0: DISABLE (Disable CW Notch Filter when processing RXB data.) 0x1: ENABLE (Enable CW Notch Filter when processing RXB data.)
5	CW_EN_RXB	Enables CW notch processing when the AGC is in states 2,3 or 7. 0x0: DISABLE (Disable CW Notch Filter when processing RXB preamble.) 0x1: ENABLE (Enable CW Notch Filter when processing RXB preamble.)
4	CW_EN_RXA_DATA	Enables CW notch processing when the AGC is in states 8 or 10. 0x0: DISABLE (Disable CW Notch Filter when processing RXA data.) 0x1: ENABLE (Enable CW Notch Filter when processing RXA data.)
3	CW_EN_RXA	Enables CW notch processing when the AGC is in states 2,3 or 6. 0x0: DISABLE (Disable CW Notch Filter when processing RXA preamble.) 0x1: ENABLE (Enable CW Notch Filter when processing RXA preamble.)
2	DC_DIS	Disables the use of the Rxfir with a DC notch. Note that this bitfield should be set in conjunction with the RACTL's rxfir_scaling_coeff register. 0x0: ENABLE (Enable DC Notch Filter.) 0x1: DISABLE (Disable DC Notch Filter.)
1	RADAR_DETECT_DIS	0x1: DISABLE (Disable use of CW detector during radar detection.) 0x0: ENABLE (Enable use of CW detector during radar detection .)
0	PKT_DETECT_DIS	0x1: DISABLE (Disable use of CW detects to abort packet detects.) 0x0: ENABLE (Enable use of CW detects to abort packet detects. .)

0x0A013C18 WCSS_A_AGC_CW_NOTCH_TIMEOUT

Type: RW

Reset State: 0x0064

The CW notch filter applies a notch to the receiver input signal at a frequency as measured by the CW detector. The notch is applied until the CW detector passes a different value to the notch filter, or until the notch filter's built-in timer expires. When this timer expires the input signal bypasses the notch filter altogether. The timeout value of the timer is defined in this register.

WCSS_A_AGC_CW_NOTCH_TIMEOUT

Bits	Name	Description
8	DIS	Setting this field to 1 is equivalent to setting an infinite timeout value. When set, the cw notch index will remain the same until is set to a different value.
7:0	VAL	Timeout value. This value is multiplied by 2^{19} to get the number of 80 MHz clock cycles that make up the timeout time. 0x1: MINIMUM ($100 * 2^{19} = 0.65$ seconds) 0x64: DEFAULT ($1 * 2^{19} = 6.5$ milliseconds) 0xFF: MAXIMUM ($255 * 2^{19} = 1.67$ seconds)

0x0A013C1C WCSS_A_AGC_GAIN_MODE

Type: RW

Reset State: 0x0000

WCSS_A_AGC_GAIN_MODE

Bits	Name	Description
1	MULT_STEP	This bit defines if only a single COARSE_STEP or SAT_STEP is made or if multiple steps are possible. 0x0: SING (Single sat/coarse gain step) 0x1: MULT (Multiple sat/coarse gain steps)
0	USE_RXFIR_PWR	Setting this field to 1 will cause the gain computation to come from the power measured in the RXFIR power detector instead of the ADC power detector.

0x0A013C24 WCSS_A_AGC_GAINSET0

Type: RW

Reset State: 0x0000

Allows to break AGC gain setting loop and manually override AGC setting of chain 0. For debugging purposes.

WCSS_A_AGC_GAINSET0

Bits	Name	Description
7	OVERRIDE	Override bit. 0x0: NORMAL (automatic gain control) 0x1: OVERRIDE (manual gain setting)
6:0	GAIN	Gain setting.

0x0A013C28 WCSS_A_AGC_GAINSET_WRITE**Type:** W**Reset State:** 0x0000

When a 1 is written to this register, the gain registers of the RFIC(s) are loaded with the values stored in bit [3:0] of registers GAINSET0. 0, provided that the override bit [4] these registers is set. At the moment that these registers are written, the gain that is programmed in the RFIC receivers will remain at its previously programmed value. Writing to this register enforces a write of the gain values to the RFIC gain registers, which would otherwise happen only when the AGC decides to change gain when a packet is received or a strong signal clips the RF frontend, or when the AGC is reset (through RX_RESET signal, SLEEP signal, packet transmission or by writing to AGC_RESET register. On the chains on which the override bit is not set, the current gain remains unchanged. This register is provided for debugging purposes. This register cannot be read back

WCSS_A_AGC_GAINSET_WRITE

Bits	Name	Description
0	OVERRIDE	Gain write pulse bit. 0x0: NORMAL (Idle) 0x1: OVERRIDE (Write gain settings to the RFIC)

0x0A013C2C WCSS_A_AGC_STAT_CTRL**Type:** RW**Reset State:** 0x0003

Control for AGC specific stat info

WCSS_A_AGC_STAT_CTRL

Bits	Name	Description
1	HTSTS_RSSI_EN	Enables RSSI measurements on (V)HT-STS symbol if there is one. Otherwise it will only use RSSI from the L-LTF.
0	RSSI_TYPE	0x0: ADC (Output ADC RSSI) 0x1: RXFIR (Output RXFIR RSSI)

0x0A013C30 WCSS_A_AGC_SUBBAND_CONFIG**Type:** RW**Reset State:** 0x0000

Sets subband configuration.

WCSS_A_AGC_SUBBAND_CONFIG

Bits	Name	Description
3:2	STG3_SUBBAND	Selects the subband location for the stage 3 RxFIR filter. 0x0: LOWER 0x1: UPPER 0x2: CENTER 0x3: RESERVED
1:0	STG2_SUBBAND	Selects the subband location for the stage 2 RxFIR filter. 0x0: LOWER 0x1: UPPER 0x2: CENTER 0x3: RESERVED

0x0A013C34 WCSS_A_AGC_CHANNEL_FREQ**Type:** RW**Reset State:** 0x096C

This stores the channel frequency in MHz is stored used to calculate resampler offset for 11b operation. This register needs to be reprogrammed every time the MAC switches to a different RF channel. Width is 13 bits, so 11b mode can also operate in 5 GHz band, if the need arises.

WCSS_A_AGC_CHANNEL_FREQ

Bits	Name	Description
12:0	FREQ	Channel frequency 0x96C: CH1 (Channel 1 (2412 MHz)) 0x971: CH2 (Channel 2 (2417 MHz)) 0x976: CH3 (Channel 3 (2422 MHz)) 0x97B: CH4 (Channel 4 (2427 MHz)) 0x980: CH5 (Channel 5 (2432 MHz)) 0x985: CH6 (Channel 6 (2437 MHz)) 0x98A: CH7 (Channel 7 (2442 MHz)) 0x98F: CH8 (Channel 8 (2447 MHz)) 0x994: CH9 (Channel 9 (2452 MHz)) 0x999: CH10 (Channel 10 (2457 MHz)) 0x99E: CH11 (Channel 11 (2462 MHz)) 0x9A3: CH12 (Channel 12 (2467 MHz)) 0x9A8: CH13 (Channel 13 (2472 MHz)) 0x9B4: CH14 (Channel 14 (2484 MHz))

0x0A013C38 WCSS_A_AGC_N_ACTIVE**Type:** RW**Reset State:** 0x0001

Specifies number of receive chains used to receive a packet.

WCSS_A_AGC_N_ACTIVE

Bits	Name	Description
0	NUMBER	Receive chains.

0x0A013C3C WCSS_A_AGC_N_LISTEN**Type:** RW**Reset State:** 0x0011

Specifies number of receive chains used to listen for a packet.

WCSS_A_AGC_N_LISTEN

Bits	Name	Description
4	RF_ANT_EN	If number of listen chains is 0, then this specifies which RF antennas to enable during listen mode.
0	NUMBER	Listen chains.

0x0A013C40 WCSS_A_AGC_N_MEASURE**Type:** RW**Reset State:** 0x0001

Specifies number of receive chains that is switched on to measure power on.

WCSS_A_AGC_N_MEASURE

Bits	Name	Description
0	NUMBER	Measure chains.

0x0A013C44 WCSS_A_AGC_N_CAPTURE**Type:** RW**Reset State:** 0x0011

Specifies number of receive chains used to capture a packet.

WCSS_A_AGC_N_CAPTURE

Bits	Name	Description
4	RF_ANT_EN	If number of capture chains is 0, then this specifies which RF antennas to enable during capture mode.
0	NUMBER	Receive chains.

0x0A013C48 WCSS_A_AGC_CCA_MODE**Type:** RW**Reset State:** 0x0B6D

Determines how the CCA signal from the PHY to the MAC is generated.

WCSS_A_AGC_CCA_MODE

Bits	Name	Description
12	FORCE_TX_CCA_IDLE	Setting to 1 forces the Tx CCA to be idle all the time. For debug purposes only.

WCSS_A_AGC_CCA_MODE (cont.)

Bits	Name	Description
11:9	SB3	Clear Channel Assessment Mode for channel subband 3 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD
8:6	SB2	Clear Channel Assessment Mode for channel subband 2 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD
5:3	SB1	Clear Channel Assessment Mode for channel subband 1 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD
2:0	SB0	Clear Channel Assessment Mode for channel subband 0 0x0: CLEAR 0x1: BUSY 0x2: GI 0x3: ED_OR_GI 0x4: GI_OR_CS_AND_CD 0x5: ED_OR_GI_AND_CS_AND_CD

0x0A013C4C WCSS_A_AGC_CCA_GI_DET_CFG**Type:** RW**Reset State:** 0x017D**WCSS_A_AGC_CCA_GI_DET_CFG**

Bits	Name	Description
9:1	TH_LGI	
0	DIS	Disable for the GI-based cca detector.

0x0A013C50 WCSS_A_AGC_TH_CD20**Type:** RW**Reset State:** 0x0000

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds this threshold, then the carrier detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_CD20

Bits	Name	Description
6:0	TH	CD Threshold. Default value (0 = -?? dB below max level).

0x0A013C54 WCSS_A_AGC_TH_CD40**Type:** RW**Reset State:** 0x0000

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds this threshold, then the carrier detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_CD40

Bits	Name	Description
6:0	TH	CD Threshold. Default value (0 = -?? dB below max level).

0x0A013C58 WCSS_A_AGC_TH_CD80**Type:** RW**Reset State:** 0x0000

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds this threshold, then the carrier detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_CD80

Bits	Name	Description
6:0	TH	CD Threshold. Default value (0 = -?? dB below max level).

0x0A013C5C WCSS_A_AGC_TH_CS20**Type:** RW**Reset State:** 0x0012

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds the carrier detect threshold, and the received energy also exceeds the carrier sense threshold, then the carrier sense flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_CS20

Bits	Name	Description
6:0	TH	CS Threshold Default value (-82 dBm)

0x0A013C60 WCSS_A_AGC_TH_CS40**Type:** RW**Reset State:** 0x0012

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds the carrier detect threshold, and the received energy also exceeds the carrier sense threshold, then the carrier sense flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_CS40

Bits	Name	Description
6:0	TH	CS Threshold Default value (-82 dBm)

0x0A013C64 WCSS_A_AGC_TH_CS80**Type:** RW**Reset State:** 0x0012

If the 11a or 11b packet correlator detects a packet and the RSSI on receive Chain 0 exceeds the carrier detect threshold, and the received energy also exceeds the carrier sense threshold, then the carrier sense flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_CS80

Bits	Name	Description
6:0	TH	CS Threshold Default value (-82 dBm)

0x0A013C68 WCSS_A_AGC_TH_EDET**Type:** RW**Reset State:** 0x2626

If the RSSI on receive chain 0 exceeds this threshold then the energy detect flag is set. Depending on the value of the CCA mode register this determines the behavior of the CCA signal from the PHY to the MAC. Value 8'hff is used to disable this check.

WCSS_A_AGC_TH_EDET

Bits	Name	Description
14:8	TH20	ED Threshold. Default value (-62 dBm)
6:0	TH40	ED Threshold. Default value (-62 dBm)

0x0A013C6C WCSS_A_AGC_D_AGC_A**Type:** RW**Reset State:** 0x0000

This latency is the sum of three components. The ADC latency, the latency through the FIR and CAL module and the latency for AGC 11a processing, which is determined by interference locator processing latency. Ranges from 0 to 1.575 micro seconds.

WCSS_A_AGC_D_AGC_A

Bits	Name	Description
5:0	DELAY	Propagation time in 80/40MHz dynamic clocks.

0x0A013C70 WCSS_A_AGC_D_AGC_B**Type:** RW**Reset State:** 0x0006

This latency is the sum of two components. The ADC latency, and the latency through the FIR and CAL module. Ranges from 0 to 1.575 micro seconds.

WCSS_A_AGC_D_AGC_B

Bits	Name	Description
5:0	DELAY	Propagation time in 50ns units. Default value is 6, corresponding to 300ns.

0x0A013C74 WCSS_A_AGC_RSSI_OFFSET0**Type:** RW**Reset State:** 0x003A

This register holds an offset value (determined at manufacturing time) that is used to translate rssi values to dBm values as measured at the antenna input. The same offset is used to correct both the ADC and FIR RSSI.

WCSS_A_AGC_RSSI_OFFSET0

Bits	Name	Description
7:0	OFFSET	Offset is a 2cc encoded number that is added to the rssi computed by the power module.

0x0A013C78 WCSS_A_AGC_RSSI_BT_OFFSET0**Type:** RW**Reset State:** 0x0000

When a Bluetooth transmission takes place the RSSI on one of the receive antennae is reduced. This register is used to compensate for that attenuation change so that the reported RSSI is the true dBm number at the antenna.

WCSS_A_AGC_RSSI_BT_OFFSET0

Bits	Name	Description
7:0	OFFSET	Offset is a 2cc encoded number that is added to the rssi computed by the power module.

0x0A013C7C WCSS_A_AGC_CLIP_COUNT**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between CORR state and GAIN_SETTLE state due to ADC clip events.

WCSS_A_AGC_CLIP_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C80 WCSS_A_AGC_SAT_COUNT**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between CORR state and GAIN_SETTLE state due to RF sat events.

WCSS_A_AGC_SAT_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C84 WCSS_A_AGC_PIP_COUNT**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts the number of packet in packet detection (power_jum_det during some of the states)

WCSS_A_AGC_PIP_COUNT

Bits	Name	Description
7:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C88 WCSS_A_AGC_RXA_NOT_AVALID_COUNT**Type:** W**Reset State:** 0x00000000

BTCF not_avalid signal

WCSS_A_AGC_RXA_NOT_AVALID_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C8C WCSS_A_AGC_RXA_HDR_INVALID_COUNT**Type:** W**Reset State:** 0x00000000

RXA header invalid counter.

WCSS_A_AGC_RXA_HDR_INVALID_COUNT

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C90 WCSS_A_AGC_RXB_NO_B_PKT_DET_COUNT**Type:** W**Reset State:** 0x00000000**WCSS_A_AGC_RXB_NO_B_PKT_DET_COUNT**

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C94 WCSS_A_AGC_RXB_INV_HDR_COUNT**Type:** W**Reset State:** 0x00000000**WCSS_A_AGC_RXB_INV_HDR_COUNT**

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C98 WCSS_A_AGC_RXB_ILL_HDR_COUNT**Type:** W**Reset State:** 0x00000000**WCSS_A_AGC_RXB_ILL_HDR_COUNT**

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013C9C WCSS_A_AGC_COARSE_DCO_UPDATE_COUNTER**Type:** W**Reset State:** 0x00000000

WCSS_A_AGC_COARSE_DCO_UPDATE_COUNTER

Bits	Name	Description
7:0	VALUE	Coarse DCO measurement update counter.

0x0A013CA0 WCSS_A_AGC_FALSE_AC_ABORT_COUNT**Type:** W**Reset State:** 0x00000000

Counts number of aborts of legacy packets that occur due to clip events in potential VHT-STS.

WCSS_A_AGC_FALSE_AC_ABORT_COUNT

Bits	Name	Description
7:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013CA4 WCSS_A_AGC_LATE_AC_DET_COUNT**Type:** W**Reset State:** 0x00000000

Counts number of late 11AC detects that cause missed VHT-STS gain commands.

WCSS_A_AGC_LATE_AC_DET_COUNT

Bits	Name	Description
7:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013CA8 WCSS_A_AGC_CCA_PKTDET_STATUS**Type:** R**Reset State:** 0x00000000

Samples the current value of the CCA and pktdet flags

WCSS_A_AGC_CCA_PKTDET_STATUS

Bits	Name	Description
6	LSIG_TXOP	
5	EARLY_PKTDET_N	
4	PKTDET_N	

WCSS_A_AGC_CCA_PKTDET_STATUS (cont.)

Bits	Name	Description
3:0	CCA	

0x0A013CAC WCSS_A_AGC_SAMPLE_ADC_I0**Type:** R**Reset State:** 0x00000000**WCSS_A_AGC_SAMPLE_ADC_I0**

Bits	Name	Description
11	OVFL	Overflow bit. 0x0: NO_OVFL (No overflow) 0x1: OVFL (Overflow)
10:0	ADC	ADC output, offset binary encoded ADC Chain 0 i output.

0x0A013CB0 WCSS_A_AGC_SAMPLE_ADC_Q0**Type:** R**Reset State:** 0x00000000**WCSS_A_AGC_SAMPLE_ADC_Q0**

Bits	Name	Description
11	OVFL	Overflow bit. 0x0: NO_OVFL (No overflow) 0x1: OVFL (Overflow)
10:0	ADC	ADC output, offset binary encoded ADC Chain 0 q output.

0x0A013CB4 WCSS_A_AGC_ADC_RSSI0**Type:** R**Reset State:** 0x00000000

Read out RSSI measured right after ADC0 while not receiving a packet. Invalid bit indicates that RSSI is not current, since a packet is being received. The value is the RSSI stored just before the AGC detected the packet.

WCSS_A_AGC_ADC_RSSI0

Bits	Name	Description
8	NAV_BUSY	NAV status which helps software to allow/ignore the sampled rssi value for 11k measurements. 0x0: IDLE (NAV idle) 0x1: BUSY (NAV busy)
7	INVALID	RSSI0 not current 0x0: VALID (RSSI valid on antenna 0) 0x1: INVALID (RSSI invalid on antenna 0)
6:0	RSSI	RSSI measurement on Chain 0 ranging from 0 (lowest RSSI) to 113 (highest RSSI), measured in dB.

0x0A013CB8 WCSS_A_AGC_FIR_RSSI0**Type:** R**Reset State:** 0x00000000

Read out RSSI measured after FIR while not receiving a packet. Invalid bit indicates that RSSI is not current, since a packet is being received. The value is the RSSI stored just before the AGC detected the packet.

WCSS_A_AGC_FIR_RSSI0

Bits	Name	Description
8	NAV_BUSY	NAV status which helps software to allow/ignore the sampled rssi value for 11k measurements. 0x0: IDLE (NAV idle) 0x1: BUSY (NAV busy)
7	INVALID	RSSI0 not current 0x0: VALID (RSSI valid on antenna 0) 0x1: INVALID (RSSI invalid on antenna 0)
6:0	RSSI	RSSI measurement on Chain 0 ranging from 0 (lowest RSSI) to 113 (highest RSSI), measured in dB.

0x0A013CBC WCSS_A_AGC_COARSE_DCO_CHAIN0_REAL**Type:** R**Reset State:** 0x0000

This register stores the measured DC offset value from the AGC_POWER module if the value exceeds the th_dco_cal parameter during CORR state and (rx_gain == INIT_GAIN). The DC offset is measured from the ADC data with the LSB truncated.

WCSS_A_AGC_COARSE_DCO_CHAIN0_REAL

Bits	Name	Description
9:0	VALUE	Value of DC offset on the real component of chain 0 measured by the AGC_POWER module

0x0A013CC0 WCSS_A_AGC_COARSE_DCO_CHAIN0_IMAG**Type:** R**Reset State:** 0x0000

This register stores the measured DC offset value from the AGC_POWER module if the value exceeds the th_dco_cal parameter during CORR state and (rx_gain == INIT_GAIN). The DC offset is measured from the ADC data with the LSB truncated.

WCSS_A_AGC_COARSE_DCO_CHAIN0_IMAG

Bits	Name	Description
9:0	VALUE	Value of DC offset on the image component of chain 0 measured by the AGC_POWER module

0x0A013CC4 WCSS_A_AGC_INIT_GAIN**Type:** RW**Reset State:** 0x0048

Initial gain setting in 1dB steps.

WCSS_A_AGC_INIT_GAIN

Bits	Name	Description
6:0	GAIN	Gain setting in 1dB steps.

0x0A013CC8 WCSS_A_AGC_MAX_GAIN**Type:** RW**Reset State:** 0x0048

maximum gain that can be commanded to RF ASIC.

WCSS_A_AGC_MAX_GAIN

Bits	Name	Description
6:0	GAIN	For RFIC operation the 7 bits denote 1 dB steps.

0x0A013CCC WCSS_A_AGC_GAIN_OFFSET0**Type:** RW**Reset State:** 0x0000

receiver gain offset in 1dB steps per chain

WCSS_A_AGC_GAIN_OFFSET0

Bits	Name	Description
4:0	VAL	

0x0A013CD0 WCSS_A_AGC_TR_SW_GAIN_THRESH0**Type:** RW**Reset State:** 0x0000

The T/R switch is driven to transmit mode whenever the commanded gain index is below this threshold. Setting this to 0 effectively disables this.

WCSS_A_AGC_TR_SW_GAIN_THRESH0

Bits	Name	Description
6:0	GAIN	

0x0A013CD4 WCSS_A_AGC_SAT_STEP**Type:** RW**Reset State:** 0x0072

The sat_step field is used to specify the step used to gain the RF Frontend down if the RF is saturated. The same value is used to step up the gain if the signal energy is below TH_NO_SIGNAL. This gain step is specified in multiples of 2dB from 0 dB to 128 dB. The enable field is used to switch this functionality on or off.

WCSS_A_AGC_SAT_STEP

Bits	Name	Description
7	IGNORE_ADC_CLIP	Normally, a sat step is only taken if a digital (or ADC) clip is also seen at the same time, but if you set this bit to 1, then only the RF sat flag is used.
6	SAT_STEP_EN	Allow AGC to make gain step when in Vega mode RF frontend is in saturation. 0x0: DISABLE (Saturated gain step disabled) 0x1: ENABLE (Saturated gain step enabled)
5:0	SAT_STEP	Coarse gain step. Default value is 25, or 50dB step for Vega mode

0x0A013CD8 WCSS_A_AGC_COARSE_STEP_HT**Type:** RW**Reset State:** 0x0514

Coarse gain step. Used to step gain down if one chain's ADCs clip. Used to step up if the signal energy is below TH_NO_SIGNAL. Specified in multiples of 4dB steps, from 0 dB to 60 dB.

WCSS_A_AGC_COARSE_STEP_HT

Bits	Name	Description
14	VHT_STS_FINE_GAIN_SET_DIS	Enable VHT-STS fine gain setting 0x1: DISABLE (Disable VHT-STS fine gain setting.) 0x0: ENABLE (Enable VHT-STS fine gain setting)
13	VHT_STS_COARSE_GAIN_SET_DIS	Enable VHT-STS coarse gain setting 0x1: DISABLE (Disable VHT-STS coarse gain setting.) 0x0: ENABLE (Enable VHT-STS coarse gain setting)
12	HT_STS_GAIN_SET_DIS	Enable HT-STS gain setting 0x1: DISABLE (Disable HT-STS gain setting.) 0x0: ENABLE (Enable HT-STS gain setting)
11:6	VHTSTS_STEP	Coarse gain step for 2nd STF in mixed mode packets.
5:0	HTSTS_STEP	Coarse gain step.

0x0A013CDC WCSS_A_AGC_COARSE_STEP**Type:** RW**Reset State:** 0x0059

Coarse gain step. Used to step gain down if one chain's ADCs clip. Used to step up if the signal energy is below TH_NO_SIGNAL. Specified in multiples of 4dB steps, from 0 dB to 60 dB.

WCSS_A_AGC_COARSE_STEP

Bits	Name	Description
6	COARSE_STEP_EN	Allow AGC to make coarse gain step when digital clip is detected. 0x0: DISABLE (Coarse gain step disabled) 0x1: ENABLE (Coarse gain step enabled)
5:0	COARSE_STEP	Coarse gain step.

0x0A013CE0 WCSS_A_AGC_MAX_POWER_DIFF**Type:** RW**Reset State:** 0x0004

The value in this register specifies maximum power difference. If the received power on all any antenna is this much less than the power on the strongest antenna, then the AGC limits the gain for the chain with the less power to that corresponding with a power of the strongest power minus the value in this register. This threshold avoids gaining up receive chains with weak signal and thereby blowing up noise. antenna.

WCSS_A_AGC_MAX_POWER_DIFF

Bits	Name	Description
3:0	DIFFERENCE	Maximum power difference in 4 dB steps. From 0 .. 14*4=56 dB

0x0A013CE4 WCSS_A_AGC_TARGET_BO_ACTIVE**Type:** RW**Reset State:** 0x0020

Target Backoff for Listen chains. The gain is set this amount of dBs below the gain that would fully saturate the receiver. The backoff is specified in 0.5 dB steps.

WCSS_A_AGC_TARGET_BO_ACTIVE

Bits	Name	Description
5:0	BACK_OFF	Backoff value. Default backoff is 32, or 16 dB.

0x0A013CE8 WCSS_A_AGC_TARGET_BO_INACTIVE**Type:** RW**Reset State:** 0x0024

Target Backoff for Receive chains, that are not listen chains. The gain is set this amount of dBs below the gain that would fully saturate the receiver. This backoff is typically higher than that of listen antennas to accommodate the unknown upfading on the inactive receive chains. The backoff is specified in 0.5 dB steps.

WCSS_A_AGC_TARGET_BO_INACTIVE

Bits	Name	Description
5:0	BACK_OFF	Backoff value. Default backoff is 36, i.e. 18 dB.

0x0A013CEC WCSS_A_AGC_TH_CLIP_HIGH

Type: RW

Reset State: 0x0734

If the output of any of the ADCs is greater than this value the clip flag of the corresponding ADC is asserted.

WCSS_A_AGC_TH_CLIP_HIGH

Bits	Name	Description
10:0	THRESHOLD	Clip threshold in offset binary. Example: if the 2's complement threshold is 400(0x190), then the 11-bit offset binary code is $400 + 1024 = 1424$, +800 corresponds to 1824

0x0A013CF0 WCSS_A_AGC_TH_CLIP_LOW

Type: RW

Reset State: 0x00CC

If the output of any of the ADCs is less than this value the clip flag of the corresponding ADC is asserted.

WCSS_A_AGC_TH_CLIP_LOW

Bits	Name	Description
10:0	THRESHOLD	Clip threshold in offset binary. Example: if the 2's complement threshold is -400, then the 11-bit offset binary code is $-400 + 1024 = 624$. -800 corresponds to 224

0x0A013CF4 WCSS_A_AGC_TH_SIGNAL_HIGH

Type: RW

Reset State: 0x00B4

AGC compares power with this threshold. If power is higher, a coarse gain reduction is done. In steps of 16384 (2^{14}).

WCSS_A_AGC_TH_SIGNAL_HIGH

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 110 (1802240).

0x0A013CF8 WCSS_A_AGC_TH_SIGNAL_LOW

Type: RW

Reset State: 0x0046

AGC compares power with this threshold. If power is lower, a coarse gain reduction is done if the ADCs clip. Specified in steps of 1024 (2^{10}).

WCSS_A_AGC_TH_SIGNAL_LOW

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 60 (61440).

0x0A013CFC WCSS_A_AGC_TH_HTSTS_CLIP

Type: RW

Reset State: 0x006E

Minimum ADC power during HT-STTS needed for clip detection.

WCSS_A_AGC_TH_HTSTS_CLIP

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 110 (1802240).

0x0A013D00 WCSS_A_AGC_TH_VHTSTS_CLIP

Type: RW

Reset State: 0x006E

Minimum ADC power during VHT-STTS needed for clip detection.

WCSS_A_AGC_TH_VHTSTS_CLIP

Bits	Name	Description
7:0	THRESHOLD	Power threshold. Default value 110 (1802240).

0x0A013D04 WCSS_A_AGC_TH_POWER_CLIP**Type:** RW**Reset State:** 0x003F

Used to do extra gain reduction if an antenna is clipping, but there is no time to do a coarse step.

WCSS_A_AGC_TH_POWER_CLIP

Bits	Name	Description
5:0	THLD	Power clip threshold.

0x0A013D08 WCSS_A_AGC_SAT_DELAY**Type:** RW**Reset State:** 0x0010**WCSS_A_AGC_SAT_DELAY**

Bits	Name	Description
5:0	TIME	

0x0A013D0C WCSS_A_AGC_CLIP_WINDOW**Type:** RW**Reset State:** 0x0000**WCSS_A_AGC_CLIP_WINDOW**

Bits	Name	Description
11:6	THRESHOLD	Threshold for the minimum number of clips needed in the window for a true clip to be detected.
5:0	TIME	Window size in 80MHz clocks that clips are monitored.

0x0A013D10 WCSS_A_AGC_TH_NO_SIGNAL**Type:** RW**Reset State:** 0x0001

Decision Threshold for absence of signal energy, which will result in the AGC stepping up the gain, if it is not already at its maximum setting.

WCSS_A_AGC_TH_NO_SIGNAL

Bits	Name	Description
7:0	THRESHOLD	Detection threshold. Default value 1.

0x0A013D14 WCSS_A_AGC_TH_DCO_CAL**Type:** RW**Reset State:** 0x000A

This register holds the RSSI threshold to trigger capture of the DCO value measured by AGC_POWER during CORR state

WCSS_A_AGC_TH_DCO_CAL

Bits	Name	Description
6:0	THLD	Coarse DCO measurement threshold.

0x0A013D18 WCSS_A_AGC_DET_DATA_SHIFT**Type:** RW**Reset State:** 0x0005

Right shift the data by this amount

WCSS_A_AGC_DET_DATA_SHIFT

Bits	Name	Description
3:2	DET11A	Right shift the det11a detector input by this amount
1:0	DET11B	Right shift the det11b detector input by this amount

0x0A013D1C WCSS_A_AGC_TH_RXB_PWR_HIGH**Type:** RW**Reset State:** 0x0005

This threshold is used to by the AGC to set the digital AGC shift value for det11b and RXB.

WCSS_A_AGC_TH_RXB_PWR_HIGH

Bits	Name	Description
5:0	THLD	11B Digital AGC power setting threshold.

0x0A013D20 WCSS_A_AGC_TH_CW_LOW

Type: RW

Reset State: 0x0020

The CW detect threshold is set to this value if non of the RSSI values exceeds the th_cw_rssi threshold.

WCSS_A_AGC_TH_CW_LOW

Bits	Name	Description
7:0	THRESHOLD	CW detect threshold.

0x0A013D24 WCSS_A_AGC_TH_CW_HIGH

Type: RW

Reset State: 0x00C8

The CW interference detect threshold is set to this value if one or more of the RSSI values exceeds the th_cw_rssi threshold.

WCSS_A_AGC_TH_CW_HIGH

Bits	Name	Description
7:0	THRESHOLD	CW detect threshold.

0x0A013D28 WCSS_A_AGC_TH_CW_RSSI

Type: RW

Reset State: 0x000E

If one of the RSSI values exceeds this threshold, the cd detect threshold is set to th_cw_high. Otherwise the CW detect threshold is set to the_cw_low. The CW detect threshold is updated when an RXA packet or an RXB packet is received.

WCSS_A_AGC_TH_CW_RSSI

Bits	Name	Description
6:0	THRESHOLD	RSSI threshold.

0x0A013D2C WCSS_A_AGC_CW_MODE_DELAY**Type:** RW**Reset State:** 0x7D00

Specifies various delays for several operating modes of the CW detector

WCSS_A_AGC_CW_MODE_DELAY

Bits	Name	Description
15:8	RADAR_DET_DELAY	Delay before starting cs_det after a pulse detect

0x0A013D30 WCSS_A_AGC_TH_D0_A**Type:** RW**Reset State:** 0x0087

This registers sets the correlation threshold above which the AGC decides an 802.11a packet is being received.

WCSS_A_AGC_TH_D0_A

Bits	Name	Description
7:0	THRESHOLD	

0x0A013D34 WCSS_A_AGC_TH_D0_A_LOW**Type:** RW**Reset State:** 0x0078

This registers sets the correlation threshold above which the AGC decides an 802.11a packet with high SNR is being received. The purpose of this register is to have a more sensitive and hence faster packet detection, since high SNR signals require two coarse gain steps, which are time consuming.

WCSS_A_AGC_TH_D0_A_LOW

Bits	Name	Description
7:0	THRESHOLD	

0x0A013D38 WCSS_A_AGC_TH_D0_B**Type:** RW**Reset State:** 0x008C

This registers sets the correlation threshold above which the AGC decides an 802.11b packet is being received. It can be set lower than the threshold for 11a packets since there is a longer time interval to correlate over.

WCSS_A_AGC_TH_D0_B

Bits	Name	Description
7:0	THRESHOLD	

0x0A013D3C WCSS_A_AGC_TH_D0_B_TF_EST**Type:** RW**Reset State:** 0x0050

This registers sets the correlation threshold above which the AGC decides an 802.11b packet is being received during the timing and frequency estimation state. This is a reconfirmation test which reduces the false alarm rate of the AGC for 11b packets. It is generally set lower than the initial threshold for 11b packets since the correlator is to allow margin for a low correlation value which can occur at the moment the correlator output is sampled (at the end of the 10 us tf(time and frequency)-estimation interval).

WCSS_A_AGC_TH_D0_B_TF_EST

Bits	Name	Description
7:0	THLD	

0x0A013D40 WCSS_A_AGC_TH_D0_11N**Type:** RW**Reset State:** 0x005A

This registers sets the correlation threshold above which the AGC decides an 802.11n packet is being received

WCSS_A_AGC_TH_D0_11N

Bits	Name	Description
7:0	VAL	

0x0A013D44 WCSS_A_AGC_TH_D0_11N_LOW**Type:** RW**Reset State:** 0x0078

This registers sets the correlation threshold above which the AGC decides an 802.11n packet is being received

WCSS_A_AGC_TH_D0_11N_LOW

Bits	Name	Description
7:0	VAL	

0x0A013D48 WCSS_A_AGC_TH_D0_11AC**Type:** RW**Reset State:** 0x0064

This registers sets the correlation threshold above which the AGC decides an 802.11ac packet is being received

WCSS_A_AGC_TH_D0_11AC

Bits	Name	Description
7:0	VAL	

0x0A013D4C WCSS_A_AGC_TH_D0_11AC_LOW**Type:** RW**Reset State:** 0x005A

This registers sets the correlation threshold above which the AGC decides an 802.11ac packet is being received

WCSS_A_AGC_TH_D0_11AC_LOW

Bits	Name	Description
7:0	VAL	

0x0A013D50 WCSS_A_AGC_TH_MAXCORBA**Type:** RW**Reset State:** 0x0000

This registers sets the cross check correlation threshold above which the AGC decides between 802.11b vs 802.11a packet is being received

WCSS_A_AGC_TH_MAXCORBA

Bits	Name	Description
7:0	VAL	

0x0A013D54 WCSS_A_AGC_TH_MAXCOR40**Type:** RW**Reset State:** 0x00FF

This registers sets the cross check correlation threshold above which the AGC decides between 802.11n40 vs 802.11a packet is being received

WCSS_A_AGC_TH_MAXCOR40

Bits	Name	Description
7:0	VAL	

0x0A013D58 WCSS_A_AGC_TH_MAXCORA40**Type:** RW**Reset State:** 0x0050

This registers sets the cross check correlation threshold above which the AGC decides between 802.11a and a 802.11n packet is being received

WCSS_A_AGC_TH_MAXCORA40

Bits	Name	Description
7:0	VAL	

0x0A013D5C WCSS_A_AGC_TH_MAXCOR20**Type:** RW**Reset State:** 0x00FF

This registers sets the cross check correlation threshold above which the AGC decides between 802.11ac vs 802.11a packet is being received

WCSS_A_AGC_TH_MAXCOR20

Bits	Name	Description
10	DIS	
9:0	VAL	

0x0A013D60 WCSS_A_AGC_TH_MAXCORA80

Type: RW

Reset State: 0x001E

This registers sets the cross check correlation threshold above which the AGC decides between 802.11a and a 802.11n packet is being received

WCSS_A_AGC_TH_MAXCORA80

Bits	Name	Description
7:0	VAL	

0x0A013D64 WCSS_A_AGC_TH_MAXCORAB

Type: RW

Reset State: 0x0005

For a positive 802.11b packet detection, not only should the auto correlation value divided by the signal power exceed TH_D0_A (or TH_D0_A_LOW in high SNR), it should also exceed that of the 802.11b bandwidth packet detector multiplied by the value in this register, divided by 256. The default fraction of the double bandwidth detector output that the 802.11b detector should exceed is 0.5 (128/256).

WCSS_A_AGC_TH_MAXCORAB

Bits	Name	Description
7:0	THRESHOLD	

0x0A013D68 WCSS_A_AGC_C11B

Type: RW

Reset State: 0x00E2

Averaging Parameter for correlation metric of 11b detector. Allowed values are 200-255

WCSS_A_AGC_C11B

Bits	Name	Description
7:0	VAL	

0x0A013D6C WCSS_A_AGC_C11BP**Type:** RW**Reset State:** 0x00FD

Averaging Parameter for power metric of 11b detector. Allowed values are 200-255

WCSS_A_AGC_C11BP

Bits	Name	Description
7:0	VAL	

0x0A013D70 WCSS_A_AGC_TH_CAP_A**Type:** RW**Reset State:** 0x0032

Detection threshold for capture event when reception of current 11a packet has been aborted. Value 0 is disables this check.

WCSS_A_AGC_TH_CAP_A

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB).

0x0A013D74 WCSS_A_AGC_TH_CAP_B**Type:** RW**Reset State:** 0x0032

Detection threshold for capture event when reception of current 11b packet has been aborted. Value 0 is disables this check.

WCSS_A_AGC_TH_CAP_B

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB).

0x0A013D78 WCSS_A_AGC_TH_CAP_RXA**Type:** RW**Reset State:** 0x0032

Detection threshold for capture event when 11a packet is being received. Value 0 disables this check.

WCSS_A_AGC_TH_CAP_RXA

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB).

0x0A013D7C WCSS_A_AGC_TH_CAP_RXB**Type:** RW**Reset State:** 0x0032

Detection threshold for capture event when 11b packet is being received. Value 0 disables this check.

WCSS_A_AGC_TH_CAP_RXB

Bits	Name	Description
7:0	LEVEL_JUMP	Delta signal level. Default value 50 (7dB).

0x0A013D80 WCSS_A_AGC_TH_PIP_PWR_JUMP**Type:** RW**Reset State:** 0x0000

Threshold for power jump to detect for a packet-in-packet case

WCSS_A_AGC_TH_PIP_PWR_JUMP

Bits	Name	Description
7:0	VAL	

0x0A013D84 WCSS_A_AGC_TH_EOP_LVL_DROP**Type:** RW**Reset State:** 0x0010

Threshold for signal level drop to detect end of packet in the case of a corrupted length field.

WCSS_A_AGC_TH_EOP_LVL_DROP

Bits	Name	Description
7:0	EOP_LVL_DROP	Delta signal level Default value 16 (12dB).

0x0A013D88 WCSS_A_AGC_TH_CORR_DROP**Type:** RW**Reset State:** 0x0000

AGC compares power with this threshold. If power is lower, in correlation state then an 802.11a trigger is ignored.

WCSS_A_AGC_TH_CORR_DROP

Bits	Name	Description
7:0	THRESHOLD	Power drop threshold. Default value 0 (i.e. disabled).

0x0A013D8C WCSS_A_AGC_CORR_TIME**Type:** RW**Reset State:** 0x01E0

This register specifies the time, in increments of 25ns, which the AGC can spend correlating if an energy jump has been detected in the AGC state.

WCSS_A_AGC_CORR_TIME

Bits	Name	Description
11:0	TIME	Correlation Time.

0x0A013D90 WCSS_A_AGC_ALL_RX_ON_TIME**Type:** RW**Reset State:** 0x0019

Time to leave all antennas on after a set_all_rx command. Units are in 0.8us steps.

WCSS_A_AGC_ALL_RX_ON_TIME

Bits	Name	Description
5:0	DELAY	

0x0A013D94 WCSS_A_AGC_TRIGGER_DELAY**Type:** RW**Reset State:** 0x0014

Detector triggers are ignored for a time specified by this register after a set_all_rx command. This enables the detectors to build up a reliable power estimate.

WCSS_A_AGC_TRIGGER_DELAY

Bits	Name	Description
4:0	TIME	Delay in 100ns increments.

0x0A013D98 WCSS_A_AGC_PWR_NOTCH_ALPHA1**Type:** RW**Reset State:** 0x012C**WCSS_A_AGC_PWR_NOTCH_ALPHA1**

Bits	Name	Description
8:0	ALPHA	

0x0A013D9C WCSS_A_AGC_PWR_NOTCH_ALPHA2**Type:** RW**Reset State:** 0x01FF**WCSS_A_AGC_PWR_NOTCH_ALPHA2**

Bits	Name	Description
8:0	ALPHA	

0x0A013DA0 WCSS_A_AGC_PWR_NOTCH_T_ALPHA**Type:** RW**Reset State:** 0x0008**WCSS_A_AGC_PWR_NOTCH_T_ALPHA**

Bits	Name	Description
9	BYPASS	0x0: ENABLE (Enable pwr DC notch filter) 0x1: BYPASS (Bypass pwr DC notch filter)
8:0	TIME	

0x0A013DA4 WCSS_A_AGC_D_TX_SETTLE**Type:** RW**Reset State:** 0x0028

Ranges from 0 to 12.775 micro seconds.

WCSS_A_AGC_D_TX_SETTLE

Bits	Name	Description
8:0	DELAY	Propagation time in 25ns units.

0x0A013DA8 WCSS_A_AGC_D_UNSATURATED**Type:** RW**Reset State:** 0x0010

Gain settling delay for RF RX non-saturated RX FE. Settling time in increments of 25 ns (40 MHz samples) Ranges from 0 to 1.575 micro seconds.

WCSS_A_AGC_D_UNSATURATED

Bits	Name	Description
5:0	DELAY	Settling time in 25ns units.

0x0A013DAC WCSS_A_AGC_D_SATURATED**Type:** RW**Reset State:** 0x0010

Gain settling delay for RF RX saturated RX FE. Settling time in increments of 25 ns (40 MHz samples) Ranges from 0 to 1.575 micro seconds.

WCSS_A_AGC_D_SATURATED

Bits	Name	Description
5:0	DELAY	Settling time in 25ns units.

0x0A013DB0 WCSS_A_AGC_D_FIRANDCAL**Type:** RW**Reset State:** 0x0010

RXFIR and CAL propagation delay. Ranges from 0 to 1.575 micro seconds.

WCSS_A_AGC_D_FIRANDCAL

Bits	Name	Description
5:0	DELAY	Propagation time in 25ns units. Default value is 14, corresponding to 350 ns.

0x0A013DB4 WCSS_A_AGC_D_HT_STS_COARSE_MEAS**Type:** RW**Reset State:** 0x0028**WCSS_A_AGC_D_HT_STS_COARSE_MEAS**

Bits	Name	Description
7:0	TIME	Settling time in 25ns units.

0x0A013DB8 WCSS_A_AGC_D_HT_STS_FINE_MEAS**Type:** RW**Reset State:** 0x0064**WCSS_A_AGC_D_HT_STS_FINE_MEAS**

Bits	Name	Description
7:0	TIME	Settling time in 25ns units.

0x0A013DBC WCSS_A_AGC_D_VHT_STS_COARSE_MEAS**Type:** RW**Reset State:** 0x0028**WCSS_A_AGC_D_VHT_STS_COARSE_MEAS**

Bits	Name	Description
7:0	TIME	Settling time in 25ns units.

0x0A013DC0 WCSS_A_AGC_D_VHT_STS_FINE_MEAS**Type:** RW**Reset State:** 0x0066

WCSS_A_AGC_D_VHT_STS_FINE_MEAS

Bits	Name	Description
7:0	TIME	Settling time in 25ns units.

0x0A013DC4 WCSS_A_AGC_D_VHT_DET_TIME**Type:** RW**Reset State:** 0x008E**WCSS_A_AGC_D_VHT_DET_TIME**

Bits	Name	Description
7:0	TIME	Max time in 25ns units that VHT detection is allowed from the start of the VHT-STS.

0x0A013DC8 WCSS_A_AGC_SIFS_TIME_A**Type:** RW**Reset State:** 0x0028

This register specifies the time in 25 ns increments, that the receiver is insensitive after the reception of an IEEE802.11a packet. This value may be set to zero which increases false detection probability of ACK packets, but which allows receptions of packets with a non-standard interframe spacing.

WCSS_A_AGC_SIFS_TIME_A

Bits	Name	Description
9:0	SIFS_A	SIFS time. Default value is 40, or 1 micro seconds (16 us as per 11a standard - 4us CCA hangover time). 0x0: MIN (0 ns, minimum value.) 0x1: STEP (25 ns, step size value.) 0x3FF: MAX (25.57 us, maximum value.)

0x0A013DCC WCSS_A_AGC_SIFS_TIME_B**Type:** RW**Reset State:** 0x0028

This register specifies the time in 25 ns increments, that the receiver is insensitive after the reception of an IEEE802.11b packet. This value may be set to zero which increases false detection probability of ACK packet, but which allows receptions of packets with a non-standard interframe spacing.

WCSS_A_AGC_SIFS_TIME_B

Bits	Name	Description
9:0	SIFS_B	SIFS time. Default value is 40, or 1 micro seconds. 0x0: MIN (0 ns, minimum value.) 0x1: STEP (25 ns, step size value.) 0x3FF: MAX (25.57 us, maximum value.)

0x0A013DD0 WCSS_A_AGC_MAX_RX_TIME_A**Type:** RW**Reset State:** 0x01AD

Max receive time of an 11a packet in 12.8 us increments. Used to prevent lockup of the AGC state machine when it is unable to determine end of packet in the case of a corrupted length field when no end of packet level drop is detected.

WCSS_A_AGC_MAX_RX_TIME_A

Bits	Name	Description
11:0	MAX_RX_TIME	Max RX time. Default value $20+4096*8/6=5482$ (6 Mbit/s packet of 4096 bytes plus OFDM preamble) and $429*12.8=5491.2$)

0x0A013DD4 WCSS_A_AGC_MAX_RX_TIME_B**Type:** RW**Reset State:** 0x0A10

Max receive time of an 11b packet in 25.6 us increments. Used to prevent lockup of the AGC state machine when it is unable to determine end of packet in the case of a corrupted length field when no end of packet level drop is detected.

WCSS_A_AGC_MAX_RX_TIME_B

Bits	Name	Description
11:0	MAX_RX_TIME	Max RX time. Default value $192+4096*8=32960$ (1 Mbit/s packet of 4096 bytes plus long preamble) and $2576*12.8=32973$)

0x0A013DD8 WCSS_A_AGC_RTT_CFG**Type:** RW**Reset State:** 0x0000

RTT configuration register.

WCSS_A_AGC_RTT_CFG

Bits	Name	Description
4	ALWAYS_VAL_RX2TX	For debugging purposes only, this eliminates the need for the WMAC to validate the t3-t2 measurement.
3	MEAS_SIFS_EN	Enables reporting the SIFS time instead of delta between packet arrivals as required in 11v. This is for compatibility with the old RTT.
2	REF_TIMER_EN	Enables the reference timer used for absolute time measurements. This should always be enabled if RTT is enabled.
1:0	MODE	Sets the RTT mode of operation. 0x0: OFF 0x1: TX2RX 0x2: RX2TX 0x3: RESERVED

0x0A013DDC WCSS_A_AGC_RTT_SIFS_WINDOW**Type:** RW**Reset State:** 0xC878

Sets the min/max SIFS time that is allowed. Anything outside this window will be regarded as an invalid RTT measurement.

WCSS_A_AGC_RTT_SIFS_WINDOW

Bits	Name	Description
15:8	MAX_TIMEOUT	In 100ns steps.
7:0	MIN_TIMEOUT	In 100ns steps.

0x0A013DE0 WCSS_A_AGC_RTT_OFFSET_20**Type:** RW**Reset State:** 0x0000

RTT offset calibration value for 20 MHz packets

WCSS_A_AGC_RTT_OFFSET_20

Bits	Name	Description
15:8	RX_OFFSET	Signed number in 12.5ns steps.
7:0	TX_OFFSET	Unsigned number in 12.5ns steps.

0x0A013DE4 WCSS_A_AGC_RTT_OFFSET_40**Type:** RW**Reset State:** 0x0000

RTT offset calibration value for 40 MHz packets

WCSS_A_AGC_RTT_OFFSET_40

Bits	Name	Description
15:8	RX_OFFSET	Signed number in 12.5ns steps.
7:0	TX_OFFSET	Unsigned number in 12.5ns steps.

0x0A013DE8 WCSS_A_AGC_RTT_OFFSET_80**Type:** RW**Reset State:** 0x0000

RTT offset calibration value for 80 MHz packets

WCSS_A_AGC_RTT_OFFSET_80

Bits	Name	Description
15:8	RX_OFFSET	Signed number in 12.5ns steps.
7:0	TX_OFFSET	Unsigned number in 12.5ns steps.

0x0A013DEC WCSS_A_AGC_RTT_VALID_COUNT**Type:** W**Reset State:** 0x00000000**WCSS_A_AGC_RTT_VALID_COUNT**

Bits	Name	Description
7:0	COUNT	Counts number of RTT valids.

0x0A013DF0 WCSS_A_AGC_RTT_DELTA_MEAS**Type:** R**Reset State:** 0x00000000

WCSS_A_AGC_RTT_DELTA_MEAS

Bits	Name	Description
13:0	TIME	In 12.5ns steps.

0x0A013DF4 WCSS_A_AGC_RTT_REF_TIME_MEAS_LS16**Type:** R**Reset State:** 0x00000000**WCSS_A_AGC_RTT_REF_TIME_MEAS_LS16**

Bits	Name	Description
15:0	TIME	In 12.5ns steps.

0x0A013DF8 WCSS_A_AGC_RTT_REF_TIME_MEAS_MS16**Type:** R**Reset State:** 0x00000000**WCSS_A_AGC_RTT_REF_TIME_MEAS_MS16**

Bits	Name	Description
15:0	TIME	In 12.5ns steps.

0x0A013DFC WCSS_A_AGC_RDET_RSSI_THRESHOLD**Type:** RW**Reset State:** 0x007F

If the maximum of the N_LISTEN RSSI inputs as calculated by the power block in the AGC exceeds the value in the up threshold field of this register, a start of pulse is flagged to the pulse train detector. When the max RSSI sinks below the value of the down threshold field, the end of pulse is flagged. If both thresholds are set to 0, the analog pulse detector (in the Mars RF ASIC) is used instead. The start of the pulse is detected on the rising edge of this signal. The end of the pulse is detected on the falling edge.

WCSS_A_AGC_RDET_RSSI_THRESHOLD

Bits	Name	Description
13:7	DET_THLD_DN	Pulse detection threshold.
6:0	DET_THLD_UP	Pulse detection threshold.

0x0A013E00 WCSS_A_AGC_RDET_MIN_IAT_WRITE**Type:** RW**Reset State:** 0x6F7C

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. Pulse that arrive after the previous pulse within a time less than the value in this register are ignored by the radar pulse train detector. If set equal to max_iat, then this register has no effect on the operation of the radar detector. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

WCSS_A_AGC_RDET_MIN_IAT_WRITE

Bits	Name	Description
15:0	MIN_IAT	Minimum Inter-arrival time. default is 0.499 ms (radar type 3). 0x1: STEP_SIZE (6.4 us)

0x0A013E04 WCSS_A_AGC_RDET_MAX_IAT_WRITE**Type:** RW**Reset State:** 0x01BF

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. If this time is exceeded, then the radar detector assumes the pulse train has ended and checks whether more than min_pulse_train_count1 pulses have been counted. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

WCSS_A_AGC_RDET_MAX_IAT_WRITE

Bits	Name	Description
15:0	MAX_IAT	Maximum Inter-arrival time. Default is 3.072 (ms radar type 1). 0x1: STEP_SIZE (6.4 us)

0x0A013E08 WCSS_A_AGC_RDET_PULSE_WIDTH_MARGIN_WRITE**Type:** RW**Reset State:** 0x0005

When the first pulse of a train arrives, its duration is stored. Subsequent pulses' durations are compared to this first one. If a pulse of a different length is encountered, the pulse train ends. The comparison uses a margin as defined by this register. The check performed is if $\text{abs}(\text{current_pulse_duration} - \text{first_pulse_duration}) \leq \text{this register}$ then the current pulse does not break the train, and the pulse counter is increased. This value gets written to the appropriate train detector selected by det_sel, with the write itself enabled using det_write (see register rdet_reset).

WCSS_A_AGC_RDET_PULSE_WIDTH_MARGIN_WRITE

Bits	Name	Description
7:0	PW_MRGN	Pulse width margin.

0x0A013E0C WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT1_WRITE**Type:** RW**Reset State:** 0x0004

If a radar pulse train ends because the maximum inter-arrival time has expired, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value gets written to the appropriate train detector selected by `det_sel`, with the write itself enabled using `det_write` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT1_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x0A013E10 WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT2_WRITE**Type:** RW**Reset State:** 0x0004

If a radar pulse train ends because a pulse of different duration as the first pulse in the train is detected, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value gets written to the appropriate train detector selected by `det_sel`, with the write itself enabled using `det_write` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT2_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x0A013E14 WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT3_WRITE**Type:** RW**Reset State:** 0x0004

If a radar a pulse is detected the number of pulses counted is increased. If the number of pulses counted is greater than or equal to this register's contents, then the radar detection flag is raised.

This value gets written to the appropriate train detector selected by `det_sel`, with the write itself enabled using `det_write` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT3_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x0A013E18 WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT4_WRITE

Type: RW

Reset State: 0x0000

If a pulse arrives before the minimum inter-arrival time has expired the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. Special values are provided to simply ignore radar pulses which arrive within the minimum arrival time or to reset the pulse counter without comparing the current pulse count with this register. This value gets written to the appropriate train detector selected by `det_sel`, with the write itself enabled using `det_write` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT4_WRITE

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Default is 0 0x0: NO_RESET (Ignore pulse, do not reset pulse counter) 0xFFFF: NO_CHECK (reset pulse counter, do not compare)

0x0A013E1C WCSS_A_AGC_RDET_MIN_RADAR_PULSE_WIDTH_WRITE

Type: RW

Reset State: 0x0012

Minimum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is less than or equal to this register's content, the pulse is ignored. This mechanism is to ensure that short glitches (for instance ripple on a pulse which is just on the `rss_i_threshold` level) or a rapidly switching clip detect signal are ignored. This value gets written to the appropriate train detector selected by `det_sel`, with the write itself enabled using `det_write` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_RADAR_PULSE_WIDTH_WRITE

Bits	Name	Description
15:0	MIN_PW	Minimum pulse width.

0x0A013E20 WCSS_A_AGC_RDET_MAX_RADAR_PULSE_WIDTH_WRITE**Type:** RW**Reset State:** 0x0016

Maximum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is greater than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that packet transmissions (typically of much longer duration as radar pulses) are not counted as radar pulses. Setting this register to 0 will disable the radar detector. This value gets written to the appropriate train detector selected by `det_sel`, with the write itself enabled using `det_write` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MAX_RADAR_PULSE_WIDTH_WRITE

Bits	Name	Description
15:0	MAX_PW	Maximum pulse width.

0x0A013E24 WCSS_A_AGC_RDET_MIN_IAT_READ**Type:** R**Reset State:** 0x00000000

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. Pulse that arrive after the previous pulse within a time less than the value in this register are ignored by the radar pulse train detector. If set equal to `max_iat`, then this value has no effect on the operation of the radar detector. This value is read from the appropriate train detector selected by `det_sel` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_IAT_READ

Bits	Name	Description
15:0	MIN_IAT	Minimum Inter-arrival time. default is 0.499 ms (radar type 3). 0x1: STEP_SIZE (6.4 us)

0x0A013E28 WCSS_A_AGC_RDET_MAX_IAT_READ**Type:** R**Reset State:** 0x00000000

This register defines the maximum inter-arrival time between radar pulses, measured in multiples of 128 samples. If this time is exceeded, then the radar detector assumes the pulse train has ended and checks whether more than `min_pulse_train_count1` pulses have been counted. This value is read from the appropriate train detector selected by `det_sel` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MAX_IAT_READ

Bits	Name	Description
15:0	MAX_IAT	Maximum Inter-arrival time. Default is 3.072 (ms radar type 1). 0x1: STEP_SIZE (6.4 us)

0x0A013E2C WCSS_A_AGC_RDET_PULSE_WIDTH_MARGIN_READ**Type:** R**Reset State:** 0x00000000

When the first pulse of a train arrives, its duration is stored. Subsequent pulses' durations are compared to this first one. If a pulse of a different length is encountered, the pulse train ends. The comparison uses a margin as defined by this register. The check performed is if $\text{abs}(\text{current_pulse_duration} - \text{first_pulse_duration}) \leq \text{this register}$ then the current pulse does not break the train, and the pulse counter is increased. This value is read from the appropriate train detector selected by `det_sel` (see register `rdet_reset`).

WCSS_A_AGC_RDET_PULSE_WIDTH_MARGIN_READ

Bits	Name	Description
7:0	PW_MRGN	Pulse width margin.

0x0A013E30 WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT1_READ**Type:** R**Reset State:** 0x00000000

If a radar pulse train ends because the maximum inter-arrival time has expired, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value is read from the appropriate train detector selected by `det_sel` (see register `rdet_reset`).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT1_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x0A013E34 WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT2_READ**Type:** R**Reset State:** 0x00000000

If a radar pulse train ends because a pulse of different duration as the first pulse in the train is detected, the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT2_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x0A013E38 WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT3_READ

Type: R

Reset State: 0x00000000

If a radar a pulse is detected the number of pulses counted is increased. If the number of pulses counted is greater than or equal to this register's contents, then the radar detection flag is raised. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT3_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold.

0x0A013E3C WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT4_READ

Type: R

Reset State: 0x00000000

If a pulse arrives before the minimum inter-arrival time has expired the current number of pulses counted is compared with this register. If the number of pulses is greater than or equal to this register's contents, then the radar detection flag is raised. Special values are provided to simply ignore radar pulses which arrive within the minimum arrival time or to reset the pulse counter without comparing the current pulse count with this register. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

WCSS_A_AGC_RDET_MIN_PULSE_TRAIN_COUNT4_READ

Bits	Name	Description
15:0	CNT_THLD	Pulse count threshold. Default is 0 0x0: NO_RESET (Ignore pulse, do not reset pulse counter) 0xFFFF: NO_CHECK (reset pulse counter, do not compare)

0x0A013E40 WCSS_A_AGC_RDET_MIN_RADAR_PULSE_WIDTH_READ**Type:** R**Reset State:** 0x00000000

Minimum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is less than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that short glitches (for instance ripple on a pulse which is just on the rssi_threshold level) or a rapidly switching clip detect signal are ignored. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

WCSS_A_AGC_RDET_MIN_RADAR_PULSE_WIDTH_READ

Bits	Name	Description
15:0	MIN_PW	Minimum pulse width.

0x0A013E44 WCSS_A_AGC_RDET_MAX_RADAR_PULSE_WIDTH_READ**Type:** R**Reset State:** 0x00000000

Maximum radar pulse width, specified in samples. When the end of a pulse is detected, its duration is compared to the contents of this registers. When the pulse duration is greater than or equal to the this register's content, the pulse is ignored. This mechanism is to ensure that packet transmissions (typically of much longer duration as radar pulses) are not counted as radar pulses. Setting this register to 0 will disable the radar detector. This value is read from the appropriate train detector selected by det_sel (see register rdet_reset).

WCSS_A_AGC_RDET_MAX_RADAR_PULSE_WIDTH_READ

Bits	Name	Description
15:0	MAX_PW	Maximum pulse width.

0x0A013E48 WCSS_A_AGC_RDET_RESET**Type:** RW**Reset State:** 0x08FF

Reset the radar detector to its initial state by writing a 1 followed by a zero to bit 0 in this register. Writing a 1 will disable the radar detector. The radar detector is disabled by default.

WCSS_A_AGC_RDET_RESET

Bits	Name	Description
14	DET_WRITE	Train detector APB write bit. 0x0: DIS (Disable APB write to train detectors) 0x1: EN (Enable APB write to train detectors)
13:11	RSSI_MODE	Configure RSSI combination mode. 0x0: RSSI0 (Use chain 0 rssi) 0x1: MAX_RSSI (Use max rssi of n_listen chains) 0x2: MIN_RSSI (Use min rssi of n_listen chains)
10:8	DET_SEL	Select train detector to program. 0x7: SEL7 (program train detector 7) 0x6: SEL6 (program train detector 6) 0x5: SEL5 (program train detector 5) 0x4: SEL4 (program train detector 4) 0x3: SEL3 (program train detector 3) 0x2: SEL2 (program train detector 2) 0x1: SEL1 (program train detector 1) 0x0: SEL0 (program train detector 0)
7:0	DET_RST	8'b0xxxxxx -> enable7 (Enable train detector 7) 8'b1xxxxxx -> disable7 (Disable train detector 7) 8'bx0xxxxx -> enable6 (Enable train detector 6) 8'bx1xxxxx -> disable6 (Disable train detector 6) 8'bxx0xxxx -> enable5 (Enable train detector 5) 8'bxx1xxxx -> disable5 (Disable train detector 5) 8'bx0xxxx -> enable4 (Enable train detector 4) 8'bx1xxxx -> disable4 (Disable train detector 4) 8'bxxx0xxx -> enable3 (Enable train detector 3) 8'bxxx1xxx -> disable3 (Disable train detector 3) 8'bxxx0xx -> enable2 (Enable train detector 2) 8'bxxx1xx -> disable2 (Disable train detector 2) 8'bxxxx0x -> enable1 (Enable train detector 1) 8'bxxxx1x -> disable1 (Disable train detector 1) 8'bxxxxx0 -> enable0 (Enable train detector and rest of radar detector) 8'bxxxxx1 -> disable0 (Disable train detector and rest of radar detector) Enable/Disable of radar detector and train detector instantiations.

0x0A013E4C WCSS_A_AGC_RDET_RADAR_DETECTED**Type:** R**Reset State:** 0x00000000

When this bit is set a radar pulse train has been detected. This bit must be reset by the radar detection (interrupt) services routine by writing a '1' into the dflag_rst register.

WCSS_A_AGC_RDET_RADAR_DETECTED

Bits	Name	Description
5:3	TRIGGER_DET	Number of detector instance that triggered the radar detector.
2:1	TRIGGER_SRC	Trigger source. For debugging purposes this field display the reason why the radar detector triggered. 0x1: C1 (Pulse count exceeds min_pulse_count1) 0x2: C2 (Pulse count exceeds min_pulse_count2) 0x3: C3 (Pulse count exceeds min_pulse_count3) 0x0: C4 (Pulse count exceeds min_pulse_count4)
0	PULSE_DET	Detection bit. 0x0: IDEL (No pulse train detected) 0x1: PDET (Pulse train detected)

0x0A013E50 WCSS_A_AGC_RDET_PULSEWIDTH**Type:** R**Reset State:** 0x00000000

This register specifies the width of the first pulse in the detected pulse train. All other pulses in the train have an equal width, to within the pulse_width_margin.

WCSS_A_AGC_RDET_PULSEWIDTH

Bits	Name	Description
15:0	PULSE_WIDTH	Pulse width.

0x0A013E54 WCSS_A_AGC_RDET_NUM_DETECTED**Type:** R**Reset State:** 0x00000000

This register reports the number of pulses counted by the radar detection algorithm.

WCSS_A_AGC_RDET_NUM_DETECTED

Bits	Name	Description
15:0	NUM_DET	Number of pulses counted.

0x0A013E58 WCSS_A_AGC_RDET_MEASUREMENT_DELAY**Type:** RW**Reset State:** 0x0020

This register configures the time interval (measured in rssi samples) after which the radar detector measures rssi level after it returns to the CORR state after a gain set due to a clip event. It can not evaluate RSSI immediately since the RSSI circuit comes out of reset when the CORR state is entered. Therefore it takes time for the RSSI to ramp up (about 32 samples). The time programmed in this register should be larger than the RSSI rampup time.

WCSS_A_AGC_RDET_MEASUREMENT_DELAY

Bits	Name	Description
8	CORR_FLAG_BYPASS	Correlation flag function bypass. If asserted, the correlation flag function in the RDET pulse detector (used to delay transition of the main state machine from IDLE to CLIP_S1) will be bypassed. Default setting = 1'b0.
7:0	TIME	Measurement delay.

0x0A013E5C WCSS_A_AGC_RDET_FLAG_RESET**Type:** W**Reset State:** 0x0000

This register contains 2 bits that control the operation of the radar detector.

WCSS_A_AGC_RDET_FLAG_RESET

Bits	Name	Description
0	DFLAG_RST	Reset detector flag. While the detector flag is set further radar detects are ignored and the num_detected and pulse width registers are not updated. By writing a 1 to this register, the detector flag is reset and will be set when the next radar burst is detected. 0x0: NORMAL (Normal) 0x1: RESET (Reset detector flag)

0x0A013E60 WCSS_A_AGC_RSSI_THRESHOLD_CLIPPED**Type:** RW**Reset State:** 0x0000

RSSI threshold for clipped pulses

WCSS_A_AGC_RSSI_THRESHOLD_CLIPPED

Bits	Name	Description
13:7	DET_THLD_DN	Pulse detection threshold.
6:0	DET_THLD_UP	Pulse detection threshold.

0x0A013E64 WCSS_A_AGC_CW_PULSE_WIDTH**Type:** RW**Reset State:** 0x0019

When the radar detector's pulse detector detects a radar pulse it monitors the CW detect flag. When this flag is set the pulse detector sets a local flag called `cw_detected`. When at the end of the radar pulse, the `cw_detected` flag is still not set, the in the pulse is discounted as a radar pulse (which should be narrow-band) and the `pulse_cancel` output is asserted. Some pulses are too short to perform a cw detection on. The cw detection time is the sum of the sample data gathering time (which is programmed in CSR `cw_radar_delay`) and the fft and cw detect calculation time. If the pulse duration is less than the number in this register, then the radar detector's pulse detector assumes that the detected pulse is a radar pulse. The radar detector's train detectors may still reject is because it is not in between the minimum and maximum radar pulse width.

WCSS_A_AGC_CW_PULSE_WIDTH

Bits	Name	Description
7:0	VAL	Duration of data gathering and calculation time for cw detection, specified in multiples of 0.8 us (16 20 Mhz sample).

0x0A013E68 WCSS_A_AGC_CW_RADAR**Type:** RW**Reset State:** 0x007D

This register configures if and with what delay the radar detector can start the CW detector.

WCSS_A_AGC_CW_RADAR

Bits	Name	Description
9	DET_DIS	Disables control of the CW detector by the radar detector.
8:0	DELAY	Amount of delay in 40 MHz samples between start pulse of the radar detector and the time that the CW detector starts calculating.

0x0A013E6C WCSS_A_AGC_ACI_DETECT_TH**Type:** RW**Reset State:** 0x0148

When detecting a radar pulse, the radar detector's pulse detector calculates the difference between the total (pre FIR) RSSI and the in-band (post FIR) RSSI. If this difference exceeds the threshold programmed in this register, the aci_detect flag is asserted. If, during a radar pulse, the ratio of the total time that this flag is asserted and the pulse's duration exceeds the second threshold specified in this register, then the radar detector decides that this pulse was in the adjacent channel. The radar detector will then ignore this pulse. This mechanism helps to avoid false triggers on packet traffic, interference and radar pulses in the adjacent channel. This type of false triggers would have the adverse effect that the radar detector would vacate a clean channel because of a noisy neighbor.

WCSS_A_AGC_ACI_DETECT_TH

Bits	Name	Description
12	DETECT_DIS	0x1: DISABLE (Disable use of ACI detector during radar detection.) 0x0: ENABLE (Enable use of ACI detector during radar detection.)
11:4	TH_RSSI_ACI	This register field specifies the RSSI delta which the pre and post FIR RSSI should differ by, to be considered adjacent channel power.
3:0	ACI_FRACTION	This register field specifies the fractional threshold that the pre and post FIR RSSI difference should exceed to be counted as ACI (Adjacent Channel Interference). This threshold is specified in integer multiples of 1/16-ths. For example, a value of 8 means that the RSSI should differ by more than th_rss_aci for more than 50% of the duration of the detected radar pulse for it to be ruled ACI.

0x0A013E70 WCSS_A_AGC_TRANSITION_COUNT_GLOBAL_EN**Type:** RW**Reset State:** 0x0001

This is a global enable/disable for all transition counters. This is useful for freezing the counters at the same time instant before reading or writing to them.

WCSS_A_AGC_TRANSITION_COUNT_GLOBAL_EN

Bits	Name	Description
0	ENABLE	

0x0A013E74 WCSS_A_AGC_TRANSITION_COUNT0_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 0. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT0_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E78 WCSS_A_AGC_TRANSITION_COUNT1_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 1. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT1_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E7C WCSS_A_AGC_TRANSITION_COUNT2_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 2. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT2_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.

WCSS_A_AGC_TRANSITION_COUNT2_EN (cont.)

Bits	Name	Description
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E80 WCSS_A_AGC_TRANSITION_COUNT3_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 3. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT3_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E84 WCSS_A_AGC_TRANSITION_COUNT4_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 4. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT4_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E88 WCSS_A_AGC_TRANSITION_COUNT5_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 5. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT5_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E8C WCSS_A_AGC_TRANSITION_COUNT6_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 6. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT6_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E90 WCSS_A_AGC_TRANSITION_COUNT7_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 7. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT7_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E94 WCSS_A_AGC_TRANSITION_COUNT8_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 8. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT8_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E98 WCSS_A_AGC_TRANSITION_COUNT9_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 9. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT9_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013E9C WCSS_A_AGC_TRANSITION_COUNT10_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 10. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT10_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.

WCSS_A_AGC_TRANSITION_COUNT10_EN (cont.)

Bits	Name	Description
4:0	CURRENT_STATE	State from which transition originates.

0x0A013EA0 WCSS_A_AGC_TRANSITION_COUNT11_EN**Type:** RW**Reset State:** 0x0000

Control word for state transition counter 11. This counter can be triggered on any transition between any 2 AGC states.

WCSS_A_AGC_TRANSITION_COUNT11_EN

Bits	Name	Description
10	ENABLE	Enables counter.
9:5	NEXT_STATE	State in which transition ends.
4:0	CURRENT_STATE	State from which transition originates.

0x0A013EA4 WCSS_A_AGC_TRANSITION_COUNT0**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT0

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EA8 WCSS_A_AGC_TRANSITION_COUNT1**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT1

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EAC WCSS_A_AGC_TRANSITION_COUNT2**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT2

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EB0 WCSS_A_AGC_TRANSITION_COUNT3**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT3

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EB4 WCSS_A_AGC_TRANSITION_COUNT4**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT4

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EB8 WCSS_A_AGC_TRANSITION_COUNT5**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT5

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EBC WCSS_A_AGC_TRANSITION_COUNT6**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT6

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EC0 WCSS_A_AGC_TRANSITION_COUNT7**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT7

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EC4 WCSS_A_AGC_TRANSITION_COUNT8**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT8

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013EC8 WCSS_A_AGC_TRANSITION_COUNT9**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT9

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013ECC WCSS_A_AGC_TRANSITION_COUNT10**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT10

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013ED0 WCSS_A_AGC_TRANSITION_COUNT11**Type:** W**Reset State:** 0x00000000

Debug Counter. Counts transitions between arbitrary states of the AGC state machine.

WCSS_A_AGC_TRANSITION_COUNT11

Bits	Name	Description
15:0	COUNT	Counter output. This counter is reset by writing a 0 to it.

0x0A013ED4 WCSS_A_AGC_NOISE_HIST_CTRL**Type:** RW**Reset State:** 0x0001

Controls various modes of operation of the noise histogram module. It can be reset and stopped, it can be read out and reset, it can read out without being reset, and it can be read out, reset and stopped.

WCSS_A_AGC_NOISE_HIST_CTRL

Bits	Name	Description
2	READ_AND_CLEAR	When this bit is set and the read_pulse bit is written to, the current noise histogram bin counter values are latched into the rssi status registers, the noise histogram counters are reset and noise histogram collection continues.
1	READOUT	When this bit is set and the read_pulse bit is written to, the current noise histogram bin counter values are latched into to the rssi status registers. Noise histogram collection continues.
0	RESET	When this bit is set the current noise histogram bin counter values are written to the rssi status registers, the noise histogram collection is halted and the counters are reset.

0x0A013ED8 WCSS_A_AGC_NOISE_HIST_BIN0_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 0. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN0_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013EDC WCSS_A_AGC_NOISE_HIST_BIN0_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 0. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN0_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013EE0 WCSS_A_AGC_NOISE_HIST_BIN1_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 1. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN1_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013EE4 WCSS_A_AGC_NOISE_HIST_BIN1_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 1. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN1_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013EE8 WCSS_A_AGC_NOISE_HIST_BIN2_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 2. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN2_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013EEC WCSS_A_AGC_NOISE_HIST_BIN2_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 2. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN2_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013EF0 WCSS_A_AGC_NOISE_HIST_BIN3_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 3. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN3_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013EF4 WCSS_A_AGC_NOISE_HIST_BIN3_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 3. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN3_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013EF8 WCSS_A_AGC_NOISE_HIST_BIN4_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 4. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN4_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013EFC WCSS_A_AGC_NOISE_HIST_BIN4_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 4. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN4_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F00 WCSS_A_AGC_NOISE_HIST_BIN5_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 5. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN5_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013F04 WCSS_A_AGC_NOISE_HIST_BIN5_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 5. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN5_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F08 WCSS_A_AGC_NOISE_HIST_BIN6_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 6. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN6_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013F0C WCSS_A_AGC_NOISE_HIST_BIN6_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 6. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN6_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F10 WCSS_A_AGC_NOISE_HIST_BIN7_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 7. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN7_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013F14 WCSS_A_AGC_NOISE_HIST_BIN7_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 7. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN7_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F18 WCSS_A_AGC_NOISE_HIST_BIN8_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 8. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN8_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013F1C WCSS_A_AGC_NOISE_HIST_BIN8_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 8. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN8_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F20 WCSS_A_AGC_NOISE_HIST_BIN9_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 9. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN9_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013F24 WCSS_A_AGC_NOISE_HIST_BIN9_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 9. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN9_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F28 WCSS_A_AGC_NOISE_HIST_BIN10_MSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 10. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BIN10_MSW

Bits	Name	Description
9:0	IPI_COUNT	IPI level counter value.

0x0A013F2C WCSS_A_AGC_NOISE_HIST_BIN10_LSW**Type:** R**Reset State:** 0x00000000

Counts RSSI samples within IPI (idle power indicator) level 10. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BIN10_LSW

Bits	Name	Description
15:0	IPI_COUNT	IPI level counter value.

0x0A013F30 WCSS_A_AGC_NOISE_HIST_BUSY_MSW**Type:** R**Reset State:** 0x00000000

Counts microseconds during noise histogram collection during which no noise is measured because a packet is transmitted, received or NAV is busy. Most significant 10 bits.

WCSS_A_AGC_NOISE_HIST_BUSY_MSW

Bits	Name	Description
9:0	COUNT	IPI level counter value.

0x0A013F34 WCSS_A_AGC_NOISE_HIST_BUSY_LSW**Type:** R**Reset State:** 0x00000000

Counts microseconds during noise histogram collection during which no noise is measured because a packet is transmitted, received or NAV is busy. Least significant 16 bits.

WCSS_A_AGC_NOISE_HIST_BUSY_LSW

Bits	Name	Description
15:0	COUNT	IPI level counter value.

0x0A013F38 WCSS_A_AGC_WATCHDOG_MASK**Type:** RW**Reset State:** 0x0001

This register is used to mask the watchdog-driven reset of the AGC state machine. When the reset is not masked, an expiry of the AGC watchdog timer will set the timeout state register, generate an interrupt and reset the AGC state machine. When the reset is masked, an expiry of the AGC watchdog timer will set the timeout state register, generate an interrupt, but will not reset the AGC state machine. This functionality is intended for debugging purposes when the AGC state machine needs to remain in the hanging state so the various conditions that may have lead to the hangup can be studied before they are automatically reset by the watchdog timer. registerComment

WCSS_A_AGC_WATCHDOG_MASK

Bits	Name	Description
0	MASK	0x0: UNMASKED (watchdog-driven reset enabled) 0x1: MASKED (watchdog-driven reset disabled)

0x0A013F3C WCSS_A_AGC_TIMEOUT_STATE**Type:** R**Reset State:** 0x00000000

AGC state in which watchdog timer expired.

WCSS_A_AGC_TIMEOUT_STATE

Bits	Name	Description
4:0	STATE	AGC State.

0x0A013F40 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A20**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the WAIT_DCO_A state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state

machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A20

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F44 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A40

Type: RW

Reset State: 0x0000

This register configures the watchdog timer for the WAIT_DCO_A40 state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A40

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F48 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A80

Type: RW

Reset State: 0x0000

This register configures the watchdog timer for the WAIT_DCO_A80 state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_A80

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F4C WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_B**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the WAIT_DCO_B state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_DCO_B

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F50 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_A**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the WAIT_A state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_A

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 8 (2^3) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^3 * 25 \text{ ns} = 51 \text{ us}$.

0x0A013F54 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXA_HDR**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the RXA_HDR state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXA_HDR

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 8 (2^3) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^3 * 25 \text{ ns} = 51 \text{ us}$.

0x0A013F58 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_COARSE**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the HT_STS_COARSE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_COARSE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F5C WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_FINE**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the HT_STS_FINE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_HT_STS_FINE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F60 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_COARSE**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the VHT_STS_COARSE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_COARSE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F64 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_FINE**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the VHT_STS_FINE state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_VHT_STS_FINE

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 2 to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2 * 12.5 \text{ ns} = 6.375 \text{ us}$.

0x0A013F68 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXA_DATA**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the RXA_DATA state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXA_DATA

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^{14}) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^{14} * 25 \text{ ns} = 104 \text{ ms}$.

0x0A013F6C WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_CAP_A**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the CAP_A state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_CAP_A

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^{14}) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^{14} * 25 \text{ ns} = 104 \text{ ms}$.

0x0A013F70 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_TF_EST**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the TF_EST state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_TF_EST

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 4 (2^2) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^2 * 25 \text{ ns} = 25.5 \text{ us}$.

0x0A013F74 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_B**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the WAIT_B state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_B

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 64 (2^6) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^6 * 25 \text{ ns} = 408 \text{ us}$.

0x0A013F78 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXB_HDR**Type:** RW**Reset State:** 0x007D

This register configures the watchdog timer for the RXB_HDR state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXB_HDR

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 64 (2^6) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^6 * 25 \text{ ns} = 408 \text{ us}$.

0x0A013F7C WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXB_DATA**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the RXB_DATA state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_RXB_DATA

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^{14}) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^{14} * 25 \text{ ns} = 104 \text{ ms}$.

0x0A013F80 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_CAP_B**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the CAP_B state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_CAP_B

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 16384 (2^{14}) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^{14} * 25 \text{ ns} = 104 \text{ ms}$.

0x0A013F84 WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_SIFS**Type:** RW**Reset State:** 0x0000

This register configures the watchdog timer for the WAIT_SIFS state of the AGC state machine. The watchdog timer is reset when the AGC state machine transitions from one state to another. When its value exceeds the threshold programmed in this register it resets the AGC state machine as well as the RXA and RXB modules. A value of zero disables the watchdog timer in this state.

WCSS_A_AGC_AGC_WATCHDOG_TIMEOUT_WAIT_SIFS

Bits	Name	Description
7:0	TIME	Timeout delay. This value is multiplied by 8 (2^3) to arrive at the number of 40 MHz clock cycles after which the watchdog timer expires. This results in a maximum delay of $255 * 2^3 * 25 \text{ ns} = 51 \text{ us}$.

0x0A013F88 WCSS_A_AGC_CCA0_WATCHDOG_TIMEOUT**Type:** RW**Reset State:** 0x0000

This register sets the maximum time CCA0 can be busy before a timeout condition is detected. Setting to 0 disables this watchdog check.

WCSS_A_AGC_CCA0_WATCHDOG_TIMEOUT

Bits	Name	Description
15:0	TIME	Timeout value in 102.4us steps. Setting to 0 disables the timeout.

0x0A013F8C WCSS_A_AGC_CCA1_WATCHDOG_TIMEOUT**Type:** RW**Reset State:** 0x0000

This register sets the maximum time CCA1 can be busy before a timeout condition is detected. Setting to 0 disables this watchdog check.

WCSS_A_AGC_CCA1_WATCHDOG_TIMEOUT

Bits	Name	Description
15:0	TIME	Timeout value in 102.4us steps. Setting to 0 disables the timeout.

0x0A013F90 WCSS_A_AGC_CCA2_WATCHDOG_TIMEOUT**Type:** RW**Reset State:** 0x0000

This register sets the maximum time CCA2 or CCA3 can be busy before a timeout condition is detected. Setting to 0 disables this watchdog check.

WCSS_A_AGC_CCA2_WATCHDOG_TIMEOUT

Bits	Name	Description
15:0	TIME	Timeout value in 102.4us steps. Setting to 0 disables the timeout.

0x0A013F94 WCSS_A_AGC_CCA0_WATCHDOG_EXPIRE_COUNT**Type:** W**Reset State:** 0x00000000

CCA0 watchdog expire count.

WCSS_A_AGC_CCA0_WATCHDOG_EXPIRE_COUNT

Bits	Name	Description
7:0	COUNT	

0x0A013F98 WCSS_A_AGC_CCA1_WATCHDOG_EXPIRE_COUNT

Type: W

Reset State: 0x00000000

CCA1 watchdog expire count.

WCSS_A_AGC_CCA1_WATCHDOG_EXPIRE_COUNT

Bits	Name	Description
7:0	COUNT	

0x0A013F9C WCSS_A_AGC_CCA2_WATCHDOG_EXPIRE_COUNT

Type: W

Reset State: 0x00000000

CCA2 watchdog expire count.

WCSS_A_AGC_CCA2_WATCHDOG_EXPIRE_COUNT

Bits	Name	Description
7:0	COUNT	

0x0A013FA0 WCSS_A_AGC_RXFIR_CONFIG

Type: RW

Reset State: 0x0000

Contains RxFIR configuration settings.

WCSS_A_AGC_RXFIR_CONFIG

Bits	Name	Description
0	DEC_BY_4	Enables decimation-by-4 in the stage 1 RxFIR instead of decimation-by-3 in the normal functional mode.

0x0A013FA4 WCSS_A_AGC_VHTSIGA_P_AID1**Type:** RW**Reset State:** 0x0000**WCSS_A_AGC_VHTSIGA_P_AID1**

Bits	Name	Description
8:0	VALUE	Use for filtering 11ac SU packet

0x0A013FA8 WCSS_A_AGC_VHTSIGA_P_AID2**Type:** RW**Reset State:** 0x0000**WCSS_A_AGC_VHTSIGA_P_AID2**

Bits	Name	Description
8:0	VALUE	Use for filtering 11ac SU packet

0x0A013FAC WCSS_A_AGC_VHTSIGA_P_AID3**Type:** RW**Reset State:** 0x0000**WCSS_A_AGC_VHTSIGA_P_AID3**

Bits	Name	Description
8:0	VALUE	Use for filtering 11ac SU packet

0x0A013FB0 WCSS_A_AGC_VHTSIGA_P_AID4**Type:** RW**Reset State:** 0x0000**WCSS_A_AGC_VHTSIGA_P_AID4**

Bits	Name	Description
8:0	VALUE	Use for filtering 11ac SU packet

0x0A013FB4 WCSS_A_AGC_VHTSIGA_P_AID5**Type:** RW**Reset State:** 0x0000**WCSS_A_AGC_VHTSIGA_P_AID5**

Bits	Name	Description
8:0	VALUE	Use for filtering 11ac SU packet

0x0A013FB8 WCSS_A_AGC_VHTSIGA_BWENCODING**Type:** RW**Reset State:** 0x01AC

Contains programming for bandwidth

WCSS_A_AGC_VHTSIGA_BWENCODING

Bits	Name	Description
8:6	BW80	Fully specified field to indicate 20M mode, 40M mode and 80M mode.
5:3	BW40	
2:0	BW20	

0x0A013FBC WCSS_A_AGC_VHTSIGA_GID1**Type:** RW**Reset State:** 0x003F

Four programmable GID values can be designated as SU (single user) for the receiver. If the receiver finds that the incoming GID matches any of the four GID values programmed in this and the following register, then it will be designated as an SU packet.

WCSS_A_AGC_VHTSIGA_GID1

Bits	Name	Description
11:6	GID2	Second programmable SU GID.
5:0	GID1	First programmable SU GID.

0x0A013FC0 WCSS_A_AGC_VHTSIGA_GID2**Type:** RW**Reset State:** 0x0000

Four programmable GID values can be designated as SU (single user) for the receiver. If the receiver finds that the incoming GID matches any of the four GID values programmed in this and the preceding register, then it will be designated as an SU packet.

WCSS_A_AGC_VHTSIGA_GID2

Bits	Name	Description
11:6	GID4	Fourth programmable SU GID.
5:0	GID3	Third programmable SU GID.

0x0A013FC4 WCSS_A_AGC_CCA_GI_DET_CFG_LGI**Type:** RW**Reset State:** 0xA59B**WCSS_A_AGC_CCA_GI_DET_CFG_LGI**

Bits	Name	Description
15:8	TIMER_MAX_END	This register holds the upper limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 160 implying 4 usec.
7:0	TIMER_MIN_END	This register holds the lower limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 160 implying 4 usec.

0x0A013FC8 WCSS_A_AGC_CCA_GI_DET_CFG_SGI**Type:** RW**Reset State:** 0x958B**WCSS_A_AGC_CCA_GI_DET_CFG_SGI**

Bits	Name	Description
15:8	TIMER_MAX_END	This register holds the upper limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 144 implying 3.6 usec.
7:0	TIMER_MIN_END	This register holds the lower limit on the timer (running off 40MHz clock) by when the subsequent ccadet-threshold crossing is expected. Ideally this value is 144 implying 3.6 usec.

0x0A013FCC WCSS_A_AGC_CCA_GI_DET_CFG1**Type:** RW**Reset State:** 0x00BE**WCSS_A_AGC_CCA_GI_DET_CFG1**

Bits	Name	Description
8:0	TH_SGI	

10.28 WCSS_A_BBANA_BBANA**0x0A014000 WCSS_A_BBANA_ADC_CTRL****Type:** RW**Reset State:** 0x0000

This set of registers are used to control ADC operations.

WCSS_A_BBANA_ADC_CTRL

Bits	Name	Description
9	OFFSET_MEAS	Enable ADCs to do offset calibration.
8:7	INTLV_CTRL	Used to control ADC interleaving.
6	ADC_PWR_DOWN_N	Power down I & Q reference, clock and output (active low). Not currently used. 0x0: PWR_DOWN (Disables both I & Q, reference, clock and output) 0x1: ENABLED (ADC I & Q, reference, clock and outputs enabled)
5	OUTPUT_DISABLE_Q	Output disable control for ADC Q data rail. 0x0: NORMAL (Normal ADC output level) 0x1: MID (Mid level AC output)
4	EN_Q_OVERRIDE	Enable override control for ADC Q data rail. 0x0: NO_OVERRIDE (Signal in bit 3 is not used to control ADC enable signal) 0x1: OVERRIDE (Signal in bit 3 is used to control ADC enable signal)
3	EN_Q	Enable ADC for Q data rail. 0x0: DISABLED (ADC Q data rail disabled) 0x1: ENABLED (ADC Q data rail enabled)
2	OUTPUT_DISABLE_I	Output disable control for ADC I data rail. 0x0: NORMAL (Normal ADC output level) 0x1: MID (Mid level AC output)

WCSS_A_BBANA_ADC_CTRL (cont.)

Bits	Name	Description
1	EN_I_OVERRIDE	Enable override control for ADC I data rail. 0x0: NO_OVERRIDE (Signal in bit 0 is not used to control ADC enable signal) 0x1: OVERRIDE (Signal in bit 0 is used to control ADC enable signal)
0	EN_I	Enable ADC for I data rail. 0x0: DISABLED (ADC I data rail disabled) 0x1: ENABLED (ADC I data rail enabled)

0x0A014004 WCSS_A_BBANA_ADC_CLK_CTRL**Type:** RW**Reset State:** 0x0000

This set of registers are used for controlling the ADC clock settings.

WCSS_A_BBANA_ADC_CLK_CTRL

Bits	Name	Description
5:4	ADJ_DUTY_CYCLE_PW	Setting used to adjust the duty cycle pulse width
3	DUTY_CYCLE_EN	Setting used to enable/disable the duty cycle circuit 0x0: DISABLED (Duty cycle circuit is disabled) 0x1: ENABLED (Duty cycle circuit is enabled)
2	CLKEDGE_SEL	Setting used to select the edge of the clock to be used by the ADCs 0x0: POSEDGE (Positive edge of clock is used) 0x1: NEGEDGE (Negative edge of clock is used)
1	CLKSRC_SEL	Setting used to select the clock source to the ADCs
0	DISABLE_CLK	Used to enable/disable clock to ADCs. 0x0: ENABLED (Clock to the ADCs is enabled) 0x1: DISABLED (Clock to the ADCs is disabled)

0x0A014008 WCSS_A_BBANA_ADC_REF_CTRL**Type:** RW**Reset State:** 0x0000

This set of registers are used for controlling the reference circuit settings.

WCSS_A_BBANA_ADC_REF_CTRL

Bits	Name	Description
6	REF_PWRDOWN	Power down the reference.
5	VDD_SEL	Switch the reference to VDD.
4	BIAS_SEL	Selects the source of the reference bias.
3:2	OUT_BIAS	Used to adjust the bias current of the reference generator.
1:0	V_ADJUST	Register value used to adjust the ADC reference voltage.

0x0A01400C WCSS_A_BBANA_ADC_CONV_ADJ**Type:** RW**Reset State:** 0x0000

This set of registers are used for adjusting various conversion settings.

WCSS_A_BBANA_ADC_CONV_ADJ

Bits	Name	Description
8:7	INP_FILT_POLE	Register value used to modify the input filter pole frequency.
6:5	CONV_DLY	Adjust the conversion delay.
4:3	COMM_BIAS	Adjust the common mode bias.
2:0	REG_ADJUST	Register value used to adjust the regulator.

0x0A014014 WCSS_A_BBANA_ADC_SPARE3**Type:** RW**Reset State:** 0x0000

This register contains the third set of ADC spare bits.

WCSS_A_BBANA_ADC_SPARE3

Bits	Name	Description
7:4	SPARE3_UNUSED	Register value holding unused (unmapped) ADC spare3 bits.
3	CONV_CTRL	Conversion control register. 0x0: CONV_UNDEF_0 (Conversion control 0 - unused) 0x1: CONV_UNDEF_1 (Conversion control 1 - unused)

WCSS_A_BBANA_ADC_SPARE3 (cont.)

Bits	Name	Description
2:0	FILT_CTRL	ADC filter control register. 0x0: FILT_UNDEF_0 (filter ctrl undefined 0) 0x1: FILT_UNDEF_1 (filter ctrl undefined 1) 0x2: FILT_UNDEF_2 (filter ctrl undefined 2) 0x3: FILT_UNDEF_3 (filter ctrl undefined 3) 0x4: FILT_UNDEF_4 (filter ctrl undefined 4) 0x5: FILT_UNDEF_5 (filter ctrl undefined 5) 0x6: FILT_UNDEF_6 (filter ctrl undefined 6) 0x7: FILT_UNDEF_7 (filter ctrl undefined 7)

0x0A014018 WCSS_A_BBANA_DAC_CTRL**Type:** RW**Reset State:** 0x0000

This set of registers are used to control DAC operations.

WCSS_A_BBANA_DAC_CTRL

Bits	Name	Description
12:10	DAC_CFG1	Register for DAC configuration settings.
9	CLKEDGE_SEL	Setting used to select the edge of the clock to be used by the DACs 0x0: POSEDGE (Positive edge of clock is used to register data) 0x1: NEGEDGE (Negative edge of clock is used to register data)
8	INPUT_STANDBY_EN_CTRL	Note: This bit is no longer used. Control of TXAIF input signal on to DAC enable/standby signal. 0x0: ENABLE_DRIVEN (TXAIF standby signal drives DAC enable signal directly. The DAC standby is driven by the standby override registers.) 0x1: STANDBY_DRIVEN (TXAIF standby signal drives DAC standby signal directly. The DAC enable is driven by the enable override registers.)
7	STANDBY_Q_OVERRIDE	Standby override control for DAC Q data rail. 0x0: NO_OVERRIDE (Signal in bit 6 is not used to control DAC standby status) 0x1: OVERRIDE (Signal in bit 6 is used to control DAC standby status)
6	STANDBY_Q	Standby control for DAC Q data rail. 0x0: NORMAL (DAC in normal mode) 0x1: MID (Place DAC in standby)

WCSS_A_BBANA_DAC_CTRL (cont.)

Bits	Name	Description
5	EN_Q_OVERRIDE	Enable override control for DAC Q data rail. 0x0: NO_OVERRIDE (Signal in bit 4 is not used to control DAC enable signal) 0x1: OVERRIDE (Signal in bit 4 is used to control DAC enable signal)
4	EN_Q	Enable DAC for Q data rail. 0x0: DISABLED (DAC Q data rail disabled) 0x1: ENABLED (DAC Q data rail enabled)
3	STANDBY_I_OVERRIDE	Standby override control for DAC I data rail. 0x0: NO_OVERRIDE (Signal in bit 2 is not used to control DAC standby status) 0x1: OVERRIDE (Signal in bit 2 is used to control DAC standby status)
2	STANDBY_I	Standby control for DAC I data rail. 0x0: NORMAL (DAC in normal mode) 0x1: STANDBY (Place DAC in standby)
1	EN_I_OVERRIDE	Enable override control for DAC I data rail. 0x0: NO_OVERRIDE (Signal in bit 0 is not used to control DAC enable signal) 0x1: OVERRIDE (Signal in bit 0 is used to control DAC enable signal)
0	EN_I	Enable DAC for I data rail. 0x0: DISABLED (DAC I data rail disabled) 0x1: ENABLED (DAC I data rail enabled)

0x0A01401C WCSS_A_BBANA_DAC_BIAS**Type:** RW**Reset State:** 0x0000

This set of registers are used to control the DAC bias.

WCSS_A_BBANA_DAC_BIAS

Bits	Name	Description
6:0	TX_BIAS	Select output current value.

0x0A014024 WCSS_A_BBANA_DAC_CFG**Type:** RW**Reset State:** 0x0000

This set of registers are used to control 19-bit extended DAC configuration.

WCSS_A_BBANA_DAC_CFG

Bits	Name	Description
15:0	DAC_CFG0	Register for DAC lower 16-bit configuration settings.

0x0A014028 WCSS_A_BBANA_DAC_CAL_CTRL

Type: RW

Reset State: 0x0000

This set of registers are used to control DAC calibration

WCSS_A_BBANA_DAC_CAL_CTRL

Bits	Name	Description
14	CAL_EN	Enable the calibration state machine
13:8	SM_DIN	Data to write in CALDAC memory for write operation
7	SM_WR	Write signal for CALDAC memory
6:0	SM_ADDR	CALDAC memory address lines

0x0A01402C WCSS_A_BBANA_DAC_CAL_CFG

Type: RW

Reset State: 0x0000

This set of registers are used to set DAC calibration configuration

WCSS_A_BBANA_DAC_CAL_CFG

Bits	Name	Description
15:0	CAL_CFG	CSM configuration bits

0x0A014030 WCSS_A_BBANA_DAC_CAL_STATUS

Type: R

Reset State: 0x0000

This set of registers capture the status of the DAC calibration

WCSS_A_BBANA_DAC_CAL_STATUS

Bits	Name	Description
7	CAL_ERR	Calibration error
6	CAL_BUSY	Calibration in progress
5:0	SM_DOUT	Data read from CALDAC memory for read operation

10.29 WCSS_A_BMU_BMU**0x0A080000 WCSS_A_BMU_CONTROL****Type:** RW**Reset State:** 0x03FE03FE

Sets the valid range of BD and PDU indexes in the BMU.

WCSS_A_BMU_CONTROL

Bits	Name	Description
31:16	MAX_PDU_INDEX_NR	Typically the MAX PDU index is greater then the MAC BD index. In that case BDs can not be used as PDUs and vice versa. When MAX_BD_Index and MAX_PDU_index are programmed to the same value, the BMU is set in a special mode: Mixed mode. Each PDU can be used as a BD or each BD used as a PDU. At initialization the PDU idle list does not need to be created, just the BD idle list. When PDUs are requested, they will be taken from the BD idle list. During operation BD and PDU idle lists will both be maintained, but all released PDUs will automatically get moved back to the BD idle list. In this mode, the MAX BD and PDU index number can not be greater then the MAX BD index number that the HW allows. Note that before the WQs get enabled, this value must be programmed accordingly to the amount of packet memoryavailable. This is similar to have to program the bd_pbu_base_address in the MCU. In Volans, the BMU should be configured to only operate in Mixed Mode.
10:0	MAX_BD_INDEX_NR	Virgo can maximum support 2K BDs. The maximum value that can therefor be programmed is 2047. Where as Libra and Volans can support only 1023 BDs Note that before the WQs get enabled, this value must be programmed accordingly to the amount of packet memoryavailable. This is similar to have to program the bd_pbu_base_address in the MCU.

0x0A080004 WCSS_A_BMU_ERR_INTR_STATUS**Type:** R**Reset State:** 0x00000000

This register indicates the BMU Error Interrupt Status. When one of these errors occur, the status will always reflect this. The Err_Intr_ENABLE register is used to indicate which error bits will cause an interrupt to be generated. Writing a 1'b1 to a particular bit will clear the error status bit. Most of these errors are generated when the BMU receives a command. In this case the command will be stored in the 'err_int_addr' and 'err_int_wdata' registers.

WCSS_A_BMU_ERR_INTR_STATUS

Bits	Name	Description
31	BMU_ACCESS_DIRECTION	When one of the error indications below gets set, this bit will indicate if this happened on a read or write BMU access. 1'b1 indicates write access 1'b0 indicates read access. On a write access, register err_int_wdata will contain the write data.
30	BMU_INTERRUPT_STATUS	Status of the BMU err interrupt status signal going to the mcu. This is the OR of all interrupts enabled in this register and bmu_idle_bd_pdu_threshold_interrupt_status bit from register: bmu_idle_bd_pdu_status.
28	BTQM_ERR	This is the OR of all the enabled bits from btqm_err_status register. Set when the btqm detects an error or some other operational related interrupt in the btqm_err_status register. The details on which btqm error happened can be found in register 'btqm_err_int_status'.
27	DOUBLE_RELEASE_PDU_ERR	Error set when head or tail of a list of linked PDUs that is being released is equal to the head or tail pointer of the idle PDU list. Note that there can be a delay between the release command and the detection of this problem due to buffering.
26	DOUBLE_RELEASE_BD_ERR	Error set when head or tail of a list of linked BDs that is being released is equal to the head or tail pointer of the idle BD list. Note that there can be a delay between the release command and the detection of this problem due to buffering.
25	DOUBLE_PUSH_ERR	Error set when a push command contains a BD index equal to the head or tail pointer of the WQ it is pushed to.
24	RELEASE_FRAG_BD_INDEX_ERR	When BMU starts releasing defragmentation BD, if a fragment contains invalid BD index this error will be set.
23	MULTIPLE_READY_ERR	Error set when multiple modules in the bmu indicate ready. That should not happen.
22	RELEASE_INTEGRITY_CHECK_PDU_LINK_ERR	Error set when on a release command, the integrity check failed. The pdu links were incorrect.
21	PUSH_INTEGRITY_CHECK_PDU_LINK_ERR	Error set when on a push bd command, the integrity check failed. The pdu links were incorrect.
20	PUSH_INTEGRITY_CHECK_HEAD_TAIL_PDU_ERR	Error set when on a push bd command, the integrity check failed. The head/tail/entries part in the BD was incorrect.
19	PUSH_INTEGRITY_CHECK_PREV_PDU_ERR	Error set when on a push bd command, the integrity check failed. The prev. pdu pointer in the BD was incorrect.
18	PREV_PDU_INDEX_ERR	Error set when on a release of BD with linked PDUs, and the A-MSDU feature is enabled and the prev PDU pointer has an invalid index.

WCSS_A_BMU_ERR_INTR_STATUS (cont.)

Bits	Name	Description
17	NR_OF_PDU_OVERFLOW_ERR	Error set when on a release of PDUs, the number of idle PDUs would gone over the theoretical amount as determined by the MAX BD index and MAX PDU index from the BMU control register
16	NR_OF_BD_OVERFLOW_ERR	Error set when on a release of BDs, the number of idle BDs would gone over the theoretical amount as determined by the MAX BD index from the BMU control register
15	WRGAM_ERR	Set when the write GAM indicated an internal error
14	RDGAM_ERR	Set when the read GAM indicated an internal error
13	TIME_OUT_ERR	Set when the BMU internally detected is has been hanging There is a timeout counter in the BMU, which tracks the length of each transaction. The timeout count value can be programmed in register: bmu_watchdog_timeout_time For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
12	IDLE_PDU_LIST_TAIL_ERR	The pdu idle list is corrupted. In the PDU idle list the PDU prefetch unit has read the PDU pointer index from the one but last PDU in the PDU idle list. It was expected that this PDU index pointer points to the PDU indicated in the idle_pdu_tail register. This was however not the case. THIS is a serious error as it indicates that the idle PDU list is corrupted.
11	IDLE_PDU_LIST_CNT_ERR	The pdu idle list is corrupted. In the PDU idle list the PDU prefetch unit has found an PDU who was pointing to the PDU tail index, which would indicate that the end of the idle PDU list has been reached. But this does not correspond with the idle PDU count in the idle_pdu_count register. This error indicates that more PDUs were expected to be in the idle PDU list. THIS is a serious error as it indicates that the idle PDU list is corrupted.
10	PDU_INDEX_FROM_BD_ERR	When a BD with linked PDUs was released, the BMU detected that in the BD the number of linked PDUs was non zero, but the head or tail PDU pointer index in the BD was greater then the MAX PDU index range. This is an indication that the Idle PDU list is broken and is a serious error.
9	RELEASE_FIFO_FULL_WARNING	Set when the BMU release fifo got full. This will not break BMU operation, but still should not occur as it can effect latency on the AHB bus. This however is minimized due to the split transaction generated by the BMU GAS if the release takes too long.
8	BD_LINKED_LIST_ERR	Set when in the bd idle list a pointer to a bd index was found that is outside of the valid bd index ranges. This is a serious error and the only way to recover is to soft reset the BMU or generate a bmu module reset
7	PDU_LINKED_LIST_ERR	Set when in the pdu idle list a pointer to a pdu index was found that is outside of the valid pdu index ranges. This is a serious error and the only way to recover is to soft reset the BMU or generate a bmu module reset

WCSS_A_BMU_ERR_INTR_STATUS (cont.)

Bits	Name	Description
6	OUT_OF_MODULE_RANGE_ERR	Set when a BMU command with module index that was out of allowed range was used The valid module index is less than or equal to BMU_HIGHEST_VALID_MASTER_INDEX For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
5	OUT_OF_PDU_RANGE	Set when a BMU command with PDU index that was out of allowed range was used For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
4	OUT_OF_BD_RANGE	Set when a BMU command with BD index that was out of allowed range was used For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
3	UNDEFINED_CMD	Set when an undefined BMU command was given to the BMU For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
2	WQ_INVALID	Set when an unenabled or undefined WQ was used in a BMU command In Volans, the valid WQs are "2 to 16 and 23 to 26" For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
1	WQ_FULL	This is set with push command when the WQ entries are greater/equal to highest_valid_bd_index value. This shouldn't happen in the system For this error the 'err_int_addr' and 'err_int_wdata' registers are updated so it is recorded which bmu command caused this error.
0	NOT_ENOUGH_BD_PDU_WARNING	Set when a request for BD_PDUs came in when they were not available. The modules should be able to handle this and resubmit their request at a later time. This is not an error, but is given for informational purposes

0x0A080008 WCSS_A_BMU_ERR_INTR_ENABLE**Type:** RW**Reset State:** 0x00000000

This register is used as BMU Interrupt enable Mask. By default all the interrupts are disabled For descriptions of each error interrupt, see register: Err_Intr_STATUS

WCSS_A_BMU_ERR_INTR_ENABLE

0x0A08000C WCSS_A_BMU_ERR_INT_ADDR**Type:** R**Reset State:** 0x00000000

This register contains the BMU access address that caused the last error interrupt is generated This information is for debug purpose only

WCSS_A_BMU_ERR_INT_ADDR

Bits	Name	Description
31:0	BMU_ERR_ACCESS_ADDRESS	

0x0A080010 WCSS_A_BMU_ERR_INT_WDATA**Type:** R**Reset State:** 0x00000000

This register contains the BMU access wdata that caused the last error interrupt is generated. This information is for debug purpose only The data in here is only valid when 'BMU_access_direction' in register Err_Intr_STATUS is set.

WCSS_A_BMU_ERR_INT_WDATA

Bits	Name	Description
31:0	BMU_ERR_ACCESS_WDATA	

0x0A080014 WCSS_A_BMU_BD_PDU_THRESHOLD0**Type:** RW**Reset State:** 0x00000035

Controls the bd_pdu_aavailable[0] signal to RXP. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[0] signal to the RXP will not be set, causing that master to stall.

WCSS_A_BMU_BD_PDU_THRESHOLD0

Bits	Name	Description
31:16	PDU_THRESHOLD_0	
10:0	BD_THRESHOLD_0	

0x0A080018 WCSS_A_BMU_BD_PDU_THRESHOLD1**Type:** RW**Reset State:** 0x00000001

Controls the bd_pdu_aavailable[1] signal to DPU. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[1] signal to the DPU will not be set, causing that master to stall. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD1

Bits	Name	Description
31:16	PDU_THRESHOLD_1	
10:0	BD_THRESHOLD_1	

0x0A08001C WCSS_A_BMU_BD_PDU_THRESHOLD2**Type:** RW**Reset State:** 0x00000001

Controls the bd_pdu_aavailable[2] signal to DPU. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[2] signal to the DPU will not be set, causing that master to stall. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD2

Bits	Name	Description
31:16	PDU_THRESHOLD_2	
10:0	BD_THRESHOLD_2	

0x0A080020 WCSS_A_BMU_BD_PDU_THRESHOLD3**Type:** RW**Reset State:** 0x00000001

Controls the bd_pdu_aavailable[3]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[3] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD3

Bits	Name	Description
31:16	PDU_THRESHOLD_3	
10:0	BD_THRESHOLD_3	

0x0A080024 WCSS_A_BMU_BD_PDU_THRESHOLD4**Type:** RW**Reset State:** 0x00000028

Controls the bd_pdu_aavailable[4]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[4] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD4

Bits	Name	Description
31:16	PDU_THRESHOLD_4	
10:0	BD_THRESHOLD_4	

0x0A080028 WCSS_A_BMU_BD_PDU_THRESHOLD5**Type:** RW**Reset State:** 0x00000028

Controls the bd_pdu_aavailable[5]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[5] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD5

Bits	Name	Description
31:16	PDU_THRESHOLD_5	
10:0	BD_THRESHOLD_5	

0x0A08002C WCSS_A_BMU_BD_PDU_THRESHOLD6**Type:** RW**Reset State:** 0x00000001

Controls the bd_pdu_aavailable[6]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[6] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD6

Bits	Name	Description
31:16	PDU_THRESHOLD_6	
10:0	BD_THRESHOLD_6	

0x0A080030 WCSS_A_BMU_BD_PDU_THRESHOLD7**Type:** RW**Reset State:** 0x00000029

Controls the bd_pdu_aavailable[7]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[7] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD7

Bits	Name	Description
31:16	PDU_THRESHOLD_7	
10:0	BD_THRESHOLD_7	

0x0A080034 WCSS_A_BMU_BD_PDU_THRESHOLD8**Type:** RW**Reset State:** 0x00000029

Controls the bd_pdu_aavailable[8]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[8] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD8

Bits	Name	Description
31:16	PDU_THRESHOLD_8	
10:0	BD_THRESHOLD_8	

0x0A080038 WCSS_A_BMU_BD_PDU_THRESHOLD9**Type:** RW**Reset State:** 0x000003FF

Controls the bd_pdu_aavailable[9]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE. If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[9] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD9

Bits	Name	Description
31:16	PDU_THRESHOLD_9	
10:0	BD_THRESHOLD_9	

0x0A08003C WCSS_A_BMU_BD_PDU_THRESHOLD10**Type:** RW**Reset State:** 0x000003FF

Controls the bd_pdu_aavailable[10]. The assignment/usage of this signal is programmable. It could be used by SW or used by the DXE If the available free BDs or PDUs are less or equal to these programmed values, the bd_pdu_aavailable[10] signal will not be set, typically preventing that new BDs and/or PDUs get reserved or requested. The SW programmers guide will have guidance on how to program these values.

WCSS_A_BMU_BD_PDU_THRESHOLD10

Bits	Name	Description
31:16	PDU_THRESHOLD_10	
10:0	BD_THRESHOLD_10	

0x0A080040 WCSS_A_BMU_BD_PDU_RESERVED0**Type:** R**Reset State:** 0x00000000

Indicates how many BDs or PDUs have been reserved by the RXP A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU.

WCSS_A_BMU_BD_PDU_RESERVED0

Bits	Name	Description
31:16	NUMBER_RESERVED_PDU	
10:0	NUMBER_RESERVED_BD	

0x0A080044 WCSS_A_BMU_BD_PDU_RESERVED1**Type:** R**Reset State:** 0x00000000

Indicates how many BDs or PDUs have been reserved by the DPU A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how

many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU.

WCSS_A_BMU_BD_PDU_RESERVED1

Type: R

Reset State: 0x00000000

Indicates how many BDs or PDUs have been reserved by master 10 (software assignable) A module can use the BMU command Idle BD and PDU reservation request to have the BMU set aside a number of BDs and PDUs for that module. These BDs and PDUs will only be set aside if this does not violate the 'BD and PDU threshold values that were set aside for this master. This register gives inside into how many BDs and PDUs have been set aside to this master. This number will decrement each time the module gets a BD or PDU. Note that this can be used as a mechanism by SW to set a number of PDUs and BDs aside for a particular DXE channel.

WCSS_A_BMU_BD_PDU_RESERVED10

Bits	Name	Description
31:16	NUMBER_RESERVED_PDU	
10:0	NUMBER_RESERVED_BD	

0x0A08006C WCSS_A_BMU_WQ_ENABLE**Type:** RW**Reset State:** 0x00000000

Controls which WQ will be enabled. These WQs should be enabled during initialization, after the BD and PDU idle lists have been created and all head and tail pointers for the to be enabled WQs have been configured. The number of WQs to be enabled need to be decided at that time. Once enabled, a WQ should never be disabled again, as this can cause BD and PDU leaks. Bit 0 corresponds to WQ0, Bit 26 corresponds to WQ 26.

WCSS_A_BMU_WQ_ENABLE

Bits	Name	Description
27:0	WQ_ENABLE	WQ0: Assigned for Idle BD from DDR/Ext Memory. WQ1: Assigned for Idle PDU WQ2: Assigned for mCPU RX WQ WQ3: Can be assigned to DPU, DXE or mCPU WQ4: Can be assigned to DPU, DXE or mCPU WQ5: Can be assigned to DPU, DXE or mCPU WQ6: Can be assigned to DPU, DXE or mCPU WQ7: Can be assigned to DPU, DXE or mCPU WQ8: Can be assigned to DPU, DXE or mCPU WQ9: Can be assigned to DPU, DXE or mCPU WQ10: Can be assigned to DPU, DXE or mCPU WQ11: Can be assigned to DXE or mCPU WQ12: Can be assigned to DXE or mCPU WQ13: Can be assigned to DXE or mCPU WQ14: Can be assigned to DXE or mCPU WQ15: Can be assigned to DXE or mCPU WQ16: Can be assigned to DXE or mCPU WQ17: Can be assigned to DXE or mCPU WQ18: Can be assigned to mCPU WQ19: Can be assigned to mCPU WQ20: Can be assigned to mCPU WQ21: Can be assigned to mCPU WQ22: Can be assigned to mCPU WQ23: Can be assigned to mCPU WQ24: Can be assigned to mCPU, or ADU WQ25: High priority entrance WQ for the BTQM (BMU Transmit Queue Manager) WQ26: Low priority entrance WQ for the BTQM (BMU Transmit Queue Manager) WQ27: Assigned for Idle BD from cMem/Local Memory.

0x0A080070 WCSS_A_BMU_DPU_WQ_ASSIGNMENT**Type:** RW**Reset State:** 0x00000809

WQs 3 to 10 can be assigned to the DPU. This register controls if they are assigned to the DPU and if so, in which direction: TX or RX By default, WQ 3 is enabled and assigned to the TX side of the DPU By default, WQ 4 is enabled and assigned to the RX side of the DPU

WCSS_A_BMU_DPU_WQ_ASSIGNMENT

Bits	Name	Description
15	WQ10_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 10 is assigned to the DPU. When set, WQ 10 is assigned to the TX side of the DPU When NOT set, WQ 10 is assigned to the RX side of the DPU
14	WQ9_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 9 is assigned to the DPU. When set, and WQ 9 is assigned to the TX side of the DPU When NOT set, WQ 9 is assigned to the RX side of the DPU
13	WQ8_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 8 is assigned to the DPU. When set, and WQ 8 is assigned to the TX side of the DPU When NOT set, WQ 8 is assigned to the RX side of the DPU
12	WQ7_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 7 is assigned to the DPU. When set, and WQ 7 is assigned to the TX side of the DPU When NOT set, WQ 7 is assigned to the RX side of the DPU
11	WQ6_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 6 is assigned to the DPU. When set, and WQ 6 is assigned to the TX side of the DPU When NOT set, WQ 6 is assigned to the RX side of the DPU
10	WQ5_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 5 is assigned to the DPU. When set, and WQ 5 is assigned to the TX side of the DPU When NOT set, WQ 5 is assigned to the RX side of the DPU
9	WQ4_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 4 is assigned to the DPU. When set, and WQ 4 is assigned to the TX side of the DPU When NOT set, WQ 4 is assigned to the RX side of the DPU
8	WQ3_DPU_ASSIGNMENT_DIRECTION	Only valid when WQ 3 is assigned to the DPU. When set, and WQ 3 is assigned to the TX side of the DPU When NOT set, WQ 3 is assigned to the RX side of the DPU
7	WQ10_DPU_ASSIGNMENT_ENABLE	When set, WQ 10 is assigned to the DPU
6	WQ9_DPU_ASSIGNMENT_ENABLE	When set, WQ 9 is assigned to the DPU
5	WQ8_DPU_ASSIGNMENT_ENABLE	When set, WQ 8 is assigned to the DPU
4	WQ7_DPU_ASSIGNMENT_ENABLE	When set, WQ 7 is assigned to the DPU
3	WQ6_DPU_ASSIGNMENT_ENABLE	When set, WQ 6 is assigned to the DPU
2	WQ5_DPU_ASSIGNMENT_ENABLE	When set, WQ 5 is assigned to the DPU
1	WQ4_DPU_ASSIGNMENT_ENABLE	When set, WQ 4 is assigned to the DPU

WCSS_A_BMU_DPU_WQ_ASSIGNMENT (cont.)

Bits	Name	Description
0	WQ3_DPU_ASSIGNMENT_ENABLE	When set, WQ 3 is assigned to the DPU

0x0A080080 WCSS_A_BMU_GAS_CONFIGURATION**Type:** RW**Reset State:** 0x000D0000

These are the configuration bits for the gas The default values should be OK This register is provided as a backup

WCSS_A_BMU_GAS_CONFIGURATION

Bits	Name	Description
19:16	GAS_CFG_HREADY_LIMIT	
15:8	GAS_CFG_HSPLIT_RESP_LIMIT	
7:0	GAS_CFG_HSPLIT_MST_R ESP_LIMIT	

0x0A080084 WCSS_A_BMU_AVAILABLE_BD_PDU_AFTER_RSV**Type:** R**Reset State:** 0x00000000

This register can be used to find out how many idle PDUs and BDs are actually available from the BD and PDU idle list when the number of reserved BDs and PDUs for all the different modules have been taken into account.

WCSS_A_BMU_AVAILABLE_BD_PDU_AFTER_RSV

Bits	Name	Description
31:16	AVAILABLE_PDUS	
15:0	AVAILABLE_BDS	

0x0A080088 WCSS_A_BMU_CONTROL2**Type:** RW**Reset State:** 0x00000001

This register can be used to control bmu A-MSDU support BD/PDU integrity checking by the BMU To enable rxp_bmu_dxe_datalength for DXE wq byte count To enable enhanced reserve all command To enable priority based BD/PDU reservation

WCSS_A_BMU_CONTROL2

Bits	Name	Description
31	FREEZE_ONE_ERROR_LESS_STRICKED_ENABLE	When bit 'freeze_one_error' is set, and this bit is set, and an error is detected in the BMU, the BMU will freeze, but in a little less rigorous way then when this bit is not set. Get commands will still go through, and the BD/PDUavailable signals to the RXP and DPU will not be masked off. This will prevent DPU and RXP getting into some error state.
7	BLOCK_RXP_PUSH_INTEGRITY_CHECK	When set, and 'push_data_integrity_check' is also set, the push integrity will be performed on all WQs except WQ 2. That is the WQ that RXP is pushing to.
6	FREEZE_ONE_ERROR_ENABLE	When set, and an error is detected in the BMU, the BMU will freeze. That is, release commands are thrown away, get bd/dpu commands will not be successful anymore, and reservation request will return unsuccessful. All wq signals and bd/pduavailable signals will be set to low.
5	RELEASE_INTEGRITY_CHECK	When set, and a release command is received by the BMU, the BMU will check the integrity of the BD and linked PDUs. If a problem is found with the linked DPU pointers, an error is reported and the frame is not pushed into the WQ, so that the contents remainsavailable for debugging
4	PUSH_DATA_INTEGRITY_CHECK	When set, and a push command is received by the BMU, the BMU will check the integrity of the BD and linked PDUs. If a problem is found with the BD/DPU pointers, an error is reported and the frame is not pushed into the WQ, so that the contents remainsavailable for debugging The index of the BD that caused the problem can be read in register: bmu_push_integrity_err_bd_index
3	RXP_BMU_DXE_DATALEN_ENABLE	When set, any packet push from Rxp to Dxe, rxp_bmu_dxe_dataLEN is taken to calculate dxe data length
2	ENHANCED_RESERVE_ALL_ENABLE	When set, reserve all command checks for TX memory threshold if tx_threshold is greater than than BTQM memory size then it reserves min of (tx_threshold - BTQM memory size, idle Packet memory size - requested module threshold)
1	PRIORITY_BASED_RES_ENABLE	When set, enables priority based BD/PDU reservation command
0	AMSDU_RELEASE_SUPPORT_ENABLE	When set, the A-MSDU support for releasing PDUs from BDs is enabled. This means that the BMU will evaluate the setting of the PREV PDU index field in the BD. If this field is zero, the PDUs are release according to the head/tail and PDU count linked to the BD. When the PREV PDU index field is unequal to zero, the BMU will use this index as the 'tail' index of the list of PDUs to release. The amount of PDUs to release is set equal to PDU count minus 1.

0x0A08008C WCSS_A_BMU_DISABLE_WQ_DA**Type:** RW**Reset State:** 0x00000000

This register can be used to disable the wq daavailable signals. In that case, modules will think that their WQ is empty.

WCSS_A_BMU_DISABLE_WQ_DA

Bits	Name	Description
26:2	DISABLE_WQ_DA	Bit 2 corresponds with WQ 2, bit 3 with WQ 3 etc. When set, the wq daavailable signal to a WQ will always indicate that the WQ is empty. This overwrites any real amount of frames buffered in a WQ.

0x0A080090 WCSS_A_BMU_DISABLE_BD_PDU_AVAIL**Type:** RW**Reset State:** 0x00000000

This register can be used to disable the bd_pduavailable signals. In that case, modules will think that no more BDs or PDUs areavailable, and will stall their operation

WCSS_A_BMU_DISABLE_BD_PDU_AVAIL

Bits	Name	Description
10:0	DISABLE_BD_PDU_AVAIL	Bit 0 corresponds with master 0, bit 1 with master 1 etc. When set, the bd_pduavailable signal to a master will always indicate that no BDs and PDUs areavailable. This overwrites any real amount of BDs or PDUs beingavailable for that module.

0x0A080094 WCSS_A_BMU_LAST_FOUR_POP_TRACE_CONTROL**Type:** RW**Reset State:** 0x00000000

This register controls the enabling of the last 4 pop command tracing control. The POP command tracing can be enabled for one specific (programmable) WQ. It also provides insight into how many times a pop command was issues for the specified WQ

WCSS_A_BMU_LAST_FOUR_POP_TRACE_CONTROL

Bits	Name	Type	Description
31:16	POP_CMD_COUNT	R	The number of times a POP command was issued on the specified WQ.

WCSS_A_BMU_LAST_FOUR_POP_TRACE_CONTROL (cont.)

Bits	Name	Type	Description
8	POP_TRACE_ENABLE	RW	When set, the pop tracing functionality for the WQ as specified in field 'pop_trace_wq_index' is enabled. The BD indexes returned for the last 4 pop commands that were issued for the specified WQ, are captured in the registers: pop_cmd_trace_bd_index0, pop_cmd_trace_bd_index1, pop_cmd_trace_bd_index2 and pop_cmd_trace_bd_index3. The index in the pop_cmd_trace_bd_index0 is the BD index returned with the most recent pop command. Whenever the 'pop_trace_wq_index' field gets changed the pop trace functionality first needs to be disabled. That will clear the 4 stored indexes and the pop counter.
4:0	POP_TRACE_WQ_INDEX	RW	The WQ index for which the pop commands need to be traced

0x0A080098 WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX0**Type:** R**Reset State:** 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX0

Bits	Name	Description
11:0	POP_BD_INDEX0	BD index

0x0A08009C WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX1**Type:** R**Reset State:** 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX1

Bits	Name	Description
11:0	POP_BD_INDEX1	BD index

0x0A0800A0 WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX2**Type:** R**Reset State:** 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX2

Bits	Name	Description
11:0	POP_BD_INDEX2	BD index

0x0A0800A4 WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX3**Type:** R**Reset State:** 0x00000000

This register contains a BD index returned as the result of a POP command on a specific WQ. See the description for the 'last_four_pop_trace_control' register for additional details.

WCSS_A_BMU_POP_CMD_TRACE_BD_INDEX3

Bits	Name	Description
11:0	POP_BD_INDEX3	BD index

0x0A0800AC WCSS_A_BMU_BMU_INTERNAL_MEM_TRACE_ADDR**Type:** R**Reset State:** 0x00000000

This register Indicates the head index pointer of where the last BMU command data was written to BMU internal memory

WCSS_A_BMU_BMU_INTERNAL_MEM_TRACE_ADDR

Bits	Name	Description
10:0	BMU_INTERNAL_MEM_INDEX	internal BMU memory address that will be used next to store the internal BMU tracing BMU commands and data. In units of BD index.

0x0A0800B0 WCSS_A_BMU_RELEASE_ERROR_DETAILS**Type:** R**Reset State:** 0x00000000

When a release error is reported, this register contains PDU index values of current & previous PDUs that caused release error This is debug information

WCSS_A_BMU_RELEASE_ERROR_DETAILS

Bits	Name	Description
31:0	RELEASE_ERROR_DETAILS	Bits 31:16 will indicate the previous PDU index Bits 15:0 will indicate the current PDU index

0x0A0800B4 WCSS_A_BMU_RELEASE_ERROR_DETAILS_LOW**Type:** R**Reset State:** 0x00000000

When a release error is reported, this register contains debug information

WCSS_A_BMU_RELEASE_ERROR_DETAILS_LOW

Bits	Name	Description
23:0	RELEASE_ERROR_DETAILS_LOW	Bit 23: when set, indicates a release of PDU linked list is ongoing when NOT set, bit 22 indicates the ongoing command: Bit 22: when NOT set, indicates a release of BD-PDU command is ongoing when set, indicates a release is ongoing based on a push to the sink WQ: FF That means, this can be a BD-PDU release or a release based on a defrag BD. The BMU will first investigate what the BD type is and process is accordingly. Bits [15:0]: when bit 23 is set: PDU head index of the PDU linked list when bit 23 is NOT set: BD index

0x0A0800B8 WCSS_A_BMU_RELEASE_ERROR_DETAILS_HIGH**Type:** R**Reset State:** 0x00000000

When a release error is reported, this register contains debug information It only contains valid info when bit 23 of register release_error_details_low is set

WCSS_A_BMU_RELEASE_ERROR_DETAILS_HIGH

Bits	Name	Description
23:0	RELEASE_ERROR_DETAIL_S_HIGH	Bits [23:16]: number of PDUs in the PDU linked list being released Bits [15:0]: PDU tail index of the PDU linked list

0x0A0800BC WCSS_A_BMU_RELEASE_FIFO_ENTRIES**Type:** R**Reset State:** 0x00000000

The register provides insight into how many entries in the release fifo have been used

WCSS_A_BMU_RELEASE_FIFO_ENTRIES

Bits	Name	Description
15:8	NR_PDU_LINKS_CHECKED	When a release (integrity) check error is reported, this field can help debug the problem This field will indicate how many PDUs the integrity check has gone down the PDU linked list that is connected to the BD
5:0	NR_USED_REL_FIFO_ENTRIES	

0x0A0800C0 WCSS_A_BMU_LAST_BD_PREFETCH_HEAD**Type:** R**Reset State:** 0x00000000

The register provides insight info what the last used bd prefetch head was. This information can be usefull in case a linked BD list error is reported

WCSS_A_BMU_LAST_BD_PREFETCH_HEAD

Bits	Name	Description
26:16	REMAINING_AVAILABLE_BD_FOR_PREFETCH_CNT	
10:0	PREFETCH_HEAD_BD_INDEX	

0x0A0800C4 WCSS_A_BMU_BD_PREFETCH_HEAD_BD_LINK**Type:** R**Reset State:** 0x00000000

The register provides insight into which BD index was the bd prefetch head was pointing to This information can be usefull in case a linked BD list error is reported

WCSS_A_BMU_BD_PREFETCH_HEAD_BD_LINK

Bits	Name	Description
10:0	NEXT_PREFETCH_HEAD_BD_INDEX	

0x0A0800C8 WCSS_A_BMU_BMU_PUSH_INTEGRITY_ERR_BD_INDEX

Type: R

Reset State: 0x00000000

This register indicates the bd index of the BD that was pushed into a WQ, but the integrity check on the BD with linked PDUs failed

WCSS_A_BMU_BMU_PUSH_INTEGRITY_ERR_BD_INDEX

Bits	Name	Description
10:0	INTEGRITY_ERR_BD_INDEX	BD index.

0x0A0800CC WCSS_A_BMU_BMU_WATCHDOG_TIMEOUT_TIME

Type: RW

Reset State: 0x0000FFFF

This register indicates the timeout in nr of clock cycles when an ahb access has started but does not get finished

WCSS_A_BMU_BMU_WATCHDOG_TIMEOUT_TIME

Bits	Name	Description
19:0	BMU_WATCHDOG_TIMEOUT_TIME	timeout time in nr of clk cycles. When set to zero, the watchdog functionality is disabled

0x0A0800D0 WCSS_A_BMU_BMU_SM_STATES_ON_ERROR_LOW

Type: R

Reset State: 0x00000000

This register provides a snapshot of the bmu statemachines when an error is reported.

WCSS_A_BMU_BMU_SM_STATES_ON_ERROR_LOW

Bits	Name	Description
31:0	BMU_SM_STATES_ON_ERROR_LOW	[31:28] = encoded_release_pdu_ctrl_sm_state[3:0]; [27:25] = encoded_release_bd_ctrl_sm_state[2:0]; [24:22] = encoded_release_ctrl_sm_state[2:0]; [21:19] = encoded_pdu_prefetch_mgr_sm_state[2:0]; [18:15] = encoded_bd_prefetch_mgr_sm_state[3:0]; [14:12] = encoded_bd_pdu_mgr_sm_state[2:0]; [11:8] = encoded_integrity_check_state[3:0]; [7:4] = {1'b0, encoded_wq_mgr_state[2:0]}; [3:0] = encoded_gas_interface_sm_state;

0x0A0800D4 WCSS_A_BMU_BMU_SM_STATES_ON_ERROR_HIGH**Type:** R**Reset State:** 0x00000000

This register provides a snapshot of the bmu statemachines when an error is reported.

WCSS_A_BMU_BMU_SM_STATES_ON_ERROR_HIGH

Bits	Name	Description
31	ERROR_CAPTURED	when set, an error state has been captured
12:0	BMU_SM_STATES_ON_ERROR_HIGH	[12] = bmu_mcu_err_int; [11] = freeze_bmu_state; [10:4] = test_bus_locally_prefetched_pdu_count[BMU_HIGH_BIT_PREFETCH_MEM + 1:0]; [3:1] = encoded_prefetch_fifo_ctrl_sm_state[2:0]; [0] = encoded_release_pdu_ctrl_sm_state[4];

0x0A0800D8 WCSS_A_BMU_BMU_PREFETCH_ERROR_DETAILS**Type:** R**Reset State:** 0x00000000

This register provides insight to the error that was reported on an reported prefetch error

WCSS_A_BMU_BMU_PREFETCH_ERROR_DETAILS

Bits	Name	Description
31:0	BMU_PREFETCH_ERROR_DETAILS	rdgam_prefetch_pdu_rdata_valid [15:0] = used_pdu_head_index_reg [31:16] = rdgam_prefetch_pdu_rdata[15:0] tail_of_pdu_list_reached_based_on_tail_pointer [15:0] = used_pdu_head_index_reg; [23:16] = locally_prefetched_pdu_count_reg; [31:24] = pdu_count_aavailable_for_prefetch[7:0]; next_tail_of_pdu_list_reached_based_on_pdu_count [15:0] = used_pdu_head_index_reg; [31:16] = local_pdu_head_index_reg;

0x0A0800DC WCSS_A_BMU_CONTROL3**Type:** RW**Reset State:** 0x00000000

This register can be used to control details for the bmu build in BD/PDU integrity checking. The enabling of the overall integrity check is controlled by bits in the control2 register. This register allows that check to tune in into specific WQs (for the push command check) or specific masters (for the release check).

WCSS_A_BMU_CONTROL3

Bits	Name	Description
15	PUSH_INTEGRITY_FOR_SPECIFIC_MASTER_SELECTED	When set, the push WQ integrity check will only be performed on pushes to the WQ identified by "push_integrity_check_wq_nr".
12:8	PUSH_INTEGRITY_CHECK_WQ_NR	This is the number of the WQ for which the BD/PDUs pushed into this WQ need to be checked for their integrity.
7	RELEASE_INTEGRITY_FOR_SPECIFIC_MASTER_SELECTED	When set, the release BD/PDU integrity check will only be performed for the master identified by "release_integrity_check_master_id".
5:0	RELEASE_INTEGRITY_CHECK_MASTER_ID	This is the id of the master from which the releases need to be checked for its integrity.

0x0A0800E0 WCSS_A_BMU_CONTROL4**Type:** RW**Reset State:** 0x00000F28

This register can be used to control the generation of the 'priority' signal to the DAHB arbiter who passes this on to the MIF. This priority setting will help BMU getting faster 'prioritized' access to the MIF memory over other (SYS, mCPU) interfaces to the MIF.

WCSS_A_BMU_CONTROL4

Bits	Name	Type	Description
31	PREFETCH_FIFO_ACCESS_PRIORITY_SET	R	When set, the prefetch fifo priority signal is set, resulting in the MIF giving priority to the DAHB accesses.
30	RELEASE_FIFO_ACCESS_PRIORITY_SET	R	When set, the release fifo priority signal is set, resulting in the MIF giving priority to the DAHB accesses.
29	PDU_PREFETCH_ACCESS_PRIORITY_SET	R	When set, the pdu based prefetch priority signal is set, resulting in the MIF giving priority to the DAHB accesses.
28	BD_PREFETCH_ACCESS_PRIORITY_SET	R	When set, the bd based prefetch priority signal is set, resulting in the MIF giving priority to the DAHB accesses.
22:16	NR_OF_PREFETCH_ENTRIES	R	The number of entries in the PDU prefetch fifo
11:8	PREFETCH_FIFO_ACCESS_PRIORITY_THRESHOLD	RW	The 'priority' signal is set when the number of used PDU entries in the prefetch fifo gets below this threshold, and there are still PDUs left that can be prefetched When BMU is operating in the special mode where every 128 byte memory segment can be BD or PDU, the amount of the 'priority' signal is set when the prefetched BDs are below the threshold, and the PDU prefetch fifo has less than this threshold number of used entries.
6:0	RELEASE_FIFO_ACCESS_PRIORITY_THRESHOLD	RW	The 'priority signal is set when the release fifo gets filled above this threshold

0x0A0800E4 WCSS_A_BMU_DPU_RSV_STATUS**Type:** RW**Reset State:** 0x00000000

This register can be used to observe and clear pending reservation commands that were issued by the dpu to the BMU. When a reservation command from the DPU is not granted, the nr of BDs and PDUs that were requested are remembered by the BMU. The BMU uses this number, together with the programmed BD/PDU threshold to control the generation of the bmu_pdu_bd_pdu_avail_for_rsv_req signals for the DPU.

WCSS_A_BMU_DPU_RSV_STATUS

Bits	Name	Type	Description
31	BMU_PDU_RX_BD_PDU_AVAILABLE_CLEAR	RW	When set, will clear the pending DPU rx reservation
30	BMU_PDU_RX_BD_PDU_AVAILABLE_FOR_RSV_REQ	R	Status of the bmu_pdu_rx_bd_pdu_avail_for_rsv_req signal to the dpu
28:24	DPU_RX_PENDING_BD_RSV_REQ	R	The number of bds the dpu rx has requested

WCSS_A_BMU_DPU_RSV_STATUS (cont.)

Bits	Name	Type	Description
23:16	DPU_RX_PENDING_PDU_RSV_REQ	R	The number of pdus the dpu rx has requested
15	BMU_PDU_TX_BD_PDU_AVAIL_CLEAR	RW	When set, will clear the pending DPU tx reservation
14	BMU_PDU_TX_BD_PDU_AVAIL_FOR_RSV_REQ	R	Status of the bmu_pdu_tx_bd_pdu_avail_for_rsv_req signal to the dpu
12:8	DPU_TX_PENDING_BD_RSVD_REQ	R	The number of bds the dpu tx has requested
7:0	DPU_TX_PENDING_PDU_RSV_REQ	R	The number of pdus the dpu tx has requested

0x0A0800F0 WCSS_A_BMU_BTQM_CONTROL1**Type:** RW**Reset State:** 0x00000000

controls BTQM (BMU Transmit Queue Manager) features

WCSS_A_BMU_BTQM_CONTROL1

Bits	Name	Type	Description
31	FAST_STAMEM_INIT_STATUS	R	When set, the fast sta-mem initialization is ongoing
28	FAST_STA_MEM_INIT	RW	Writing a 1 to this register bit, the BTQM will initialize the STA mem to all zeros, which means all staids are disabled. It is safest to immediately clear this bit after it was set.
27	BTQM_COUNTERS_CLEAR	R	Writing a 1 to this register bit will clear the btqm related counters. This register auto clears.
26	CFG_MASK_OFF_APSD_SESSION_ENABLE	RW	When set, the 'get_info_apspd_session_ongoing' signal will never be set.
25	CFG_FIXED_BCN_QUEUE_ID_MAPPING	RW	When set, the beacon queueid 0 will always be mapped to BO_DA0, beacon queueid 1 is mapped to BO_DA1, etc. When not set, the same mapping as for the NON beacon STAids is used.
24	CFG_CORRECTED_ARBITRATION_ENABLED	RW	When set, the arbitration logic treats the lowest STAid that has data among all STAids that have data for the same queueid, with the same priority as all the others STAids. When NOT set, the lowest STAid that has data among all STAids that have data for the same queueid, might get less opportunity to transmit

WCSS_A_BMU_BTQM_CONTROL1 (cont.)

Bits	Name	Type	Description
23	TPE_STATS_BUSY_FLAG_SET_ON_FEEDBACK	RW	When set, the ampdu stats busy signal will be set when a TPE feedback signal is received. It will only get cleared when a BA bitmap has been received and has been fully processed
22	APSD_TRIGGER_PM_BIT_SETTING_ENABLE	RW	When set, an incoming apsd frame that has an TID that is of the trigger category, is always considered to be setting the power save status of the STA, irrespective of the pm bit in the frame.
21	PSPOLL_PM_BIT_SETTING_ENABLE	RW	When set, an incoming pspoll frame is always considered to be setting the power save status of the STA, irrespective of the pm bit in the frame
20	APSD_TRIGGER_PM_BIT_MASKING_ENABLE	RW	When set, the PM bit from the received APSD trigger frame is masked off and not interpreted to (properly) indicate the power state of the transmitters STA
19	PSPOLL_PM_BIT_MASKING_ENABLE	RW	When set, the PM bit from the received PS-Poll frame is masked off and not interpreted to (properly) indicate the power state of the transmitters STA
18	REGISTER_APSD_TRIGGER_WHEN_DATA_AVAILABLE	RW	When set, and QoS Null transmission is NOT enabled as response to an APSD trigger, the APSD trigger will only be registered when there is data in any of the delivery enabled queues
17	REGISTER_PSPOLL_TRIGGER_WHEN_DATA_AVAILABLE	RW	When set, and Data Null transmission is NOT enabled as response to a PSPoll, the pspoll trigger will only be registered when there is data in a transmit queue
16	ADVANCED_MORE_DATA_BIT_GENERATION_ENABLED	RW	When set, data frames that are pushed into a transmit queue from which a transmission is happening, will be taken into account for the more data bit generation.
15	COMBINED_SEARCH_ENABLED	RW	When set, BEACON STA and NON BEACON sta search arbitration will happen in parallel as long as NO NON BEACON sta is in power save mode
13	QOS_NULL_TID_SOURCE_IS_TRIGGER_TID	RW	When set, and a qos null frame is transmitted, the TID inserted in the qos null frame is set to the tid field of the trigger frame received. When Not set, the TID inserted in the QoS Null frame will be based on the U-APSD queue with the highest queueid number.
12	SW_PROCESSING_OF_PSPOLL_DATA_NULL_ENABLED	RW	When set, and a valid PSPOLL is received, the reception will be registered in the STA descriptor, so that SW can find out this trigger was received and the start the handling of it.
11	SW_PROCESSING_OF_APSD_QOS_NULL_ENABLED	RW	When set, and a valid APSD trigger is received, the trigger will be registered in the STA descriptor, so that SW can find out this trigger was received and the start the handling of it.
10	RANDOM_PSPOLL_APSD_TRIGGER_PRIORITY_SCHEDULE_ENABLED	RW	When set, and a valid pspoll or APSD trigger is received, the STA has a 50% chance to be put close to the start of the transmit queue.

WCSS_A_BMU_BTQM_CONTROL1 (cont.)

Bits	Name	Type	Description
9	PSPOLL_APSD_TRIGGER_PRIORITY_SCHEDULING_ENABLE	RW	When set, and a valid pspoll or APSD trigger is received, the STA is put at close to the start of the transmit queue
8	BD_PUSH_OWNERSHIP_CHECK_ENABLE	RW	When set, the ownership check on all the push commands gets enabled
7	BD_OWNERSHIP_ASSIGNMENT_DISABLE	RW	When set, the BD_PDU manager module will stop updating the BD ownership assignment when a BD is taken out of the BD idle list and handed over to an other module. Disabling this feature reduces the overhead on the BD SRAM memory
6	BD_OWNERSHIP_CHECK_ENABLE	RW	When set, the will start assigning and tracking who owns a BD. There are 4 owners: 0: BD idle list 1: External module 2: WQ managed by the BMU 3: BTQM transmit WQ
5	APSD_AMPDU_BA_SUPPORT_ENABLED	RW	When set, the BTQM can handle BA policy transmissions while APSD is enabled. Frames can be aggregated in an AMPDU.
4	BTQM_RXP_PWR_INTERFACE_ENABLE	RW	When set, the BMU interface to the RXP related to the power state processing of a station processing is enabled
3	BTQM_RXP_BA_INTERFACE_ENABLE	RW	When set, the BMU interface to the RXP related to the Block Ack bitmap processing is enabled
2	BTQM_TPE_INTERFACE_ENABLE	RW	When set, the BMU interface to the TPE is enabled
1	BTQM_QUEUEING_CTRL_LP_ENABLE	RW	When set, the btqm will start popping frames out of the low priority BTQM entrance WQ 26 and pushing them into the Transmit WQs
0	BTQM_QUEUEING_CTRL_HP_ENABLE	RW	When set, the btqm will start popping frames out of the high priority BTQM entrance WQ 25 and pushing them into the Transmit WQs

0x0A0800F4 WCSS_A_BMU_BTQM_CONTROL2**Type:** RW**Reset State:** 0x00000000

controls BTQM (BMU Transmit Queue Manager) features

WCSS_A_BMU_BTQM_CONTROL2

Bits	Name	Description
31	CFG_BA_PARTIAL_BITMAP_UPDATE	When set, and an AMPDU session, if BA is received without sending BAR(Partial bitmap) and received BA SSN is greater than current SSN the frames are not dropped.

WCSS_A_BMU_BTQM_CONTROL2 (cont.)

Bits	Name	Description
30	CFG_SW_OWNERSHIP_HA S_PRIORITY	When set, the sw access should be getting higher priority over the other ownership request accesses
29	CFG_SENT_QOS_NULL_AF TER_EOSP_WITH_RETRY_ DROP	When set, and an AMPDU session exchange with the TPE is ongoing for which the EOSP gets set, and any frame for which the EOSP was set gets dropped because the max retry count is reached, the BMU will set the internal' QoS data sent flag, so that when no BA is received in which frames get acknowledged, only one more QoS Null frame will be sent, and not any more data frames.
28	CFG_DATA_NULL_SENT_HI GH_PRIORITY_ENABLE	When set, and a data null frame has been sent, but has not yet been acknowledged, the frame will be resent with high priority.
27	CFG_QOS_NULL_SENT_HI GH_PRIORITY_ENABLE	When set, and a qos null frame has been sent, but has not yet been acknowledged, the frame will be resent with high priority.
26	CFG_AMPDU_APSD_MISSI NG_EOSP_HANDLING_EN ABLE	When set, more frames get acknowledged by an BA then the Remaining frame count and NO EOSP was sent (which should not have happened), the BTQM will force a QOS NULL to be sent next, with the EOSP bit set.
25	CFG_END_APSD_AFTER_B A_APSD_EOSP_SENT	When set, and an APSD session with BA is ongoing and an EOSP was set, and the BA gets received, the APSD session will be ended independent of how many frames were acknowledged
24	CFG_SEND_QOSNULL_AF TER_BA_APSD_EOSP_SEN T	When set, and an APSD session with BA is ongoing and an EOSP was set, and the BA gets received, a QoS null will be sent if the BA is not confirming all frames to be ACKED.
10:0	BTQM_QUEUEID_QUEUE_ ENABLE	When set, the corresponding queueid transmission is enabled. Bit zero corresponds with queueid0 This register allows high level blocking of all the transmission of frames out of a particular queueid

0x0A0800F8 WCSS_A_BMU_BTQM_STATUS**Type:** R**Reset State:** 0x00000000

This register indicates the status of several BTQM features

WCSS_A_BMU_BTQM_STATUS

Bits	Name	Description
3	BTQM_TPE_INT_STATUS	When set, the BTQM TPE interface is active providing the TPE queue related information.
2	BTQM_ARBITER_STATUS	When set, the BTQM arbiter is active searching for the next STA to transmit a new frame from
1	BTQM_BA_HANDLER_STAT US	When set, the BTQM Block Ack handler is processing a Block ACK bitmap

WCSS_A_BMU_BTQM_STATUS (cont.)

Bits	Name	Description
0	BTQM_QUEUE_CTRL_STATUS	When set, the BTQM queue controller is active popping a frame out of one of the BTQM entrance WQs and pushing them into the transmit WQs

0x0A0800FC WCSS_A_BMU_BTQM_STA_ENABLE_DISABLE_CONTROL**Type:** RW**Reset State:** 0x00000000

Controls the enable-ing or disable-ing of a STA Whenever a value is written into this register, the BTQM will process the STA settings that came with it. A status bit will indicate if the BTQM is still processing an 'update' command. The next update comand should not be issued till the status bit has been cleared. Note that this can sometimes take quite a while. If for example just before a STA-disable command, a transmit exchange sequence with that STA had started, that transmit exchange sequence will be allowed to finish first. This is done to prevent abnormal abortion of sequences.

WCSS_A_BMU_BTQM_STA_ENABLE_DISABLE_CONTROL

Bits	Name	Type	Description
31	STA_UPDATE_STATUS	R	When set to one, BTQM is processing the last STAid configuration command written to this register.
10:8	STA_CONFIGURATION_COMMAND	RW	000: Enable the transmit queues, but do NOT enable transmission 001: Enable the transmit queues, AND enable transmission 010: Disable the transmit queues AND disable transmission 011: Disable the transmit queues AND disable transmission AND cleanup any data left in the transmit queues 100: Clear the fields related to control frames (ps-poll bit, apsd trigger bit, data null sent bit, qos null sent bit, remaining apsd frame count and eosp sent bit) 101: Disable transmission, but leave transmit queues enabled AND clear the fields related to control frames (ps-poll bit, apsd trigger bit, data null sent bit, qos null sent bit, remaining apsd frame count and eosp sent bit) 110: Disable transmission, but leave transmit queues enabled
3:0	STAID	RW	The STAid for which the STA operation is intended.

0x0A080134 WCSS_A_BMU_BAR_AND_FRAME_DROP_CONTROL**Type:** RW**Reset State:** 0x00000000

controls bar indication and frame drop indication This operation complete is indicated by setting bit-31 of transmit_queue_access_control4 register

WCSS_A_BMU_BAR_AND_FRAME_DROP_CONTROL

Bits	Name	Description
2	SET_QUEUE_BAR_INDICATION	When set to 1, the BTQM will force the 'BAR request' setting in the indicated transmit queue to be set. This feature should be used when a Block ack session is to be initialized, and with the 'BAR request' setting set, the TPE will be forced to first transmit a BAR frame.
1	SET_FRAME_DROP_INDICATION	When set to 1, the BTQM will force the 'drop frame' setting in the indicated transmit queue to be set.

0x0A080138 WCSS_A_BMU_TX_QUEUE_STAID_QUEUEID_CONFIG**Type:** RW**Reset State:** 0x00000000

controls the valid STAid and queueid ranges

WCSS_A_BMU_TX_QUEUE_STAID_QUEUEID_CONFIG

Bits	Name	Description
19:16	MAX_VALID_QUEUEID	The maximum allowed queueid. When a frame is pushed to a transmit WQ for a queueid higher then the programmed value, an error indication will be generated.
11:8	MAX_VALID_STAID	The maximum allowed staId. When a frame is pushed to a transmit WQ for a STAid higher then the programmed value, an error indication will be generated.
3:0	NR_OF_BEACON_STAIDS	The number of staids set aside for beacon handling The STAids reserved start from 0. A number of 5 programmed here, means STAids 0, 1, 2, 3, and 4 are set aside for beacon transmission

0x0A08013C WCSS_A_BMU_ENHANCED_TRACING_CONTROL1**Type:** RW**Reset State:** 0x00000000

Control for the enhance gen5/6 HW tracing capabilities

WCSS_A_BMU_ENHANCED_TRACING_CONTROL1

Bits	Name	Description
31	SW_BMU_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for SW data
30	BTQM_ARBITER_SEARCH_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for btqm next STA/qid transmission selection
29	BTQM_PWR_STATE_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for receive frames pwr state handling
28	TPE_BMU_HWTRACE_ENABLE	Implemented: When set, tracing is enabled for signals from the TPE module
27	GET_BD_PDU_TRACE_FOR_PDU_ENABLE	Implemented: When set, get bd and pdu command tracing is enabled for GET commands that request at least one PDU
26	NAV_UPDATE_TRACE_ENABLE	Implemented: When set, NAV updated (setting or clearing) are registered
25	PHYTX_IDLE_TRACE_ENABLE	Implemented: When set, phytx idle level changes are registered
24	RXP_PKDET_N_TRACE_ENABLE	Implemented: When set, pktdet_n level changes are registered
23	RXP_SECONDARY_CCA_TRACE_ENABLE	Implemented: When set, secondary cca level changes are registered
22	RXP_PRIMARY_CCA_TRACE_ENABLE	Implemented: When set, primary cca level changes are registered

WCSS_A_BMU_ENHANCED_TRACING_CONTROL1 (cont.)

Bits	Name	Description
21	RXP_RPE_BITMAP_UPDAT E_TRACE_ENABLE	Implemented: When set, rxp - rpe bitmap update interaction is registered
20	RXP_RPE_DUPL_DETECT_ TRACE_ENABLE	Implemented: When set, rxp - rpe dupl detect interaction is registered
19	BTQM_QUEUEING_CTRL	Implemented: When set, popping of frames by the BTQM transmit queue controller of frames pushed into the BTQM entrance WQs are registered
18	TPE_FEEDBACK_CMD_TR ACE_ENABLE	Implemented: When set, tpe feedback info is registered
17	TPE_GET_BDIDX_CMD_TR ACE_ENABLE	Implemented: When set, tpe bd index info command are registered
16	TPE_GET_LENGTH_CMD_ TRACE_ENABLE	Implemented: When set, tpe get length info command are registered
15	TPE_GET_INFO_CMD_TRA CE_ENABLE	Implemented: When set, tpe get info command are registered
14	DETAILED_BD_IDLE_LIST_ PUSH_HW_TRACE_ENABL E	Implemented: When set, every push to the bd idle list is registered
13	BTQM_QUEUEING_DROP_ FRAME_TRACE_ENABLE	Implemented: When set, frame drops by the BTQM queue controller tracing is enabled
12	RELEASE_TPE_INT_FRAM E_TRACE_ENABLE	Implemented: When set, release frames from tpe interface tracing is enabled
11	RELEASE_DISABLED_STA_ QUEUE_TRACE_ENABLE	Implemented: When set, release disabled_sta queue command tracing is enabled
10	RELEASE_BA_DROP_TRA CE_ENABLE	When set, release ba_drop command tracing is enabled
9	RELEASE_SINK_CMD_TRA CE_ENABLE	Implemented: When set, release sink command tracing is enabled
8	RELEASE_BD_PDU_CMD_ TRACE_ENABLE	Implemented: When set, release bd_pdu command tracing is enabled
7	RELEASE_PDU_CMD_TRA CE_ENABLE	Implemented: When set, release pdu command tracing is enabled
6	RELEASE_BD_CMD_TRAC E_ENABLE	Implemented: When set, release bd command tracing is enabled
5	BD_PDU_RESERVATION_T RACE_ENABLE	Implemented: When set, bd pdu reservation command tracing is enabled
4	GET_BD_PDU_TRACE_FO R_BD_ENABLE	Implemented: When set, get bd and pdu command tracing is enabled for GET commands that request at least one BD
3	PUSH_CMD_TRACE_ENAB LE	Implemented: When set, push command tracing is enabled

WCSS_A_BMU_ENHANCED_TRACING_CONTROL1 (cont.)

Bits	Name	Description
2	POP_CMD_TRACE_ENABLE	Implemented: When set, pop command tracing is enabled
1	TRACE_FREEZE_ON_ERR	Implemented: When set, the tracing memory will freeze when the bmu detects an internal error for which an BMU error interrupt was enabled.
0	ENHANCED_TRACING_ENABLE	Implemented: When set, all legacy (gen 4) modes of BMU HW-TRACING are disabled, and the new mode is enabled. In this mode all legacy tracing control bit settings are discarded

0x0A080140 WCSS_A_BMU_BTQM_QUEUE_INFO_BASE_ADDR**Type:** RW**Reset State:** 0x00000000

sets the memory address location where the BTQM is going to find the transmit queues

WCSS_A_BMU_BTQM_QUEUE_INFO_BASE_ADDR

Bits	Name	Description
31:2	ADDRESS	The memory address where the BTQM is going to find the transmit queues

0x0A080144 WCSS_A_BMU_QOS_QUEUEID_MAPPING1**Type:** RW**Reset State:** 0x000000FF

indicates to the BMU which queueids contain QoS frames

WCSS_A_BMU_QOS_QUEUEID_MAPPING1

Bits	Name	Description
10:0	QOS_SETTING	When a bit is set, the corresponding queueid will contain QoS frames

0x0A080148 WCSS_A_BMU_QOS_QUEUEID_MAPPING2**Type:** RW**Reset State:** 0x76543210

indicates to the BMU what QoS TID frames are located in a queue. This setting is only valid for a queueid, if the corresponding 'qos_setting' bit for that queue is set.

WCSS_A_BMU_QOS_QUEUEID_MAPPING2

Bits	Name	Description
31:28	TID_FOR_QUEUEID7	
27:24	TID_FOR_QUEUEID6	
23:20	TID_FOR_QUEUEID5

2:0	BO_FOR_QUEUEID0	

0x0A080158 WCSS_A_BMU_QUEUEID_BO_MAPPING2**Type:** RW**Reset State:** 0x00000032

indicates to the BMU how queueid are mapped to BO engines

WCSS_A_BMU_QUEUEID_BO_MAPPING2

Bits	Name	Description
10:8	BO_FOR_QUEUEID10	
6:4	BO_FOR_QUEUEID9	
2:0	BO_FOR_QUEUEID8	

0x0A080160 WCSS_A_BMU_FAST_TRACE_READING_CONTROL**Type:** RW**Reset State:** 0x00000000

Indicates the start bd index address from which fast trace reading should start programming this field set the trace reading head ptr automatically back to this programmed index

WCSS_A_BMU_FAST_TRACE_READING_CONTROL

Bits	Name	Type	Description
26:16	CURRENT_FAST_TRACE_BD_INDEX_ADDRESS	R	The current bd index used for the next bd index read. This value gets automatically updated to the 'fast_trace_start_bd_index_address' field when that is reprogrammed. This value also gets automatically updated to point to the trace table entry when 'fast_trace_reading_data2' register is read. The hardware takes care of 'wrapping around', when the end of the trace memory has been reached.
10:0	FAST_TRACE_START_BD_INDEX_ADDRESS	RW	

0x0A080164 WCSS_A_BMU_FAST_TRACE_READING_DATA0**Type:** R**Reset State:** 0x00000000

returns the lower 32 bits of the bd index data of the bd index indicated in field:
current_fast_trace_bd_index_address

WCSS_A_BMU_FAST_TRACE_READING_DATA0

Bits	Name	Description
31:0	TRACE_DATA0	The lower 32 bits of the trace data

0x0A080168 WCSS_A_BMU_FAST_TRACE_READING_DATA1**Type:** R**Reset State:** 0x00000000

returns the middle 32 bits of the bd index data of the bd index indicated in field:
current_fast_trace_bd_index_address.

WCSS_A_BMU_FAST_TRACE_READING_DATA1

Bits	Name	Description
31:0	TRACE_DATA1	The upper X bits of the trace data

0x0A08016C WCSS_A_BMU_FAST_TRACE_READING_DATA2**Type:** R**Reset State:** 0x00000000

returns the upper X bits of the bd index data of the bd index indicated in field:
current_fast_trace_bd_index_address. Reading from this register, automatically updates the
'current_fast_trace_bd_index_address' field to point to the next entry in the trace table (exact width
of this field: TBD)

WCSS_A_BMU_FAST_TRACE_READING_DATA2

Bits	Name	Description
31:0	TRACE_DATA2	The upper X bits of the trace data

0x0A080170 WCSS_A_BMU_FAST_BD_LINK_SETUP_CONTROL

Type: RW

Reset State: 0x00000000

Initiates fast automated linking of BDs

WCSS_A_BMU_FAST_BD_LINK_SETUP_CONTROL

Bits	Name	Type	Description
31	CREATE_BD_LINKED_LIST	RW	When writing a 1 to this field, the BMU will start linking all the BDs indicated by the 'bd_start_index' and 'bd_end_index' fields.
30	BD_LINK_LIST_CREATION_STATUS	R	When set, the BMU is still busy creating the BD linked list
26:16	BD_END_INDEX	RW	The index of the last BD in the BD linked list to be created by HW
10:0	BD_START_INDEX	RW	The index of the first BD in the BD linked list to be created by HW

0x0A080174 WCSS_A_BMU_STA_CONFIG_STATUS1

Type: RW

Reset State: 0x00000000

Selects the STAid for which the STA parameters need to be read Whenever this register is written, the hardware will start reading or writing the sta parameters related to this staid

WCSS_A_BMU_STA_CONFIG_STATUS1

Bits	Name	Type	Description
31	READ_WRITE_STATUS	R	When set, the hardware is busy retrieving the station information for the last time this register got programmed

WCSS_A_BMU_STA_CONFIG_STATUS1 (cont.)

Bits	Name	Type	Description
8	STA_CONFIG_UPDATE	RW	When NOT set, the hardware will read the sta_id settings When set, the hardware will write back the sta_id settings as programmed in the 'sta_config_status2' and 'sta_config_status3' registers.
3:0	STAID	RW	The STAID for which the station parameters need to be read

0x0A080178 WCSS_A_BMU_STA_CONFIG_STATUS2**Type:** RW**Reset State:** 0x00000000

Provides the STA information corresponding to the 'sta_id' programmed in the 'sta_config_status1' register. This register only has valid contents when the 'read_write_status' bit in the 'sta_config_status1' register is NOT set.

WCSS_A_BMU_STA_CONFIG_STATUS2

Bits	Name	Description
22	EOSP_SENT_STATUS	When set to one, the BTQM has sent a QoS frame for which the EOSP bit in the QoS field was set. This field is used by the BTQM to track the sending of this indicating in case APSD in combination with AMPDU aggregation is used.
21	QOS_NULL_SENT_ONCE_STATUS	When set to one, the BTQM has sent a QoS Null frame. This field is used to be able to indicate that the previous transmission was not successful, and the next time around the QoS Null will be resent one more time.
20	DATA_NULL_SENT_ONCE_STATUS	When set to one, the BTQM has sent a Data Null frame. This field is used to be able to indicate that the previous transmission was not successful, and the next time around the Data Null will be resent one more time.
18:16	CURRENT_REMAINING_TX_FRAME_CNT	This value will be taken as the 'current remaining tx frame count'. Typically this value should be set to zero, and access here is only provided for backup or testing purposes. When set to a non zero value, it will only be used when also 'current_apsd_trig_received_setting' has been set, and the 'sta_u_apsd_enable' has been set.
14	CURRENT_APSD_TRIG_RECEIVED_SETTING	When set to one, the BTQM will assume that an apsd trigger frame has just been received.
13	CURRENT_PS_POLL_RECEIVED_SETTING	When set to one, the BTQM will assume that a ps_poll frame has just been received.
12	CURRENT_PWR_STATE_SETTING	When set to one, the BTQM will assume that the STA is in power save mode.

WCSS_A_BMU_STA_CONFIG_STATUS2 (cont.)

Bits	Name	Description
10:8	INITIAL_REMAINING_TX_FRAME_CNT	After receiving an APSD trigger frame, the value in this register will represent the number of response frames that will be sent to the STA. A value of 7 indicates, to drain the complete transmit queue
6	QOS_NULL_RESP_ENABLE	When set, and an apsd trigger is received and all APSD delivery enabled queues are empty, the BTQM will indicate to the TPE to transmit a QoS null frame
5	U_DATA_NULL_RESP_ENABLE	When set, and a ps-poll apsd trigger is received and all the (non APSD deliver enabled) queues are empty, the BTQM will indicate to the TPE to transmit a Data null frame
4	STA_U_APSD_TRACK_ENABLE	When set to one, the BTQM will the reception and handling of APSD trigger frames
1	STA_TX_ENABLE	When set, transmission for this sta is enabled
0	STA_ENABLE	When set, the STAid is enabled

0x0A08017C WCSS_A_BMU_STA_CONFIG_STATUS3**Type:** RW**Reset State:** 0x00000000

Provides the STA information corresponding to the 'sta_id' programmed in the 'sta_config_status1' register. This register only has valid contents when the 'read_write_status' bit in the 'sta_config_status1' register is NOT set.

WCSS_A_BMU_STA_CONFIG_STATUS3

Bits	Name	Description
31:16	DELIVERY_ENABLED_TCID_QUEUES	When set, the corresponding TCID is part of the delivery enabled queues. Bit 0 corresponds with TCID 0
15:0	TRIGGER_ENABLED_TCID	When set, and a QoS Data frame of the corresponding TCID is received, the frame will be interpreted as an APSD trigger frame

0x0A080180 WCSS_A_BMU_STA_CONFIG_STATUS4**Type:** RW**Reset State:** 0x00000000

Provides the STA information corresponding to the 'sta_id' programmed in the 'sta_config_status1' register. This register only has valid contents when the 'read_write_status' bit in the 'sta_config_status1' register is NOT set.

WCSS_A_BMU_STA_CONFIG_STATUS4

Bits	Name	Description
10:0	DATA_AVAILABLE	When set, the corresponding queueid queue contains frames Bit 0, corresponds to queueid 0 Bit 1, corresponds to queueid 1 ...

0x0A080184 WCSS_A_BMU_BTQM_ERR_STATUS**Type:** R**Reset State:** 0x00000000

Provides status information on BTQM internal errors

WCSS_A_BMU_BTQM_ERR_STATUS

Bits	Name	Description
27	BTQM_POLL_STATUS_TIMER_INT_STATUS	
26	STA_CONFIG_DONE_INT_STATUS	
25	BTQM_SW_QUEUE_ACCESS_DONE_INT_STATUS	
24	STA_CONTROL_UPDATE_DONE_INT_STATUS

0	LINKED_LIST_ERR_ENABLE	

0x0A08018C WCSS_A_BMU_BTQM_ERR_STATE**Type:** R**Reset State:** 0x00000000

Provides the BTQM statemachine states when a BMU error interrupt is generated

WCSS_A_BMU_BTQM_ERR_STATE

Bits	Name	Description
29:0	BTQM_STATES	Snapshot of the btqm statemachines states when a BMU error interrupt is generated

0x0A080190 WCSS_A_BMU_BTQM_ERR_STATE2**Type:** R**Reset State:** 0x00000000

Provides part 2 of the BTQM statemachine states when a BMU error interrupt is generated

WCSS_A_BMU_BTQM_ERR_STATE2

Bits	Name	Description
19:0	BTQM_STATES	Snapshot of the btqm statemachines states when a BMU error interrupt is generated

0x0A080194 WCSS_A_BMU_BTQM_TPE_INT_STATS**Type:** R**Reset State:** 0x00000000

Provides status information on the bmu_tpe interface

WCSS_A_BMU_BTQM_TPE_INT_STATS

Bits	Name	Description
19	TPE_INTERACTION_ERROR_STATUS	When set, a TPE interface interaction error occurred
18:16	TPE_INTERACTION_ERROR_CODE	indicates the first tpe interface interaction error that happened
15:8	BO_DATA_AVAIL	status of the dataavailable signals to the TPE
4:0	TPE_INT_SM_STATE	Represent the statemachine state

0x0A0801B4 WCSS_A_BMU_RETRY_LIMIT_DROP_CNT**Type:** R**Reset State:** 0x00000000

Provides the number of frames that were dropped by the BTQM because the retry limit was reached.

WCSS_A_BMU_RETRY_LIMIT_DROP_CNT

Bits	Name	Description
23:0	RETRY_LIMIT_DROP_CNT	

0x0A0801B8 WCSS_A_BMU_TPE_DROP_CNT**Type:** R**Reset State:** 0x00000000

Provides the number of frames that were dropped by the BTQM because the TPE gave a 'DROP feedback' command

WCSS_A_BMU_TPE_DROP_CNT

Bits	Name	Description
23:0	TPE_DROP_CNT	

0x0A0801BC WCSS_A_BMU_BA_HANDLER_ACKED_DROP_CNT**Type:** R**Reset State:** 0x00000000

Provides the number of frames that were dropped by the BTQM BA handler because the frame reception got acknowledge by the BA bitmap

WCSS_A_BMU_BA_HANDLER_ACKED_DROP_CNT

Bits	Name	Description
23:0	BA_HANDLER_ACKED_DROP_CNT	

0x0A0801C0 WCSS_A_BMU_BA_HANDLER_WINDOW_MOVED_DROP_CNT**Type:** R**Reset State:** 0x00000000

Provides the number of frames that were dropped by the BTQM BA handler because the BA bitmap SSN moved on beyond the frame Sequence number still in the queue

WCSS_A_BMU_BA_HANDLER_WINDOW_MOVED_DROP_CNT

Bits	Name	Description
23:0	BA_HANDLER_WINDOW_MOVED_DROP_CNT	

0x0A0801C4 WCSS_A_BMU_GET_INFO_CNT**Type:** R**Reset State:** 0x00000000

Provides the number times the BTQM received a 'get_info' command from the TPE

WCSS_A_BMU_GET_INFO_CNT

Bits	Name	Description
23:0	GET_INFO_CNT	

0x0A0801C8 WCSS_A_BMU_GET_BD_INDEX_CNT**Type:** R**Reset State:** 0x00000000

Provides the number times the BTQM received a 'get_bd_index' command from the TPE

WCSS_A_BMU_GET_BD_INDEX_CNT

Bits	Name	Description
23:0	GET_BD_INDEX_CNT	

0x0A0801CC WCSS_A_BMU_PWR_SAVE_STA_CNT**Type:** RW**Reset State:** 0x00000000

The number of STAs that are in power save mode & bit map for power save stations

WCSS_A_BMU_PWR_SAVE_STA_CNT

Bits	Name	Description
31:16	POWER_SAVE_STAS_BIT_MAP	
8:0	PWR_SAVE_STA_CNT	

0x0A0801D0 WCSS_A_BMU_BTQM_FRAME_CNT**Type:** R**Reset State:** 0x00000000

The number of frames currently managed by the btqm

WCSS_A_BMU_BTQM_FRAME_CNT

Bits	Name	Description
10:0	BTQM_FRAME_CNT	

0x0A0801D4 WCSS_A_BMU_BTQM_TIMEOUT_CHECK_CTRL**Type:** RW**Reset State:** 0x00000000

The number of clk cycles the BTQM is allowed to empty all btqm transmit queues measured from the point where the last frame got pushed into the BTQM. When this number is exceeded, an BTQM timeout error interrupt is generated. A value of zero disables this check.

WCSS_A_BMU_BTQM_TIMEOUT_CHECK_CTRL

Bits	Name	Description
31:0	BTQM_TIMEOUT_CLK_CYC LE_CNT	

0x0A0801D8 WCSS_A_BMU_PWR_STATE_CHANGE_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

Provides interrupt control and status of STA power state changes.

WCSS_A_BMU_PWR_STATE_CHANGE_INT_CONTROL

Bits	Name	Type	Description
31	PWR_STATE_CHANGE_INT _AUTO_CLEAR_ENABLE	RW	
30	PWR_STATE_CHANGE_INT _OVERFLOW	RW	
29	PWR_STATE_STATUS2	R	
28	PWR_STATE_STATUS1	R	
27	PWR_STATE_STATUS0	R	
26	PWR_STATE_ENTRY2_VAL ID	RW	
25	PWR_STATE_ENTRY1_VAL ID	RW	
24	PWR_STATE_ENTRY0_VAL ID	RW	
23:16	STAID_PWR_INT2	R	
15:8	STAID_PWR_INT1	R	
7:0	STAID_PWR_INT0	R	

0x0A0801DC WCSS_A_BMU_BTQM_INTERRUPT_STATUS**Type:** R**Reset State:** 0x00000000

This register indicates the status of BTQM interrupts. When one of the corresponding events occur, the status will reflect this. An interrupt is only generated if the interrupt is also enabled (see next register).

WCSS_A_BMU_BTQM_INTERRUPT_STATUS

Bits	Name	Description
2	PWRSTATE_DROP_INTERRUPT	When set, the maximum number of frames in a queue for an STA in power save mode has been reached.
1	BTQM_QUEUES_EMPTY_INTERRUPT	When set, the BTQM queues have become empty.
0	PWRSTATE_CHANGE_INTERRUPT	When set, an STA has indicated a power state change.

0x0A0801E0 WCSS_A_BMU_BTQM_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

This register controls the enables of BTQM interrupts.

WCSS_A_BMU_BTQM_INTERRUPT_ENABLE

Bits	Name	Description
2	PWRSTATE_DROP_INTERRUPT_ENABLE	When set, an interrupt will be generated when the maximum number of frames in a queue for an STA in power save mode has been reached.
1	BTQM_QUEUES_EMPTY_INTERRUPT_ENABLE	When set, an interrupt will be generated when the BTQM queues have become empty.
0	PWRSTATE_CHANGE_INTERRUPT_ENABLE	When set, an interrupt will be generated when an STA has indicated a power state change.

0x0A0801E4 WCSS_A_BMU_PWR_SAVE_DROP_CTRL**Type:** RW**Reset State:** 0x00000000

This register controls dropping of frames for an STA in power save mode.

WCSS_A_BMU_PWR_SAVE_DROP_CTRL

Bits	Name	Description
8	PWR_SAVE_DROP_ENABLE	When set, and the number of frames in a queue for a STA is larger than this 'drop_threshold' number, the frame will be dropped.
7:0	PWR_SAVE_DROP_THRES HOLD	When set, an interrupt will be generated when an STA has indicated a power state change

0x0A0801E8 WCSS_A_BMU_PWR_SAVE_DROP_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

Provides interrupt control and status for the power save frame DROP interrupt generations (For when BTQM starts dropping frames for an STA in power save mode because the max threshold of frames is reached.)

WCSS_A_BMU_PWR_SAVE_DROP_INT_CONTROL

Bits	Name	Type	Description
31	DROP_INT_AUTO_CLEAR_ENABLE	RW	
30	DROP_INT_OVERFLOW	RW	
29	DROP_ENTRY1_VALID	RW	
28	DROP_ENTRY0_VALID	RW	
25:21	DROP_QUEUEID_PWR_INT1	R	
20:16	DROP_QUEUEID_PWR_INT0	R	
15:8	DROP_STAID_PWR_INT1	R	
7:0	DROP_STAID_PWR_INT0	R	

0x0A0801EC WCSS_A_BMU_BMU_BACKUP_CONTROL**Type:** RW**Reset State:** 0x00000000

This register controls backup functionality build into the BMU

WCSS_A_BMU_BMU_BACKUP_CONTROL

Bits	Name	Description
4	SW_TRIGGERED_REARBITRAION_ENABLE	When set, BTQM arbiter to force a re-arbitration for the STAs It removes the current selected STAs from all the prefetched queues, and then re-start the arbitration Once rearbitration is done this bit will be cleared
3	CFG_CLEAR_DA_ON_FINDING_EMPTY_QUEUE_ENABLE	When set, and an empty queue is prefetched, the dataavailable signal corresponding to that STA/queueid will be cleared
2	STA_DA_AVAIL_BACKUP_MODE_ENABLED	When set, on every frame pushed into a queue, all sta daavailable settings will be set
1	ARBITRATION_BACKUP_MODE_ENABLED	When set, on every frame pushed into a queue, all queue daavailable and min/max values will be set again
0	RESERVED	Do NOT set

0x0A0801F0 WCSS_A_BMU_BMU_QUEUE_DELAY_ACCESS_CONTROL**Type:** RW**Reset State:** 0x0A0A0000

This register to control the access of Queue/Transmit delay parameters

WCSS_A_BMU_BMU_QUEUE_DELAY_ACCESS_CONTROL

Bits	Name	Description
28:24	QUEUE_DELAY_RANGE_FIELD_VALUE	Queue delay Bin 0 Range field value for first bin
20:16	TRANSMIT_DELAY_RANGE_FIELD_VALUE	Transmit delay Bin 0 Range field value for first bin
8	READ_MODIFY_WRITE_ZERO	Control to access Queue/Transmit Delay parameters 0 : Data read only 1 : After reading the value, data is initialized to zero
7	QUEUE_TRANSMIT_DELAY	Control to access Queue/Transmit Delay parameters 0 : Queue Delay 1 : Transmit Delay
6:3	TID_INDEX	TID access control
2:0	BIN_INDEX	Bin access control 000 : Bin-0 001 : Bin-1 . . 101 : Bin-5

0x0A0801F4 WCSS_A_BMU_QUEUE_TRANSMIT_DELAY_VALUE**Type:** R**Reset State:** 0x00000000

Queue/Transmit delay value, and this register access is controlled through "bmu_queue_delay_access_control" register

WCSS_A_BMU_QUEUE_TRANSMIT_DELAY_VALUE

Bits	Name	Description
31:0	QUEUE_TRANSMIT_DELAY_VALUE	

0x0A0801F8 WCSS_A_BMU_DXE_RX_WQ_INDEX

Type: RW

Reset State: 0x0000040B

DXE rx WQ index where the received packed are being pushed. BMU keeps track of byte cnt for this WQ for SIF-DXE interface

WCSS_A_BMU_DXE_RX_WQ_INDEX

Bits	Name	Description
15:8	DXE_RX_PRIORITY_WQ_INDEX	DXE high WQ index for high priority traffic
7:0	DXE_RX_WQ_INDEX	DXE WQ index for normal traffic

0x0A0801FC WCSS_A_BMU_BMU_SIF_DATA_LENGTH

Type: R

Reset State: 0x00000000

Number bytes pushed to DXE Rx WQ

WCSS_A_BMU_BMU_SIF_DATA_LENGTH

Bits	Name	Description
16	DXE_WQ_DATA_UNDERFLOW	When this bit is set, SIF transfer byte count is more than DXE WQ data
15:0	BMU_SIF_DATA_LENGTH	Data accumulated in DXE WQ

0x0A080200 WCSS_A_BMU_SW_BMU_DXE_DATA_LENGTH

Type: RW

Reset State: 0x00000000

Number bytes pushed to DXE Rx WQ

WCSS_A_BMU_SW_BMU_DXE_DATA_LENGTH

Bits	Name	Description
15:0	SW_BMU_DXE_DATA_LENGTH	Data length to be added to DXE Rx WQ count

0x0A080208 WCSS_A_BMU_BTQM_PACKET_MEMORY_UNIT_SIZE**Type:** RW**Reset State:** 0x00000001

BTQM reports consumed memory in btqm_packet_memory_unit_size*128-bytes

WCSS_A_BMU_BTQM_PACKET_MEMORY_UNIT_SIZE

Bits	Name	Description
3:0	BTQM_PACKET_MEMORY_UNIT_SIZE	

0x0A080210 WCSS_A_BMU_BTQM_TX_THRESHOLD**Type:** RW**Reset State:** 0x00000080

Controls the memory resources for Tx traffic If the Tx memory usage is greater than equal to this value Any request for BD/PDUs from reserve all command is ignored

WCSS_A_BMU_BTQM_TX_THRESHOLD

Bits	Name	Description
10:0	BTQM_MEM_THRESHOLD	

0x0A080214 WCSS_A_BMU_BTQM_STAID_3_TO_0_MEM_STATUS**Type:** R**Reset State:** 0x00000000

BTQM memory status for STAid3 to STAid0. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

WCSS_A_BMU_BTQM_STAID_3_TO_0_MEM_STATUS

Bits	Name	Description
31:24	STAID3	
23:16	STAID2	
15:8	STAID1	
7:0	STAID0	

0x0A080218 WCSS_A_BMU_BTQM_STAID_7_TO_4_MEM_STATUS**Type:** R**Reset State:** 0x00000000

BTQM memory status for STAid7 to STAid4. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

WCSS_A_BMU_BTQM_STAID_7_TO_4_MEM_STATUS

Bits	Name	Description
31:24	STAID7	
23:16	STAID6	
15:8	STAID5	
7:0	STAID4	

0x0A08021C WCSS_A_BMU_BTQM_PKT_MEMORY_STATUS**Type:** R**Reset State:** 0x00000000

BTQM combined memory status for all the stations.

WCSS_A_BMU_BTQM_PKT_MEMORY_STATUS

Bits	Name	Description
10:0	BTQM_PKT_MEMORY_STATUS	

0x0A080220 WCSS_A_BMU_HP_RX_MEMORY_UPPER_LIMIT**Type:** RW**Reset State:** 0x000000E8

Controls the memory resources for Rx high priority RX traffic. If the Rx memory usage is greater than equal to this value Any request for BD/PDUs from Rx modules is ignored

WCSS_A_BMU_HP_RX_MEMORY_UPPER_LIMIT

Bits	Name	Description
10:0	HP_RX_MEMORY_UPPER_LIMIT	

0x0A080224 WCSS_A_BMU_LP_RX_MEMORY_UPPER_LIMIT**Type:** RW**Reset State:** 0x000000D1

Controls the memory resources for Rx high priority RX traffic. If the Rx memory usage is greater than equal to this value Any request for BD/PDUs from Rx modules is ignored

WCSS_A_BMU_LP_RX_MEMORY_UPPER_LIMIT

Bits	Name	Description
10:0	LP_RX_MEMORY_UPPER_LIMIT	

0x0A080228 WCSS_A_BMU_BTQM_STAID_1_TO_0_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid1 to STAid0. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_1_TO_0_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID1	
10:0	STAID0	

0x0A08022C WCSS_A_BMU_BTQM_STAID_3_TO_2_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid3 to STAid2. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_3_TO_2_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID3	
10:0	STAID2	

0x0A080230 WCSS_A_BMU_BTQM_STAID_5_TO_4_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid5 to STAid4. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_5_TO_4_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID5	
10:0	STAID4	

0x0A080234 WCSS_A_BMU_BTQM_STAID_7_TO_6_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid7 to STAid6. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_7_TO_6_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID7	
10:0	STAID6	

0x0A080238 WCSS_A_BMU_BTQM_STAID_15_TO_0_MEM_USAGE_STATUS**Type:** RW**Reset State:** 0x00000000

BTQM memory status for STAid15 to STAid0. When the memory usage for STAidX is less than the threshold value the bit will be set

WCSS_A_BMU_BTQM_STAID_15_TO_0_MEM_USAGE_STATUS

Bits	Name	Type	Description
31	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_STATUS	RW	Writing one to this register bit will clear the interrupt
30	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_ENABLE	RW	When this bit is set, bmu_mcu_queue_usage_threshold_interrupt is enabled
15:0	STAID	R	

0x0A08023C WCSS_A_BMU_POLL_STATUS_TIMER_THRESHOLD**Type:** RW**Reset State:** 0x0000FFFF

BTQM poll status threshold, this value represents no.of clock cycles BTQM generates an interrupt when the delay exceeds this value

WCSS_A_BMU_POLL_STATUS_TIMER_THRESHOLD

Bits	Name	Description
15:0	POLL_STATUS_TIMER_THRESHOLD	

0x0A080240 WCSS_A_BMU_BMU_IDLE_BD_PDU_STATUS**Type:** RW**Reset State:** 0x00000000

BMU keeps track of no.of idle bd/pdus in the system. When this idle bd/pdu number reaches the programmed threshold value it generates an interrupt

WCSS_A_BMU_BMU_IDLE_BD_PDU_STATUS

Bits	Name	Description
31	BMU_IDLE_BD_PDU_THRESHOLD_INTERRUPT_STATUS	Writing one to this register bit will clear the interrupt
15	BMU_IDLE_BD_PDU_THRESHOLD_INTERRUPT_ENABLE	When this bit is set, bmu_idle_bd_pdu_threshold_interrupt is enabled
10:0	BMU_IDLE_BD_PDU_THRESHOLD	

0x0A080244 WCSS_A_BMU_BTQM_STAID_11_TO_8_MEM_STATUS**Type:** R**Reset State:** 0x00000000

BTQM memory status for STAid11 to STAid8. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

WCSS_A_BMU_BTQM_STAID_11_TO_8_MEM_STATUS

Bits	Name	Description
31:24	STAID11	
23:16	STAID10	
15:8	STAID9	
7:0	STAID8	

0x0A080248 WCSS_A_BMU_BTQM_STAID_15_TO_12_MEM_STATUS**Type:** R**Reset State:** 0x00000000

BTQM memory status for STAid15 to STAid12. It is multiples of 128bytes. This needs to be multiplied by setting in "btqm_packet_memory_unit_size" register.

WCSS_A_BMU_BTQM_STAID_15_TO_12_MEM_STATUS

Bits	Name	Description
31:24	STAID15	
23:16	STAID14	
15:8	STAID13	

WCSS_A_BMU_BTQM_STAID_15_TO_12_MEM_STATUS (cont.)

Bits	Name	Description
7:0	STAID12	

0x0A08024C WCSS_A_BMU_BTQM_STAID_9_TO_8_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid9 to STAid8. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_9_TO_8_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID9	
10:0	STAID8	

0x0A080250 WCSS_A_BMU_BTQM_STAID_11_TO_10_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid11 to STAid10. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_11_TO_10_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID11	
10:0	STAID10	

0x0A080254 WCSS_A_BMU_BTQM_STAID_13_TO_12_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid13 to STAid12. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_13_TO_12_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID13	
10:0	STAID12	

0x0A080258 WCSS_A_BMU_BTQM_STAID_15_TO_14_MEM_THRESHOLD**Type:** RW**Reset State:** 0x00000000

BTQM memory threshold for STAid15 to STAid14. It is multiples of 128bytes. BMU generates an interrupt when STAx memory usage is less than this threshold value

WCSS_A_BMU_BTQM_STAID_15_TO_14_MEM_THRESHOLD

Bits	Name	Description
26:16	STAID15	
10:0	STAID14	

0x0A08025C WCSS_A_BMU_BMU_PKT_MEMORY_CONFIG_MODE**Type:** RW**Reset State:** 0x00000000

To configure each module operational mode i.e to use local/external memory as packet memory to get BD/PDUs 00 : EXternal Memory Only -> Defined master gets BD/PDUs from External (DDR) memory only 01 : Local Memory Only -> Defined master gets BD/PDUs from Local Memory(cMem) only 10 : Local/Ext -> Defined master gets from cMem and whenavailable BD/PDUs falls below the threshold level BMU gives out BD/PDUs for DDR memory 11 : Reserved

WCSS_A_BMU_BMU_PKT_MEMORY_CONFIG_MODE

Bits	Name	Description
21:20	MASTER10	To configure Master10 module operational mode
19:18	MASTER9	To configure Master9 module operational mode
17:16	MASTER8	To configure Master8 module operational mode
15:14	MASTER7	To configure Master7 module operational mode
13:12	MASTER6	To configure Master6 module operational mode
11:10	MASTER5	To configure Master5 module operational mode

WCSS_A_BMU_BMU_PKT_MEMORY_CONFIG_MODE (cont.)

Bits	Name	Description
9:8	MASTER4	To configure Master4 module operational mode
7:6	MASTER3	To configure Master3 module operational mode
5:4	MASTER2	To configure Master2 module operational mode
3:2	MASTER1	To configure Master1 module operational mode
1:0	MASTER0	To configure Master0 module operational mode

0x0A080260 WCSS_A_BMU_AVAILABLE_BD_PDU_AFTER_RSV_IN_LOCAL_MEM**Type:** R**Reset State:** 0x00000000

This register can be used to find out how many idle BD/PDUs are actually available (in Local memory) from the BD and PDU idle list when the number of reserved BDs and PDUs for all the different modules have been taken into account.

WCSS_A_BMU_AVAILABLE_BD_PDU_AFTER_RSV_IN_LOCAL_MEM

Bits	Name	Description
15:0	AVAILABLE_BD_PDUS_IN_LOCAL_MEMORY	

0x0A080264 WCSS_A_BMU_BLOCK_DPU_RX_THRESHOLD**Type:** RW**Reset State:** 0x00000000

If at certain moment no flat memory space is available anymore, DXE RX will stop pulling out frames from cMEM. cMEM can now fill up with frame pulled by DPU RX out of DDR, to prevent Tx block, this threshold is used block the data available signal to DPU_Rx.

WCSS_A_BMU_BLOCK_DPU_RX_THRESHOLD

Bits	Name	Description
10:0	BLOCK_DPU_RX_THRESHOLD	

0x0A080268 WCSS_A_BMU_ADU_RX_LOW_THRESHOLD**Type:** RW**Reset State:** 0x00000000

ADU RX can consume cMEM BDs in case of A-MSDU de-aggregation, ADU cMEM threshold should have the smallest value in Receive path BMU will switch to this threshold value when there is a block in Rx-path

WCSS_A_BMU_ADU_RX_LOW_THRESHOLD

Bits	Name	Description
10:0	ADU_RX_LOW_THRESHOLD	

0x0A08026C WCSS_A_BMU_DXE_TX_LOW_THRESHOLD**Type:** RW**Reset State:** 0x00000000

when DXE RX WQ is not empty (and RX path might be stalling), increase the memory amount available for TX data (=> Decrease threshold) When RX is stalled BMU will switch to this threshold

WCSS_A_BMU_DXE_TX_LOW_THRESHOLD

Bits	Name	Description
10:0	DXE_TX_LOW_THRESHOLD	

0x0A080270 WCSS_A_BMU_DXE_RX_DA_SELECTION**Type:** RW**Reset State:** 0x00000810

Data available signal that goes all the way from BMU to DXE to prevent Rx blocking, These are the bits to configure assigned DXE WQs. By default WQ-4 & WQ-11 assumed as DXE Rx WQs

WCSS_A_BMU_DXE_RX_DA_SELECTION

Bits	Name	Description
24:2	DXE_RX_DA_SELECTION	

10.30 WCSS_A_BTCF_BTCF

0x0A014800 WCSS_A_BTCF_BTCF_CONFIG

Type: RW

Reset State: 0x0EDD

Programs the offsets that will be added to the computed values

WCSS_A_BTCF_BTCF_CONFIG

Bits	Name	Description
11:8	FFT_TOFFSET256	signed 2's complement number which is used to adjust the timing offset for the 256-point FFT start time
7:4	FFT_TOFFSET128	signed 2's complement number which is used to adjust the timing offset for the 128-point FFT start time
3:0	FFT_TOFFSET64	signed 2's complement number which is used to adjust the timing offset for the 64-point FFT start time

0x0A014804 WCSS_A_BTCF_BTCF_DET_RATIO

Type: RW

Reset State: 0x0005

Detection thresholds for OFDM packets.

WCSS_A_BTCF_BTCF_DET_RATIO

Bits	Name	Description
2:0	VALUE	The alpha value used to compute the pkt_valid flag. unsigned number. A combination of pkt_det_ratio and pkt_det_dshift determine the 11a detection threshold.

0x0A014808 WCSS_A_BTCF_BTCF_DET_DSHIFT

Type: RW

Reset State: 0x0001

Detection shift values for OFDM packets.

WCSS_A_BTCF_BTCF_DET_DSHIFT

Bits	Name	Description
2:0	VALUE	The shift value used to compute the pkt_valid flag. unsigned number

0x0A01480C WCSS_A_BTCF_BTCFMIN**Type:** R**Reset State:** 0x00000000

Stores the last computed btcf_min value

WCSS_A_BTCF_BTCFMIN

Bits	Name	Description
14:0	BTCF	The last latched btcf value when newmin was asserted. This is denoted as Bmin(t) in the uarch.

0x0A014810 WCSS_A_BTCF_PWRMIN**Type:** R**Reset State:** 0x00000000

Stores the last computed pow(t) value corresponding to btcf_min

WCSS_A_BTCF_PWRMIN

Bits	Name	Description
15:0	POW	The last latched pow(t) value when newmin was asserted

0x0A014814 WCSS_A_BTCF_OFFSETMIN**Type:** R**Reset State:** 0x00000000

Stores the last computed offset counter value corresponding to btcf_min

WCSS_A_BTCF_OFFSETMIN

Bits	Name	Description
7:0	COUNT	The last latched offset count when newmin was asserted. This provides the count value from when the first valid btcf value was computed. This value added with fft_toffset gives the deltata to the TDC module

10.31 WCSS_A_CAHB_CAHB**0x0A082C00 WCSS_A_CAHB_CAHB_RXP_PL****Type:** RW**Reset State:** 0x00000005

cahb Arbiter arbitration priority level for rxp master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_RXP_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rxp master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C04 WCSS_A_CAHB_CAHB_TPE_PL**Type:** RW**Reset State:** 0x00000005

cahb Arbiter arbitration priority level for tpe master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_TPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for tpe master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C08 WCSS_A_CAHB_CAHB_RPE_PL**Type:** RW**Reset State:** 0x00000005

cahb Arbiter arbitration priority level for rpe master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_RPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rpe master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C0C WCSS_A_CAHB_CAHB_RPEM_PL**Type:** RW**Reset State:** 0x00000005

cahb Arbiter arbitration priority level for rpem master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_RPEM_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rpem master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C10 WCSS_A_CAHB_CAHB_DPU_PL**Type:** RW**Reset State:** 0x00000001

cahb Arbiter arbitration priority level for dpu master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_DPU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dpu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C14 WCSS_A_CAHB_CAHB_ADU_PL**Type:** RW**Reset State:** 0x00000001

cahb Arbiter arbitration priority level for adu master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_ADU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for adu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C18 WCSS_A_CAHB_CAHB_CBR_PL**Type:** RW**Reset State:** 0x00000004

cahb Arbiter arbitration priority level for cbr master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_CBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for cbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C1C WCSS_A_CAHB_CAHB_CSU_PL**Type:** RW**Reset State:** 0x00000001

cahb Arbiter arbitration priority level for csu master. In the cahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CAHB_CAHB_CSU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for csu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cahb arbiter will prevent a master from disabling itself.

0x0A082C48 WCSS_A_CAHB_CAHB_DFLT_MST**Type:** RW**Reset State:** 0x00000000

This register identifies the default master for the cahb

WCSS_A_CAHB_CAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY (Grant ownership to cahb dummy master) 0x1: RXP (Grant ownership to cahb rxp master) 0x2: TPE (Grant ownership to cahb tpe master) 0x3: RPE (Grant ownership to cahb rpe master) 0x4: RPEM (Grant ownership to cahb rpem master) 0x5: DPU (Grant ownership to cahb dpu master) 0x6: ADU (Grant ownership to cahb adu master) 0x7: CBR (Grant ownership to cahb cbr master) 0x8: CSU (Grant ownership to cahb csu master)

10.32 WCSS_A_CAL_CAL

0x0A008000 WCSS_A_CAL_CALMODE

Type: RW

Reset State: 0x00000000

Determines the calibration mode and generates calibration enables during these modes. The Enable_Measure bit in the MSB of the register is used to enable the measurement of the value. For instance, in DC offset initial calibration mode, the CPU writes to the DC offset DAC in the RF ASIC through the SPI interface. The CPU then has to command the DC offset calibration module in the PHY to measure the DC offset (at the ADC output) after the new DAC output (in the RF ASIC) can be observed at the ADC output (typically after 0.5 us after the DAC is written to in the RF ASIC). Hence, once the CPU writes to the SPI interface, it then waits for a specific period of time (1 us) after the SPI write completes, and then asserts this bit to command the DC offset module to start the measurement. Once the measurement is done (as indicated by the CAL_STATUS) register, this bit has to be disabled so as to setup for the next measurement.

WCSS_A_CAL_CALMODE

Bits	Name	Description
2:0	MODE	Sets the calibration mode value. 3'b101 to 3'b111 are unused. 0x0: NORMAL (Normal Mode, No calibration being done) 0x1: INITDCCAL (DC Offset Initial Calibration Mode. In this mode we correct for the DC offset in all of the receive chains (3x2) by writing to the DC offset correction DAC in the respective RF ICs. This offset measurement is done serially (one receive chain at a time).) 0x2: RESDCCAL (Digital/Residual DC Offset Calibration Mode. In this mode we measure the DC offset (to account for any drift in DC offset due to temperature and/or gain settings) and correct for it digitally at the output of the ADCs for all the receive chains (3x2). This offset measurement is done in parallel.) 0x3: IQCAL (I/Q Amplitude Phase Imbalance Calibration Mode. In this mode we measure the amplitude and phase imbalance between the I and Q for each receive chain) 0x4: TXLOCAL (TX LO Leakage Measurement mode. In this mode we measure the transmit chain local oscillator leakage by connecting the transmit path to the receive path and measuring the DC offset introduced by the transmit path at the output of the ADCs in the receive chain. The transmit DACs are then adjusted to minimize this measured DC offset)

0x0A008004 WCSS_A_CAL_MEASURE

Type: W

Reset State: 0x0000

By writing to this register, in calibration modes other than normal mode, a measure pulse is pulsed to the calibration module. Originally, this was a level signal called Enable_Measure. With the wr_Pulse register type being supported, it was decided to add this, so that software does not have to disable and then enable for the cal module to detect a pulse

WCSS_A_CAL_MEASURE

Bits	Name	Description
0	CMD	Measure write pulse bit which enables the measurement for the specified calibration mode in the cal_mode register 0x0: NORMAL (Idle) 0x1: MEASURE (Measure pulse to calibration controller)

0x0A008008 WCSS_A_CAL_CHAIN_SEL

Type: RW

Reset State: 0x00000000

Determines which transmit/receive channel is being calibrated. If Bit 2 is 0, then the I channel of the transmit/receive chain is selected. If Bit 2 is 1, then the Q chain of the transmit/receive chain is selected. CS1 and CS0 determine which of the receive chains 0,1,2 or the transmit chains 0,1 are being calibrated as shown in table below.

WCSS_A_CAL_CHAIN_SEL

Bits	Name	Description
2	IQSEL	Selects I/Q inputs for the inputs specified in chain 0x0: ISEL (I input Select) 0x1: QSEL (Q input Select)
1:0	CHAIN	Selects receive chain output 0x0: CHAIN0 (Chain 0 Select) 0x1: CHAIN1 (Chain 1 Select) 0x2: CHAIN2 (Chain 2 Select) 0x3: CHAIN3 (Chain 3 Select)

0x0A00800C WCSS_A_CAL_LENGTH_INIT

Type: RW

Reset State: 0x03FF

The CAL_LENGTH registers are used to determine what length should the calibration module average over. If it is desirable to average over N samples, the CPU should write N-1 to this register where N is always an integer number that represents some power of 2.

WCSS_A_CAL_LENGTH_INIT

Bits	Name	Description
11:0	LENGTH	

0x0A008010 WCSS_A_CAL_LENGTH_RSA**Type:** RW**Reset State:** 0x0001

The CAL_LENGTH registers are used to determine what length should the calibration module average over. If it is desirable to average over N samples, the CPU should write N-1 to this register where N is always an integer number that represents some power of 2.

WCSS_A_CAL_LENGTH_RSA

Bits	Name	Description
11:0	LENGTH	

0x0A008014 WCSS_A_CAL_LENGTH_RSB**Type:** RW**Reset State:** 0x00FF

The CAL_LENGTH registers are used to determine what length should the calibration module average over. If it is desirable to average over N samples, the CPU should write N-1 to this register where N is always an integer number that represents some power of 2.

WCSS_A_CAL_LENGTH_RSB

Bits	Name	Description
11:0	LENGTH	

0x0A008018 WCSS_A_CAL_PIE_FFT**Type:** RW**Reset State:** 0x0000

Size of FFT for IQ phase imbalance measurement.

WCSS_A_CAL_PIE_FFT

Bits	Name	Description
1:0	SIZE	0x0: PTS64 (FFT size = 64 points) 0x1: PTS128 (FFT size = 128 points) 0x2: PTS256 (FFT size = 256 points)

0x0A00801C WCSS_A_CAL_DCO_THRESHOLD**Type:** RW**Reset State:** 0x004C

Threshold value for the digital DC offset measured on a per-packet basis. If the measured digital DC offset is more than this threshold, the DC offset module sets the CAL_ATTENTION register to request CPU to recalibrate. Default is 150 mV (= 76 LSBs of a 10-bit ADC with a -1V to +1V swing) = 0x4C

WCSS_A_CAL_DCO_THRESHOLD

Bits	Name	Description
10:0	VALUE	

0x0A008020 WCSS_A_CAL_DCTIMER1**Type:** RW**Reset State:** 0x2C24

When the DC offset module is commanded to measure the digital DC offset either by the CPU or the AGC module (the AGC module does so on every packet), the DC offset module terminates all the RFICs inputs and waits for the time (number for 80MHz clocks) specified in the CAL_DC_TIMER1 register. This allows for the terminated input to be observed at the ADC outputs. This time is typically in the order of 0.5 us = 20 40MHz clocks = 40 80 MHz clocks = 0x28 - 1 POR. Note that this number should always be an odd number (to be a multiple of 40 MHz clocks)

WCSS_A_CAL_DCTIMER1

Bits	Name	Description
15:8	VALUE_RSB	
7:0	VALUE_RSA	

0x0A008024 WCSS_A_CAL_DCTIMER2**Type:** RW**Reset State:** 0x2000

When the DC offset module is commanded to measure the digital DC offset either by the CPU or the AGC module (the AGC module does so on every packet), the DC offset module terminates all the RFICs inputs and waits for the time (number for 80MHz clocks) specified in the CAL_DC_TIMER1 register. This allows for the terminated input to be observed at the ADC outputs. This time is typically in the order of $0.5 \mu s = 20 \text{ 40MHz} = 40 \text{ 80 MHz clocks} = 0x28-1$. Now when the DC offset measurement is done, the DC offset module switches the RF frontend back in. After switching the RF FE in, the DC offset module waits for CAL_DC_TIMER2 time before it can assert a data valid signal to the rest of the blocks. The reason there are two different timer registers for turning on and turning off the RF FE is so as to support any asymmetry in turning on/turning off the RF FE. If this saves clocks, then it allows data to be sampled earlier which may be particularly useful in per-packet calibration. Presently, the default value is 0.5us.

WCSS_A_CAL_DCTIMER2

Bits	Name	Description
15:8	VALUE_RSB	
7:0	VALUE_RSA	

0x0A008028 WCSS_A_CAL_DCOFFSET**Type:** R**Reset State:** 0x0000

Measured DC offset, lower order bits. This register gives the measured DC offset (the output of the ADC of the selected chain) when the calibration mode is in DC Offset Initial Calibration and/or Digital DC offset calibration mode. This is a 11-bit 2's complement value. The CPU reads this value when it reads the CAL_STATUS to be done. The value read corresponds to the value in CHAIN_SEL.

WCSS_A_CAL_DCOFFSET

Bits	Name	Description
10:0	DCOFFSET	

0x0A00802C WCSS_A_CAL_PWRDCOFFSET**Type:** R**Reset State:** 0x0000

Measured power of DC offset, lower order bits. This register gives the measured power of the input signal (the output of the ADC of the selected chain) when the calibration mode is in DC Offset Initial Calibration and/or Digital DC offset calibration mode. This is a 11-bit 2's complement value. The CPU reads this value when it reads the CAL_STATUS to be done. The value read corresponds to the value in CHAIN_SEL.

WCSS_A_CAL_PWRDCOFFSET

Bits	Name	Description
15:0	POWER	

0x0A008030 WCSS_A_CAL_CLR_DCOFFSET

Type: W

Reset State: 0x0000

Usually the last measured DC offset is held for the next packet as well until a new dco measurement is commanded by the AGC. Since, DC offset can change with time, when the AGC comes out of reset (like after beacon power save modes), software may decide to clear the DC offset register.

WCSS_A_CAL_CLR_DCOFFSET

Bits	Name	Description
0	CMD	Clear write pulse bit which clears the latched DC offset values 0x0: NORMAL (Idle) 0x1: MEASURE (Clear command pulse to DC Offset module)

0x0A008034 WCSS_A_CAL_CHN0_DCO_OVR

Type: RW

Reset State: 0x0000

Used to override the measured DC offset for chain 0

WCSS_A_CAL_CHN0_DCO_OVR

Bits	Name	Description
15:8	Q0	
7:0	I0	

0x0A008038 WCSS_A_CAL_STATUS**Type:** R**Reset State:** 0x0000

Indicates the calibration status for the current mode

WCSS_A_CAL_STATUS

Bits	Name	Description
15:14	STATUS	Only busy, idle and done are implemented 0x0: IDLE (Idle) 0x1: DONE (Done) 0x2: BUSY (Busy) 0x3: ERR (Error)

0x0A00803C WCSS_A_CAL_OVERRIDE**Type:** RW**Reset State:** 0x0000

Sets the test mode for calibration

WCSS_A_CAL_OVERRIDE

Bits	Name	Description
0	CHN0_DC	DCO bypass bit 0x0: NORMAL (DCO Correction is performed) 0x1: BYPASS (DCO Correction is bypassed)

0x0A008040 WCSS_A_CAL_CORR_ENABLE**Type:** RW**Reset State:** 0x0002

This register provides packet-type specific enables for DCO correction

WCSS_A_CAL_CORR_ENABLE

Bits	Name	Description
1	EN_11B	
0	EN_OFDM	

0x0A008044 WCSS_A_CAL_AIEST**Type:** R**Reset State:** 0x0000

When CAL_MODE is set to I/Q amplitude imbalance, this register gives the amplitude imbalance for that tone (CAL_IQ_TONENUM reg) for the current gain setting in AGC_GAIN_SET register. This is a 10-bit value. The CPU reads this value when it reads the CAL_STATUS to be done. The value read corresponds to the value in CHAIN_SEL.

WCSS_A_CAL_AIEST

Bits	Name	Description
8:0	AIEST	

0x0A008048 WCSS_A_CAL_IQ_CORR_MODE**Type:** RW**Reset State:** 0x0005

This register is used for controlling the corrector modes.

WCSS_A_CAL_IQ_CORR_MODE

Bits	Name	Description
3:1	C0_THROUGH_TAP_SEL	Allows for selecting the specific tap location as the through tap component for the I/Q correctors. Default selection is the centre tap location. Non-listed encodings default to centre tap selection. 0x0: C0_IN_DATA_TAP (Through tap selects input data (no delay)) 0x1: C0_IN_DATA_DLY1 (Through tap selects input data delayed by 1 cycle) 0x2: C0_IN_DATA_DLY2 (Through tap selects input data delayed by 2 cycles (centre tap)) 0x3: C0_IN_DATA_DLY3 (Through tap selects input data delayed by 3 cycles) 0x4: C0_IN_DATA_DLY4 (Through tap selects input data (final tap))
0	BYPASS	When set(1), the iq corr coefficients are set to 0. When 0, iq corr coefficients are read from IQ_CORR_COEFF memory. This register was added to purely save test time and sim issues so the memories don't have to be slammed at the start of the sim

0x0A008050 WCSS_A_CAL_FORCE_TR_SWITCH**Type:** RW**Reset State:** 0x0000

Using this register, the T/R switches may be set to TX mode during DCO calibration. The register provides this function to be enabled in any of the three following categories - coarse (periodic) cal, OFDM packet residual CAL and 11b residual CAL.

WCSS_A_CAL_FORCE_TR_SWITCH

Bits	Name	Description
2	EN_11B	
1	EN_OFDM	
0	EN_COARSE	

0x0A008054 WCSS_A_CAL_AIEST_DISABLE**Type:** RW**Reset State:** 0x0000

Using this register, the IQ amplitude imbalance estimate may be suppressed during IQ phase imbalance calculation.

WCSS_A_CAL_AIEST_DISABLE

Bits	Name	Description
0	FLAG	

0x0A008058 WCSS_A_CAL_BARAM_ACCESS**Type:** RW**Reset State:** 0x0000

This register controls which data stream has access to the BARAM memory. When set, the BARAM is only accessible by the host, not by internal logic.

WCSS_A_CAL_BARAM_ACCESS

Bits	Name	Description
0	APB	

0x0A008800+ WCSS_A_CAL_BARAMn_0, n=[0..255]**0x8*n****Type:** RW**Reset State:** 0x0000

Read write interface to the burst average RAM in the PIE module

WCSS_A_CAL_BARAMn_0

Bits	Name	Description
15:0	IAVG	

0x0A008804+ WCSS_A_CAL_BARAMn_1, n=[0..255]**0x8*n****Type:** RW**Reset State:** 0x0000

Read write interface to the burst average RAM in the PIE module

WCSS_A_CAL_BARAMn_1

Bits	Name	Description
15:0	QAVG	

0x0A009000+ WCSS_A_CAL_IQ_CORR_COEFF_MEMn_0, n=[0..39]**0x20*n****Type:** RW**Reset State:** 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_0

Bits	Name	Description
15:9	C0_I1_0	2's complement IQ imbalance correction coefficient for I-rail tap1 on chain 0
8:0	C0_I0	2's complement IQ imbalance correction coefficient for I-rail tap0 on chain 0

0x0A009004+ WCSS_A_CAL_IQ_CORR_COEFF_MEMn_1, n=[0..39]**0x20*n****Type:** RW**Reset State:** 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_1

Bits	Name	Description
15:11	C0_I3_0	2's complement IQ imbalance correction coefficient for I-rail tap3 on chain 0
10:2	C0_I2	2's complement IQ imbalance correction coefficient for I-rail tap2 on chain 0
1:0	C0_I1_1	2's complement IQ imbalance correction coefficient for I-rail tap1 on chain 0

0x0A009008+ WCSS_A_CAL_IQ_CORR_COEFF_MEMn_2, n=[0..39] 0x20*n

Type: RW

Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_2

Bits	Name	Description
15:13	C0_Q0_0	2's complement IQ imbalance correction coefficient for Q-rail tap0 on chain 0
12:4	C0_I4	2's complement IQ imbalance correction coefficient for I-rail tap4 on chain 0
3:0	C0_I3_1	2's complement IQ imbalance correction coefficient for I-rail tap3 on chain 0

0x0A00900C+ WCSS_A_CAL_IQ_CORR_COEFF_MEMn_3, n=[0..39] 0x20*n

Type: RW

Reset State: 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_3

Bits	Name	Description
15	C0_Q2_0	2's complement IQ imbalance correction coefficient for Q-rail tap2 on chain 0
14:6	C0_Q1	2's complement IQ imbalance correction coefficient for Q-rail tap1 on chain 0

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_3 (cont.)

Bits	Name	Description
5:0	C0_Q0_1	2's complement IQ imbalance correction coefficient for Q-rail tap0 on chain 0

**0x0A009010+ WCSS_A_CAL_IQ_CORR_COEFF_MEMn_4, n=[0..39]
0x20*n****Type:** RW**Reset State:** 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_4

Bits	Name	Description
15:8	C0_Q3_0	2's complement IQ imbalance correction coefficient for Q-rail tap3 on chain 0
7:0	C0_Q2_1	2's complement IQ imbalance correction coefficient for Q-rail tap2 on chain 0

**0x0A009014+ WCSS_A_CAL_IQ_CORR_COEFF_MEMn_5, n=[0..39]
0x20*n****Type:** RW**Reset State:** 0x0000

Contains RX IQ imbalance correction coefficients for each RF gain setting

WCSS_A_CAL_IQ_CORR_COEFF_MEMn_5

Bits	Name	Description
9:1	C0_Q4	2's complement IQ imbalance correction coefficient for Q-rail tap4 on chain 0
0	C0_Q3_1	2's complement IQ imbalance correction coefficient for Q-rail tap3 on chain 0

10.33 WCSS_A_CCU_CCU**0x0A204000 WCSS_A_CCU_CCU_ENABLE_CLK****Type:** RW**Reset State:** 0x00017FFF

This register enables the clock to Common SS modules. If set, the clock is enabled.

WCSS_A_CCU_CCU_ENABLE_CLK

Bits	Name	Description
16	AOWBR_ROOT_CLK_ENABLE	Enable clock for aowbr
15	RESERVED	reserved
14	PMU_TCXO_ENABLE_CLK	Enable clock for pmu_tcxo [UNUSED]
13	LTE_ENABLE_CLK	Enable clock for lte
12	FM_ENABLE_CLK	Enable clock for fm
11	BT_ENABLE_CLK	Enable clock for bt
10	TIC_ENABLE_CLK	Enable clock for tic
9	ROM_ENABLE_CLK	Enable clock for rom
8	SPDM_ENABLE_CLK	Enable clock for spdm
7	CDAHB_ENABLE_CLK	Enable clock for cda hb
6	CCAHB_ENABLE_CLK	Enable clock for cca hb
5	A2XB_ENABLE_CLK	Enable clock for a2xb
4	A2AB_ENABLE_CLK	Enable clock for a2ab
3	RRI_ENABLE_CLK	Enable clock for rri
2	DXE_ENABLE_CLK	Enable clock for dxe
1	CMEM_ENABLE_CLK	Enable clock for cmem
0	CCPU_ENABLE_CLK	Enable clock for ccpu

0x0A204004 WCSS_A_CCU_CCU_DISABLE_CLK_GATING**Type:** RW**Reset State:** 0x0002C5F0

Controls clock gating in the module. If set, clock gating to the module and in the module is disabled.

WCSS_A_CCU_CCU_DISABLE_CLK_GATING

Bits	Name	Description
17	AOWBR_CLKGATE_DISABLE	Disable clock gating for aowbr
16	RESERVED	reserved
15	PMU_TCXO_DISABLE_CLK_GATING	Disable clk gating for pmu_tcxo [UNUSED]

WCSS_A_CCU_CCU_DISABLE_CLK_GATING (cont.)

Bits	Name	Description
14	PMU_DISABLE_CLK_GATING	Disable clk gating for pmu
13	LTE_DISABLE_CLK_GATING	Disable clk gating for lte
12	FM_DISABLE_CLK_GATING	Disable clk gating for fm
11	BT_DISABLE_CLK_GATING	Disable clk gating for bt
10	TIC_DISABLE_CLK_GATING	Disable clk gating for tic
9	AXI_FABRIC_DISABLE_CLK_GATING	Disable clk gating for AXI Fabric clock
8	SPDM_DISABLE_CLK_GATING	Disable clk gating for spdm
7	CDAHB_DISABLE_CLK_GATING	Disable clk gating for cdaHB
6	CCAHB_DISABLE_CLK_GATING	Disable clk gating for ccaHB
5	A2XB_DISABLE_CLK_GATING	Disable clk gating for a2xb
4	A2AB_DISABLE_CLK_GATING	Disable clk gating for a2ab
3	RRI_DISABLE_CLK_GATING	Disable clk gating for rri
2	DXE_DISABLE_CLK_GATING	Disable clk gating for dxe
1	CMEM_DISABLE_CLK_GATING	Disable clk gating for cmem
0	CCPU_DISABLE_CLK_GATING	Disable clk gating for ccpu

0x0A204008 WCSS_A_CCU_CCU_GCU_DISABLE_CLK_GATING**Type:** RW**Reset State:** 0x000040F0

Controls clock gating in the module. If set, clock gating to the module and in the module is disabled.

WCSS_A_CCU_CCU_GCU_DISABLE_CLK_GATING

Bits	Name	Description
14	AOWBR_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for aowbr
13	LTE_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for lte
12	FM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for fm
11	BT_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for bt
10	TIC_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for tic
9	ROM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for rom
8	SPDM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for spdm
7	CDAHB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for cdaHB
6	CCAHB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for ccaHB
5	A2XB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for a2xb
4	A2AB_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for a2ab
3	RRI_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for rri
2	DXE_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for dxe
1	CMEM_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for cmem
0	CCPU_GCU_DISABLE_CLK_GATING	Disable GCU clk gating for ccpu

0x0A20400C WCSS_A_CCU_CCU_CRCM_CONTROL**Type:** RW**Reset State:** 0x00000000

This register represents CRCM control signals

WCSS_A_CCU_CCU_CRCM_CONTROL

Bits	Name	Description
2	WMAC_SYNC_RST_CLK_EN_OVERRIDE	wmac_sync_rst_clk_en_override to CRCM
1	CMEM_MEM_CLK_ENABLE_D	cmem_mem_clk_enabled to CMEM
0	RESERVED	reserved

0x0A204010 WCSS_A_CCU_CCU_SOFT_RESET**Type:** RW**Reset State:** 0x00000000

This register controls Soft Reset control of Common SS modules. Set high to reset.

WCSS_A_CCU_CCU_SOFT_RESET

Bits	Name	Description
18	AOWBR_SOFT_RESET	Soft Reset for aowbr. Asserts the reset when set. Needs to be cleared by SW.
17	RESERVED	reserved
16	SPARE_16	Unused.
15	SPARE_15	Unused.
14	PMU_AHB_SOFT_RESET	Soft Reset for PMU. Asserts the reset when set. Needs to be cleared by SW.
13	LTE_SOFT_RESET	Soft Reset for LTE. Asserts the reset when set. Needs to be cleared by SW.
12	FM_SOFT_RESET	Soft Reset for FM. Asserts the reset when set. Needs to be cleared by SW.
11	BT_SOFT_RESET	Soft Reset for FM. Asserts the reset when set. Needs to be cleared by SW.
10	TIC_SOFT_RESET	Soft Reset for TIC. Asserts the reset when set. Needs to be cleared by SW.
9	ROM_SOFT_RESET	Soft Reset for ROM. Asserts the reset when set. Needs to be cleared by SW.
8	SPDM_SOFT_RESET	Soft Reset for SPDM. Asserts the reset when set. Needs to be cleared by SW.
7	CDAHB_SOFT_RESET	Soft Reset for CDAHB. Asserts the reset when set. Needs to be cleared by SW.
6	CCAHB_SOFT_RESET	Soft Reset for CCHB. Asserts the reset after 4 clock cycles. Self-clearing

WCSS_A_CCU_CCU_SOFT_RESET (cont.)

Bits	Name	Description
5	A2XB_SOFT_RESET	Soft Reset for A2XB. Asserts the reset when set. Needs to be cleared by SW.
4	A2AB_SOFT_RESET	Soft Reset for A2AB. Asserts the reset after 4 clock cycles. Self-clearing
3	RRI_SOFT_RESET	Soft Reset for RRI. Asserts the reset when set. Needs to be cleared by SW.
2	DXE_SOFT_RESET	Soft Reset for DXE. Asserts the reset when set. Needs to be cleared by SW.
1	CMEM_SOFT_RESET	Soft Reset for CMEM. Asserts the reset when set. Needs to be cleared by SW.
0	CCPU_SOFT_RESET	Soft Reset for CCPU. Asserts the reset when set. Needs to be cleared by SW.

0x0A205000 WCSS_A_CCU_CCU_ROM_BASE_ADDR1**Type:** RW**Reset State:** 0x00000000

Base Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_BASE_ADDR1

Bits	Name	Description
27:21	BA3	patch3_base_addr
20:14	BA2	patch2_base_addr
13:7	BA1	patch1_base_addr
6:0	BA0	patch0_base_addr

0x0A205004 WCSS_A_CCU_CCU_ROM_BASE_ADDR2**Type:** RW**Reset State:** 0x00000000

6:0	BA4	patch4_base_addr

0x0A205008 WCSS_A_CCU_CCU_ROM_START_ADDR1**Type:** RW**Reset State:** 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_START_ADDR1

Bits	Name	Description
31:16	SA1	patch1_start_addr
15:0	SA0	patch0_start_addr

0x0A20500C WCSS_A_CCU_CCU_ROM_START_ADDR2**Type:** RW**Reset State:** 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_START_ADDR2

Bits	Name	Description
31:16	SA3	patch3_start_addr
15:0	SA2	patch2_start_addr

0x0A205010 WCSS_A_CCU_CCU_ROM_START_ADDR3**Type:** RW**Reset State:** 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_START_ADDR3

Bits	Name	Description
31:16	SA5	patch5_start_addr
15:0	SA4	patch4_start_addr

0x0A205014 WCSS_A_CCU_CCU_ROM_START_ADDR4**Type:** RW**Reset State:** 0x00000000

Start Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_START_ADDR4

Bits	Name	Description
31:16	SA7	patch7_start_addr
15:0	SA6	patch6_start_addr

0x0A205018 WCSS_A_CCU_CCU_ROM_END_ADDR1**Type:** RW**Reset State:** 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_END_ADDR1

Bits	Name	Description
31:16	EA1	patch1_end_addr
15:0	EA0	patch0_end_addr

0x0A20501C WCSS_A_CCU_CCU_ROM_END_ADDR2**Type:** RW**Reset State:** 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_END_ADDR2

Bits	Name	Description
31:16	EA3	patch3_end_addr
15:0	EA2	patch2_end_addr

0x0A205020 WCSS_A_CCU_CCU_ROM_END_ADDR3**Type:** RW**Reset State:** 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_END_ADDR3

Bits	Name	Description
31:16	EA5	patch5_end_addr
15:0	EA4	patch4_end_addr

0x0A205024 WCSS_A_CCU_CCU_ROM_END_ADDR4**Type:** RW**Reset State:** 0x00000000

End Address for ROM in Dwords; Left-Shift by 2-bits to get the byte address

WCSS_A_CCU_CCU_ROM_END_ADDR4

Bits	Name	Description
31:16	EA7	patch7_end_addr
15:0	EA6	patch6_end_addr

0x0A205038 WCSS_A_CCU_CCU_RRI_SW_REG_REINIT**Type:** W**Reset State:** 0x00000000

CCU_RRI_SW_REG_REINIT

WCSS_A_CCU_CCU_RRI_SW_REG_REINIT

Bits	Name	Description
0	RRI_SW_REG_REINIT_P	Write a one to initiate the reg-reinit process. Write only

0x0A20503C WCSS_A_CCU_CCU_RRI_SW_REG_REINIT_ADDR**Type:** RW**Reset State:** 0x00000000

CCU_RRI_SW_REG_REINIT_ADDR

WCSS_A_CCU_CCU_RRI_SW_REG_REINIT_ADDR

Bits	Name	Description
31:2	RRI_SW_REG_REINIT_ADDR	The starting (word) address of the sw triggered register re-configuration table.

0x0A205040 WCSS_A_CCU_CCU_RRI_POLL_CMD_ERR_ADDR**Type:** R**Reset State:** 0x00000000

CCU_RRI_POLL_CMD_ERR_ADDR

WCSS_A_CCU_CCU_RRI_POLL_CMD_ERR_ADDR

Bits	Name	Description
31:2	RRI_POLL_CMD_ERR_ADDR	the poll cmd address when it reaches retry timeout error. Read Only

0x0A205044 WCSS_A_CCU_CCU_RRI_MISC_CFG**Type:** RW**Reset State:** 0x00000000

CCU_RRI_MISC_CFG

WCSS_A_CCU_CCU_RRI_MISC_CFG

Bits	Name	Type	Description
27:20	CCU_RRI_SW_REG_REINIT_CMD_EXT_BASE_ADDR	RW	For RRI to config the external base addr if RRI should go out of pronto addr space

WCSS_A_CCU_CCU_RRI_MISC_CFG (cont.)

Bits	Name	Type	Description
19:15	RRI_CCU_ENCODED_FSM	R	rri_ccu_encoded_fsm, Read Only
14:11	RESERVED	RW	reserved
10	CCU_RRI_GOTO_IDLE	RW	When set, force RRI FSM to go back to idle. Default to 0
9	CCU_RRI_ERR_STATE_CFG	RW	When set, RRI FSM will continue to finish the process when error occurs. When cleared, RRI FSM will go to error state and SW has to write to the ccu_rri_err_exit bit to clear the error. Default to 0.
8	CCU_RRI_ERR_EXIT	RW	Write 1 for RRI FSM to go back to IDLE from error state. Always read 0.
7:0	CCU_RRI_ONE_USEC_LIMIT	RW	Value in number of clock cycles to generate the 1usec pulse.

0x0A20504C WCSS_A_CCU_CCU_MISC_CTL**Type:** RW**Reset State:** 0x00012000

CCU Controller related misc control.

WCSS_A_CCU_CCU_MISC_CTL

Bits	Name	Description
16	CCU_CCPU_A9SS_JTAG_SYNC_EN	ccu_ccpu_a9ss_jtag_sync_en, disable to bypass the sync logic on JTAG signals in A9SS if needed
15:8	CCU_CCPU_SPM_ACK_EXTEND_COUNT_VAL	Count in AHB Clocks to extend the gating of irq/fiq from the posedge of spm_ack
7	CCU_CCPU_DISABLE_SPM_ACK_LOGIC	When set it disables the spm_ack extend logic implemented in CCPU for Pronto SS
6	CCU_CCPU_WRAP8_DISABLE	When set it disables the wrap8 logic implemented in CCPU for Riva 2.0
5	CCPU_CMEM_TIMEOUT_CHK_EN	CCPU CMEM Timeout check enable
4	CCPU_STATUS_COUNT_RESET	Signal to reset CCPU Status count
3	CCPU_STATUS_COUNT_ENABLE	Signal to enable CCPU Status count
2	ITCM_ENABLE	0: ITCM interface on ARM9 disabled 1: ITCM interface on ARM9 enabled
1	GAS2CRIF_WR_CLK_GATE_DISABLE	0: QGICs CRIF wr_clk gating not disabled 1: QGICs CRIF wr_clk gating disabled

WCSS_A_CCU_CCU_MISC_CTL (cont.)

Bits	Name	Description
0	GAS2CRIF_NS_SELECT	0: QGICs CRIF accesses are Secure 1: QGICs CRIF accesses are Non-Secure

0x0A205050 WCSS_A_CCU_CCU_CCPU_STALL_COUNT**Type:** R**Reset State:** 0x00000000

CCPU Stall counter value

WCSS_A_CCU_CCU_CCPU_STALL_COUNT

Bits	Name	Description
31:0	CCPU_STALL_COUNT	CCPU Stall Counter value

0x0A205054 WCSS_A_CCU_CCU_CCPU_ACTIVE_COUNT**Type:** R**Reset State:** 0x00000000

CCPU Active counter value.

WCSS_A_CCU_CCU_CCPU_ACTIVE_COUNT

Bits	Name	Description
31:0	CCPU_ACTIVE_COUNT	CCPU Active Counter value

0x0A205058 WCSS_A_CCU_CCU_CCPU_INVALID_ADDR**Type:** R**Reset State:** 0x00000000

CCPU Last Invalid Addr.

WCSS_A_CCU_CCU_CCPU_INVALID_ADDR

Bits	Name	Description
31:0	CCPU_INVALID_ADDR	CCPU Last Invalid Addr

0x0A20505C WCSS_A_CCU_CCU_CCPU_LAST_ADDR0**Type:** R**Reset State:** 0x00000000

CCPU Last Address 0. The last 3 addresses the ARM9 has requested over the memory bus

WCSS_A_CCU_CCU_CCPU_LAST_ADDR0

Bits	Name	Description
31:0	CCPU_LAST_ADDR0	CCPU Last Address 0

0x0A205060 WCSS_A_CCU_CCU_CCPU_LAST_ADDR1**Type:** R**Reset State:** 0x00000000

CCPU Last Address 1. The last 3 addresses the ARM9 has requested over the memory bus

WCSS_A_CCU_CCU_CCPU_LAST_ADDR1

Bits	Name	Description
31:0	CCPU_LAST_ADDR1	CCPU Last Address 1

0x0A205064 WCSS_A_CCU_CCU_CCPU_LAST_ADDR2**Type:** R**Reset State:** 0x00000000

CCPU Last Address 2. The last 3 addresses the ARM9 has requested over the memory bus

WCSS_A_CCU_CCU_CCPU_LAST_ADDR2

Bits	Name	Description
31:0	CCPU_LAST_ADDR2	CCPU Last Address 2

0x0A205068 WCSS_A_CCU_CCU_A2AB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

A2AB error address register.

WCSS_A_CCU_CCU_A2AB_ERR_ADDR

Bits	Name	Description
31:0	A2AB_CCU_AHB_ERR_ADDR	a2ab_ccu_ahb_err_addr, can be cleared by writing to A2AB_CTL register

0x0A20506C WCSS_A_CCU_CCU_A2AB_CTL**Type:** RW**Reset State:** 0x00000000

A2AB control register.

WCSS_A_CCU_CCU_A2AB_CTL

Bits	Name	Description
0	A2AB_AHB_ERR_CLEAR	Write 1 to clear CCU_A2AB_ERR_ADDR register and generate ccu_a2ab_ahb_err_clear signal. SW needs to clear this bit to de-assert the clear signal.

0x0A205070 WCSS_A_CCU_CCU_A2AB_CFG**Type:** RW**Reset State:** 0x00000000

A2AB config register.

WCSS_A_CCU_CCU_A2AB_CFG

Bits	Name	Description
3:0	CCU_A2AB_CFG_HREADY_LIMIT	A2AB input config signal

0x0A205074 WCSS_A_CCU_CCU_WRAP_ADDR**Type:** RW**Reset State:** 0x00000000

A2AB wrap access address register.

WCSS_A_CCU_CCU_WRAP_ADDR

Bits	Name	Description
31:0	A2AB_WRAP_ADDR	a2ab_wrap_addr, Last wrap access address

0x0A205078 WCSS_A_CCU_CCU_AOWBR_ERR_ADDR**Type:** R**Reset State:** 0x00000000

AOWBR error address register.

WCSS_A_CCU_CCU_AOWBR_ERR_ADDR

Bits	Name	Description
31:0	AOWBR_CCU_AHB_ERR_A DDR	aowbr_ccu_ahb_err_addr

0x0A206000 WCSS_A_CCU_CCU_CCPU_TO_MSM_MB_INT_STAT**Type:** R**Reset State:** 0x00000000register indicating for which mailboxes an interrupt to the **msm** is pending**WCSS_A_CCU_CCU_CCPU_TO_MSM_MB_INT_STAT**

Bits	Name	Description
3:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending

0x0A206004 WCSS_A_CCU_CCU_MSM_TO_CCPU_MB_INT_STAT**Type:** R**Reset State:** 0x00000000

register indicating for which mailboxes an interrupt to the cCPU is pending

WCSS_A_CCU_CCU_MSM_TO_CCPU_MB_INT_STAT

Bits	Name	Description
3:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending

0x0A206008 WCSS_A_CCU_CCU_MB0_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB0_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to Zero: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A20600C WCSS_A_CCU_CCU_MB0_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB0_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb0_control register. This value gets cleared on a mb0 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset.

0x0A206010 WCSS_A_CCU_CCU_MB1_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB1_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to Zero: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A206014 WCSS_A_CCU_CCU_MB1_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB1_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb1_control register. This value gets cleared on a mb1 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A206018 WCSS_A_CCU_CCU_MB2_CONTROL**Type:** RW**Reset State:** 0x00000000General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.**WCSS_A_CCU_CCU_MB2_CONTROL**

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to Zero: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A20601C WCSS_A_CCU_CCU_MB2_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB2_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb2_control register. This value gets cleared on a mb2 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A206020 WCSS_A_CCU_CCU_MB3_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB3_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to Zero: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A206024 WCSS_A_CCU_CCU_MB3_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB3_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb3_control register. This value gets cleared on a mb3 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A206028 WCSS_A_CCU_CCU_MB4_CONTROL**Type:** RW**Reset State:** 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB4_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to One: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A20602C WCSS_A_CCU_CCU_MB4_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB4_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb4_control register. This value gets cleared on a mb4 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A206030 WCSS_A_CCU_CCU_MB5_CONTROL**Type:** RW**Reset State:** 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB5_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to One: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A206034 WCSS_A_CCU_CCU_MB5_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB5_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb5_control register. This value gets cleared on a mb5 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A206038 WCSS_A_CCU_CCU_MB6_CONTROL**Type:** RW**Reset State:** 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB6_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to One: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A20603C WCSS_A_CCU_CCU_MB6_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB6_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb6_control register. This value gets cleared on a mb6 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A206040 WCSS_A_CCU_CCU_MB7_CONTROL**Type:** RW**Reset State:** 0x00000002

General purpose Mailbox register, which can be used to generate interrupts to the ccpu or to the **msm**.

WCSS_A_CCU_CCU_MB7_CONTROL

Bits	Name	Description
31:2	MAILBOX_VALUE	A 30 bit value from sender to receiver
1	INT_DIRECTION	Interrupt direction: When set to zero: cCPU to msm When set to one: msm to cCPU Hard Coded to One: ReadOnly
0	MB_RESET	When set, all to this MB related parameters, including the counters, are cleared.

0x0A206044 WCSS_A_CCU_CCU_MB7_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_CCU_CCU_MB7_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb7_control register. This value gets cleared on a mb7 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A2060B0 WCSS_A_CCU_CCU_MUTEX0**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX0

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060B4 WCSS_A_CCU_CCU_MUTEX1**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX1

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060B8 WCSS_A_CCU_CCU_MUTEX2**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX2

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060BC WCSS_A_CCU_CCU_MUTEX3**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX3

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060C0 WCSS_A_CCU_CCU_MUTEX4**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX4

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060C4 WCSS_A_CCU_CCU_MUTEX5**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX5

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060C8 WCSS_A_CCU_CCU_MUTEX6**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX6

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A2060CC WCSS_A_CCU_CCU_MUTEX7**Type:** RW**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_CCU_CCU_MUTEX7

Bits	Name	Type	Description
31	RESET	RW	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	RW	The Max count of semaphores available. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	R	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A20507C WCSS_A_CCU_CCU_TRACE_CONTROL1**Type:** RW**Reset State:** 0x00000000

Trace function enable/disable control

WCSS_A_CCU_CCU_TRACE_CONTROL1

Bits	Name	Description
1	CCU_TRC_BUF_CFG	0 = captured samples write is blocked when buffer is full, 1 = overwrite mode enabled
0	CCU_TRC_ENABLE	When set, the trace function is enabled

0x0A205080 WCSS_A_CCU_CCU_TRACE_CONTROL2**Type:** RW**Reset State:** 0x7FFF0000

Trace function sample storage location in cMEM control

WCSS_A_CCU_CCU_TRACE_CONTROL2

Bits	Name	Description
30:16	CCU_TRC_END_ADDR	trace buffer cMEM ending address
14:0	CCU_TRC_START_ADDR	trace buffer cMEM starting address

0x0A205084 WCSS_A_CCU_CCU_TRC_WFT_CAPTURE_CTRL**Type:** RW**Reset State:** 0x00000000

Wait for Trigger capture control

WCSS_A_CCU_CCU_TRC_WFT_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_WFT_CAPTURE_MODE	00 = no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved
29:0	CCU_WFT_CAPTURE_MASK	Wait For trigger capture mask

0x0A205088 WCSS_A_CCU_CCU_TRC_WFT_STATE_CTRL**Type:** RW**Reset State:** 0x00000000

Wait for Trigger state control

WCSS_A_CCU_CCU_TRC_WFT_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples
15:5	CCU_SPARE2	Reserved
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger statemachine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen

0x0A20508C WCSS_A_CCU_CCU_TRC_TS1_CAPTURE_CTRL**Type:** RW**Reset State:** 0x00000000

Trigger State 1 capture control

WCSS_A_CCU_CCU_TRC_TS1_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS1_CAPTURE_MODE	00 = no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved
29:0	CCU_TS1_CAPTURE_MASK	TS1 capture mask

0x0A205090 WCSS_A_CCU_CCU_TRC_TS1_STATE_CTRL**Type:** RW**Reset State:** 0x00000000

Trigger State 1 state control

WCSS_A_CCU_CCU_TRC_TS1_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples
15:5	CCU_SPARE2	Reserved
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger statemachine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen

0x0A205094 WCSS_A_CCU_CCU_TRC_TS1_TRIGGER_MASK**Type:** RW**Reset State:** 0x00000000

TS1 Trigger Mask control

WCSS_A_CCU_CCU_TRC_TS1_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger.

0x0A205098 WCSS_A_CCU_CCU_TRC_TS1_TRIGGER_VALUE**Type:** RW**Reset State:** 0x00000000

TS1 Trigger value control

WCSS_A_CCU_CCU_TRC_TS1_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts1 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal.

0x0A20509C WCSS_A_CCU_CCU_TRC_TS2_CAPTURE_CTRL**Type:** RW**Reset State:** 0x00000000

Trigger State 2 capture control

WCSS_A_CCU_CCU_TRC_TS2_CAPTURE_CTRL

Bits	Name	Description
31:30	CCU_TS2_CAPTURE_MODE	00 = no capture of samples, 01 = capture samples every clock, 10 = capture only when signals selected by capture mask have changed states, 11 = reserved
29:0	CCU_TS2_CAPTURE_MASK	TS1 capture mask

0x0A2050A0 WCSS_A_CCU_CCU_TRC_TS2_STATE_CTRL**Type:** RW**Reset State:** 0x00000000

Trigger State 2 state control

WCSS_A_CCU_CCU_TRC_TS2_STATE_CTRL

Bits	Name	Description
31:16	CCU_MAX_CAPTURE_COUNT	Maximum number of samples to be captured after entering this state. A value of 0 indicates unlimited samples
15:5	CCU_SPARE2	Reserved

WCSS_A_CCU_CCU_TRC_TS2_STATE_CTRL (cont.)

Bits	Name	Description
4:0	CCU_TS_TRANSITION_ENABLE	These enables indicate to which other TSs the trigger statemachine is allowed to jump when the corresponding trigger is seen. When multiple enabled triggers come in at the same time, the lowest TS gets priority Bit 0: When set, transition to TS1 enabled when TS1 trigger is seen Bit 1: When set, transition to TS2 enabled when TS2 trigger is seen Bit 2: When set, transition to TS3 enabled when TS3 trigger is seen Bit 3: When set, transition to TS4 enabled when TS4 trigger is seen Bit 4: When set, transition to TS5 enabled when TS5 trigger is seen

0x0A2050A4 WCSS_A_CCU_CCU_TRC_TS2_TRIGGER_MASK**Type:** RW**Reset State:** 0x00000000

TS2 Trigger Mask control

WCSS_A_CCU_CCU_TRC_TS2_TRIGGER_MASK

Bits	Name	Description
29:0	CCU_TRIGGER_MASK	All bits set to 1 in this mask, selects the signals in the test bus for which a trigger value is defined. All bits set to 0 indicate testbus signals that are don't cares, and will not be used for this trigger.

0x0A2050A8 WCSS_A_CCU_CCU_TRC_TS2_TRIGGER_VALUE**Type:** RW**Reset State:** 0x00000000

TS2 Trigger value control

WCSS_A_CCU_CCU_TRC_TS2_TRIGGER_VALUE

Bits	Name	Description
29:0	CCU_TRIGGER_VALUE	For each bit that is a 1 in the ts2 trigger mask, the value in of the corresponding bit in this register indicates the trigger value of the testbus signal.

The interrupt enables for generating apss interrupt: pronto_apss_asic_interrupt

WCSS_A_CCU_CCU_ASIC_INT_ENABLE

Bits	Name	Description
23	DXE_CHANNEL7_ENABLE	When set, dxe channel 7 interrupt will set pronto_apss_asic_intr interrupt.
22	DXE_CHANNEL6_ENABLE	When set, dxe channel 6 interrupt will set pronto_apss_asic_intr interrupt.
21	DXE_CHANNEL5_ENABLE	When set, dxe channel 5 interrupt will set pronto_apss_asic_intr interrupt.
20	DXE_CHANNEL4_ENABLE	When set, dxe channel 4 interrupt will set pronto_apss_asic_intr interrupt.
19	DXE_CHANNEL3_ENABLE	When set, dxe channel 3 interrupt will set pronto_apss_asic_intr interrupt.
18	DXE_CHANNEL2_ENABLE	When set, dxe channel 2 interrupt will set pronto_apss_asic_intr interrupt.
17	DXE_CHANNEL1_ENABLE	When set, dxe channel 1 interrupt will set pronto_apss_asic_intr interrupt.
16	DXE_CHANNEL0_ENABLE	When set, dxe channel 0 interrupt will set pronto_apss_asic_intr interrupt.
15	AOWBR_TIMEOUT_INTR_EN	when set, either AOWBR read or write timeout will set pronto_apss_asic_intr interrupt.
14	AOWBR_AHB_ERR_INTR_EN	when set, either AOWBR read or write AHB error will set pronto_apss_asic_intr interrupt.

WCSS_A_CCU_CCU_ASIC_INT_ENABLE (cont.)

Bits	Name	Description
13:12	CCU_SPARE	Reserved
11	MAC_HOST_INTR_EN	When set, it enables the MAC-HOST interrupt (generated from MCU register: MAC_HOST_INT_(MASKED)_STATUS)
10	ADU_ERR_WQ10_WQ13_D AVAIL_INTR_EN	When set, it enables the ADU error WQ10 or WQ13 dataavailable interrupt.
9	DPU_ERR_WQ8_WQ9_DAV AIL_INTR_EN	When set, it enables the DPU error WQ8 or WQ9 dataavailable interrupt.
8	MTU_TIMER_3_INTR_EN	When set, it enables the MTU timer 3 timeout interrupt.
7	MTU_TIMER_2_INTR_EN	When set, it enables the MTU timer 2 timeout interrupt.
6:3	SYS_MB_INTR_EN	When each bit is set, it enables the corresponding SYS MB interrupt. Bit3: MCU MB0 Bit4: MCU MB1, etc
2	DPU_MIC_ERR_INTR_EN	When set, it enables the DPU MIC error interrupt.
1	WATCHDOG_INTR_2_EN	When set, it enables the watchdog timer 2 event interrupt.
0	CCU_SPARE2	Reserved

0x0A2050E8 WCSS_A_CCU_CCU_ASIC_INT_STATUS**Type:** R**Reset State:** 0x00000000

The (enable masked) status of all inputs generating apss interrupt: pronto_apss_asic_interrupt

WCSS_A_CCU_CCU_ASIC_INT_STATUS

Bits	Name	Description
23	DXE_CHANNEL7_STATUS	When set, dxe channel 7 interrupt will set pronto_apss_asic_intr interrupt.
22	DXE_CHANNEL6_STATUS	When set, dxe channel 6 interrupt will set pronto_apss_asic_intr interrupt.
21	DXE_CHANNEL5_STATUS	When set, dxe channel 5 interrupt will set pronto_apss_asic_intr interrupt.
20	DXE_CHANNEL4_STATUS	When set, dxe channel 4 interrupt will set pronto_apss_asic_intr interrupt.
19	DXE_CHANNEL3_STATUS	When set, dxe channel 3 interrupt will set pronto_apss_asic_intr interrupt.
18	DXE_CHANNEL2_STATUS	When set, dxe channel 2 interrupt will set pronto_apss_asic_intr interrupt.
17	DXE_CHANNEL1_STATUS	When set, dxe channel 1 interrupt will set pronto_apss_asic_intr interrupt.

WCSS_A_CCU_CCU_ASIC_INT_STATUS (cont.)

Bits	Name	Description
16	DXE_CHANNEL0_STATUS	When set, dxe channel 0 interrupt will set pronto_apss_asic_intr interrupt.
15	AOWBR_TIMEOUT_INTR	When set, AOWBR read or write transaction timeout will set pronto_apss_asic_intr interrupt. This status bit will be cleared when AOWBR ahb_err_timeout_flags register is read.
14	AOWBR_AHB_ERR_INTR	When set, AOWBR read or write AHB error will set pronto_apss_asic_intr interrupt. This status bit will be cleared when AOWBR ahb_err_timeout_flags register is read.
11	MAC_HOST_INTR	When set, the MAC-HOST interrupt (generated from MCU register: MAC_HOST_INT_(MASKED)_STATUS) is pending
10	ADU_ERR_WQ10_WQ13_DATAVAIL_INTR	When set, it indicates that the ADU error WQ10 or WQ13 dataavailable interrupt occurs.
9	DPU_ERR_WQ8_WQ9_DATAVAIL_INTR	When set, it indicates that the DPU error WQ8 or WQ9 dataavailable interrupt occurs.
8	MTU_TIMER_3_INTR	When set, it indicates that the MTU timer 3 timeout interrupt occurs.
7	MTU_TIMER_2_INTR	When set, it indicates that the MTU timer 2 timeout interrupt occurs.
6:3	SYS_MB_INTR	When each bit is set, it indicates that the corresponding SYS MB interrupt occurs.
2	DPU_MIC_ERR_INTR	When set, it indicates that a DPU MIC error interrupt occurs.
1	WATCHDOG_2_EVENT_INTERRUPT	When set, it indicates that the watchdog timer 2 event interrupt occurs.

cdahb Arbiter arbitration priority level for rri master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CDAH_B_CDAH_B_RRI_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rri master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cdahb arbiter will prevent a master from disabling itself.

0x0A100004 WCSS_A_CDAH_B_CDAH_B_FD_B_R_PL**Type:** RW**Reset State:** 0x00000004

cdahb Arbiter arbitration priority level for fdbr master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CDAHB_CDAHB_FDBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for fdbbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cdaHB arbiter will prevent a master from disabling itself.

0x0A100008 WCSS_A_CDAHB_CDAHB_CCPU_PL**Type:** RW**Reset State:** 0x00000005

cdahb Arbiter arbitration priority level for ccpu master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CDAHB_CDAHB_CCPU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for ccpu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cdaHB arbiter will prevent a master from disabling itself.

0x0A10000C WCSS_A_CDAHB_CDAHB_DBR_PL**Type:** RW**Reset State:** 0x00000003

cdahb Arbiter arbitration priority level for dbr master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CDAHB_CDAHB_DBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cdaHB arbiter will prevent a master from disabling itself.

0x0A100010 WCSS_A_CDAHB_CDAHB_A2AB_PL**Type:** RW**Reset State:** 0x00000001

cdahb Arbiter arbitration priority level for a2ab master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CDAHB_CDAHB_A2AB_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for a2ab master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cdahb arbiter will prevent a master from disabling itself.

0x0A100014 WCSS_A_CDAHB_CDAHB_DXE_PL**Type:** RW**Reset State:** 0x00000002

cdahb Arbiter arbitration priority level for dxm master. In the cdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_CDAHB_CDAHB_DXE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dxm master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the cdahb arbiter will prevent a master from disabling itself.

0x0A100048 WCSS_A_CDAHB_CDAHB_DFLT_MST**Type:** RW**Reset State:** 0x00000000

This register identifies the default master for the cdahb

WCSS_A_CDAH_B_CDAH_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY (Grant ownership to cdahb dummy master) 0x1: RRI (Grant ownership to cdahb rri master) 0x2: FDBR (Grant ownership to cdahb fdbr master) 0x3: CCPU (Grant ownership to cdahb ccpu master) 0x4: DBR (Grant ownership to cdahb dbr master) 0x5: A2AB (Grant ownership to cdahb a2ab master) 0x6: DXE (Grant ownership to cdahb dxe master)

10.36 WCSS_A_CFG_CFG_WCSS**0x0A141000 WCSS_A_CFG_CSI_TEMPLATE_DW0****Type:** RW**Reset State:** 0x00000000

this register contains first dword of the CSI template

WCSS_A_CFG_CSI_TEMPLATE_DW0

Bits	Name	Description
31:0	CFG_TEMPLATE_DW0	First dword of template is stored in register since memory is not big enough. SO this register contains first dword of the template, this is filled by SW. Refer CSI template in to bd_datastructure document for the contents of this dword

0x0A141004 WCSS_A_CFG_CSI_TEMPLATE_MEM**Type:** RW**Reset State:** 0x00000000

Registers 000-810 give access to 528 locations of the CSI template that is stored in the local memory refer to BD_Data_structure.doc for template format

WCSS_A_CFG_CSI_TEMPLATE_MEM

Bits	Name	Description
31:0	CFG_TEMPLATE_DATA	Check bit 32 of the config register, if it is zero then YOu can either read from any of the locations or write to any of the locations.

0x0A141844 WCSS_A_CFG_CFG_STALL_TIMEOUT**Type:** RW**Reset State:** 0x00000A00

Stall timeout functionality - allows CFG to return to idle if PMI interface stalls.

WCSS_A_CFG_CFG_STALL_TIMEOUT

Bits	Name	Description
16	STALL_TIMEOUT_EN	Enable stall timeout functionality on the MPI.
11:0	STALL_TIMEOUT_TIME	Number of cycles of no activity during PMI transaction before stall timeout occurs.

0x0A141848 WCSS_A_CFG_CFG_CONFIG**Type:** RW**Reset State:** 0x00150000

gives some configurations for CFG

WCSS_A_CFG_CFG_CONFIG

Bits	Name	Type	Description
31	CSIPROC_REGACCESS_FAIL	RW	when set indicates template is being updates internally hence read or write access failed this needs to be cleared by SW
30	CSIPROC_BUSY	R	when set indicates template is being updates internally
29	CSIPROC_TEMPLATE_READY	R	when set indicates template is ready
28:24	LOCAL_CLKGATE_DIS	RW	local clock gate disable for all clk gates in cfg bit0 - gas/config modules bit1 - async fifo bit2 - phy_rxif bit3 - csi_proc bit4 - memif
23:16	CFG_11AC_VHCB_CATEGORY	RW	VHTCB frame is a management Action frame which has category field which is not decided in IEEE spec hence it is made programmable Program VHTCB category field here

WCSS_A_CFG_CFG_CONFIG (cont.)

Bits	Name	Type	Description
12:11	RESERVED		reserved
10:8	RESERVED		reserved
3	SW_TEMPLATE_READY	RW	This is done only for debug purpose. SW can first write to bit 2 in this register to ignore PHY transfers, then write the VHT-CB frame or CSI frame to memory when it is finished creating template, write 1'b1 to bit 3 indicating to TPE frame is ready for transfer
2	IGNORE_PHY_XFERS_EN	RW	when this bit is set any phy transfer is ignored and only SW will do the writes, this is for debug purpose.
1	SOFT_PMI_ABORT_EN	RW	Soft PMI abort enable. this is basically to create phy abort thro' sw in this case need to make sure stall timeout is enabled
0	CFG_CSI_EN	RW	Enables the CSI functionality, by default it is disabled

0x0A14184C WCSS_A_CFG_STALL_TIMEOUT_PHY_ABORT_CNT**Type:** R**Reset State:** 0x00000000

Number of times stall timeout occurs with PHY interface. this register also has PHY abort cntnts

WCSS_A_CFG_STALL_TIMEOUT_PHY_ABORT_CNT

Bits	Name	Description
27:24	FIFOFULL_CNT	counts number of times fifo full happened
23:16	PHY_CLKSTART_CNT	counts number of clock starts
11:8	PHY_ABORT_CNT	PHY Abort Packet Cnt.
3:0	STALL_TIMEOUT_COUNT	Number of times the PMI interface encounters a stall timeout

0x0A141858 WCSS_A_CFG_CFG_SM_STATE**Type:** R**Reset State:** 0x00010001

this register gives the state of the two CFG state machines

WCSS_A_CFG_CFG_SM_STATE

Bits	Name	Description
21:16	RXIF_PHY_STATE	RX interface to phy state machine state
8:0	CSIPROC_STATE	CSI processing state machine state

0x0A14185C WCSS_A_CFG_CFG_TPE_INFO_CNT**Type:** R**Reset State:** 0x00000000

this register gives the counts number of tpe_info_p pulses

WCSS_A_CFG_CFG_TPE_INFO_CNT

Bits	Name	Description
15:0	CFG_TPE_INFO_P_CNT	counter for number of tpe_cfg_info_p pulses

10.37 WCSS_A_DAHB_DAHB**0x0A120000 WCSS_A_DAHB_DAHB_DPUW_PL****Type:** RW**Reset State:** 0x00000004

dahb Arbiter arbitration priority level for dpuw master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_DPUW_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dpuw master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A120004 WCSS_A_DAHB_DAHB_DPUR_PL**Type:** RW**Reset State:** 0x00000004

dahb Arbiter arbitration priority level for dpur master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_DPUR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dpur master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A120008 WCSS_A_DAHB_DAHB_BMUW_PL

Type: RW

Reset State: 0x00000005

dahb Arbiter arbitration priority level for bmuw master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_BMUW_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for bmuw master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A12000C WCSS_A_DAHB_DAHB_BMUR_PL

Type: RW

Reset State: 0x00000005

dahb Arbiter arbitration priority level for bmur master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_BMUR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for bmur master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A120010 WCSS_A_DAHB_DAHB_ADU_PL**Type:** RW**Reset State:** 0x00000002

dahb Arbiter arbitration priority level for adu master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_ADU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for adu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A120014 WCSS_A_DAHB_DAHB_DBR_PL**Type:** RW**Reset State:** 0x00000005

dahb Arbiter arbitration priority level for dbr master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_DBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for dbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A120018 WCSS_A_DAHB_DAHB_CSU_PL**Type:** RW**Reset State:** 0x00000004

dahb Arbiter arbitration priority level for csu master. In the dahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_DAHB_DAHB_CSU_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for csu master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the dahb arbiter will prevent a master from disabling itself.

0x0A120048 WCSS_A_DAHB_DAHB_DFLT_MST**Type:** RW**Reset State:** 0x00000000

This register identifies the default master for the dahb

WCSS_A_DAHB_DAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY (Grant ownership to dahb dummy master) 0x1: DPUW (Grant ownership to dahb dpuw master) 0x2: DPUR (Grant ownership to dahb dpur master) 0x3: BMUW (Grant ownership to dahb bmuw master) 0x4: BMUR (Grant ownership to dahb bmur master) 0x5: ADU (Grant ownership to dahb adu master) 0x6: DBR (Grant ownership to dahb dbr master) 0x7: CSU (Grant ownership to dahb csu master)

10.38 WCSS_A_DPU_DPU

0x0A081800 WCSS_A_DPU_DPU_TXPKTCOUNT

Type: RW

Reset State: 0x00000000

Total TX packets handled by the PDU

WCSS_A_DPU_DPU_TXPKTCOUNT

Bits	Name	Description
15:0	DD_TXPKTCOUNT	Total TX packets handled by the PDU

0x0A081804 WCSS_A_DPU_DPU_RXPKTCOUNT

Type: RW

Reset State: 0x00000000

Total RX packets handled by the PDU

WCSS_A_DPU_DPU_RXPKTCOUNT

Bits	Name	Description
15:0	DD_RXPKTCOUNT	Total RX packets handled by the PDU

0x0A08180C WCSS_A_DPU_DPU_BASE_ADDR

Type: RW

Reset State: 0x00010000

Base address of the DPU data structure

WCSS_A_DPU_DPU_BASE_ADDR

Bits	Name	Description
31:0	DD_BASE	Base address of the DPU data structure

0x0A081810 WCSS_A_DPU_DPU_KEYBASE_ADDR

Type: RW

Reset State: 0x00011000

Base address of the Key data structure

WCSS_A_DPU_DPU_KEYBASE_ADDR

Bits	Name	Description
31:0	DD_KEYBASE	Base address of the key data structure

0x0A081814 WCSS_A_DPU_DPU_MICKEYBASE_ADDR

Type: RW

Reset State: 0x00012000

Base address of the TKIP Mic Key data structure

WCSS_A_DPU_DPU_MICKEYBASE_ADDR

Bits	Name	Description
31:0	DD_MICKEYBASE	Base address of the TKIP MIC key data structure

0x0A081818 WCSS_A_DPU_DPU_RCBASE_ADDR

Type: RW

Reset State: 0x00013000

Base address of the Reply_counter data structure

WCSS_A_DPU_DPU_RCBASE_ADDR

Bits	Name	Description
31:0	DD_RCBASE	Base address of the reply-counter data structure

0x0A08181C WCSS_A_DPU_DPU_CONTROL

Type: RW

Reset State: 0x00000006

Holds DPU based configuration fields

WCSS_A_DPU_DPU_CONTROL

Bits	Name	Type	Description
31	SP_CLKGATE_DISABLE	RW	Disable clock gating for Security block 0: Clock gating is enabled 1: Clock gating is disabled

WCSS_A_DPU_DPU_CONTROL (cont.)

Bits	Name	Type	Description
30	WEP_CLKGATE_DISABLE	RW	Disable clock gating for RC4 engine 0: Clock gating is enabled 1: Clock gating is disabled
29	TKIP_CLKGATE_DISABLE	RW	Disable clock gating for TKIP block 0: Clock gating is enabled 1: Clock gating is disabled
28	AES_CLKGATE_DISABLE	RW	Disable clock gating for AES engine 0: Clock gating is enabled 1: Clock gating is disabled
27	FRAG_CLKGATE_DISABLE	RW	Disable clock gating for fragmentation/defragmentation block 0: Clock gating is enabled 1: Clock gating is disabled
26	PDUBD_STALL	R	DPU is stalled as no PDU/BD's are available and the DPU requires more. 0: DPU is not stalled 1: DPU is stalled
25	IGR_BUSY	R	DPU Egress State-machine is Busy indication. 0: Ingress SM is IDLE. 1: Ingress SM is BUSY.
24	EGR_BUSY	R	DPU Egress State-machine is Busy indication. 0: Egress SM is IDLE. 1: Egress SM is BUSY.
23	SP_BUSY	R	Encryption/Decryption engine is Busy indication. 0: SP is IDLE. 1: SP is BUSY.
18	WAPI_BUSY	R	WAPI Encryption/Decryption engine is Busy indication. 0: WAPI is IDLE. 1: WAPI is BUSY.
17	SP_RC4_BUSY	R	RC4 Encryption/Decryption engine is Busy indication. 0: SP is IDLE. 1: SP is BUSY.
16	SP_AES_BUSY	R	AES Encryption/Decryption engine is Busy indication. 0: SP is IDLE. 1: SP is BUSY.
15	WAPI_CLKGATE_DISABLE	RW	Disable clock gating for WAPI engine 0: Clock gating is enabled 1: Clock gating is disabled
14	CSR_CLKGATE_DISABLE	RW	Disable clock gating for config reg module 0: Clock gating is enabled 1: Clock gating is disabled
13	WAPI_REVERSE_IV_ENDIAN_RX	RW	This bit reverses the endianness of WAPI replay counter in rx direction
12	INCL_PN_IN_BD_EN	RW	By enabling this bit, DPU writes the packet number in BD(0x38) when replay check is disabled
11	WAPI_REVERSE_IV_ENDIAN_TX	RW	This bit reverses the endianness of WAPI replay counter in tx direction
10	WAPI_QOS_EN	RW	This bit enables wapi QoS field to calculate MIC value
9	RHS_WINCHK_EN	RW	This bit enables right hand side window check
8	WQ_TX_RSV_EN	RW	This bit enables reservations on for TX WQ's
7	WQ_RX_RSV_EN	RW	This bit enables reservations on for RX WQ's
6	DROP_EQ_LEN	RW	Setting this bit drops all envelope only received packets 0: Removes the envelope and passes zero byte packet to Host 1: Drops all envelope only received packets

WCSS_A_DPU_DPU_CONTROL (cont.)

Bits	Name	Type	Description
5	ROUTING_FLAG_EN	RW	Setting this bit overrides the BD routing flag 0: Packet will be routed to the value set in BD 1: Packet will be routed to the value set in routing flag register
4	COPY_FRAME_EN	RW	Setting this bit enables Copying of incoming local memory frame to external memory, i This is needed only when there is no encryption/fragmentation 0: No copying 1: Copy incoming local memory BD/PDUs to External memory BD/PDUs
3	SEQUENCE_NO_INS_EN	RW	Setting this bit enables inserting of DPU generated sequence no in frame control 0: Sequence no from Host is passed on 1: Inserts Sequence number generated by DPU
2	RX_TAG_CHK_EN	RW	Setting this bit enables BD TAG checking against the DPU TAG for RX packets 0: Don't check BD and DD tag on RX 1: Do check BD and DD tag on RX
1	TX_TAG_CHK_EN	RW	Setting this bit enables BD TAG checking against the DPU TAG for TX packets 0: Don't check BD and DD tag on TX 1: Do check BD and DD tag on TX
0	WQ_ARB_MODE	RW	Setting this bit selects the arbitration scheme of the Work Queues (WQ). 0: Arbitration priority is ordered RX0->RX7 followed by TX0->TX7 i.e. RX WQ's have higher priority than TX WQ's 1: Arbitration priority is ordered RX0,TX0,RX1,TX1,RX2,TX2,etc i.e. RX WQ 0 has higher priority than TX WQ 0 which has higher priority than RX WQ 1 and so on.

0x0A081820 WCSS_A_DPU_DPU_INTERRUPT_MASK**Type:** RW**Reset State:** 0x00000000

Enables/Disables the DPU interrupts

WCSS_A_DPU_DPU_INTERRUPT_MASK

Bits	Name	Description
31	EGR_WR_ERROR	Setting this bit enables the EGR State Machine Error interrupt. The interrupt occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Write AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled

WCSS_A_DPU_DPU_INTERRUPT_MASK (cont.)

Bits	Name	Description
30	EGR_GBI_ERROR	Setting this bit enables the EGR State Machine Error interrupt. The interrupt occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Command AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled
29	IGR_ERROR	Setting this bit enables the IGR State Machine Error interrupt. The interrupt occurs when the DPU ingress state-machine enters the error state. Such errors are triggered by errors on the Read AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled
28	PDUBD_STALL	Setting this bit enables the PDU/BD Stalled interrupt. The interrupt occurs when the DPU requires BD/PDU's but none are available. 0: Disabled 1: Enabled
27	WATCHDOG_TIMER	Setting this bit enables the Watchdog Timer interrupt. The interrupt occurs when the Watchdog timer reaches its programmable threshold. 0: Disabled 1: Enabled
24	DPU_WAKEUPHOST_EN	Setting this bit enables the wake-up host interrupt. In WoWL mode whenever it detects magic packet the interrupt bit is set 0: Disabled 1: Enabled
23	MIC_ERR_EN	Setting this bit enables the MIC error interrupt. The interrupt occurs when a TKIP MIC is detected as errored. 0: Disabled 1: Enabled
20:0	PKT_ERR_EN	The state of each bit enables/disables an interrupt for the corresponding Packet Error Code. The interrupt occurs when a packet Error is detected. 0: Disabled (per-bit) 1: Enabled (per-bit)

0x0A081824 WCSS_A_DPU_DPU_INTERRUPT_STATUS**Type:** R**Reset State:** 0x00000000

Returns the status of the DPU interrupts

WCSS_A_DPU_DPU_INTERRUPT_STATUS

Bits	Name	Description
31	EGR_WR_ERROR	This bit indicates the status of the EGR State Machine Error interrupt. The event occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Write AHB bus which, should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled

WCSS_A_DPU_DPU_INTERRUPT_STATUS (cont.)

Bits	Name	Description
30	EGR_GBI_ERROR	This bit indicates the status of the EGR State Machine Error interrupt. The event occurs when the DPU egress state-machine enters the error state. Such errors are triggered by errors on the Command AHB bus which, should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled
29	IGR_ERROR	This bit indicates the status of the IGR State Machine Error interrupt. The event occurs when the DPU ingress state-machine enters the error state. Such errors are triggered by errors on the Read AHB bus, which should not happen. The DPU does not handle these errors and may result in a DPU lock up. 0: Disabled 1: Enabled
28	PDUBD_STALL	This bit indicates the status of the PDU/BD Stalled interrupt. The event occurs when the DPU requires BD/PDU's but none are available. 0: Disabled 1: Enabled
27	WATCHDOG_TIMER	This bit indicates the status of the Watchdog Timer event. The event occurs when the Watchdog timer reaches its programmable threshold. 0: Disabled 1: Enabled
23	MIC_ERR	This bit indicates the status of the MIC error event. The event occurs when a TKIP MIC is detected as errored. 0: Disabled 1: Enabled
20:0	PKT_ERR	The state of each bit enables/disables an interrupt for the corresponding Packet Error Code. The interrupt occurs when a packet Error is detected. 0: Disabled (per-bit) 1: Enabled (per-bit) 0x2: DPU_BAD_TAG_ERR (BD / DD Tag mis-match) 0x4: DPU_BAD_BD_ERR (BD corruption) 0x20: DPU_FRAG_CNT_ERR (DPU - Max Frag Count) 0x40: DPU_BAD_MIC_ERR (SP - TKIP MIC Error) 0x100: DPU_BAD_DECRYPT_ERR (SP - Decryption failed) 0x200: DPU_ENV_ONLY_ERR (SP - Minimum length packet) 0x400: DPU_ENV_PART_ERR (SP - Less than Minimum length packet) 0x800: DPU_ZERO_LEN_ERR (SP - Zero length packet) 0x1000: DPU_BAD_EXTIV_ERR (SP - ExtIV not set (AES or TKIP)) 0x2000: DPU_BAD_KID_ERR (SP - RX Key ID mis-match) 0x4000: DPU_BAD_TSC1_ERR (SP - WEP SEED Mis-match in TKIP) 0x8000: DPU_UNPROT_ERR (SP - Un-protected packet on encrypted channel) 0x10000: DPU_PROT_ERR (SP - Protected packet on un-encrypted channel) 0x20000: DPU_BAD_RC_ERR (SP - Replay Counter mis-match) 0x40000: DPU_RC_WRAP_ERR (SP - Replay Counter Overflow) 0x80000: DPU_STALL_FLUSH (DPU - STALL and flushed) 0x100000: DPU_BD_CHNG_ERR (DPU - BD changed during fragmentation)

15:8	LENGTH	Default this value is 16, This is Length Information
7:0	ELEMENT_ID	Default this value is 0, This is MMIE Element ID

0x0A081848 WCSS_A_DPU_DPU_WATCHDOG**Type:** RW**Reset State:** 0xFFFF0000

This value represents the DPU watch dog timer and controls. The watchdog self resets to 0 when the DPU is idle and increments by 1 at 128 micro-second intervals when the DPU is not idle.

NOTE: The Watchdog does not stop/change the operation of the DPU.

WCSS_A_DPU_DPU_WATCHDOG

Bits	Name	Type	Description
31:16	WATCHDOG_THRES	RW	This is the value that if reached the DPU will issue a timeout interrupt. Writing to this register resets the watchdog timer
15:0	WATCHDOG_VALUE	R	This is the current value of the DPU watchdog timer.

0x0A08184C WCSS_A_DPU_DPU_BD_IN_COUNTS**Type:** R**Reset State:** 0x00000000

This register provides debug counts of BD's into the DPU

WCSS_A_DPU_DPU_BD_IN_COUNTS

Bits	Name	Description
19:16	BD_REQUEST	This is the count of BD's requested by the DPU.
3:0	BD_POP	This is the count of BD's popped by the DPU.

0x0A081850 WCSS_A_DPU_DPU_BD_OUT_COUNTS**Type:** R**Reset State:** 0x00000000

This register provides debug counts of BD's out of the DPU

WCSS_A_DPU_DPU_BD_OUT_COUNTS

Bits	Name	Description
19:16	BD_RELEASE	This is the count of BD's released by the DPU.
3:0	BD_PUSH	This is the count of BD's pushed by the DPU.

0x0A081854 WCSS_A_DPU_DPU_WQ_3_RESERVE**Type:** RW**Reset State:** 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 3 WQ. If the reservation fails the TX/RX 3 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 4 WQ reservation values.

WCSS_A_DPU_DPU_WQ_3_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 3.
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 3.

0x0A08185C WCSS_A_DPU_DPU_WQ_5_RESERVE**Type:** RW**Reset State:** 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 5 WQ. If the reservation fails the TX/RX 5 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 6 WQ reservation values.

WCSS_A_DPU_DPU_WQ_5_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 5.
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 5.

0x0A081860 WCSS_A_DPU_DPU_WQ_6_RESERVE**Type:** RW**Reset State:** 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 6 WQ. If the reservation fails the TX/RX 6 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 7 WQ reservation values.

WCSS_A_DPU_DPU_WQ_6_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 6.
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 6.

0x0A081864 WCSS_A_DPU_DPU_WQ_7_RESERVE**Type:** RW**Reset State:** 0x00000110

This register is used to define the number of BD/PDU's the DPU reserves before processing a TX/RX 4 WQ. If the reservation fails the TX/RX 7 to 10 WQ's are disabled from selection until there enough BD/PDU's to satisfy the reservation request. The BD/PDU reservation values must be less than TX/RX 8 WQ reservation values.

WCSS_A_DPU_DPU_WQ_7_RESERVE

Bits	Name	Description
12:8	BD_CNT	This the number of BD's the DPU will reserve before processing a WQ 7.
6:0	PDU_CNT	This the number of PDU's the DPU will reserve before processing a WQ 7.

0x0A081874 WCSS_A_DPU_DPU_ERROR_WQ**Type:** RW**Reset State:** 0x0000FF08

This register is used to define two Work Queues to which error packets can be routed. By default, both of these error work queues are set to 0xFF, which is intended to be a 'junk' work queue where data is discarded.

WCSS_A_DPU_DPU_ERROR_WQ

Bits	Name	Description
15:8	ERR_WQ_B	This indicates the work queue number for work queue B.
7:0	ERR_WQ_A	This indicates the work queue number for work queue A.

0x0A081878 WCSS_A_DPU_DPU_ERROR_WQ_SELECT**Type:** RW**Reset State:** 0x00000000

This register is used to select the work queue routing for error packet with particular error codes. Each error code is represented by a single bit in this register; for example bit 3 is used for selecting routing of packets with error code 3. A set bit will direct error packets with that error code to work queue B. A cleared bit will direct error packets with that error code to work queue A. By default all errors are routed to error work queue A.

WCSS_A_DPU_DPU_ERROR_WQ_SELECT

Bits	Name	Description
18:1	ERR_WQ_SELECT	If bit n is set in this field then error packets with error code n are sent to error work queue B; if the bit is clear then they are sent to work queue A. All bit numbers other than valid error codes are reserved and should be left zero.

0x0A08187C WCSS_A_DPU_DPU_ERROR_WQ_COUNT**Type:** RW**Reset State:** 0x00000000

This register contains counters for errors pushed to each error work queue. The counts are cleared when it is written.

WCSS_A_DPU_DPU_ERROR_WQ_COUNT

Bits	Name	Description
19:16	ERR_WQ_B_CNT	Count of error packets that have been routed to error work queue B.
3:0	ERR_WQ_A_CNT	Count of error packets that have been routed to error work queue A.

0x0A081880 WCSS_A_DPU_DPU_FRAG_COUNT**Type:** RW**Reset State:** 0x00000000

This register contains counters for fragments received and transmitted. The counts are cleared when it is written.

WCSS_A_DPU_DPU_FRAG_COUNT

Bits	Name	Description
31:16	RX_FRAG_CNT	This is a count of fragments de-fragmented by the DPU. Packets that pass through the DPU without being de-fragmented do not increment this count.
15:0	TX_FRAG_CNT	This is a count of fragments created by the DPU. Packets that pass through the DPU without being fragmented do not increment this count.

0x0A0818E4 WCSS_A_DPU_DPU_WAPIMICKEYBASE_ADDR**Type:** RW**Reset State:** 0x00012000

Base address of the WAPI Mic Key data structure

WCSS_A_DPU_DPU_WAPIMICKEYBASE_ADDR

Bits	Name	Description
31:0	DD_WAPIMICKEYBASE	Base address of the WAPI MIC key data structure

0x0A0818E8 WCSS_A_DPU_DPU_BUG_FIX**Type:** RW**Reset State:** 0x00000000

This register holds bug fix controls.

WCSS_A_DPU_DPU_BUG_FIX

Bits	Name	Description
2	TKIP_PRIORITY_SEL	Selects the method by which the PRIORITY field is generated for the TKIP MIC calculations. 0: from the BD TID field. PRIORITY = {4'h0,BD_TID} 1: from the QC field. PRIORITY = (QC_VALID) ? QC[7:0] : 8'h0

0x0A0818EC WCSS_A_DPU_DPU_AES_MASK

Type: RW

Reset State: 0x80000000

This register holds AES AAD Mask controls.

WCSS_A_DPU_DPU_AES_MASK

Bits	Name	Description
31	FRAME_CONTROL_MASK_15	Selects the masking control for Frame Control bit 15 0: Frame Control bit 15 set to 0 1: Frame Control bit 15 set to value in MAC Header
7	QOS_MASK_7	Selects the masking control for QOS bit 7 0: QOS bit 7 set to 0 1: QOS bit 7 set to value in MAC Header

0x0A0818F0 WCSS_A_DPU_DPU_TKIP_MASK

Type: RW

Reset State: 0x00000000

This register holds TKIP MIC Mask controls.

WCSS_A_DPU_DPU_TKIP_MASK

Bits	Name	Description
7	PRIORITY_MASK_7	Selects the masking control for PRORITY bit 7 0: PRIORITY bit 7 set to 0 1: PRIORITY bit 7 set to value in MAC Header

0x0A0818F4 WCSS_A_DPU_DPU_SEQUENCE_NO

Type: RW

Reset State: 0x00000000

This register holds Sequence number.

WCSS_A_DPU_DPU_SEQUENCE_NO

Bits	Name	Description
11:0	SEQUENCE_NO	DPU generated Sequence Number

0x0A0818F8 WCSS_A_DPU_DPU_ROUTING_FLAG**Type:** RW**Reset State:** 0x0000FF18

This register holds the Routing Flag Value.

WCSS_A_DPU_DPU_ROUTING_FLAG

Bits	Name	Description
15:8	WOW_ROUTING_FLAG	Routing flag to rout the packets in WOW mode (This is controlled by wow_routing_flag_en)
7:0	ROUTING_FLAG	Routing flag to rout the packets in WOW mode (This controlled by wow_en)

0x0A0818FC WCSS_A_DPU_DPU_HOST_WAKEUP_STATUS_MAGICBD**Type:** R**Reset State:** 0x00000000

This register holds host wakeup reason code and magic BD index Value

WCSS_A_DPU_DPU_HOST_WAKEUP_STATUS_MAGICBD

Bits	Name	Description
31:16	MAGIC_PACKET_BD_INDEX	Bd index value for the Magic packet
15	HOST_WAKEUP_STATUS	Host wake-up status
6:0	HOST_WAKEUP_REASON_CODE	Host wake-up reason code

0x0A081900 WCSS_A_DPU_DPU_WOW_CONFIG**Type:** RW**Reset State:** 0x00000000

Holds WOW based configuration fields

WCSS_A_DPU_DPU_WOW_CONFIG

Bits	Name	Description
7	WOW_ROUTING_FLAG_EN	When this bit is enabled 0: 1:
6	WOW_PKTERR_EN	When this bit is enabled 0: 1:
5	WOW_CHANSWITCH_EN	When this bit is set wow block will also wake up the host if channel switch frame is received 0: 1: When this bit is set wow block will also wake up the host if channel switch frame is received
4	WOW_DEAUTH_EN	When this bit is set wow block will also wake up the host if deauthentication packet is received 0: 1: When this bit is set wow block will also wake up the host if deauthentication packet is received
3	WOW_DISASS_EN	When this bit is set wow block will also wake up the host if disassociation packet is received 0: 1: When this bit is set wow block will also wake up the host if disassociation packet is received
2:1	WOW_MODE	four wow modes from the register data that is programmed by SW 00: Magic packet 01: Client only(reserved) 10: AP-Assist(reserved) 11: AP
0	WOW_EN	Setting this bit enables/disables the wow mode. 0: WOW blockdisabled 1: WOW block enable

0x0A081904 WCSS_A_DPU_DPU_WOW_TIMERS**Type:** RW**Reset State:** 0x00000000

Link down Timer :The value programmed indicates the threshold for consecutive missed beacons. If the timer reaches this value host is woken up. Wake-up Timer : Time out timer if an wakeup even has not occurred and this timer expires we wakeup the host

WCSS_A_DPU_DPU_WOW_TIMERS

Bits	Name	Description
31:8	WAKEUP	
5:0	LINK_DOWN	

0x0A081908 WCSS_A_DPU_DPU_WOW_MAGIC_PACKET_HI**Type:** RW**Reset State:** 0x00000000

This is 48bit mac address that is written by software, this is the pattern that is used for magic packet. It can be any pattern also

WCSS_A_DPU_DPU_WOW_MAGIC_PACKET_HI

Bits	Name	Description
15:0	MAGIC_PACKET_47_TO_32	This is 48bit mac address that is written by software

0x0A08190C WCSS_A_DPU_DPU_WOW_MAGIC_PACKET_LO**Type:** RW**Reset State:** 0x00000000

This is 48bit mac address that is written by software, this is the pattern that is used for magic packet. It can be any pattern also

WCSS_A_DPU_DPU_WOW_MAGIC_PACKET_LO

Bits	Name	Description
31:0	MAGIC_PACKET_31_TO_0	This is 48bit mac address that is written by software

0x0A081910 WCSS_A_DPU_WOW_FOUND_MAGIC_COUNTER**Type:** R**Reset State:** 0x00000000

Number of packets received after magic packet has been detected Note That these packets will be pushed to DXE WQ including magic packet, which is something you can verify

WCSS_A_DPU_WOW_FOUND_MAGIC_COUNTER

Bits	Name	Description
31:0	VALUE	

0x0A081914 WCSS_A_DPU_WOW_WAITING4MAGIC_COUNTER**Type:** R**Reset State:** 0x00000000

Number of packets received before we detect a magic packet These packets are pushed to drop WQ

WCSS_A_DPU_WOW_WAITING4MAGIC_COUNTER

Bits	Name	Description
31:0	VALUE	

0x0A081918 WCSS_A_DPU_WAPI_STA_KEY_INDEX_VALUES**Type:** R**Reset State:** 0x00000000

Station key index values

WCSS_A_DPU_WAPI_STA_KEY_INDEX_VALUES

Bits	Name	Description
31:0	VALUE	

0x0A081920 WCSS_A_DPU_WAPI_STA0_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA0_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081924 WCSS_A_DPU_WAPI_STA1_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA1_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081928 WCSS_A_DPU_WAPI_STA2_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA2_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A08192C WCSS_A_DPU_WAPI_STA3_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA3_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081930 WCSS_A_DPU_WAPI_STA4_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA4_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081934 WCSS_A_DPU_WAPI_STA5_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA5_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081938 WCSS_A_DPU_WAPI_STA6_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA6_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2

WCSS_A_DPU_WAPI_STA6_KEY_INDEXES (cont.)

Bits	Name	Description
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A08193C WCSS_A_DPU_WAPI_STA7_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA7_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081940 WCSS_A_DPU_WAPI_STA8_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA8_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081944 WCSS_A_DPU_WAPI_STA9_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA9_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081948 WCSS_A_DPU_WAPI_STA10_KEY_INDEXES

Type: RW

Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA10_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A08194C WCSS_A_DPU_WAPI_STA11_KEY_INDEXES

Type: RW

Reset State: 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA11_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081950 WCSS_A_DPU_WAPI_STA12_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA12_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081954 WCSS_A_DPU_WAPI_STA13_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA13_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081958 WCSS_A_DPU_WAPI_STA14_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA14_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2

WCSS_A_DPU_WAPI_STA14_KEY_INDEXES (cont.)

Bits	Name	Description
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A08195C WCSS_A_DPU_WAPI_STA15_KEY_INDEXES**Type:** RW**Reset State:** 0x00000000

This register holds wapi key indexes to map key Ids

WCSS_A_DPU_WAPI_STA15_KEY_INDEXES

Bits	Name	Description
31:24	KEY_INDEX3	Keyindex value to map keyid3
23:16	KEY_INDEX2	Keyindex value to map keyid2
15:8	KEY_INDEX1	Keyindex value to map keyid1
7:0	KEY_INDEX0	Keyindex value to map keyid0

0x0A081964 WCSS_A_DPU_WAPI_PN_CONFIG**Type:** RW**Reset State:** 0x00000064

This register configures WAPI packet number even/Odd check in Rx path and PN increment by one/two in Tx path Bit Field Definitions 00 : Sequential 01 : Odd 10 : Even

WCSS_A_DPU_WAPI_PN_CONFIG

Bits	Name	Description
15:14	CASE7	{uc_bc, to_bs, from_ds} = 3'b111
13:12	CASE6	{uc_bc, to_bs, from_ds} = 3'b110
11:10	CASE5	{uc_bc, to_bs, from_ds} = 3'b101

3:2	CASE1	{uc_bc, to_bs, from_ds} = 3'b001
1:0	CASE0	{uc_bc, to_bs, from_ds} = 3'b000

10.39 WCSS_A_FDAHB_FDAHB

0x0A140000 WCSS_A_FDAHB_FDAHB_RXP_PL

Type: RW

Reset State: 0x00000004

fdahb Arbiter arbitration priority level for rxp master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_FDAHB_FDAHB_RXP_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rxp master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the fdahb arbiter will prevent a master from disabling itself.

0x0A140004 WCSS_A_FDAHB_FDAHB_TXP_PL

Type: RW

Reset State: 0x00000004

fdahb Arbiter arbitration priority level for txp master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_FDAHB_FDAHB_TXP_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for txp master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the fdahb arbiter will prevent a master from disabling itself.

0x0A140008 WCSS_A_FDAHB_FDAHB_TPE_PL

Type: RW

Reset State: 0x00000004

fdahb Arbiter arbitration priority level for tpe master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_FDAH_B_FDAH_B_TPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for tpe master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the fdahb arbiter will prevent a master from disabling itself.

0x0A14000C WCSS_A_FDAH_B_FDAH_B_FDBR_PL

Type: RW

Reset State: 0x00000005

fdahb Arbiter arbitration priority level for fdbr master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_FDAH_B_FDAH_B_FDBR_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for fdbr master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the fdahb arbiter will prevent a master from disabling itself.

0x0A140010 WCSS_A_FDAH_B_FDAH_B_RPE_PL

Type: RW

Reset State: 0x00000004

fdahb Arbiter arbitration priority level for rpe master. In the fdahb arbitration scheme the master with highest priority level always wins. Should there be more than one master with the same priority then the winning master will be selected using a round-robin algorithm.

WCSS_A_FDAHB_FDAHB_RPE_PL

Bits	Name	Description
3:0	PRIORITY	Arbitration priority for rpe master. The lowest priority level is 1 and the highest priority level is 15. A priority level of 0 has a special significance, it means that the master is disabled and stops participating in the arbitration scheme. Note that the fdahb arbiter will prevent a master from disabling itself.

0x0A140048 WCSS_A_FDAHB_FDAHB_DFLT_MST**Type:** RW**Reset State:** 0x00000000

This register identifies the default master for the fdahb

WCSS_A_FDAHB_FDAHB_DFLT_MST

Bits	Name	Description
3:0	DFT_MST	Default Master ID number register. The default master is the master that is granted by the bus when no master has requested ownership. NOTE: Writing anything beyond the 4 R/W bits will cause the entire write to be discarded. 0x0: DMY (Grant ownership to fdahb dummy master) 0x1: RXP (Grant ownership to fdahb rxp master) 0x2: TXP (Grant ownership to fdahb txp master) 0x3: TPE (Grant ownership to fdahb tpe master) 0x4: FDBR (Grant ownership to fdahb fdbr master) 0x5: RPE (Grant ownership to fdahb rpe master)

10.40 WCSS_A_FFT_FFT

0x0A00C000+WCSS_A_FFT_FFT_RAM_0n_0, n=[0..255]
0x8*n

Type: RW**Reset State:** 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

WCSS_A_FFT_FFT_RAM_0n_0

Bits	Name	Description
15:12	IMAG_DATA0_0	12-bit imagee data for Rx antenna 0
11:0	REAL_DATA0	12-bit real data for Rx antenna 0

0x0A00C004+WCSS_A_FFT_FFT_RAM_0n_1, n=[0..255]
0x8*n
Type: RW**Reset State:** 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

WCSS_A_FFT_FFT_RAM_0n_1

Bits	Name	Description
7:0	IMAG_DATA0_1	12-bit imagee data for Rx antenna 0

0x0A00C800+WCSS_A_FFT_FFT_RAM_1n_0, n=[0..255]
0x8*n
Type: RW**Reset State:** 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

WCSS_A_FFT_FFT_RAM_1n_0

Bits	Name	Description
15:12	IMAG_DATA0_0	12-bit imagee data for Rx antenna 0
11:0	REAL_DATA0	12-bit real data for Rx antenna 0

0x0A00C804+WCSS_A_FFT_FFT_RAM_1n_1, n=[0..255]
0x8*n
Type: RW**Reset State:** 0x0000

Ping-Pong FFT Reorder RAM shared by all receive chains.

WCSS_A_FFT_FFT_RAM_1n_1

Bits	Name	Description
7:0	IMAG_DATA0_1	12-bit imagee data for Rx antenna 0

0x0A00D000 WCSS_A_FFT_APB_ACCESS**Type:** RW**Reset State:** 0x0000

This register controls APB access of the FFT Reorder RAM.

WCSS_A_FFT_APB_ACCESS

Bits	Name	Description
0	APB_MODE	APB access enable bit - internal memory may be accessed only when this bit is asserted

0x0A00D004 WCSS_A_FFT_FFT_TOGGLE**Type:** R**Reset State:** 0x00000000

This register is a 1-bit counter that is updated at the end of each FFT block.

WCSS_A_FFT_FFT_TOGGLE

Bits	Name	Description
0	COUNT	FFT block count

10.41 WCSS_A_MCU_MCU**0x0A080C00 WCSS_A_MCU_BD_PDU_BASE_ADDR****Type:** RW**Reset State:** 0x00000000

Sets the memory base address of the BDs and PDUs in external memory.

WCSS_A_MCU_BD_PDU_BASE_ADDR

Bits	Name	Description
31:7	BD_PDU_BASE_ADDRESS	Base address of the BDs and PDUs in external memory. Note that the lowest 8 bits can not be programmed as these bits will always have to be zero. BDs and PDUs are in units of 128 bytes.

0x0A080C04 WCSS_A_MCU_MLC_CONTROL**Type:** RW**Reset State:** 0x00330000

MAC Loop back Control register

WCSS_A_MCU_MLC_CONTROL

Bits	Name	Description
31	MLC_LOOPBACK_ENABLE	When set to 1'b1, the MLC loopback functionality is enabled
30	MLC_SNOOPING_ENABLE	When set to 1'b1, the MLC snooping functionality is enabled
29	MLC_ADDRESS_SWAP_ENABLE	When set to 1'b1, the MLC will swap address 1 and address2 of the frame received from the TXP
23:16	BYTE_FORWARDING_INTERVAL	The number of 160MHz clock cycles in between each data byte requested from the TXP and forwarded to the RXP. A value of 8'd3 corresponds with 315 Mbps. A value of 8'd7 corresponds with 100 mbps. This setting is only used in MLC loopback functionality mode, not snooping mode. bits [17:16] are read only and are always tied to 2'b11 since this is the minimum value that you can program. It is tied to this value preventing user from programming it anything other

0x0A080C0C WCSS_A_MCU_DBR_STATUS**Type:** RW**Reset State:** 0x00000000

Status register of the DBR

WCSS_A_MCU_DBR_STATUS

Bits	Name	Description
5	DBR_GAM_ERROR	When set to 1'b1, the gam inside the DBR reported an error to overcome some rtl issue, please write to this bit to clear DBR_incorrect_length_error
4	DBR_INCORRECT_LENGTH_ERROR	When set to 1'b1, the DBR reported an error: a module tried an access that was larger then 1 word to overcome some rtl issue, please write to this bit to clear DBR_GAM_error

0x0A080C10 WCSS_A_MCU_MCPU_TO_HOST_MB_INT_STAT**Type:** R**Reset State:** 0x00000000

register indicating for which mailboxes an interrupt to the host is pending

WCSS_A_MCU_MCPU_TO_HOST_MB_INT_STAT

Bits	Name	Description
15:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending

0x0A080C14 WCSS_A_MCU_HOST_TO_MCPU_MB_INT_STAT**Type:** R**Reset State:** 0x00000000

register indicating for which mailboxes an interrupt to the mCPU is pending

WCSS_A_MCU_HOST_TO_MCPU_MB_INT_STAT

Bits	Name	Description
15:0	MBX_INT_STATUS	Each bit stands for the corresponding mailbox. When set, an interrupt from that Mailbox is pending

0x0A080C18 WCSS_A_MCU_MB0_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mcpu or to the host.

WCSS_A_MCU_MB0_CONTROL

Bits	Name	Type	Description
31:2	MAILBOX_VALUE	RW	A 30 bit value from sender to receiver
1	INT_DIRECTION	RW	Interrupt direction: When set to zero: mCPU to host When set to one: host to mCPU
0	MB_RESET	R	When set, all to this MB related parameters, including the counters, are cleared.

0x0A080C1C WCSS_A_MCU_MB0_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_MCU_MB0_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb0_control register. This value gets cleared on a mb0 reset.

WCSS_A_MCU_MB0_CONTROL_COUNTERS (cont.)

Bits	Name	Description
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset.

0x0A080C20 WCSS_A_MCU_MB1_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mcpu or to the host.

WCSS_A_MCU_MB1_CONTROL

Bits	Name	Type	Description
31:2	MAILBOX_VALUE	RW	A 30 bit value from sender to receiver
1	INT_DIRECTION	RW	Interrupt direction: When set to zero: mCPU to host When set to one: host to mCPU
0	MB_RESET	R	When set, all to this MB related parameters, including the counters, are cleared.

0x0A080C24 WCSS_A_MCU_MB1_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_MCU_MB1_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb1_control register. This value gets cleared on a mb1 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A080C28 WCSS_A_MCU_MB2_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mcpu or to the host.

WCSS_A_MCU_MB2_CONTROL

Bits	Name	Type	Description
31:2	MAILBOX_VALUE	RW	A 30 bit value from sender to receiver
1	INT_DIRECTION	RW	Interrupt direction: When set to zero: mCPU to host When set to one: host to mCPU
0	MB_RESET	R	When set, all to this MB related parameters, including the counters, are cleared.

0x0A080C2C WCSS_A_MCU_MB2_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_MCU_MB2_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb2_control register. This value gets cleared on a mb2 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A080C30 WCSS_A_MCU_MB3_CONTROL**Type:** RW**Reset State:** 0x00000000

General purpose Mailbox register, which can be used to generate interrupts to the mcpu or to the host.

WCSS_A_MCU_MB3_CONTROL

Bits	Name	Type	Description
31:2	MAILBOX_VALUE	RW	A 30 bit value from sender to receiver
1	INT_DIRECTION	RW	Interrupt direction: When set to zero: mCPU to host When set to one: host to mCPU
0	MB_RESET	R	When set, all to this MB related parameters, including the counters, are cleared.

0x0A080C34 WCSS_A_MCU_MB3_CONTROL_COUNTERS**Type:** R**Reset State:** 0x00000000

Access counters for tracking the usage and handling of the MB interrupt

WCSS_A_MCU_MB3_CONTROL_COUNTERS

Bits	Name	Description
18:16	WRITE_CNT	A 3 bit value indicating the number of times a none reset write operation has been performed on the mb3_control register. This value gets cleared on a mb3 reset.
2:0	READ_CNT	A 3 bit value indicating the number of times a read operation has been performed on the control register of this mailbox This value gets cleared on a MB reset

0x0A080C98 WCSS_A_MCU_MUTEX0**Type:** R**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_MCU_MUTEX0

Bits	Name	Description
31	RESET	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	THE Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.

WCSS_A_MCU_MUTEX0 (cont.)

Bits	Name	Description
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A080C9C WCSS_A_MCU_MUTEX1**Type:** R**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_MCU_MUTEX1

Bits	Name	Description
31	RESET	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A080CA0 WCSS_A_MCU_MUTEX2**Type:** R**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_MCU_MUTEX2

Bits	Name	Description
31	RESET	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.

WCSS_A_MCU_MUTEX2 (cont.)

Bits	Name	Description
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A080CA4 WCSS_A_MCU_MUTEX3**Type:** R**Reset State:** 0x00000101

General purpose semaphore and/or mutex register

WCSS_A_MCU_MUTEX3

Bits	Name	Description
31	RESET	When set, both Current Count and MaxCount fields get initialized with the value written to the MAXcount field. This bit will not get set on a write operation.
15:8	MAXCOUNT	The Max count of semaphoresavailable. Can only be set when the Reset bit is written with value 1.
7:0	CURRENTCOUNT	Current count of the semaphore. On a read, the current value of the Semaphore is returned and if the CurrentCount > 0, the CurrentCount value is decreased by one. On a write, the current value of the Semaphore is increased by one if the CurrentCount < MaxCount

0x0A080CB8 WCSS_A_MCU_SOFT_RESET**Type:** RW**Reset State:** 0x00000000

Control to soft reset MAC modules. For mCPU reset control, refer to register: MCPU_reset_control

WCSS_A_MCU_SOFT_RESET

Bits	Name	Type	Description
31	TXP_PHYTX_ABORT	RW	When set, the abort signal to the PHYTX is raised.
30	CAHB_SOFT_RESET_DOW NCNT_EN	RW	When set, the cahb_soft_reset_downcount starts to count for 63 cycles then reset the mrcm_cahb
20	CSU_SOFT_RESET	RW	When set, the csu is held in soft reset

WCSS_A_MCU_SOFT_RESET (cont.)

Bits	Name	Type	Description
19	FDAHB_SOFT_RESET	RW	When set, the fdahb is held in soft reset
18	FDBR_SOFT_RESET	RW	When set, the fdbr is held in soft reset
17	CBR_SOFT_RESET	W	write 1 to soft reset cbr. This is self-clear
16	QTA_SOFT_RESET	RW	When set, the QTA is held in soft reset
15	CFG_SOFT_RESET	RW	When set, the CFG is held in soft reset
14	PHY_SOFT_RESET	RW	When set, the PHY is held in soft reset
13	ADU_SOFT_RESET	RW	When set, the ADU is held in soft reset
12	RPE_SOFT_RESET	RW	When set, the RPE is held in soft reset
11	TPE_SOFT_RESET	RW	When set, the TPE is held in soft reset
10	DAHB_SOFT_RESET	RW	When set, the DAHB is held in soft reset
9	MCU_SOFT_RESET	RW	When set, the MCU is held in soft reset
8	PHY_AHB_2_APB_SOFT_RESET	RW	When set, the PHY AHB to APB interface is held in soft reset
7	DPU_SOFT_RESET	RW	When set, the DPU is held in soft reset
6	BMU_SOFT_RESET	RW	When set, the BMU is held in soft reset
5	MTU_SOFT_RESET	RW	When set, the MTU (MAC Timing Unit) is held in soft reset When set, the RXP is held in soft reset
3	TXP_SOFT_RESET	RW	When set, the TXP is held in soft reset
2	DBR_SOFT_RESET	RW	Reserved
0	MLC_SOFT_RESET	RW	When set, the MLC (MAC Loopback Controller) is held in soft reset

0x0A080CBC WCSS_A_MCU_MAC_CLK_GATING_ENABLE**Type:** RW**Reset State:** 0x047F8DF9

Control to enable the dynamic clock gating functionality in the MAC modules

WCSS_A_MCU_MAC_CLK_GATING_ENABLE

Bits	Name	Description
31:27	SPARE	spare register bits
26	MCU_CSU_CLK_GATING_ENABLE	When set, the csu dynamic clock gating function is enabled
25	MCU_FDAHB_CLK_GATING_ENABLE	When set, the fdahb dynamic clock gating function is enabled

WCSS_A_MCU_MAC_CLK_GATING_ENABLE (cont.)

Bits	Name	Description
24	MCU_FDBR_CLK_GATING_ENABLE	When set, the fdbr dynamic clock gating function is enabled
23	MCU_CBR_CLK_GATING_ENABLE	When set, the cbr dynamic clock gating function is enabled
22	MCU_CFG_CLK_GATING_ENABLE	When set, the cfg dynamic clock gating function is enabled
21	MCU_GAS_CLK_GATING_ENABLE	When set, the MCU gas dynamic clock gating function is enabled
20	QTA_CLK_GATING_ENABLE	When set, the QTA dynamic clock gating function is enabled
19	ARM_CLK_GATING_ENABLE	When set, the ARM dynamic clock gating function is enabled
18	BTC_CLK_GATING_ENABLE	When set, the BTC dynamic clock gating function is enabled
17	ADU_CLK_GATING_ENABLE	When set, the ADU dynamic clock gating function is enabled
16	TPE_CLK_GATING_ENABLE	When set, the TPE dynamic clock gating function is enabled
15	RPE_CLK_GATING_ENABLE	When set, the RPE dynamic clock gating function is enabled
14	DPU_HISTBUF_CLK_ENABLE	This bit is a little bit different since 0-> the clks to hist buff are enabled 1-> the clks are disabled write zero to enable the clock
13	DAHB_CLK_GATING_ENABLE	When set, the DAHB bus module dynamic clock gating function is enabled
12	CAHB_CLK_GATING_ENABLE	When set, the CAHB module dynamic clock gating function is enabled
11	MCU_RESERVED1	RESERVED
10	MIF_CLK_GATING_ENABLE	Reserved
9	MCU_CLK_GATING_ENABLE	When set, the MCU dynamic clock gating function is enabled
8	PHY_AHB_2_APB_CLK_GATING_ENABLE	When set, the PHY AHB to APB interface dynamic clock gating function is enabled
7	DPU_CLK_GATING_ENABLE	When set, the DPU dynamic clock gating function is enabled
6	BMU_CLK_GATING_ENABLE	When set, the BMU dynamic clock gating function is enabled
5	MTU_CLK_GATING_ENABLE	When set, the MTU (MAC Timing Unit) dynamic clock gating function is enabled
4	RXP_CLK_GATING_ENABLE	When set, the RXP dynamic clock gating function is enabled

WCSS_A_MCU_MAC_CLK_GATING_ENABLE (cont.)

Bits	Name	Description
3	TXP_CLK_GATING_ENABLE	When set, the TXP dynamic clock gating function is enabled
2	DBR_CLK_GATING_ENABLE	When set, the DBR dynamic clock gating function is enabled
1	RESERVED2	RESERVED
0	MLC_CLK_GATING_ENABLE	When set, the MLC (MAC Loopback Controller) dynamic clock gating function is enabled

0x0A080CD4 WCSS_A_MCU_MAC_MODULES_ROOT_CLK_ENABLES**Type:** RW**Reset State:** 0x0007FFFD

Control to enable the root clocks for each of the MAC modules

WCSS_A_MCU_MAC_MODULES_ROOT_CLK_ENABLES

Bits	Name	Description
18	CSU_ROOT_CLK_ENABLE	When set, the csu root clock is enabled
17	FDAHB_ROOT_CLK_ENABLE	When set, the fdahb root clock is enabled
16	FDBR_ROOT_CLK_ENABLE	When set, the fdbr root clock is enabled
15	CBR_ROOT_CLK_ENABLE	When set, the cbr root clock is enabled
14	CFG_ROOT_CLK_ENABLE	When set, the CFG root clock is enabled
13	RTCK_ROOT_CLK_ENABLE	Reserved.
12	ADU_ROOT_CLK_ENABLE	When set, the ADU root clock is enabled
11	RPE_ROOT_CLK_ENABLE	When set, the RPE root clock is enabled
10	TPE_ROOT_CLK_ENABLE	When set, the TPE root clock is enabled
9	MCPU_ROOT_CLK_ENABLE	When set, the MCPU root clock is enabled
8	PHY_AHB_2_APB_ROOT_CLK_ENABLE	When set, the PHY AHB to APB interface root clock is enabled
7	DPU_ROOT_CLK_ENABLE	When set, the DPU root clock is enabled
6	BMU_ROOT_CLK_ENABLE	When set, the BMU root clock is enabled
5	MTU_ROOT_CLK_ENABLE	When set, the MTU (MAC Timing Unit) root clock is enabled

WCSS_A_MCU_MAC_MODULES_ROOT_CLK_ENABLES (cont.)

Bits	Name	Description
4	RXP_ROOT_CLK_ENABLE	When set, the RXP root clock is enabled
3	TXP_ROOT_CLK_ENABLE	When set, the TXP root clock is enabled
2	DBR_ROOT_CLK_ENABLE	When set, the DBR root clock is enabled
0	MLC_ROOT_CLK_ENABLE	When set, the MLC (MAC Loopback Controller) root clock is enabled

0x0A080CD8 WCSS_A_MCU_MAC_MODULES_GOTO_IDLE_CONTROL**Type:** RW**Reset State:** 0x00000000

The statemachines in the MAC modules can be forced to go back to idle by setting these signals. This resembles somewhat the softreset functionality, except that the configuration registers maintain their settings. It is therefore less intrusive than a soft reset, and might achieve restoring the modules into a known state

WCSS_A_MCU_MAC_MODULES_GOTO_IDLE_CONTROL

Bits	Name	Description
13	CSU_GOTO_IDLE	When set, the CSU HW state machines will return to idle
12	CFG_GOTO_IDLE	When set, the CFG HW state machines will return to idle
11	ADU_GOTO_IDLE	When set, the ADU HW state machines will return to idle
10	TPE_GOTO_IDLE	When set, the TPE HW state machines will return to idle
9	RPE_GOTO_IDLE	When set, the RPE HW state machines will return to idle
8	PHY_AHB_2_APB_GOTO_IDLE	When set, the PHY AHB to APB interface HW state machines will return to idle
7	DPU_GOTO_IDLE	When set, the DPU HW state machines will return to idle
6	BMU_GOTO_IDLE	When set, the BMU HW state machines will return to idle
5	MTU_GOTO_IDLE	When set, the MTU (MAC Timing Unit) HW state machines will return to idle When set, the RXP HW state machines will return to idle
2	DBR_GOTO_IDLE	Reserved
0	MLC_GOTO_IDLE	When set, the MLC (MAC Loopback Controller) HW state machines will return to idle

0x0A080CEC WCSS_A_MCU_APB2PHY_STATUS**Type:** RW**Reset State:** 0x00000000

Status register of the apb interface to the PHY

WCSS_A_MCU_APB2PHY_STATUS

Bits	Name	Description
1	AHB2PHY_MCU_TIMEOUT_ERROR1	When set to 1'b1, a timeout has happened in the apb2phy interface
0	AHB2PHY_MCU_TIMEOUT_ERROR2	When set to 1'b1, a timeout has happened in the apb2phy interface

0x0A080CF0 WCSS_A_MCU_MLC_STATUS**Type:** R**Reset State:** 0x00000000

Status register of the MLC

WCSS_A_MCU_MLC_STATUS

Bits	Name	Description
31:28	MLC_CONTROLLER_STATUS	State that the MLC controller is in: 0x0: idle 0xf:0x1: MLC active
27:24	NR_OF_RXP_STARTS	The number of txp_mlc_start pulses received
23:22	NR_OF_TXP_MLC_ABORTS	The number of txp_mlc_aborts received. This number freezes on 2'b11.
21:20	NR_OF_MLC_ENDS	The number of command bytes passed on to the RXP
19:12	NR_OF_COMMAND_BYTES	The number of command bytes passed on to the RXP
11:0	NR_OF_DATA_BYTES	The number of data bytes and statistics bytes passed on to the RXP

0x0A080CF4 WCSS_A_MCU_MCU_RESERVED**Type:** RW**Reset State:** 0x00000000

These bits have been reserved for future use

WCSS_A_MCU_MCU_RESERVED

Bits	Name	Description
15:1	MCU_RESERVED	Spare register bits read writable
0	PMU_AGC_SLEEP	pmu_agc_sleep

0x0A080D00 WCSS_A_MCU_RF_WARMUP_CONTROL**Type:** RW**Reset State:** 0x00000000

This register has controls for txp for rf warmup

WCSS_A_MCU_RF_WARMUP_CONTROL

Bits	Name	Type	Description
2	TXP_MCU_RF_WARMUP	R	This is a read only signal. It is basically the status of the of the warmup signal that is given by the TXP to the PHY
1	MCU_TXP_RF_WARMUP	RW	Reserved. Not used.
0	MCU_TXP_RF_WARMUP_END	RW	Reserved. Not used.

0x0A080D04 WCSS_A_MCU_BTC**Type:** RW**Reset State:** 0x00000040

This register controls the operation of the BTC function. This register also masks the various conditions that this device will be reporting 'ACTIVE' to the Bluetooth device. Setting a bit to "1" enables the condition, "0" masks(disables) the condition.

WCSS_A_MCU_BTC

Bits	Name	Type	Description
23	MTU_BTC_TX_RX_BUSY	R	Gives status of busy signal going to BTC after the override
22	MTU_MCU_TX_RX_BUSY	R	Gives status of busy signal coming from MTU
21	BTC_GPIO_INTEL_WLAN_ACTIVE	R	Reserved. 2-wire is not supported
20	BTC_BSR_WLAN_ACTIVE	R	Gives status of wlan active signal going to the pad
19	BTC_BLUETOOTH_ACTIVE	R	Gives status input bluetooth active signal
18	BTC_WLAN_ACTIVE	R	Gives status of wlan active signal from logic (before override)

WCSS_A_MCU_BTC (cont.)

Bits	Name	Type	Description
17	BTC_INTEL_WLAN_ACTIVE	R	Reserved. 2-wire is not supported
16	CHANNEL_DATA_DONE	RW	Reserved. 2-wire is not supported
12	BTC_WLAN_ACTIVE_SW_SEL	RW	When '1', this bit selects override for the wlan active signal
11	BTC_WLAN_ACTIVE_OVERRIDE	RW	When '1', this bit overrides the wlan active signal from logic
10	BTC_INTEL_WLAN_ACTIVE_OVERRIDE	RW	Reserved. 2-wire is not supported
9	BTC_INTEL_WLAN_ACTIVE_SW_SEL	RW	Reserved. 2-wire is not supported
8	BTC_TX_RX_BUSY_SW_SEL	RW	Reserved
7	BTC_TX_RX_BUSY_OVERRIDE	RW	Reserved
6	BT_ACTIVE_EN	RW	When '1', this bit enables the sensing of the Bluetooth devices activity on the shared transmission channel for both Dell and Intel modes of operation.
5	BTC_MODE	RW	Reserved. 2-wire is not supported
4	CHANNEL_DATA_WR_EN	RW	Reserved. 2-wire is not supported
3:0	CHANNEL_DATA	RW	Reserved. 2-wire is not supported

0x0A080D08 WCSS_A_MCU_RF_ON_OFF_CONTROL**Type:** R**Reset State:** 0x00000000

This register reflects the status of radio on/off HW pin

WCSS_A_MCU_RF_ON_OFF_CONTROL

Bits	Name	Description
0	RD_ON_OFF_HWPIN_STAT	1'b0 : radio OFF 1'b1 : radio ON

0x0A080D94 RESERVED**0x0A080E10 WCSS_A_MCU_DABH_MIF_PRIORITY_GENERATION_CONTROL****Type:** RW**Reset State:** 0x00000000

controls the way the 'priority signal from the DAHB to the MIF is generated

WCSS_A_MCU_DABH_MIF_PRIORITY_GENERATION_CONTROL

Bits	Name	Description
1:0	DABH_MIF_PRIORITY_MODE	00: txp, rxp bus request based, BMU priority request based 01: txp, rxp and bmu bus request based (when BMU priority requested) AND mif txp/rxp/bmu busy based 10: same as 01, but with extended bus request version 11: request starts on a rising edge of the busrequest from txp/rxp/bmu(when bmu priority requested) and ends at the falling edge of the txp/rxp/bmu mif busy indication

0x0A080E14 WCSS_A_MCU_BTC_CTRL**Type:** RW**Reset State:** 0x0006019F

This register controls the BTC function in 3/4 wire mode.

WCSS_A_MCU_BTC_CTRL

Bits	Name	Type	Description
29:27	SCO_RESERVE_SLOT	RW	To setup the sco/esco reserve slot in terms of slot
26	FORCE_SYNC_TO_SCO	RW	A 0->1 transition will force pta to sync to the bt_active when the counter reaches 0 within the programmed boundary as sco start. SW has to clear this bit.
25	STATS_EN	RW	When set, enable the states counters
24	ESCO_WAIT_FOR_RETX_EN	RW	When set, the wlan will not be allow to transmit until the esco retransmission slot is cleared
23:21	ESCO_RETRANSMIT_SLOT	RW	To setup the esco retransmission slot in terms of slot
20:16	SCO_PERIOD	RW	To setup the sco period in terms of slot
15	PERIOD_INT_CLEAR	W	Reserved. Not required any more
14	PRIORITY_INT_CLEAR	W	Reserved. Not required any more
13	BT_SIMUL_TX_NONOVERLAP	RW	Reserved. No simultaneous transmission
12	BT_SIMUL_TX_ALL	RW	Reserved. No simultaneous transmission

WCSS_A_MCU_BT_CTRL (cont.)

Bits	Name	Type	Description
11	PERIOD_INT_DISABLE	RW	Reserved. Not required any more
10	PRIORITY_INT_DISABLE	RW	Reserved. Not required any more
9:8	BT_3_4WIRE_MODE	RW	Reserved. Only 3-wire is supported
7	BT_DELL_PRIORITY	RW	Reserved. 2-wire is not supported
6	BT_SVO_MODE	RW	Set this bit if BT is in SVO mode. 0x0: NOT_IN_SVO (BT is not in SVO mode.) 0x1: IN_SVO (BT is in SVO mode.)
5	BT_SCO_MODE	RW	Set this bit if BT is in SCO mode. 0x0: NOT_IN_SCO (BT is not in SCO mode.) 0x1: IN_SCO (BT is in SCO mode.)
4	BT_STATUS_POLARITY	RW	Set this bit if BT is operating in 3/4 wire protocol. 0x0: TX_LOW (bt_priority is low when BT TX) 0x1: TX_HIGH (bt_priority is high when BT TX)
3	WLAN_ACTIVE_POLARITY	RW	To configure the polarity of wlan_active signal from BT. 0x0: ACTIVE_LOW (wlan_active is low when WLAN is busy.) 0x1: ACTIVE_HIGH (wlan_active is high when WLAN is busy.)
2	BT_FREQ_POLARITY	RW	Reserved. 4-wire is not supported
1	BT_PRIORITY_POLARITY	RW	To configure the polarity of bt_priority signal from BT 0x0: ACTIVE_LOW (bt_priority is low when BT is in high priority) 0x1: ACTIVE_HIGH (bt_priority is high when BT is in high priority)
0	BT_ACTIVE_POLARITY	RW	To configure the polarity of bt_active signal from BT 0x0: ACTIVE_LOW (bt_active is low to indicate BT traffic) 0x1: ACTIVE_HIGH (bt_active is high to indicate BT traffic)

0x0A080E18 WCSS_A_MCU_BT_CTRL2**Type:** RW**Reset State:** 0x01003200

This register is to setup the counter value in 3/4 wire mode.

WCSS_A_MCU_BT_CTRL2

Bits	Name	Description
31:24	OFFSET_UNCERTANTY	To setup the allowed offset value for period validation

WCSS_A_MCU_BTC_CTRL2 (cont.)

Bits	Name	Description
23	BEFORE_LAG	Reserved 0x0: CNT_LAG (early_end_cnt is after bt_active assertion) 0x1: CNT_PRIORI (early_end_cnt is before bt_active assertion)
15:8	EARLY_END_CNT	To setup the number of cycles for wlan to stop to transmit after bt_active assertion.(keep the name of the bit field in case any TB might use it for whatever purpose). Note this value should be larger than t2 to avoid wrong priority bt traffic request signal sent to TPE.
7:0	LATE_START_CNT	To setup the number of cycles for wlan to start to transmit after bt_active deassertion.

0x0A080E1C WCSS_A_MCU_BTC_CTRL3**Type:** RW**Reset State:** 0x00014196

This register is to setup the timing spec in 3/4 wire mode.

WCSS_A_MCU_BTC_CTRL3

Bits	Name	Description
17:12	BTC_T3	To setup the T3 number (default to 20us).
11:8	BTC_T2	To setup the T2 number (default to 1us).
7:0	BTC_T1	To setup the T1 number (default to 150us).

0x0A080E20 WCSS_A_MCU_BTC_STATUS**Type:** RW**Reset State:** 0x010EA500

This register contains the status of internal signals.

WCSS_A_MCU_BTC_STATUS

Bits	Name	Type	Description
31	WAIT_FOR_ESCO_DONE	R	The status of the esco_bt_is_done signal. If it's in esco mode, and the BTC_CTRL[24] is set, the signal will be asserted until the esco retransmission is done. Otherwise this signal will be 0.
30	BTC_MODE	R	When '1', BT is in tx in current slot. When '0' and bt_active is high, BT is in rx in current slot

WCSS_A_MCU_BTC_STATUS (cont.)

Bits	Name	Type	Description
29:24	SCO_SLOT_CNT	R	The sco slot counter value
23	SCO_SYNC_FLAG	R	To indicate whether the sco period is locked(1) or not(0)
22:8	BT_AVAIL_CNT	RW	The sco period counter which s/w can write to change the value (The big field name is kept in case any mcs relies on it)
7	MASTER_SLAVE_STATUS	R	To indicate whether it's master(1) or slave(0) This is only valid in sco/esco mode.
6	BT_PERIOD_STATUS	R	The status of the bt_period_int signal which validates the bt mode and period (Always read 0 since the interrupt is removed)
5	BT_PRIORITY_STATUS	R	The status of the bt_priority_int signal signalwhich validates the bt mode and priority (Always read 0 since the interrupt is removed)
4	BT_PRIORITY_TO_TPE	R	The status of the bt_priority signal to TPE
3	BT_TRAFFIC_REQUEST	R	The status of the bt_traffic_request signal to TPE
2	BT_FREQ	R	The status of the incoming bt_freq signal (Always read 0 since we only use 3 wire protocol)
1	BT_PRIORITY	R	The status of the incoming bt_priority signal
0	BT_ACTIVE_S	R	The status of the sync-ed bt_active signal

0x0A080E24 WCSS_A_MCU_BTC_STATUS2**Type:** R**Reset State:** 0x00007FFF

This register contains the status of internal signals.

WCSS_A_MCU_BTC_STATUS2

Bits	Name	Description
31:28	CNT_3750US	Reserved
27:24	S_STATE	The encoded state machine status
23:16	CNT_T2_T3	The status of the t2_t3 counter
14:0	BT_AVAIL_CNT	The down counter to next bt-active assertion in sco/esco mode to TPE

0x0A080E2C RESERVED**0x0A080E30 RESERVED****0x0A080E38 WCSS_A_MCU_FIQ_EN****Type:** RW**Reset State:** 0x00000000

This register contains the acpu fiq enable signals

WCSS_A_MCU_FIQ_EN

Bits	Name	Description
31	SW_1_FIQ_EN	When set, sw 1 interrupt is enabled.
30	RXP_ERR_FIQ_EN	When set, rxp error interrupt is enabled.
29	QTA_FIQ_EN	When set, qta interrupt is enabled.
28	MTU_TIMER7_EN	When set, mtu timer7/tsf_timer7 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
27	MTU_TIMER6_EN	When set, mtu timer6/tsf_timer6 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
26	PHY_HIF_FIQ_EN	When set, phy hif interrupt is enabled.
25	WQ_DATA_AVAIL_FIQ_EN	When set, wq dataavailable interrupt is enabled.
24	PHY_FIQ_IRQ_EN	When set, phy irq interrupt is enabled.
23	PHY_FIQ_FIQ_EN	When set, phy fiq interrupt is enabled.
22	TPE_FIQ_EN	When set, tpe_mcu_int interrupt is enabled.
21	MIF_FIQ_EN	When set, mif interrupt is enabled.
20	BT_INACTIVE_FIQ_EN	When set, the bt inactive interrupt is enabled.
19	BT_ACTIVE_FIQ_EN	When set, the bt active interrupt is enabled.
18	MTU_TIMER5_EN	When set, mtu timer5/tsf_timer5 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
17	ADU_FIQ_EN	When set, adu interrupt is enabled.
16	MTU_TIMER4_EN	When set, mtu timer4/tsf_timer4 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
15	RPE_FIQ_EN	When set, rpe interrupt is enabled.
13	COMBINED_FIQ_EN	When set, the combined txp/dpu/dbr/ahb2phy interrupt is enabled. See combined_int related registers for detail
12	RXP_FIQ_EN	When set, rxp beacon related interrupt is enabled.
7	HOST_TO_ACPU_MB3_FIQ_EN	When set, host to acpu MB3 interrupt is enabled.

WCSS_A_MCU_FIQ_EN (cont.)

Bits	Name	Description
6	HOST_TO_ACPU_MB2_FIQ_EN	When set, host to acpu MB2 interrupt is enabled.
5	HOST_TO_ACPU_MB1_FIQ_EN	When set, host to acpu MB1 interrupt is enabled.
4	HOST_TO_ACPU_MB0_FIQ_EN	When set, host to acpu MB0 interrupt is enabled.
3	MTU_FIQ_EN	When set, combined mtu interrupt is enabled. See mtu_int related registers for detail
2	SW_0_FIQ_EN	When set, sw 0 interrupt is enabled.
1	SCU_UART_FIQ_EN	When set, uart interrupt is enabled.
0	MTU_WD_1_FIQ_EN	When set, mtu watchdog timer (warning) interrupt is enabled.

0x0A080E3C WCSS_A_MCU_FIQ_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the acpu fiq raw status signals

WCSS_A_MCU_FIQ_STATUS

Bits	Name	Description
31	SW_1_FIQ_STATUS	sw 1 interrupt status.
30	RXP_ERR_FIQ_STATUS	rxp error interrupt status.
29	QTA_FIQ_STATUS	qta interrupt status.
28	MTU_TIMER7_STATUS	When set, mtu timer7/tsf_timer7 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
27	MTU_TIMER6_STATUS	When set, mtu timer6/tsf_timer6 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
26	PHY_HIF_FIQ_STATUS	phy hif interrupt status.
25	WQ_DATA_AVAIL_FIQ_STATUS	wq dataavailable interrupt status.
24	PHY_FIQ_IRQ_STATUS	phy irq interrupt status.
23	PHY_FIQ_FIQ_STATUS	phy fiq interrupt status.
22	TPE_FIQ_STATUS	tpe_mcu_int interrupt status.
21	MIF_FIQ_STATUS	mif interrupt status.
20	BT_INACTIVE_FIQ_STATUS	bt inactive interrupt status.

WCSS_A_MCU_FIQ_STATUS (cont.)

Bits	Name	Description
19	BT_ACTIVE_FIQ_STATUS	bt active interrupt status.
18	MTU_TIMER5_STATUS	When set, mtu timer5/tsf_timer5 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
17	ADU_FIQ_STATUS	adu interrupt status.
16	MTU_TIMER4_STATUS	When set, mtu timer4/tsf_timer4 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
15	RPE_FIQ_STATUS	rpe interrupt status.
13	COMBINED_FIQ_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt status. See combined_int related registers for detail
12	RXP_FIQ_STATUS	rxp beacon related interrupt status.
7	HOST_TO_ACPU_MB3_FIQ_STATUS	host to acpu MB3 interrupt status.
6	HOST_TO_ACPU_MB2_FIQ_STATUS	host to acpu MB2 interrupt status.
5	HOST_TO_ACPU_MB1_FIQ_STATUS	host to acpu MB1 interrupt status.
4	HOST_TO_ACPU_MB0_FIQ_STATUS	host to acpu MB0 interrupt status.
3	MTU_FIQ_STATUS	combined mtu interrupt status. See mtu_int related registers for detail
2	SW_0_FIQ_STATUS	sw 0 interrupt status.
1	SCU_UART_FIQ_STATUS	uart interrupt status.
0	MTU_WD_1_FIQ_STATUS	mtu watchdog timer (warning) interrupt status.

0x0A080E40 WCSS_A_MCU_FIQ_MASKED_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the acpu fiq masked status

WCSS_A_MCU_FIQ_MASKED_STATUS

Bits	Name	Description
31	SW_1_FIQ_MASKED_STATUS	sw 1 interrupt masked status.
30	RXP_ERR_FIQ_MASKED_STATUS	rxp error interrupt masked status.

WCSS_A_MCU_FIQ_MASKED_STATUS (cont.)

Bits	Name	Description
29	QTA_FIQ_MASKED_STATUS	qta interrupt masked status.
28	MTU_TIMER7_MASKED_STATUS	When set, mtu timer7/tsf_timer7 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
27	MTU_TIMER6_MASKED_STATUS	When set, mtu timer6/tsf_timer6 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
26	PHY_HIF_FIQ_MASKED_STATUS	phy hif interrupt masked status.
25	WQ_DATA_AVAIL_FIQ_MASKED_STATUS	wq dataavailable interrupt masked status.
24	PHY_FIQ_IRQ_MASKED_STATUS	phy irq interrupt masked status.
23	PHY_FIQ_FIQ_MASKED_STATUS	phy fiq interrupt masked status.
22	TPE_FIQ_MASKED_STATUS	tpe_mcu_int interrupt masked status.
21	MIF_FIQ_MASKED_STATUS	mif interrupt masked status.
20	BT_INACTIVE_FIQ_MASKED_STATUS	bt inactive interrupt masked status.
19	BT_ACTIVE_FIQ_MASKED_STATUS	bt active interrupt masked status.
18	MTU_TIMER5_MASKED_STATUS	When set, mtu timer5/tsf_timer5 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
17	ADU_FIQ_MASKED_STATUS	adu interrupt masked status.
16	MTU_TIMER4_MASKED_STATUS	When set, mtu timer4/tsf_timer4 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
15	RPE_FIQ_MASKED_STATUS	rpe interrupt masked status.
13	COMBINED_FIQ_MASKED_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt masked status. See combined_int related registers for detail
12	RXP_FIQ_MASKED_STATUS	rxp beacon related interrupt masked status.
11	DXE_MXU_CHAIN_2_FIQ_MASKED_STATUS	dx channel 2 interrupt masked status.
10	DXE_MXU_CHAIN_1_FIQ_MASKED_STATUS	dx channel 1 interrupt masked status.
9	DXE_MXU_CHAIN_0_FIQ_MASKED_STATUS	dx channel 0 interrupt masked status.
8	PMU_PWR_UP_FIQ_MASKED_STATUS	pmu_pwr_up interrupt masked status.

WCSS_A_MCU_FIQ_MASKED_STATUS (cont.)

Bits	Name	Description
7	HOST_TO_ACPU_MB3_FIQ_MASKED_STATUS	host to acpu MB3 interrupt masked status.
6	HOST_TO_ACPU_MB2_FIQ_MASKED_STATUS	host to acpu MB2 interrupt masked status.
5	HOST_TO_ACPU_MB1_FIQ_MASKED_STATUS	host to acpu MB1 interrupt masked status.
4	HOST_TO_ACPU_MB0_FIQ_MASKED_STATUS	host to acpu MB0 interrupt masked status.
3	MTU_FIQ_MASKED_STATUS	combined mtu interrupt masked status. See mtu_int related registers for detail
2	SW_0_FIQ_MASKED_STATUS	sw 0 interrupt masked status.
1	SCU_UART_FIQ_MASKED_STATUS	uart interrupt masked status.
0	MTU_WD_1_FIQ_MASKED_STATUS	mtu watchdog timer (warning) interrupt masked status.

0x0A080E44 WCSS_A_MCU_FIQ_CLEAR**Type:** W**Reset State:** 0x00000000

This register contains the acpu fiq clear signals

WCSS_A_MCU_FIQ_CLEAR

Bits	Name	Description
31	SW_1_FIQ_CLEAR	When set, sw 1 interrupt is cleared.
30	RXP_ERR_FIQ_CLEAR	When set, rxp error interrupt is cleared.
29	QTA_FIQ_CLEAR	When set, qta interrupt is cleared.
28	MTU_TIMER7_CLEAR	When set, mtu timer7/tsf_timer7 interrupt is cleared
27	MTU_TIMER6_CLEAR	When set, mtu timer6/tsf_timer6 interrupt is cleared
26	PHY_HIF_FIQ_CLEAR	When set, phy hif interrupt is cleared.
25	WQ_DATA_AVAIL_FIQ_CLEAR	When set, wq dataavailable interrupt is cleared.
24	PHY_FIQ_IRQ_CLEAR	When set, phy irq interrupt is cleared.
23	PHY_FIQ_FIQ_CLEAR	When set, phy fiq interrupt is cleared.
22	TPE_FIQ_CLEAR	When set, tpe_mcu_int interrupt is cleared.

WCSS_A_MCU_FIQ_CLEAR (cont.)

Bits	Name	Description
21	MIF_FIQ_CLEAR	When set, mif interrupt is cleared.
20	BT_INACTIVE_FIQ_CLEAR	When set, bt inactive interrupt is cleared.
19	BT_ACTIVE_FIQ_CLEAR	When set, bt active interrupt is cleared.
18	MTU_TIMER5_CLEAR	When set, mtu timer5/tsf_timer5 interrupt is cleared
17	ADU_FIQ_CLEAR	When set, adu interrupt is cleared.
16	MTU_TIMER4_CLEAR	When set, mtu timer4/tsf_timer4 interrupt is cleared
15	RPE_FIQ_CLEAR	When set, rpe interrupt is cleared.
13	COMBINED_FIQ_CLEAR	When set, the combined txp/dpu/dbt/ahb2phy interrupt is cleared. See combined_int related registers for detail
12	RXP_FIQ_CLEAR	When set, rxp beacon related interrupt is cleared.
7	HOST_TO_ACPU_MB3_FIQ_CLEAR	When set, host to acpu MB3 interrupt is cleared.
6	HOST_TO_ACPU_MB2_FIQ_CLEAR	When set, host to acpu MB2 interrupt is cleared.
5	HOST_TO_ACPU_MB1_FIQ_CLEAR	When set, host to acpu MB1 interrupt is cleared.
4	HOST_TO_ACPU_MB0_FIQ_CLEAR	When set, host to acpu MB0 interrupt is cleared.
3	MTU_FIQ_CLEAR	When set, combined mtu interrupt is cleared. See mtu_int related registers for detail
2	SW_0_FIQ_CLEAR	When set, sw 0 interrupt is cleared.
1	SCU_UART_FIQ_CLEAR	When set, uart interrupt is cleared.
0	MTU_WD_1_FIQ_CLEAR	When set, mtu watchdog timer (warning) interrupt is cleared.

0x0A080E84 WCSS_A_MCU_BMU_WQ_INT_CLEAR**Type:** W**Reset State:** 0x00000000

This register contains the bmu wq dataavailable interrupt clear signals

WCSS_A_MCU_BMU_WQ_INT_CLEAR

Bits	Name	Description
24:2	BMU_WQ_INT_CLEAR	BMU WQ 2-24 dataavailable

0x0A080E98 WCSS_A_MCU_SW_INT_0**Type:** RW**Reset State:** 0x00000000

This register contains the sw interrupt signals

WCSS_A_MCU_SW_INT_0

Bits	Name	Description
0	COMBINED_INT_EN	SW generated interrupt

0x0A080E9C WCSS_A_MCU_SW_INT_1**Type:** RW**Reset State:** 0x00000000

This register contains the sw interrupt signals

WCSS_A_MCU_SW_INT_1

Bits	Name	Description
0	COMBINED_INT_EN	SW generated interrupt1

0x0A080EA0 WCSS_A_MCU_MCU_HOST_INT_EN**Type:** RW**Reset State:** 0x00000000

This register contains the mcu_host interrupt enable signals

WCSS_A_MCU_MCU_HOST_INT_EN

Bits	Name	Description
11	RESERVE	This bit is reserved.
10	ADU_ERR_WQ_DA_AVAIL_EN	When set, adu_err_wq_da_avail interrupt is enabled
9	DPU_ERR_WQ_DA_AVAIL_EN	When set, dpu_err_wq_da_avail interrupt is enabled
8	MTU_TIMER3_EN	When set, mtu timer3/tsf_timer3 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
7	MTU_TIMER2_EN	When set, mtu timer2/tsf_timer2 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
6	MB3_EN	When set, mb3 interrupt is enabled
5	MB2_EN	When set, mb2 interrupt is enabled
4	MB1_EN	When set, mb1 interrupt is enabled
3	MB0_EN	When set, mb0 interrupt is enabled
2	DPU_MIC_ERROR_EN	When set, dpu mic error interrupt is enabled
1	MTU_WATCHDOG_EN	When set, mtu watchdog interrupt is enabled

0x0A080EA4 WCSS_A_MCU_MCU_HOST_INT_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the mcu_host interrupt raw status signals

WCSS_A_MCU_MCU_HOST_INT_STATUS

Bits	Name	Description
11	RESERVE	This bit is reserve
10	ADU_ERR_WQ_DA_AVAIL_STATUS	adu_err_wq_da_avail status
9	DPU_ERR_WQ_DA_AVAIL_STATUS	dpu_err_wq_da_avail status

WCSS_A_MCU_MCU_HOST_INT_STATUS (cont.)

Bits	Name	Description
8	MTU_TIMER3_STATUS	mtu timer3/tsf_timer3 status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
7	MTU_TIMER2_STATUS	mtu timer2/tsf_timer2 status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
6	MB3_STATUS	mb3 status
5	MB2_STATUS	mb2 status
4	MB1_STATUS	mb1 status
3	MB0_STATUS	mb0 status
2	DPU_MIC_ERROR_STATUS	dpu mic error status
1	MTU_WATCHDOG_STATUS	mtu watchdog status

0x0A080EA8 WCSS_A_MCU_MCU_HOST_INT_MASKED_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the mcu_host interrupt masked status signals

WCSS_A_MCU_MCU_HOST_INT_MASKED_STATUS

Bits	Name	Description
11	RESERVE	This bit is reserve
10	ADU_ERR_WQ_DA_AVAIL_MASK_STATUS	adu_err_wq_da_avail masked status
9	DPU_ERR_WQ_DA_AVAIL_MASK_STATUS	dpu_err_wq_da_avail masked status
8	MTU_TIMER3_MASK_STAT US	mtu timer2/tsf_timer2 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
7	MTU_TIMER2_MASK_STAT US	mtu timer2/tsf_timer2 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
6	MB3_MASK_STATUS	mb3 masked status
5	MB2_MASK_STATUS	mb2 masked status

1	MTU_WATCHDOG_MASK_ STATUS	mtu watchdog masked status

0x0A080EAC WCSS_A_MCU_MCU_HOST_INT_CLEAR**Type:** W**Reset State:** 0x00000000

This register contains the mcu_host interrupt clear signals

WCSS_A_MCU_MCU_HOST_INT_CLEAR

Bits	Name	Description
11	RESERVE	This bit is reserve for future usage
10	ADU_ERR_WQ_DA_AVAIL_CLEAR	When set, clear adu_err_wq_da_avail interrupt
9	DPU_ERR_WQ_DA_AVAIL_CLEAR	When set, clear dpu_err_wq_da_avail interrupt
8	MTU_TIMER3_CLEAR	When set, clear mtu timer3/tsf_timer3 interrupt
7	MTU_TIMER2_CLEAR	When set, clear mtu timer2/tsf_timer2 interrupt
6	MB3_CLEAR	When set, clear mb3 interrupt
5	MB2_CLEAR	When set, clear mb2 interrupt
4	MB1_CLEAR	When set, clear mb1 interrupt
3	MB0_CLEAR	When set, clear mb0 interrupt
2	DPU_MIC_ERROR_CLEAR	When set, clear dpu mic error interrupt
1	MTU_WATCHDOG_CLEAR	When set, clear mtu watchdog interrupt

0x0A080EB0 WCSS_A_MCU_MCU_PMU_INFO**Type:** RW**Reset State:** 0x00000000

This register contains the RF register reinitialization is done information

WCSS_A_MCU_MCU_PMU_INFO

Bits	Name	Description
0	MCU_PMU_RF_REINIT_DONE	SW writes to this register to tell pmu that RF reg reinit is done.

0x0A080EB4 WCSS_A_MCU_MCU_WMAC_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the wmac modules status

WCSS_A_MCU_MCU_WMAC_STATUS

Bits	Name	Description
11	CSU_MCU_STATUS	When set, csu is busy.
10	ACPU_MCU_STATUS	When set, acpu is busy.
9	SIF_MCU_STATUS	When set, sif is busy.
8	BTQM_MCU_STATUS	When set, btqm queue is not empty.
7	BMU_MCU_STATUS	When set, bmu wq is not empty.
6	TPE_MCU_STATUS	When set, tpe is busy.
5	TXP_MCU_STATUS	When set, txp is busy.
4	DXE_MCU_STATUS	When set, dxe is busy.
3	ADU_MCU_STATUS	When set, adu is busy.
2	DPU_MCU_STATUS	When set, dpu is busy.
1	RPE_MCU_STATUS	When set, rpe is busy.
0	RXP_MCU_STATUS	When set, rxp is busy.

0x0A080EB8 WCSS_A_MCU_MAC_HOST_INT_EN

Type: RW

Reset State: 0x00000000

This register contains the mac to host interrupt enable signals. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

WCSS_A_MCU_MAC_HOST_INT_EN

Bits	Name	Description
31	SW_1_INT_EN	When set, sw 1 interrupt is enabled.
30	RXP_ERR_INT_EN	When set, rxp error interrupt is enabled.
29	QTA_INT_EN	When set, qta interrupt is enabled.
28	MTU_TIMER7_EN	When set, mtu timer7/tsf_timer7 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
27	MTU_TIMER6_EN	When set, mtu timer6/tsf_timer6 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
26	PHY_HIF_INT_EN	When set, phy hif interrupt is enabled.
25	WQ_DATA_AVAIL_INT_EN	When set, wq dataavailable interrupt is enabled.
24	PHY_IRQ_INT_EN	When set, phy irq interrupt is enabled.

WCSS_A_MCU_MAC_HOST_INT_EN (cont.)

Bits	Name	Description
23	PHY_FIQ_INT_EN	When set, phy fiq interrupt is enabled.
22	TPE_INT_EN	When set, tpe_mcu_int interrupt is enabled.
21	MIF_INT_EN	When set, mif interrupt is enabled.
20	BT_INACTIVE_INT_EN	When set, bt_inactive interrupt is enabled.
19	BT_ACTIVE_INT_EN	When set, bt active interrupt is enabled.
18	MTU_TIMER5_EN	When set, mtu timer5/tsf_timer5 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
17	ADU_INT_EN	When set, adu interrupt is enabled.
16	MTU_TIMER4_EN	When set, mtu timer4/tsf_timer4 interrupt is enabled. See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
15	RPE_INT_EN	When set, rpe interrupt is enabled.
13	COMBINED_INT_EN	When set, the combined txp/dpu/dbt/ahb2phy interrupt is enabled. See combined_int related registers for detail
12	RXP_INT_EN	When set, rxp beacon related interrupt is enabled.
7	ACPU_TO_HOST_MB3_INT_EN	When set, acpu to host MB3 interrupt is enabled.
6	ACPU_TO_HOST_MB2_INT_EN	When set, acpu to host MB2 interrupt is enabled.
5	ACPU_TO_HOST_MB1_INT_EN	When set, acpu to host MB1 interrupt is enabled.
4	ACPU_TO_HOST_MB0_INT_EN	When set, acpu to host MB0 interrupt is enabled.
3	MTU_INT_EN	When set, combined mtu interrupt is enabled. See mtu_int related registers for detail
2	SW_0_INT_EN	When set, sw 0 interrupt is enabled.
1	SCU_UART_INT_EN	When set, uart interrupt is enabled.
0	MTU_WD_1_INT_EN	When set, mtu watchdog timer (warning) interrupt is enabled.

0x0A080EBC WCSS_A_MCU_MAC_HOST_INT_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the mac to host interrupt raw status signals. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

WCSS_A_MCU_MAC_HOST_INT_STATUS

Bits	Name	Description
31	SW_1_INT_STATUS	sw 1 interrupt status.
30	RXP_ERR_INT_STATUS	rxp error interrupt status.
29	QTA_INT_STATUS	qta interrupt status
28	MTU_TIMER7_STATUS	When set, mtu timer7/tsf_timer7 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
27	MTU_TIMER6_STATUS	When set, mtu timer6/tsf_timer6 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
26	PHY_HIF_INT_STATUS	phy hif interrupt status.
25	WQ_DATA_AVAIL_INT_STATUS	wq dataavailable interrupt status.
24	PHY_IRQ_INT_STATUS	phy irq interrupt status.
23	PHY_FIQ_INT_STATUS	phy fiq interrupt status.
22	TPE_INT_STATUS	tpe_mcu_int interrupt status.
21	MIF_INT_STATUS	mif interrupt status.
20	BT_INACTIVE_INT_STATUS	bt inactive interrupt status.
19	BT_ACTIVE_INT_STATUS	bt active interrupt status.
18	MTU_TIMER5_STATUS	When set, mtu timer5/tsf_timer5 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
17	ADU_INT_STATUS	adu interrupt status.
16	MTU_TIMER4_STATUS	When set, mtu timer4/tsf_timer4 interrupt status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection
15	RPE_INT_STATUS	rpe interrupt status.
13	COMBINED_INT_STATUS	the combined txp/dpu/dbr/ahb2phy interrupt status. See combined_int related registers for detail
12	RXP_INT_STATUS	rxp beacon related interrupt status.
7	ACPU_TO_HOST_MB3_INT_STATUS	acpu to host MB3 interrupt status.
6	ACPU_TO_HOST_MB2_INT_STATUS	acpu to host MB2 interrupt status.
5	ACPU_TO_HOST_MB1_INT_STATUS	acpu to host MB1 interrupt status.
4	ACPU_TO_HOST_MB0_INT_STATUS	acpu to host MB0 interrupt status.
3	MTU_INT_STATUS	combined mtu interrupt status. See mtu_int related registers for detail
2	SW_0_INT_STATUS	sw 0 interrupt status.

WCSS_A_MCU_MAC_HOST_INT_STATUS (cont.)

Bits	Name	Description
1	SCU_UART_INT_STATUS	uart interrupt status.
0	MTU_WD_1_INT_STATUS	mtu watchdog timer (warning) interrupt status.

0x0A080EC0 WCSS_A_MCU_MAC_HOST_INT_MASKED_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the mac to host interrupt masked status. The bit order is the same as those in the IRQ/FIQ register which are used by acpu, this is dedicated for host.

WCSS_A_MCU_MAC_HOST_INT_MASKED_STATUS

Bits	Name	Description
31	SW_1_INT_MASKED_STATUS	sw 1 interrupt masked status.
30	RXP_ERR_INT_MASKED_STATUS	rxp error interrupt masked status.
29	QTA_INT_MASKED_STATUS	qta interrupt masked status
28	MTU_TIMER7_MASKED_STATUS	When set, mtu timer7/tsf_timer7 masked status See register 'MTU_TIMER_INTERRUPT_SOURCE' for timer selection

21	BTC_PATTERN_DET_INT_P_HOSTINT_MASK_STATUS	btc_pattern_det_int_p interrupt masked status
20	BTC_SCO_INT_P_HOSTINT_MASK_STATUS	btc_sco_int_p interrupt masked status
19	TPE_MCU_WRONG_SSN_OR_TID_ERROR_P_HOSTINT_MASK_STATUS	tpe_mcu_wrong_ssn_or_tid_error_p interrupt masked status

WCSS_A_MCU_COMBINED_HOST_INT_MASKED_STATUS (cont.)

Bits	Name	Description
18	TPE_MCU_BD_BASED_TX_INT_1_P_HOSTINT_MASK_STATUS	tpe_mcu_bd_based_tx_int_1_p interrupt masked status
17	TPE_MCU_BD_BASED_TX_INT_0_P_HOSTINT_MASK_STATUS	tpe_mcu_bd_based_tx_int_0_p interrupt masked status
16	TPE_MCU_ERROR_VAILD_P_HOSTINT_MASK_STATUS	tpe_mcu_error_vaild_p interrupt masked status
15	TPE_MCU_GOT_ACK_FOR_BACK_P_HOSTINT_MASK_STATUS	tpe_mcu_got_ack_for_back_p interrupt masked status
14	BMU_MCU_PWRSTATE_DROP_INT_STATUS	bmu_mcu_pwrstate_drop_interrupt masked status
13	BMU_MCU_PWRSTATE_CHANGE_INT_STATUS	bmu_mcu_pwrstate_change_interrupt masked status
12	BMU_MCU_BTQM_QUEUE_EMPTY_INTERRUPT_HOSTINT_MASK_STATUS	bmu_mcu_btqm_queues_empty_interrupt interrupt masked status
11	BMU_MCU_ERR_INT_HOSTINT_MASK_STATUS	bmu_mcu_err_int interrupt masked status
10	AHB2PHY_MCU_TIMEOUT_ERROR2_HOSTINT_MASK_STATUS	ahb2phy_mcu_timeout_error2 interrupt masked status
9	AHB2PHY_MCU_TIMEOUT_ERROR1_HOSTINT_MASK_STATUS	ahb2phy_mcu_timeout_error1 interrupt masked status
8	DBR_MCU_GAM_ERR_HOSTINT_MASK_STATUS	dbr_mcu_gam_err interrupt masked status
7	DBR_MCU_INCORRECT_LENGTH_ERR_HOSTINT_MASK_STATUS	dbr_mcu_incorrect_length_err interrupt masked status
6	DPU_MCU_MICERR_P_HOSTINT_MASK_STATUS	dpu_mcu_micerr_p interrupt masked status
5	DPU_MCU_ERRINTR_P_HOSTINT_MASK_STATUS	dpu_mcu_errintr_p interrupt masked status
4	BMU_MCU_QUEUE_USAGE_THRESHOLD_INTERRUPT_STATUS	bmu_mcu_queue_usage_threshold_interrupt interrupt status
3	ACPU_MCU_MIF_TIMEOUT_INT_P_HOSTINT_MASK_STATUS	acpu_mcu_mif_timeout_int_p interrupt masked status

WCSS_A_MCU_COMBINED_HOST_INT_MASKED_STATUS (cont.)

Bits	Name	Description
2	ACPU_MCU_AHB_ERR_INT_P_HOSTINT_MASK_STATUS	acpu_mcu_ahb_err_int_p interrupt masked status
1	TXP_MCU_TXP_TIMEOUT_INT_P_HOSTINT_MASK_STATUS	txp_mcu_txp_timeout_int_p interrupt masked status
0	TXP_MCU_ERR_INT_HOST_INT_MASK_STATUS	txp_mcu_err_int interrupt masked status

0x0A080ED8 WCSS_A_MCU_BMU_WQ_HOST_INT_EN**Type:** RW**Reset State:** 0x00000000

This register contains the bmu wq dataavailable interrupt enable signals

WCSS_A_MCU_BMU_WQ_HOST_INT_EN

Bits	Name	Description
24:2	BMU_WQ_HOST_INT_EN	BMU WQ 2-24 data available

0x0A080EDC WCSS_A_MCU_BMU_WQ_HOST_INT_MASKED_STATUS**Type:** R**Reset State:** 0x00000000

This register contains the bmu wq dataavailable interrupt masked status signals

WCSS_A_MCU_BMU_WQ_HOST_INT_MASKED_STATUS

Bits	Name	Description
24:2	BMU_WQ_HOST_INT_MASKED_STATUS	BMU WQ 2-24 data available

0x0A080EE0 WCSS_A_MCU_MTU_TIMER_INTERRUPT_SOURCE**Type:** RW**Reset State:** 0x00000000

This register controls which interrupt, TSF based or timer based, interrupt from MTU is selected

WCSS_A_MCU_MTU_TIMER_INTERRUPT_SOURCE

Bits	Name	Description
7	TSF_TIMER7_INT_SELECT	When set, in all interrupt related registers indicating mtu timer7/tsf_timer7 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 7
6	TSF_TIMER6_INT_SELECT	When set, in all interrupt related registers indicating mtu timer6/tsf_timer6 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 6
5	TSF_TIMER5_INT_SELECT	When set, in all interrupt related registers indicating mtu timer5/tsf_timer5 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 5
4	TSF_TIMER4_INT_SELECT	When set, in all interrupt related registers indicating mtu timer4/tsf_timer4 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 4
3	TSF_TIMER3_INT_SELECT	When set, in all interrupt related registers indicating mtu timer3/tsf_timer3 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 3
2	TSF_TIMER2_INT_SELECT	When set, in all interrupt related registers indicating mtu timer2/tsf_timer2 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 2
1	TSF_TIMER1_INT_SELECT	When set, in all interrupt related registers indicating mtu timer1/tsf_timer1 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 1
0	TSF_TIMER0_INT_SELECT	When set, in all interrupt related registers indicating mtu timer0/tsf_timer0 interrupt, the interrupt source is set to TSF. When NOT set, the interrupt source is set to mtu timer 0

0x0A080F00 WCSS_A_MCU_BTC_CTRL4**Type:** RW**Reset State:** 0x00000000

This register is to setup the pta.

WCSS_A_MCU_BTC_CTRL4

Bits	Name	Description
15:0	SCO_INTERRUPT_OFFSET	The btc_sco_int will be trigger when the sco period counter matches the value When MSB is '1', the interrupt is to be triggered the programmed time after the bt_active assertion When MSB is '0', the interrupt is to be triggered the programmed time before the bt_active assertion

0x0A080F04 WCSS_A_MCU_BTC_PATTERN_DET1**Type:** RW**Reset State:** 0x00000000

This register contains the info for pattern detection

WCSS_A_MCU_BTC_PATTERN_DET1

Bits	Name	Description
15:0	DATA	The mask bits for pattern detection. The LSB should be 1.

0x0A080F08 WCSS_A_MCU_BTC_PATTERN_DET2**Type:** RW**Reset State:** 0x00000000

This register contains the set up for pattern detection

WCSS_A_MCU_BTC_PATTERN_DET2

Bits	Name	Description
31:16	BT_PRIORITY_PATTERN_DET	The bt_priority pattern for pattern detection
15:0	BT_ACTIVE_PATTERN_DET	The bt_active pattern for pattern detection

0x0A080F0C WCSS_A_MCU_BTC_PATTERN_HISTORY**Type:** R**Reset State:** 0x00000000

This register contains the history of bt_active and bt_priority

WCSS_A_MCU_BTC_PATTERN_HISTORY

Bits	Name	Description
31:16	BT_PRIORITY_HISTORY	The bt_priority history
15:0	BT_ACTIVE_HISTORY	The bt_active history

0x0A080F10 WCSS_A_MCU_BTC_HI_GRANT**Type:** RW**Reset State:** 0x00000000

This register countans the stats of bt high priority grant

WCSS_A_MCU_BTC_HI_GRANT

Bits	Name	Description
31:20	BT_HI_PRI_GRANT_CNT	BT high priority grant counts
19:0	BT_HI_PRI_GRANT_TIME	BT high priority grant time in microsecond

0x0A080F14 WCSS_A_MCU_BTC_LOW_GRANT**Type:** RW**Reset State:** 0x00000000

This register contains the stats of bt log priority grant

WCSS_A_MCU_BTC_LOW_GRANT

Bits	Name	Description
31:20	BT_LOW_PRI_GRANT_CNT	BT low priority grant counts
19:0	BT_LOW_PRI_GRANT_TIME	BT low priority grant time in microsecond

0x0A080F18 WCSS_A_MCU_BTC_REQ_CNT**Type:** RW**Reset State:** 0x00000000

This register is to setup the pta.

WCSS_A_MCU_BTC_REQ_CNT

Bits	Name	Description
23:12	BT_LO_PRI_REQ_CNT	BT low priority requests.
11:0	BT_HI_PRI_REQ_CNT	BT high priority requests.

0x0A080F1C WCSS_A_MCU_MRCM_CLK_GATE_DISABLE**Type:** RW**Reset State:** 0x00003883

This register controls the dynamic clock gating of the wmac modules in mrcm

WCSS_A_MCU_MRCM_CLK_GATE_DISABLE

Bits	Name	Description
14	MCU_MRCM_CSU_GCU_CLK_GATE_DISABLE	When set, disable csu dynamic clock gating
13	MCU_MRCM_FDAH_B_GCU_CLK_GATE_DISABLE	When set, disable fdahb dynamic clock gating
12	MCU_MRCM_FDBR_GCU_CLK_GATE_DISABLE	When set, disable fdbr dynamic clock gating
11	MCU_MRCM_CBR_GCU_CLK_GATE_DISABLE	When set, disable cbr dynamic clock gating
10	MCU_MRCM_TXP_GCU_CLK_GATE_DISABLE	When set, disable txp dynamic clock gating
9	MCU_MRCM_CFG_GCU_CLK_GATE_DISABLE	When set, disable cfg dynamic clock gating
8	MCU_MRCM_RXP_GCU_CLK_GATE_DISABLE	When set, disable rxp dynamic clock gating
7	MCU_MRCM_DBR_GCU_CLK_GATE_DISABLE	When set, disable dbr dynamic clock gating
6	MCU_MRCM_BMU_GCU_CLK_GATE_DISABLE	When set, disable bmu dynamic clock gating
5	MCU_MRCM_DPU_GCU_CLK_GATE_DISABLE	When set, disable dpu dynamic clock gating
4	MCU_MRCM_ADU_GCU_CLK_GATE_DISABLE	When set, disable adu dynamic clock gating
3	MCU_MRCM_TPE_GCU_CLK_GATE_DISABLE	When set, disable tpe dynamic clock gating
2	MCU_MRCM_RPE_GCU_CLK_GATE_DISABLE	When set, disable rpe dynamic clock gating
1	MCU_MRCM_CAHB_GCU_CLK_GATE_DISABLE	When set, disable cahb dynamic clock gating
0	MCU_MRCM_DAHB_GCU_CLK_GATE_DISABLE	When set, disable dahb dynamic clock gating

0x0A080F20 WCSS_A_MCU_TXP_BUSY_CNT**Type:** RW**Reset State:** 0x00000000

This register controls the counter counting on the time when txp is busy

WCSS_A_MCU_TXP_BUSY_CNT

Bits	Name	Description
23:0	TXP_BUSY_CNT	The time (in unit of us) when txp is busy

0x0A080F24 WCSS_A_MCU_WLAN_BRIDGE_CTRL**Type:** RW**Reset State:** 0x00000000

This register contains the control signal to the wlan bridges

WCSS_A_MCU_WLAN_BRIDGE_CTRL

Bits	Name	Description
23:20	MCU_FDBR_CDAHB2FDAHB_TBUS_SEL	The testbus control signal for fdbr cdahb2fdahb
19:16	MCU_FDBR_FDAHB2CDAHB_TBUS_SEL	The testbus control signal for fdbr fdahb2cdahb
15:12	MCU_DBR_CDAHB2DAHB_TBUS_SEL	The testbus control signal for dbr dahb2cdahb
11:8	MCU_DBR_DAHB2CDAHB_TBUS_SEL	The testbus control signal for dbr dahb2cdahb
7:4	MCU_CBR_CCAHB2CAHB_TBUS_SEL	The testbus control signal for cbr ccahb2cahb
3:0	MCU_CBR_CAHB2CCAHB_TBUS_SEL	The testbus control signal for cbr cahb2ccahb

0x0A080F30 WCSS_A_MCU_BD_PDU_BASE_ADDR_LOCAL**Type:** RW**Reset State:** 0x00000000

Sets the memory base address of the BDs and PDUs in the local memory.

WCSS_A_MCU_BD_PDU_BASE_ADDR_LOCAL

Bits	Name	Description
31:7	BD_PDU_BASE_ADDRESS	Base address of the BDs and PDUs in the local memory. Note that the lowest 8 bits can not be programmed as these bits will always have to be zero. BDs and PDUs are in units of 128 bytes.

0x0A080F34 WCSS_A_MCU_CMEM_BDINDEX_THRESHOLD**Type:** RW**Reset State:** 0x00000000

The bd/pdu threshold in local memory.

WCSS_A_MCU_CMEM_BDINDEX_THRESHOLD

Bits	Name	Description
15:0	CMEM_BDINDEX_THRESH OLD	If the bd/pdu index is less than this value, the pkt is in local memory.

0x0A080F38 WCSS_A_MCU_CSU_CONFIGURATION**Type:** RW**Reset State:** 0x00000000

This register configures the CSU module operations.

WCSS_A_MCU_CSU_CONFIGURATION

Bits	Name	Description
31:28	MCU_CSU_SPARE	CSU spare configuration register.
27:24	RESERVED	reserved
23	MCU_CSU_RX_PRIORITY_SEL	Enable higher priority for serving RX bmu_csu_rx_wq_da.
22	MCU_CSU_RX_COUNTER_CLEAR	Enable RX UDP Checksum logic.
21	MCU_CSU_RX_EN	Enable RX UDP Checksum logic.
18	MCU_CSU_RX_ERROR_EX IT	Enable RX UDP Checksum logic.
17	MCU_CSU_RX_UDP_CHEC KSUM_VALIDATE_EN	Enable RX UDP Checksum logic.
16	MCU_CSU_RX_TCP_CHEC KSUM_VALIDATE_EN	Enable RX TCP Checksum logic.

WCSS_A_MCU_CSU_CONFIGURATION (cont.)

Bits	Name	Description
15	MCU_CSU_RX_IP_CHECKSUM_VALIDATE_EN	Enable RX IP Checksum logic.
14	MCU_CSU_RX_MODULE_EN	Enable CSU RX module
13	MCU_CSU_TX_COUNTER_CLEAR	Enable clearing of all status counters.
12	MCU_CSU_TX_EN	Enable TX FSM logic.
9	MCU_CSU_TX_ERROR_EXIT	Enable exiting of CSU TX Error FSM logic.
8	MCU_CSU_TX_UDP_CHECKSUM_GEN_EN	Enable CSU TX UDP Checksum logic.
7	MCU_CSU_TX_TCP_CHECKSUM_GEN_EN	Enable CSU TX TCP Checksum logic.
6	MCU_CSU_TX_IP_CHECKSUM_GEN_EN	Enable CSU TX IP Checksum logic.
5	MCU_CSU_TX_MODULE_EN	Enable CSU TX logic.
4	MCU_CSU_VLAN_ETHER_EN	Enables VLAN Tag EtherType processing
3	MCU_CSU_IPV6_ETHER_EN	Enables IPv6 EtherType processing
2	MCU_CSU_IPV4_ETHER_EN	Enables IPv4 EtherType processing

0x0A080F3C WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_0**Type:** RW**Reset State:** 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_0

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BITMAP_0	This register stores Next Header decoded values.

0x0A080F40 WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_1**Type:** RW**Reset State:** 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_1

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BITMAP_1	This register stores Next Header decoded values.

0x0A080F44 WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_2**Type:** RW**Reset State:** 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_2

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BITMAP_2	This register stores Next Header decoded values.

0x0A080F48 WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_3**Type:** RW**Reset State:** 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_3

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BITMAP_3	This register stores Next Header decoded values.

0x0A080F4C WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_4**Type:** RW**Reset State:** 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_4

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BIT MAP_4	This register stores Next Header decoded values.

0x0A080F50 WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_5

Type: RW

Reset State: 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_5

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BIT MAP_5	This register stores Next Header decoded values.

0x0A080F54 WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_6

Type: RW

Reset State: 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_6

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BIT MAP_6	This register stores Next Header decoded values.

0x0A080F58 WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_7

Type: RW

Reset State: 0x00000000

This register allows software to define Next Header for IPv6

WCSS_A_MCU_MCU_CSU_NEXTHDR_BITMAP_7

Bits	Name	Description
31:0	MCU_CSU_NEXTHDR_BITMAP_7	This register stores Next Header decoded values.

0x0A080F5C WCSS_A_MCU_MCU_CSU_TX_WORK_QUEUES**Type:** RW**Reset State:** 0x00150006

This register contains CSU work queues

WCSS_A_MCU_MCU_CSU_TX_WORK_QUEUES

Bits	Name	Description
23:16	MCU_CSU_TX_POP_WQ_INDEX	CSU TX Pop Work Queue Index
15:8	MCU_CSU_TX_ERROR_WQ	CSU TX Error Push Work Queue Index
7:0	MCU_CSU_TX_PUSH_WQ	CSU TX Push Work Queue Index

0x0A080F6C WCSS_A_MCU_MCU_CSU_RX_WORK_QUEUES**Type:** RW**Reset State:** 0x0416000B

This register contains CSU work queues

WCSS_A_MCU_MCU_CSU_RX_WORK_QUEUES

Bits	Name	Description
31:24	MCU_CSU_RX_HPR_PUSH_WQ	CSU RX High Priority Push Work Queue
23:16	MCU_CSU_RX_POP_WQ_INDEX	CSU RX Pop Work Queue Index
15:8	MCU_CSU_RX_ERROR_WQ	CSU RX Error Push Work Queue Index
7:0	MCU_CSU_RX_PUSH_WQ	CSU RX Push Work Queue Index

0x0A080F7C WCSS_A_MCU_MCU_CSU_INTERRUPT**Type:** RW**Reset State:** 0x00000000

This register allows software to see number of error conditions

WCSS_A_MCU_MCU_CSU_INTERRUPT

Bits	Name	Type	Description
15:8	CSU_MCU_INT_STATUS	R	This register records the causes of interrupts.
7:0	MCU_CSU_INT_MASK	RW	This register is used to program interrupt masks.

0x0A080F80 WCSS_A_MCU_MCU_CBR_CCAHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

This register records the error beat address in either a read or write transaction on CCAHB when CBR detects CCAHB slave error response.

WCSS_A_MCU_MCU_CBR_CCAHB_ERR_ADDR

Bits	Name	Description
31:0	ERROR_BEAT_ADDRESS	The address of a write or read beat that resulted in error response sent by CCAHB slave. This register will not be cleared when it is read.

0x0A080F84 WCSS_A_MCU_MCU_CBR_CAHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

This register records the error beat address in either a read or write transaction on CAHB when CBR detects CAHB slave error response.

WCSS_A_MCU_MCU_CBR_CAHB_ERR_ADDR

Bits	Name	Description
31:0	ERROR_BEAT_ADDRESS	The address of a write or read beat that resulted in error response sent by CAHB slave. This register will not be cleared when it is read.

0x0A080F88 WCSS_A_MCU_MCU_CBR_CCAHB_TIMEOUT_ADDR**Type:** R**Reset State:** 0x00000000

This register recorded the start address of a read or write transaction originated from CCAHB that encountered a suspend timeout.

WCSS_A_MCU_MCU_CBR_CCAHB_TIMEOUT_ADDR

Bits	Name	Description
31:0	START_ADDRESS	The start address of a write or read transaction originated from a CCAHB master that resulted in suspend timeout. This register will not be cleared when it is read.

0x0A080F8C WCSS_A_MCU_MCU_CBR_CAHB_TIMEOUT_ADDR**Type:** R**Reset State:** 0x00000000

This register recorded the start address of a read or write transaction originated from CAHB that encountered a suspend timeout.

WCSS_A_MCU_MCU_CBR_CAHB_TIMEOUT_ADDR

Bits	Name	Description
31:0	START_ADDRESS	The start address of a write or read transaction originated from a CAHB master that resulted in suspend timeout. This register will not be cleared when it is read.

0x0A080F90 WCSS_A_MCU_MCU_DBR_CDAHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

This register records the error beat address in either a read or write transaction on CDAHB when DBR detects CDAHB slave error response.

WCSS_A_MCU_MCU_DBR_CDAHB_ERR_ADDR

Bits	Name	Description
31:0	ERROR_BEAT_ADDRESS	The address of a write or read beat that resulted in error response sent by CDAHB slave. This register will not be cleared when it is read.

0x0A080F94 WCSS_A_MCU_MCU_DBR_DAHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

This register records the error beat address in either a read or write transaction on DAHB when DBR detects DAHB slave error response.

WCSS_A_MCU_MCU_DBR_DAHB_ERR_ADDR

Bits	Name	Description
31:0	ERROR_BEAT_ADDRESS	The address of a write or read beat that resulted in error response sent by DAHB slave. This register will not be cleared when it is read.

0x0A080F98 WCSS_A_MCU_MCU_DBR_CDAHBTIMEOUT_ADDR**Type:** R**Reset State:** 0x00000000

This register recorded the start address of a read or write transaction originated from CDAHBT that encountered a suspend timeout at DBR.

WCSS_A_MCU_MCU_DBR_CDAHBTIMEOUT_ADDR

Bits	Name	Description
31:0	START_ADDRESS	The start address of a write or read transaction originated from a CDAHBT master that resulted in suspend timeout. This register will not be cleared when it is read.

0x0A080F9C WCSS_A_MCU_MCU_DBR_DAHBTIMEOUT_ADDR**Type:** R**Reset State:** 0x00000000

This register recorded the start address of a read or write transaction originated from DAHB that encountered a suspend timeout at DBR.

WCSS_A_MCU_MCU_DBR_DAHBTIMEOUT_ADDR

Bits	Name	Description
31:0	START_ADDRESS	The start address of a write or read transaction originated from a DAHB master that resulted in suspend timeout. This register will not be cleared when it is read.

0x0A080FA0 WCSS_A_MCU_MCU_FDBR_CDAHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

This register records the error beat address in either a read or write transaction on CDAHB when FDBR detects CDAHB slave error response.

WCSS_A_MCU_MCU_FDBR_CDAHB_ERR_ADDR

Bits	Name	Description
31:0	ERROR_BEAT_ADDRESS	The address of a write or read beat that resulted in error response sent by CDAHB slave. This register will not be cleared when it is read.

0x0A080FA4 WCSS_A_MCU_MCU_FDBR_FDAHB_ERR_ADDR**Type:** R**Reset State:** 0x00000000

This register records the error beat address in either a read or write transaction on FDAHB when FDBR detects DAHB slave error response.

WCSS_A_MCU_MCU_FDBR_FDAHB_ERR_ADDR

Bits	Name	Description
31:0	ERROR_BEAT_ADDRESS	The address of a write or read beat that resulted in error response sent by FDAHB slave. This register will not be cleared when it is read.

0x0A080FA8 WCSS_A_MCU_MCU_FDBR_CDAHB_TIMEOUT_ADDR**Type:** R**Reset State:** 0x00000000

This register recorded the start address of a read or write transaction originated from CDAHB that encountered a suspend timeout at FDBR.

WCSS_A_MCU_MCU_FDBR_CDAHB_TIMEOUT_ADDR

Bits	Name	Description
31:0	START_ADDRESS	The start address of a write or read transaction originated from a CDAHB master that resulted in suspend timeout. This register will not be cleared when it is read.

0x0A080FAC WCSS_A_MCU_MCU_FDBR_FDAHB_TIMEOUT_ADDR**Type:** R**Reset State:** 0x00000000

This register recorded the start address of a read or write transaction originated from FDAHB that encountered a suspend timeout at FDBR.

WCSS_A_MCU_MCU_FDBR_FDAHB_TIMEOUT_ADDR

Bits	Name	Description
31:0	START_ADDRESS	The start address of a write or read transaction originated from a FDAHB master that resulted in suspend timeout. This register will not be cleared when it is read.

0x0A080FB0 WCSS_A_MCU_MCU_WLAN_BRIDGE_ERR_TIMEOUT_SRC**Type:** R**Reset State:** 0x00000000

This register records all CBR, DBR and FDBR AHB error pulses as well as read and write transactions suspend timeout pulses. When this register is read, its content will be cleared.

WCSS_A_MCU_MCU_WLAN_BRIDGE_ERR_TIMEOUT_SRC

Bits	Name	Description
23	FDBR_MCU_FDAHB_RD_TIMEOUT_P	FDBR FDAHB to CDAHB read transaction suspend timeout.
22	FDBR_MCU_FDAHB_WR_TIMEOUT_P	FDBR FDAHB to CDAHB write transaction suspend timeout.
21	FDBR_MCU_CDAHB_RD_TIMEOUT_P	FDBR CDAHB to FDAHB read transaction suspend timeout.
20	FDBR_MCU_CDAHB_WR_TIMEOUT_P	FDBR CDAHB to FDAHB write transaction suspend timeout.
19	FDBR_MCU_FDAHB_RD_AHB_ERR_P	FDBR detects FDAHB slave read transaction error response.
18	FDBR_MCU_FDAHB_WR_AHB_ERR_P	FDBR detects FDAHB slave write transaction error response.
17	FDBR_MCU_CDAHB_RD_AHB_ERR_P	FDBR detects CDAHB slave read transaction error response.
16	FDBR_MCU_CDAHB_WR_AHB_ERR_P	FDBR detects CDAHB slave write transaction error response.
15	DBR_MCU_DAHB_RD_TIMEOUT_P	DBR DAHB to CDAHB read transaction suspend timeout.

WCSS_A_MCU_MCU_WLAN_BRIDGE_ERR_TIMEOUT_SRC (cont.)

Bits	Name	Description
14	DBR_MCU_DAHB_WR_TIM EOUT_P	DBR DAHB to CDAHB write transaction suspend timeout.
13	DBR_MCU_CDAHB_RD_T IMEOUT_P	DBR CDAHB to DAHB read transaction suspend timeout.
12	DBR_MCU_CDAHB_WR_T IMEOUT_P	DBR CDAHB to DAHB write transaction suspend timeout.
11	DBR_MCU_DAHB_RD_A HB_ERR_P	DBR detects DAHB slave read transaction error response.
10	DBR_MCU_DAHB_WR_A HB_ERR_P	DBR detects DAHB slave write transaction error response.
9	DBR_MCU_CDAHB_RD_A HB_ERR_P	DBR detects CDAHB slave read transaction error response.
8	DBR_MCU_CDAHB_WR_A HB_ERR_P	DBR detects CDAHB slave write transaction error response.
7	CBR_MCU_CAHB_RD_T IMEOUT_P	CBR CAHB to CCAHB read transaction suspend timeout.
6	CBR_MCU_CAHB_WR_T IMEOUT_P	CBR CAHB to CCAHB write transaction suspend timeout.
5	CBR_MCU_CCAHB_RD_T IMEOUT_P	CBR CCAHB to CAHB read transaction suspend timeout.
4	CBR_MCU_CCAHB_WR_T IMEOUT_P	CBR CCAHB to CAHB write transaction suspend timeout.
3	CBR_MCU_CAHB_RD_A HB_ERR_P	CBR detects CAHB slave read transaction error response.
2	CBR_MCU_CAHB_WR_A HB_ERR_P	CBR detects CAHB slave write transaction error response.
1	CBR_MCU_CCAHB_RD_A HB_ERR_P	CBR detects CCAHB slave read transaction error response.
0	CBR_MCU_CCAHB_WR_A HB_ERR_P	CBR detects CCAHB slave write transaction error response.

10.42 WCSS_A_MPI_MPI**0x0A013400 WCSS_A_MPI_WATCHDOG_MAX_COMMAND1****Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in COMMAND1 state

WCSS_A_MPI_WATCHDOG_MAX_COMMAND1

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A013404 WCSS_A_MPI_WATCHDOG_MAX_COMMAND2**Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in COMMAND2 state

WCSS_A_MPI_WATCHDOG_MAX_COMMAND2

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A013408 WCSS_A_MPI_WATCHDOG_MAX_WAIT**Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in WAIT state

WCSS_A_MPI_WATCHDOG_MAX_WAIT

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A01340C WCSS_A_MPI_WATCHDOG_MAX_TRANSFER**Type:** RW**Reset State:** 0x0000

Allowed time between request or data_valid pulses in TRANSFER state

WCSS_A_MPI_WATCHDOG_MAX_TRANSFER

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A013410 WCSS_A_MPI_MAX_REQAORB**Type:** RW**Reset State:** 0x0000

Holds the maximum number of txa or txb requests per packet that should be allowed during transmit. Default value of 0 disables the reporting of max_request_exceeded violation

WCSS_A_MPI_MAX_REQAORB

Bits	Name	Description
15:0	VALUE	

0x0A013414 WCSS_A_MPI_COMMAND2_DELAY**Type:** RW**Reset State:** 0x026C

Delay between end of first 4 bytes of COMMAND and start of rest of COMMAND. The state machine automatically adjusts for 20/40/80MHz bandwidth settings.

WCSS_A_MPI_COMMAND2_DELAY

Bits	Name	Description
15:0	VALUE	

0x0A013418 WCSS_A_MPI_MPI_ENABLE**Type:** RW**Reset State:** 0x0000

This register must be set to 0x1 for the MPI to respond to TXP signals. This register is used to disable the MPI during MAC loopback tests.

WCSS_A_MPI_MPI_ENABLE

Bits	Name	Description
0	VALUE	

0x0A01341C WCSS_A_MPI_TXP_MPI_START**Type:** W**Reset State:** 0x00000000

Counts number of TXP_MPI_START events received by TX Mac-PHY Interface module.

WCSS_A_MPI_TXP_MPI_START

Bits	Name	Description
15:0	COUNT	TXP_MPI_START event counter.

0x0A013420 WCSS_A_MPI_MPI_TXP_REQ**Type:** W**Reset State:** 0x00000000

Counts number of MPI_TXP_REQ generated by TX MAC-PHY Interface module.

WCSS_A_MPI_MPI_TXP_REQ

Bits	Name	Description
15:0	COUNT	MPI_TXP_REQ event counter.

0x0A013424 WCSS_A_MPI_TXA_MPI_DATA_REQ**Type:** W**Reset State:** 0x00000000

Counts number of TXA_MPI_DATA_REQ events received by TX Mac-PHY Interface module.

WCSS_A_MPI_TXA_MPI_DATA_REQ

Bits	Name	Description
15:0	COUNT	TXA_MPI_DATA_REQ event counter.

0x0A013428 WCSS_A_MPI_TXB_MPI_DATA_REQ**Type:** W**Reset State:** 0x00000000

Counts number of TXB_MPI_DATA_REQ events received by TX Mac-PHY Interface module.

WCSS_A_MPI_TXB_MPI_DATA_REQ

Bits	Name	Description
15:0	COUNT	TXB_MPI_DATA_REQ event counter.

0x0A01342C WCSS_A_MPI_TXP_MPI_DATA_VAL**Type:** W**Reset State:** 0x00000000

Counts number of TXP_MPI_DATA_VAL pulses received.

WCSS_A_MPI_TXP_MPI_DATA_VAL

Bits	Name	Description
15:0	COUNT	TXP_MPI_DATA_VAL event counter.

0x0A013430 WCSS_A_MPI_MPI_TXA_DATA_VAL**Type:** W**Reset State:** 0x00000000

Counts number of MPI_TXA_DATA_VAL generated by TX MAC-PHY Interface module.

WCSS_A_MPI_MPI_TXA_DATA_VAL

Bits	Name	Description
15:0	COUNT	MPI_TXA_DATA_VAL event counter.

0x0A013434 WCSS_A_MPI_MPI_TXB_DATA_VAL**Type:** W**Reset State:** 0x00000000

Counts number of MPI_TXB_DATA_VAL generated by TX MAC-PHY Interface module.

WCSS_A_MPI_MPI_TXB_DATA_VAL

Bits	Name	Description
15:0	COUNT	MPI_TXB_DATA_VAL event counter.

0x0A013438 WCSS_A_MPI_MPI_TXA_LASTBYTE**Type:** W**Reset State:** 0x00000000

Counts number of MPI_TXA_LASTBYTE generated by TX MAC-PHY Interface module.

WCSS_A_MPI_MPI_TXA_LASTBYTE

Bits	Name	Description
15:0	COUNT	MPI_TXA_LASTBYTE event counter.

0x0A01343C WCSS_A_MPI_MPI_TXA_CW_LASTBYTE**Type:** W**Reset State:** 0x00000000

Counts number of MPI_TXA_CW_LASTBYTE generated by TX MAC-PHY Interface module.

WCSS_A_MPI_MPI_TXA_CW_LASTBYTE

Bits	Name	Description
15:0	COUNT	MPI_TXA_CW_LASTBYTE event counter.

0x0A013440 WCSS_A_MPI_MPI_TXA_CW_MAX_PARITY**Type:** W**Reset State:** 0x00000000

Counts number of MPI_TXA_CW_MAX_PARITY generated by TX MAC-PHY Interface module.

WCSS_A_MPI_MPI_TXA_CW_MAX_PARITY

Bits	Name	Description
15:0	COUNT	MPI_TXA_CW_MAX_PARITY event counter.

0x0A013444 WCSS_A_MPI_MPI_STATE**Type:** R**Reset State:** 0x00000000

Stores the last 4 MPI states.

WCSS_A_MPI_MPI_STATE

Bits	Name	Description
15:0	VALUE	Bit[15:12] = Previous MPI state (N-3) Bit[11:8] = Previous MPI state (N-2) Bit[7:4] = Previous MPI state (N-1) Bit[3:0] = Current MPI state

0x0A013448 WCSS_A_MPI_STATUS_FLAGS**Type:** R**Reset State:** 0x00000000

Indicates current state of the IDLE and RF warmup flags.

WCSS_A_MPI_STATUS_FLAGS

Bits	Name	Description
1	RF_WARMUP	Bit[0] = PHY idle flag - MAC may transmit when this flag is set Bit[1] = RF warmup flag - indicates that MAC has asserted the RF warm-up flag
0	IDLE	

0x0A01344C WCSS_A_MPI_REQ_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of REQ_ALARM abort pulses generated by TX MAC-PHY Interface module (when too many MPI requests were issued or if contiguous request pulses received).

WCSS_A_MPI_REQ_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A013450 WCSS_A_MPI_WATCHDOG_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of WATCHDOG_ALARM abort pulses generated by TX MAC-PHY Interface module.

WCSS_A_MPI_WATCHDOG_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A013454 WCSS_A_MPI_COMMAND_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of times that a command word was received when data was expected by the TX MAC-PHY Interface module and vice versa.

WCSS_A_MPI_COMMAND_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A013458 WCSS_A_MPI_TXP_ABORT**Type:** W**Reset State:** 0x00000000

Counts number of times that an abort was received from the TXP.

WCSS_A_MPI_TXP_ABORT

Bits	Name	Description
15:0	COUNT	

0x0A01345C WCSS_A_MPI_TXCTL_ABORT**Type:** W**Reset State:** 0x00000000

Counts number of times that an abort was received from the TXCTL.

WCSS_A_MPI_TXCTL_ABORT

Bits	Name	Description
15:0	COUNT	

10.43 WCSS_A_MTU_MTU**0x0A081400 WCSS_A_MTU_DIFS_LIMIT_0TO3****Type:** RW**Reset State:** 0x1C1C2525

AIFS limit register for 0 to 3 back off engines. The value is in micro seconds Though the name is DIFS, it is used for both DIFS,AIFS. It is up to s/w to select the value

WCSS_A_MTU_DIFS_LIMIT_0TO3

Bits	Name	Description
31:24	SW_MTU_DIFS_LIMIT_3	AIFS value in micro seconds for the back-off engine 3
23:16	SW_MTU_DIFS_LIMIT_2	AIFS value in micro seconds for the back-off engine 2
15:8	SW_MTU_DIFS_LIMIT_1	AIFS value in micro seconds for the back-off engine 1
7:0	SW_MTU_DIFS_LIMIT_0	AIFS value in micro seconds for the back-off engine 0

0x0A081404 WCSS_A_MTU_DIFS_LIMIT_4TO7**Type:** RW**Reset State:** 0x1F431616

AIFS limit register for 4 to 7 back off engines. The value is in micro seconds Though the name is DIFS, it is used for both DIFS,AIFS. It is up to s/w to select the value

WCSS_A_MTU_DIFS_LIMIT_4TO7

Bits	Name	Description
31:24	SW_MTU_DIFS_LIMIT_7	AIFS value in micro seconds for the back-off engine 7
23:16	SW_MTU_DIFS_LIMIT_6	AIFS value in micro seconds for the back-off engine 6
15:8	SW_MTU_DIFS_LIMIT_5	AIFS value in micro seconds for the back-off engine 5
7:0	SW_MTU_DIFS_LIMIT_4	AIFS value in micro seconds for the back-off engine 4

0x0A081408 WCSS_A_MTU_EIFS_PIFS_SLOT_LIMIT**Type:** RW**Reset State:** 0x005A1309

This register contains the limits for eifs, pifs and the slot_limit for data and bcn

WCSS_A_MTU_EIFS_PIFS_SLOT_LIMIT

Bits	Name	Description
31:16	SW_MTU_EIFS_LIMIT	EIFS value in micro seconds
15:8	SW_PIFS_LIMIT	PIFS value in micro seconds
7:0	SW_MTU_SLOT_LIMIT	slot limit value in micro seconds for all the back-off engines

0x0A08140C WCSS_A_MTU_SW_MTU_BCN_SLOT_USEC_SIFS_LIMIT**Type:** RW**Reset State:** 0x20007714

this register contains the limits for beacon slot usec pulse generation sifs

WCSS_A_MTU_SW_MTU_BCN_SLOT_USEC_SIFS_LIMIT

Bits	Name	Description
31:24	SW_MTU_EARLY_PKT_DET_MISS_LIMIT	sw_mtu_early_pkt_det_miss_limit-- this is used in respons_to(ack_to) logic if the system is expecting a response and if the early_pkt_det is HIGH for this limit, an interrupt is generated (old name is cca_miss_limit)
15:8	SW_MTU_ONE_USEC_LIMIT	limit value to be programmed to get one usec pulse. Basically this is number of clk cycles. this value is loaded into a counter and keep getting decremented at every clk.
7:0	SW_MTU_BCN_SLOT_LIMIT	slot limit value in micro seconds for all the back-off engines

0x0A081410 WCSS_A_MTU_SW_MTU_MISC_LIMITS**Type:** RW**Reset State:** 0x0C20091E

This register contains the limits for one usec puls and for programmable pulse generation the programmable pulse is sued by the timers in one of the modes and the sw delay limits

WCSS_A_MTU_SW_MTU_MISC_LIMITS

Bits	Name	Description
31:24	SW_MTU_PUSH_MISS_LIMIT	Limit to control the missing_push interrupt. If pkt_det goes high and we don't get a packet from the rxp before this limit, the interrupt will go.
21:16	SW_MTU_TXP_DELAY_LIMIT	TXP is indicated earlier indication of transmission of a pkt. The number in this register indicates the delay between the indication to s/w and the corresponding flag set that goes to txp The actual delay is the number programmed multiplied by the sw_mtu_txp_delay_pulse_limit multiplied by 8ns
11:8	SW_MTU_TXP_DELAY_PULSE_LIMIT	this number dictates the resolution of the delay between the s/w interrupt and the corresponding txp flag
7:0	TIMER_RESOLUTION_LIMIT	A pulse is generated at the end of 'this limit' number of 120mhz pulses. This pulse represents the resolution in timers.

0x0A081414 WCSS_A_MTU_NAV_CNT**Type:** RW**Reset State:** 0x000000FF

This register contains the nav value NAV is updated by hw as well as by the s/w. s/w has higher priority over the h/w updates

WCSS_A_MTU_NAV_CNT

Bits	Name	Description
31:0	NAV_CNT	This register contains the nav value. There has to some default. So I kept ff The value is in micro seconds

0x0A081418 WCSS_A_MTU_TSF_TIMER_LO**Type:** RW**Reset State:** 0x00000000

This register contains the lower 32 bits of the tsf timer

WCSS_A_MTU_TSF_TIMER_LO

Bits	Name	Description
31:0	TSF_TIMER_LO	This register contains the lower 32 bits of tsf timer

0x0A08141C WCSS_A_MTU_TSF_TIMER_HI**Type:** RW**Reset State:** 0x00000000

This register contains the upper 32 bits of the tsf timer

WCSS_A_MTU_TSF_TIMER_HI

Bits	Name	Description
31:0	TSF_TIMER_HI	This register contains the upper 32 bits of tsf timer

0x0A081420 WCSS_A_MTU_TIMER_0**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 0 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_0.

WCSS_A_MTU_TIMER_0

Bits	Name	Description
23:0	TIMER_0	This register contains the timer 0 value. This timer is rd/writable,up/down

0x0A081424 WCSS_A_MTU_TIMER_1**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 1 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_1.

WCSS_A_MTU_TIMER_1

Bits	Name	Description
23:0	TIMER_1	This register contains the timer 1 value. This timer is rd/writable,up/down

0x0A081428 WCSS_A_MTU_TIMER_2**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 2 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_2.

WCSS_A_MTU_TIMER_2

Bits	Name	Description
23:0	TIMER_2	This register contains the timer 2 value. This timer is rd/writable,up/down

0x0A08142C WCSS_A_MTU_TIMER_3**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 3 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_3.

WCSS_A_MTU_TIMER_3

Bits	Name	Description
23:0	TIMER_3	This register contains the timer 3 value. This timer is rd/writable,up/down

0x0A081430 WCSS_A_MTU_TIMER_4**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 4 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_4.

WCSS_A_MTU_TIMER_4

Bits	Name	Description
23:0	TIMER_4	This register contains the timer 4 value. This timer is rd/writable,up/down

0x0A081434 WCSS_A_MTU_TIMER_5**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 5 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_5.

WCSS_A_MTU_TIMER_5

Bits	Name	Description
23:0	TIMER_5	This register contains the timer 5 value. This timer is rd/writable,up/down

0x0A081438 WCSS_A_MTU_TIMER_6**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 6 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_6.

WCSS_A_MTU_TIMER_6

Bits	Name	Description
23:0	TIMER_6	This register contains the timer 6 value. This timer is rd/writable,up/down

0x0A08143C WCSS_A_MTU_TIMER_7**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 7 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_7.

WCSS_A_MTU_TIMER_7

Bits	Name	Description
23:0	TIMER_7	This register contains the timer 7 value. This timer is rd/writable,up/down

0x0A081440 WCSS_A_MTU_TIMER_CONTROL

Type: RW

Reset State: 0x00000000

This register contains all the controls for the timers.

WCSS_A_MTU_TIMER_CONTROL

Bits	Name	Description
31:16	SW_MTU_BASIC_UNIT_SELECT	2 bit for each timer is provided. bit [1:0] for timer 0, bit [3:2] for timer 1... To make these timers more flexible, 3 basic units are provided. if the control =0, the timer will be stopped (this is the only way to disable the counters if the control =01, timer is ++ at every clk if the control =10, timer is ++ at every one us if the control =11, timer is ++ at every programmable pulse. Basically in this mode, the period of the pulse is also controlled by s/w. Note that this programmable pulse is only one for all the timers
11:0	SW_MTU_TIMER_UP_DOWN_CNTRL	1 bit for each timer is provided. bit 0 for timer 0, bit 1 for timer 1... This controls the up/down functionality of the timers. 1-> up, 0->down.

0x0A081444 WCSS_A_MTU_BKOF_CNT_0

Type: RW

Reset State: 0x00000003

This register contains the bkof_cnt of bkof 0. The units are slot number. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating. In this mode, sw needs to take care of the random number generation also

WCSS_A_MTU_BKOF_CNT_0

Bits	Name	Description
15:0	BKOF_CNT_0	This register contains the bkof_counter value for the back-off 0 In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A081448 WCSS_A_MTU_BKOF_CNT_1**Type:** RW**Reset State:** 0x00000004

This register contains the bkof_cnt of bkof 1. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating In this mode, sw needs to take care of the random number generation also

WCSS_A_MTU_BKOF_CNT_1

Bits	Name	Description
15:0	BKOF_CNT_1	This register contains the bkof_counter value for the back-off 1 In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A08144C WCSS_A_MTU_BKOF_CNT_2**Type:** RW**Reset State:** 0x00000007

This register contains the bkof_cnt of bkof 2. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating In this mode, sw needs to take care of the random number generation also

WCSS_A_MTU_BKOF_CNT_2

Bits	Name	Description
15:0	BKOF_CNT_2	This register contains the bkof_counter value for the back-off 2 In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter =0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A081450 WCSS_A_MTU_BKOF_CNT_3**Type:** RW**Reset State:** 0x00000001

This register contains the bkof_cnt of bkof 3. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating. In this mode, sw needs to take care of the random number generation also

WCSS_A_MTU_BKOF_CNT_3

Bits	Name	Description
15:0	BKOF_CNT_3	This register contains the bkof_counter value for the back-off 4. In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter = 0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A081454 WCSS_A_MTU_BKOF_CNT_4**Type:** RW**Reset State:** 0x00000002

This register contains the bkof_cnt of bkof 4. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating. In this mode, sw needs to take care of the random number generation also

WCSS_A_MTU_BKOF_CNT_4

Bits	Name	Description
15:0	BKOF_CNT_4	This register contains the bkof_counter value for the back-off 4. In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter = 0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A081458 WCSS_A_MTU_BKOF_CNT_5**Type:** RW**Reset State:** 0x00000005

This register contains the bkof_cnt of bkof 5. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating. In this mode, sw needs to take care of the random number generation also

WCSS_A_MTU_BKOF_CNT_5

Bits	Name	Description
15:0	BKOF_CNT_5	This register contains the bkof_counter value for the back-off 5. In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter = 0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A08145C WCSS_A_MTU_BKOF_CNT_6**Type:** RW**Reset State:** 0x00000006

This register contains the bkof_cnt of bkof 6. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating. In this mode, sw needs to take care of the random number generation also.

WCSS_A_MTU_BKOF_CNT_6

Bits	Name	Description
15:0	BKOF_CNT_6	This register contains the bkof_counter value for the back-off 6. In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter = 0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A081460 WCSS_A_MTU_BKOF_CNT_7**Type:** RW**Reset State:** 0x00000000

This register contains the bkof_cnt of bkof 7. In one of the modes, sw can control this counter and run the back offs with this value. But this is normal way of operating. In this mode, sw needs to take care of the random number generation also.

WCSS_A_MTU_BKOF_CNT_7

Bits	Name	Description
15:0	BKOF_CNT_7	This register contains the bkof_counter value for the back-off 7. In the sw controlled mode, (sw_mtu_use_sw_bkof_counter = 1), sw will have to write this register before starting the back-off. if sw_mtu_use_sw_bkof_counter = 0, hw generates this value = (lfsr_data & sw_mtu_cw_reg)

0x0A081464 WCSS_A_MTU_BKOF_CONTROL**Type:** RW**Reset State:** 0xFF000000

This register contains all the controls for the back-off engines.

WCSS_A_MTU_BKOF_CONTROL

Bits	Name	Description
31:24	SW_MTU_SUPPRESS_COLLISION_INT	1 bit for each back off is provided. bit 0 for back 0, bit 1 for back 1... this bit is set to 1, the back off will not send interrupt to s/w for collision case (int status = 2'b11) warm up also will not be generated
23:16	SW_MTU_QUEUE_DATA_AVAIL	1 bit for each back is provided. bit 0 for back 0, bit 1 for back 1... data avail bits from the s/w. Unless this bit is set, s/w won't get interrupt (irrespective of the status of back-off).
15:8	SW_MTU_STALL_BKOF	1 bit for each back is provided. bit 0 for back 0, bit 1 for back 1... if this bit is set, the corresponding back-off will be stalled. Basically the back-off counter -- will be stopped. This is used to stall all the back-offs while beacon is supposed to be sent or for any other reasons.
7:0	SW_MTU_USE_SW_BKOF_COUNTER	1 bit for each back is provided. bit 0 for back 0, bit 1 for back 1... if this bit is set, the back_off counter is set by sw. Otherwise, HW will use the cw_reg & lfsdr

0x0A081468 WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_0**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw. For backoff engine_0 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_0

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VALID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_0	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_0	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_0 (cont.)

Bits	Name	Description
15:0	SW_MTU_CW_REG_0	This register contains the cw_reg value for the back-off 0

0x0A08146C WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_1**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw . For backoff engine_1 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_1

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_1	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_ 1	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_1	This register contains the cw_reg value for the back-off 1

0x0A081470 WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_2**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw. For backoff engine_2 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_2

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_2	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_2 (cont.)

Bits	Name	Description
16	SW_MTU_WAIT_DONE_P_2	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_2	This register contains the cw_reg value for the back-off 2

0x0A081474 WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_3**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw . For backoff engine_3 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_3

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_3	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_3	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_3	This register contains the cw_reg value for the back-off 3

0x0A081478 WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_4**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw . For backoff engine_4 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_4

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_4 (cont.)

Bits	Name	Description
18:17	SW_MTU_CW_ACTION_4	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_4	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_4	This register contains the cw_reg value for the back-off 4

0x0A08147C WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_5**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw . For backoff engine_5 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_5

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_5	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_5	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_5	This register contains the cw_reg value for the back-off 5

0x0A081480 WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_6**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw . For backoff engine_6 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_6

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_6	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_6	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_6	This register contains the cw_reg value for the back-off 6

0x0A081484 WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_7**Type:** RW**Reset State:** 0x00000007

This register contains the cw_reg value that needs to be used by hw . For backoff engine_7 This register also has the control bit that initiates the back-off after the hw issued an interrupt to s/w for its attention.

WCSS_A_MTU_CW_REG_CONTROL_FOR_BACKOFF_7

Bits	Name	Description
19	SW_MTU_CW_UPDATE_VA LID	this is write only register The sw_mtu_cw_reg will be updated only when this bit is set. Otherwise the hw update will take place
18:17	SW_MTU_CW_ACTION_7	This field indicates the action that bkoff-engine need to do to the cw_reg. 00-> no change, 01-> reset cw (cw_reg=cw_min), 10-> ++cw, hw does the boundary checks and resets the cw if it reaches the cw_max automatically
16	SW_MTU_WAIT_DONE_P_7	This bit is write only. The HW will be waiting for this signal to start the next back-off after issuing the interrupt by the back-off engine
15:0	SW_MTU_CW_REG_7	This register contains the cw_reg value for the back-off 7

0x0A081488 WCSS_A_MTU_MTU_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

This register contains the status of all the interrupts that are generated by mtu Basically enevry interrupt has a corresponding register bit which will be set on sending interrupt pulse to the interrupt module and this bit is reset by writing '1' to it. sw has higher priority over hw

WCSS_A_MTU_MTU_INTERRUPT_STATUS

Bits	Name	Type	Description
31	SECONDARY_CCA_TO	R	the secondary_cca_to is sampled and s/w can read its status through this register
30	SIFS_TO	R	the sifs_to is sampled and s/w can read its status through this register
29	PIFS_TO	R	the pifs_to is sampled and s/w can read its status through this register
28	MTU_MCU_WATCH_DOG_ENABLE_DISABLE_ERROR	RW	if s/w tries to write wrong combinations to the watch dog enable disable bits this interrupt will be generated
27	MTU_MCU_WATCH_DOG_PROTECTION_ERROR	RW	if s/w tries to write to the watch dog register and if the protection vector matches, this interrupt will be generated.
26:24	MTU_MCU_WATCH_DOG_TIMER_FLAG	RW	watch dog interrupt flags. 24 is for thr0, bit 25 is for thr1, bit 26 is fr thr3
23:16	MTU_MCU_TSF_INT_FLAG	RW	8 registers for 8 tsf based match register interrupts. bit 0 for match 0, 1 for match 1 ...
15:8	MTU_MCU_BKOF_INT_FLAG	RW	8 registers for 8 back off interrupts. bit 0 for timer 0, 1 for timer 1 ...
7:0	MTU_MCU_TIMER_INT_FLAG	RW	8 registers for 8 timer interrupts. bit 0 for timer 0, 1 for timer 1 ...

0x0A08148C WCSS_A_MTU_SW_MATCH_REGISTER_0**Type:** RW**Reset State:** 0x00000000

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 0 in up mode. Basically when the timer is operated in up mode, when the Timer 0 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_0

Bits	Name	Description
31:30	SW_TSF_SEL_0	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_0_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_0	This register contains the match value for tsf based counter interrupt 0, timer 0 (in up mode)

0x0A081490 WCSS_A_MTU_SW_MATCH_REGISTER_1**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 1 in up mode. Basically when the timer is operated in up mode, when the Timer 1 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_1

Bits	Name	Description
31:30	SW_TSF_SEL_1	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_1_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_1	This register contains the match value for tsf based counter interrupt 1, timer 1 (in up mode)

0x0A081494 WCSS_A_MTU_SW_MATCH_REGISTER_2**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 2 in up mode. Basically when the timer is operated in up mode, when the Timer 2 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_2

Bits	Name	Description
31:30	SW_TSF_SEL_2	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_2_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_2	This register contains the match value for tsf based counter interrupt 2, timer 2 (in up mode)

0x0A081498 WCSS_A_MTU_SW_MATCH_REGISTER_3**Type:** RW**Reset State:** 0x00000000

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 3 in up mode. Basically when the timer is operated in up mode, when the Timer 3 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_3

Bits	Name	Description
31:30	SW_TSF_SEL_3	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_3_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_3	This register contains the match value for tsf based counter interrupt 3, timer 3 (in up mode)

0x0A08149C WCSS_A_MTU_SW_MATCH_REGISTER_4**Type:** RW**Reset State:** 0x00000000

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 4 in up mode. Basically when the timer is operated in up mode, when the Timer 4 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_4

Bits	Name	Description
31:30	SW_TSF_SEL_4	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_4_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_4	This register contains the match value for tsf based counter interrupt 4, timer 4 (in up mode)

0x0A0814A0 WCSS_A_MTU_SW_MATCH_REGISTER_5**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 5 in up mode. Basically when the timer is operated in up mode, when the Timer 5 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_5

Bits	Name	Description
31:30	SW_TSF_SEL_5	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_5_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_5	This register contains the match value for tsf based counter interrupt 5, timer 5 (in up mode)

0x0A0814A4 WCSS_A_MTU_SW_MATCH_REGISTER_6**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 6 in up mode. Basically when the timer is operated in up mode, when the Timer 6 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_6

Bits	Name	Description
31:30	SW_TSF_SEL_6	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_6_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_6	This register contains the match value for tsf based counter interrupt 6, timer 6 (in up mode)

0x0A0814A8 WCSS_A_MTU_SW_MATCH_REGISTER_7**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 7 in up mode. Basically when the timer is operated in up mode, when the Timer 7 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_7

Bits	Name	Description
31:30	SW_TSF_SEL_7	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_7_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_7	This register contains the match value for tsf based counter interrupt 7, timer 7 (in up mode)

0x0A0814AC WCSS_A_MTU_SW_CW_MIN_CW_MAX_0**Type:** RW**Reset State:** 0x03FF000F

Contains the cw_min and cw_max for back-off 0

WCSS_A_MTU_SW_CW_MIN_CW_MAX_0

Bits	Name	Description
31:16	SW_CW_MAX_0	This register contains the cw_max for back-off 0. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_0	This register contains the cw_min for back-off 0. The default is 3f. Any suggested value is welcome

0x0A0814B0 WCSS_A_MTU_SW_CW_MIN_CW_MAX_1**Type:** RW**Reset State:** 0x03FF000F

Contains the cw_min and cw_max for back-off 1

WCSS_A_MTU_SW_CW_MIN_CW_MAX_1

Bits	Name	Description
31:16	SW_CW_MAX_1	This register contains the cw_max for back-off 1. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_1	This register contains the cw_min for back-off 1. The default is 3f. Any suggested value is welcome

0x0A0814B4 WCSS_A_MTU_SW_CW_MIN_CW_MAX_2**Type:** RW**Reset State:** 0x00070003

Contains the cw_min and cw_max for back-off 2

WCSS_A_MTU_SW_CW_MIN_CW_MAX_2

Bits	Name	Description
31:16	SW_CW_MAX_2	This register contains the cw_max for back-off 2. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_2	This register contains the cw_min for back-off 2. The default is 3f. Any suggested value is welcome

0x0A0814B8 WCSS_A_MTU_SW_CW_MIN_CW_MAX_3**Type:** RW**Reset State:** 0x00070003

Contains the cw_min and cw_max for back-off 3

WCSS_A_MTU_SW_CW_MIN_CW_MAX_3

Bits	Name	Description
31:16	SW_CW_MAX_3	This register contains the cw_max for back-off 3. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_3	This register contains the cw_min for back-off 3. The default is 3f. Any suggested value is welcome

0x0A0814BC WCSS_A_MTU_SW_CW_MIN_CW_MAX_4**Type:** RW**Reset State:** 0x00070003

Contains the cw_min and cw_max for back-off 4

WCSS_A_MTU_SW_CW_MIN_CW_MAX_4

Bits	Name	Description
31:16	SW_CW_MAX_4	This register contains the cw_max for back-off 4. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_4	This register contains the cw_min for back-off 4. The default is 3f. Any suggested value is welcome

0x0A0814C0 WCSS_A_MTU_SW_CW_MIN_CW_MAX_5

Type: RW

Reset State: 0x000F0007

Contains the cw_min and cw_max for back-off 5

WCSS_A_MTU_SW_CW_MIN_CW_MAX_5

Bits	Name	Description
31:16	SW_CW_MAX_5	This register contains the cw_max for back-off 5. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_5	This register contains the cw_min for back-off 5. The default is 3f. Any suggested value is welcome

0x0A0814C4 WCSS_A_MTU_SW_CW_MIN_CW_MAX_6

Type: RW

Reset State: 0x03FF000F

Contains the cw_min and cw_max for back-off 6

WCSS_A_MTU_SW_CW_MIN_CW_MAX_6

Bits	Name	Description
31:16	SW_CW_MAX_6	This register contains the cw_max for back-off 6. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_6	This register contains the cw_min for back-off 6. The default is 3f. Any suggested value is welcome

0x0A0814C8 WCSS_A_MTU_SW_CW_MIN_CW_MAX_7**Type:** RW**Reset State:** 0x03FF000F

Contains the cw_min and cw_max for back-off 7

WCSS_A_MTU_SW_CW_MIN_CW_MAX_7

Bits	Name	Description
31:16	SW_CW_MAX_7	This register contains the cw_max for back-off 7. The default is 7ff. Any suggested value is welcome
15:0	SW_CW_MIN_7	This register contains the cw_min for back-off 7. The default is 3f. Any suggested value is welcome

0x0A0814CC WCSS_A_MTU_CCA_COUNTER0**Type:** RW**Reset State:** 0x00000000

this register contains the primary cca count. the primary cca is sampled at every us and incremented if the cca is LOW

WCSS_A_MTU_CCA_COUNTER0

Bits	Name	Description
31:0	CCA_COUNTER0	contains the cca primary counter. s/w write has higher periority over h/w update

0x0A0814D0 WCSS_A_MTU_CCA_COUNTER1**Type:** RW**Reset State:** 0x00000000

this register contains the cca count. the selection to the cca used by this counter is programmable -
--

WCSS_A_MTU_CCA_COUNTER1

Bits	Name	Description
31:0	CCA_COUNTER1	depending on the cca_count1_sel-- a programmable bit, the enable to this counter is selected as shown below s/w write has higher periority over h/w update cca_term0 = ~rxp_mtu_secondary_cca; cca_term1 = ~rxp_mtu_secondary_cca & ~rxp_mtu_primary_cca; cca_term2 = rxp_mtu_secondary_cca & ~rxp_mtu_primary_cca; cca_term3 = ~rxp_mtu_secondary_cca cca_term4 = rxp_mtu_secondary_cca cca_term5 = ~cca_term1; cca_term6 = ~cca_term3; cca_term7 = ~cca_term4; cca_count0_en_temp = ~rxp_mtu_primary_cca; 3'b000: cca_count1_en_temp = cca_term0; 3'b001: cca_count1_en_temp = cca_term1; 3'b010: cca_count1_en_temp = cca_term2; 3'b011: cca_count1_en_temp = cca_term3; 3'b100: cca_count1_en_temp = cca_term4; 3'b101: cca_count1_en_temp = cca_term5; 3'b110: cca_count1_en_temp = cca_term6; 3'b111: cca_count1_en_temp = cca_term7; cca_count1_en_final = consider_rx_cca_only ? (cca_count1_en_temp & ~txp_mtu_phytx_idle) : cca_count1_en_temp;

0x0A0814D4 WCSS_A_MTU_CCA_COUNTER2**Type:** RW**Reset State:** 0x00000000

this register contains the cca count. the selection to the cca used by this counter is programmable -
--

WCSS_A_MTU_CCA_COUNTER2

Bits	Name	Description
31:0	CCA_COUNTER2	depending on the cca_count2_sel-- a programmable bit, the enable to this counter is selected as shown below s/w write has higher periority over h/w update 3'b000: cca_count2_en_temp = ~rxp_mtu_primary_cca & ~rxp_mtu_secondary_cca & ~rxp_mtu_tertiary_cca & ~rxp_mtu_quaternary_cca; 3'b001: cca_count2_en_temp = ~rxp_mtu_tertiary_cca; 3'b010: cca_count2_en_temp = ~rxp_mtu_quaternary_cca; 3'b011: cca_count2_en_temp = ~rxp_mtu_tertiary_cca & ~rxp_mtu_quaternary_cca; 3'b100: cca_count2_en_temp = ~rxp_mtu_tertiary_cca 3'b101: cca_count2_en_temp = rxp_mtu_tertiary_cca & ~rxp_mtu_quaternary_cca; 3'b110: cca_count2_en_temp = rxp_mtu_tertiary_cca 3'b111: cca_count2_en_temp = 1'b0; cca_count2_en_final = consider_rx_cca_only ? (cca_count2_en_temp & ~txp_mtu_phytx_idle) : cca_count2_en_temp;

0x0A0814D8 WCSS_A_MTU_WATCH_DOG_TIMER**Type:** RW**Reset State:** 0x00000000

This is watch dog timer register. Basically, when the watch dog timer is enabled, this timer keeps ++ at every us. Once it reaches watch dog thr0, an interrupt is generated when it reaches thr1 another interrupt is generated (higher priority). On reaching thr3, another higher priority interrupt is generated. Typically this is used to reset the chip

WCSS_A_MTU_WATCH_DOG_TIMER

Bits	Name	Description
31:30	WATCH_DOG_TIMER_ENABLE_DISABLE	Watch dog timer and the corresponding interrupts are enabled only when these bits are 10. 01 is disable. Any other combination will not be accepted and if sw writes 00 or 11, the status is maintained. We may have an interrupt to this condition as well as for any writes to the watch dog register without protection vector match
29:24	WATCH_DOG_TIMER_PROTECTION_VECTOR	This is write only register. when it is read ZEROs are returned. Writes to the watch dog register can happen (including the enable/disable) only when this field matches the watch_dog_thr0[25:24],thr1[25:24],thr2[25:24]
23:0	WATCH_DOG_TIMER	if it is enabled, it keeps ++ at every us. S/W can write to it only when the protection vector matches the concat of the 2 bit protection bits from the watch dog threshold register. The protection vector can't be 00 or 3f

0x0A0814DC WCSS_A_MTU_WATCH_DOG_THR0**Type:** RW**Reset State:** 0x00000000

this register contains thr0 for watch dog

WCSS_A_MTU_WATCH_DOG_THR0

Bits	Name	Description
27:26	THR0_PROTECTION_FIELD	This register is writable only when this field is 11
25:24	WATCH_DOG_PROTECTION_VECTOR0	2 bits of the protection vector of watch_dog_timer
23:0	WATCH_DOG_THR0	contains the watch dog thr0. It is writable by s/w only when its protection field =11

0x0A0814E0 WCSS_A_MTU_WATCH_DOG_THR1**Type:** RW**Reset State:** 0x00000000

this register contains thr1 for wathch dog

WCSS_A_MTU_WATCH_DOG_THR1

Bits	Name	Description
27:26	THR1_PROTECTION_FIELD	This register is writable only when this field is 10
25:24	WATCH_DOG_PROTECTIO N_VECTOR1	2 bits of the protection vector of watch_dog_timer
23:0	WATCH_DOG_THR1	contains the watch dog thr1. It is writable by s/w only when its protection field =10

0x0A0814E4 WCSS_A_MTU_WATCH_DOG_THR2**Type:** RW**Reset State:** 0x00000000

this register contains thr2 for wathch dog

WCSS_A_MTU_WATCH_DOG_THR2

Bits	Name	Description
27:26	THR2_PROTECTION_FIELD	This register is writable only when this field is 01
25:24	WATCH_DOG_PROTECTIO N_VECTOR2	2 bits of the protection vector of watch_dog_timer
23:0	WATCH_DOG_THR2	contains the watch dog thr2. It is writable by s/w only when its protection field =01

0x0A0814E8 WCSS_A_MTU_BKOF_SW_INT_TYPE**Type:** RW**Reset State:** 0x00000000

this register contains the status of the interrupt type for the back off engines

WCSS_A_MTU_BKOF_SW_INT_TYPE

Bits	Name	Description
15:0	BKOF_SW_INT_TYPE	contains the type of the interrupt from the back off engines. 1:0 is bkoff 0, 3:2 for bkoff 1 and so on. Value 2'b00: No interrupt pending, or cleared by SW Value 2'b01: Backoff engine expired successfully (no collision with a higher priority backoff engine) Value 2'b10: There was an internal collision between this and a higher priority backoff engine. SW needs to re-initialize the backoff engine. Value 2'b11: Dataavailable got programmed after the backoff engine had already run and reached the BKOFF_DONE state. At the moment of programming Dataavailable, the CCA was low. SW needs to re-program the backoff engine. This is read only register. But any write 1 to this register will clear the status for the corresponding back-off. For ex. write of a 1 to bit 0 will clear 1:0, write of a 1 to bit 1 clears the 3:2 and so on. Only 11:0 are enabled for write operation, but will also automatically clear on a write. Corresponds to reset_bkof_sw_int_type_p in RTL

0x0A0814EC WCSS_A_MTU_CCA_CONTROL_REG**Type:** RW**Reset State:** 0x00000000

this register contains the controls to select the cca that needs to be used for a particular back_off engine

WCSS_A_MTU_CCA_CONTROL_REG

Bits	Name	Description
31	SW_MTU_BKOF_GOTO_ID LE	If the back-offs are stuck for some reason, this bit will take the back-offs to idle We see a hang in the lab on a netlist which has no test buses. But could not be reproduced. To be on safe side this bit is added
30	SW_MTU_PIFS_RAW_CCA _SEL_NEW	Work with bit[25:24] to select the cca to be used for pifs.
29	SW_MTU_CCA_FLAG	this is software controlled cca. if the sw_mtu_sel is 11, the corresponding back off engine uses this register bit as its cca
28:26	SW_MTU_PIFS_FINAL_CC A_SEL	We want follow the same strategy we followed for back-off cca since the last_slot_time doesn't make sense for pifs, we kept the last_slot_time corresponds to back-off 0 000 -- raw CCA 001 -- (raw CCA && early_pkt_det_n) 010 -- (raw CCA && pkt_det_n) 011 - - early_pkt_det_n 100 -- pkt_det_n 101 -- (raw CCA && (early_pkt_det_n ~last_slot_time)) 110 -- (raw CCA && pkt_det_n && (early_pkt_det_n ~last_slot_time))

WCSS_A_MTU_CCA_CONTROL_REG (cont.)

Bits	Name	Description
25:24	SW_MTU_PIFS_RAW_CCA_SEL	It was not clear which cca to be used for pifs. So a programmability is provided for this also. if bit[30] = 0, 00 selects primary cca, 01 selects secondary cca, 10 selects combined cca(basically and of both primary and secondary) 11 select the sw_mtu_cca_flag which is sw config registe bit. if bit[30] = 1, 00 selects tertiary cca, 01 selects quaternary cca, 10 selects all cca(basically and of primary, secondary, tertiary and quaternary) Finall cca selection is done based on the next 3 bits-- sw_mtu_pifs_final_cca_sel
23:16	SW_MTU_EIFS_CCA_SEL	1 bit for each back off. It was not clear which cca to use for eifs. So a programmability is provided such that either the same cca that is used for difs is used for eifs also or just primary cca is selected. If this bit is 0, the primary cca is used for eifs (for the corresponding back off). Otherwise the cca that is used for the back off is used for eifs also
15:0	SW_MTU_RAW_CCA_SEL	2 bits for each back off. 1:0 for back off 0, 3:2 back off 1,... and so on if the corresponding mtu_cca_control.sw_mtu_raw_cca_sel=0, 00 selects primary cca, 01 selects secondary cca, 10 selects combined cca(basically and of both primary and secondary) 11 select the sw_mtu_cca_flag which is sw config registe bit if the corresponding mtu_cca_control.sw_mtu_raw_cca_sel=1, 00 selects tertiary cca, 01 selects quaternary cca, 10 selects all cca(basically and of primary, secondary, tertiary and quaternary)

0x0A0814F0 WCSS_A_MTU_TIMER_8**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 8 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_8.

WCSS_A_MTU_TIMER_8

Bits	Name	Description
23:0	TIMER_8	This register contains the timer 8 value. This timer is rd/writable,up/down

0x0A0814F4 WCSS_A_MTU_TIMER_9**Type:** RW**Reset State:** 0x00FFFFFF

This register contains the timer 9 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching

Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_9.

WCSS_A_MTU_TIMER_9

Bits	Name	Description
23:0	TIMER_9	This register contains the timer 9 value. This timer is rd/writable,up/down

0x0A0814F8 WCSS_A_MTU_TIMER_10

Type: RW

Reset State: 0x00FFFFFF

This register contains the timer c value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_10.

WCSS_A_MTU_TIMER_10

Bits	Name	Description
23:0	TIMER_10	This register contains the timer 10 value. This timer is rd/writable,up/down

0x0A0814FC WCSS_A_MTU_TIMER_11

Type: RW

Reset State: 0x00FFFFFF

This register contains the timer 11 value. This timer is rd/writable,up/down Based on the configuration, this can be used either for up or down counter and generates an interrupt on reaching Zero in down mode. in up mode interrupt is generated when the timer reaches the sw_match_register_11.

WCSS_A_MTU_TIMER_11

Bits	Name	Description
23:0	TIMER_11	This register contains the timer 11 value. This timer is rd/writable,up/down

0x0A081510 WCSS_A_MTU_SW_MATCH_REGISTER_8**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 8 in up mode. Basically when the timer is operated in up mode, when the Timer 8 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_8

Bits	Name	Description
31:30	SW_TSF_SEL_8	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_8_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_8	This register contains the match value for tsf based counter interrupt 8, timer 8 (in up mode)

0x0A081514 WCSS_A_MTU_SW_MATCH_REGISTER_9**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 9 in up mode. Basically when the timer is operated in up mode, when the Timer 9 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_9

Bits	Name	Description
31:30	SW_TSF_SEL_9	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_9_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_9	This register contains the match value for tsf based counter interrupt 9, timer 9 (in up mode)

0x0A081518 WCSS_A_MTU_SW_MATCH_REGISTER_10**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 10 in up mode. Basically when the timer is operated in up mode, when the Timer 10 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_10

Bits	Name	Description
31:30	SW_TSF_SEL_10	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_10_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_10	This register contains the match value for tsf based counter interrupt 10, timer 10 (in up mode)

0x0A08151C WCSS_A_MTU_SW_MATCH_REGISTER_11**Type:** RW**Reset State:** 0x00000EFF

This register contains the match value for tsf based interrupts. Basically whenever the tsf is equal to this register, corresponding interrupt will be generated. This register is also used the timer 11 in up mode. Basically when the timer is operated in up mode, when the Timer 11 reaches this value, an interrupt is generated

WCSS_A_MTU_SW_MATCH_REGISTER_11

Bits	Name	Description
31:30	SW_TSF_SEL_11	Lower bits to select the tsf will trigger the interrupt when the timer value reaches 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100: BSS2 TSF
29	SW_TSF_SEL_11_HI	Upper bit to select the tsf will trigger the interrupt when the timer value reaches
23:0	SW_MATCH_REGISTER_11	This register contains the match value for tsf based counter interrupt 11, timer 11 (in up mode)

0x0A081534 WCSS_A_MTU_BKOF_CONTROL2**Type:** RW**Reset State:** 0x000E0000

This register contains all the controls for the back-off engines.

WCSS_A_MTU_BKOF_CONTROL2

Bits	Name	Description
31	SW_MTU_CONSIDER_CSI_BKOF_EN	When set, csi bkof enable signal from MTU for HW controlled sending CSI frame in calibration and delayed explicit beamform will be enabled
30	SW_MTU_CONSIDER_QOS_NULL_BKOF_EN	When set, qosnull bkof enable signal from MTU for HW controlled sending qosnull frame in implicit beamform will be enabled
19:16	SW_MTU_PKT_DET_TO_CNT_THR	pkt_det_to_cnt is compared with this register and generates a signal. This is used by tpe to start requesting BA. Basically allow tpe to get the bitmap updated.

0x0A081538 WCSS_A_MTU_CCA_CONTROL_REG2**Type:** RW**Reset State:** 0x00000000

this register contains the controls to select the cca that needs to be used for a particular back_off engine

WCSS_A_MTU_CCA_CONTROL_REG2

Bits	Name	Description
19	CONSIDER_RX_CCA_ONLY	since the cca will be asserted even for the tx, we may want to ave count of only rx busy if this bit is set, the cca counters will be ++ only if txp_mtu_phytx_idle txp_mtu_phytx_idle =1
18:16	CCA_COUNT2_SEL	these bits select the count enable to the cca_count2 3'b000: cca_count2_en_temp = cca_term0; 3'b001: cca_count2_en_temp = cca_term1; 3'b010: cca_count2_en_temp = cca_term2; 3'b011: cca_count2_en_temp = cca_term3; 3'b100: cca_count2_en_temp = cca_term4; 3'b101: cca_count2_en_temp = cca_term5; 3'b110: cca_count2_en_temp = cca_term6; 3'b111: cca_count2_en_temp = cca_term7; cca_count2_en_final = consider_rx_cca_only ? (cca_count2_en_temp & ~txp_mtu_phytx_idle) : cca_count2_en_temp;

WCSS_A_MTU_CCA_CONTROL_REG2 (cont.)

Bits	Name	Description
14:12	CCA_COUNT1_SEL	these bits select the count enable to the cca_count1 3'b000: cca_count1_en_temp = cca_term0; 3'b001: cca_count1_en_temp = cca_term1; 3'b010: cca_count1_en_temp = cca_term2; 3'b011: cca_count1_en_temp = cca_term3; 3'b100: cca_count1_en_temp = cca_term4; 3'b101: cca_count1_en_temp = cca_term5; 3'b110: cca_count1_en_temp = cca_term6; 3'b111: cca_count1_en_temp = cca_term7; cca_count1_en_final = consider_rx_cca_only ? (cca_count1_en_temp & ~txp_mtu_phytx_idle) : cca_count1_en_temp;
7	CONSIDER_RX_CCA_ONLY_345	since the cca will be asserted even for the tx, we may want to ave count of only rx busy if this bit is set, the cca counters 3,4,5 will be ++ only if txp_mtu_phytx_idle txp_mtu_phytx_idle = 1
6:4	CCA_COUNT5_SEL	these bits select the count enable to the cca_count5 3'b000: cca_count5_en_temp = cca_term0; 3'b001: cca_count5_en_temp = cca_term1; 3'b010: cca_count5_en_temp = cca_term2; 3'b011: cca_count5_en_temp = cca_term3; 3'b100: cca_count5_en_temp = cca_term4; 3'b101: cca_count5_en_temp = cca_term5; 3'b110: cca_count5_en_temp = cca_term6; 3'b111: cca_count5_en_temp = cca_term7; cca_count5_en_final = consider_rx_cca_only_345 ? (cca_count5_en_temp & ~txp_mtu_phytx_idle) : cca_count5_en_temp;
2:0	CCA_COUNT4_SEL	these bits select the count enable to the cca_count4 3'b000: cca_count4_en_temp = cca_term0; 3'b001: cca_count4_en_temp = cca_term1; 3'b010: cca_count4_en_temp = cca_term2; 3'b011: cca_count4_en_temp = cca_term3; 3'b100: cca_count4_en_temp = cca_term4; 3'b101: cca_count4_en_temp = cca_term5; 3'b110: cca_count4_en_temp = cca_term6; 3'b111: cca_count4_en_temp = cca_term7; cca_count4_en_final = consider_rx_cca_only_345 ? (cca_count4_en_temp & ~txp_mtu_phytx_idle) : cca_count4_en_temp;

0x0A08154C WCSS_A_MTU_TIMER_CONTROL11TO8**Type:** RW**Reset State:** 0x00000000

This register contains all the controls for the timers 11 to 8.

WCSS_A_MTU_TIMER_CONTROL11TO8

Bits	Name	Description
19:8	SW_MTU_CONTINUOUS_V ALID	One bit for timer. if this bit is set, the timer will be loaded either with zero or the corresponding match register(depending on up/down). Basically if this bit is set the timer works as divided by N

WCSS_A_MTU_TIMER_CONTROL11TO8 (cont.)

Bits	Name	Description
7:0	SW_MTU_BASIC_UNIT_SELECT11TO8	2 bit for each timer is provided. bit [1:0] for timer 0, bit [3:2] for timer 1... To make these timers more flexible, 3 basic units are provided. if the control =0, the timer will be stopped (this is the only way to disable the counters if the control =01, timer is ++ at every clk if the control =10, timer is ++ at every one us if the control =11, timer is ++ at every programmable pulse. Basically in this mode, the period of the pulse is also controlled by s/w. Note that this programmable pulse is only one for all the timers

0x0A081550 WCSS_A_MTU_MTU_GLOBAL_CONTROL**Type:** RW**Reset State:** 0x19000000

Contains the global controls for mtu

WCSS_A_MTU_MTU_GLOBAL_CONTROL

Bits	Name	Description
31:24	SW_MTU_SECONDARY_CCA_LIMIT	Whenever the secondary cca is high for this limit (in us) time, mtu_mcu_secondary_cca_to will be generated. This functionality is exactly similar to pifs to except that the cca used is always secondary
7:0	SW_MTU_SUPPRESS_RF_WARMUP	If this bit is set, mtu will not send rf_warmup to txp Any suggested value is welcome bitfield [19:12] sw_mtu_suppress_rf_warmup_for_collision configuration 8'b0 bitfieldComment If this bit is set, mtu will not send rf_warmup to txp for the collision case Any suggested value is welcome

0x0A081554 WCSS_A_MTU_MTU_INTERRUPT_STATUS11TO8**Type:** RW**Reset State:** 0x00000000

This register contains the status of all the interrupts that are generated by mtu Basically every interrupt has a corresponding register bit which will be set on sending interrupt pulse to the interrupt module and this bit is reset by writing '1' to it. sw has higher priority over hw

WCSS_A_MTU_MTU_INTERRUPT_STATUS11TO8

Bits	Name	Type	Description
31:17	TXP_SIFS_DELAY_CNT_FOR_INNAV	R	The internal count is exposed. Basically this counter keeps ++ after the rising edge of pkt_det. The resolution is one clock (it is 25ns in 40Mhz mode, 12.5 if mac is selected of 80Mhz)

WCSS_A_MTU_MTU_INTERRUPT_STATUS11TO8 (cont.)

Bits	Name	Type	Description
11:8	MTU_MCU_TSF_INT_FLAG11TO8	RW	4 registers for upper 4 tsf based match register interrupts. bit 0 for match 0, 1 for match 1 ...
7:4	MTU_MCU_BKOF_INT_FLAG11TO8	RW	4 registers for upper 4 back off interrupts. bit 0 for timer 0, 1 for timer 1 ...
3:0	MTU_MCU_TIMER_INT_FLAG11TO8	RW	4 registers for upper 4 timer interrupts. bit 0 for timer 0, 1 for timer 1 ...

0x0A081558 WCSS_A_MTU_MTU_GLOBAL_CONTROL2**Type:** RW**Reset State:** 0x000000EE

Contains the global controls for mtu

WCSS_A_MTU_MTU_GLOBAL_CONTROL2

Bits	Name	Description
15:12	SW_MTU_RTS_NAV_TO_LIMIT_U	The upper bits of sw_mtu_rts_nav_to_limit
11	SW_MTU_IGNORE_NAV_FOR_EIFS_FCS	Set to 1 to ignore the nav_greater-than-64 check. Whenever rxp indicates that fcs error, the eifs selection will be set regardless of the nav count.
10	SW_MTU_CONSIDER_SKIP_DIFS	if this bit is set, the skip_difs from the rxp is used.. to take care of any bug in other module. Since this is not a main line function, better to have a protection
9	SW_MTU_SELECT_LATE_PKT_DET_FOR_ACK_TO	if this bit is set, the late_pkt_det is used for ack_to. By default the early_pkt-det should be used. This bit should never be set in the system. The configuration is provided for unknown flexibility.. Should be removed in the next spin atleast
8	SW_MTU_NAV_BASED_ON_RTS_VALID	The shadow_nav_cnt logic is enabled only when this bit is set. The nav update for RTS is done irrespective of this bit but the rts_nav_to logic is not enabled if this bit is set
7:0	SW_MTU_RTS_NAV_TO_LIMIT	This register represents the timeout count in the following On receiving an RTS based NAV, a shadow NAV counter will keep running the previous NAV setting. The RTS NAV will be used to set the NAV. A (Programmable) timeout counter is started. If no pkdet_n is detected before the timeout count expires, the shadow NAV will be used again to set the NAV. If a pkdet_n is seen before the timeout expires, the RTS based NAV will continue. The 'shadow' NAV can now be discarded. The default is a randomly chosen. Any suggested value is welcome

0x0A08155C WCSS_A_MTU_SW_MTU_SHADOW_NAV_CNT**Type:** RW**Reset State:** 0x000000FF

This register contains the nav value in shadow register NAV is updated by hw as well as by the s/w. s/w has higher priority over the h/w updates

WCSS_A_MTU_SW_MTU_SHADOW_NAV_CNT

Bits	Name	Description
31:0	SW_MTU_SHADOW_NAV_CNT	This register contains the nav value. There has to some default. So I kept ff The value is in micro seconds. This register just follows the nav_cnt but it will differ during the rts_nav update. When there is rts NAV update, the current NAV is copied to this register and keeps updated. If there is rts_nav_to, this value is copied to the nav_cnt.

0x0A081560 WCSS_A_MTU_PRIMARY_CCA_HISTOGRAM_LO**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the lower 32 bits of primary_cca_histogram

WCSS_A_MTU_PRIMARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	PRIMARY_CCA_HISTOGRAM31TO0	the primary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A081564 WCSS_A_MTU_PRIMARY_CCA_HISTOGRAM_HI**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the higher 32 bits of primary_cca_histogram

WCSS_A_MTU_PRIMARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	PRIMARY_CCA_HISTOGRAM63TO32	the primary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A081568 WCSS_A_MTU_SECONDARY_CCA_HISTOGRAM_LO**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the lower 32 bits of secondary_cca_histogram

WCSS_A_MTU_SECONDARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	SECONDARY_CCA_HISTOGRAM31TO0	the secondary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A08156C WCSS_A_MTU_SECONDARY_CCA_HISTOGRAM_HI**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the higher 32 bits of secondary_cca_histogram

WCSS_A_MTU_SECONDARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	SECONDARY_CCA_HISTOGRAM63TO32	the secondary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A081570 WCSS_A_MTU_TIMEOUT_LIMIT**Type:** RW**Reset State:** 0x000640F5

This register contains the Timeouts for rsp_to and ..

WCSS_A_MTU_TIMEOUT_LIMIT

Bits	Name	Description
24:10	SW_MTU_SIFS_LIMIT_FOR_WARMUP	This is the time within SIFS up to which we will mask out warmup (in clks) The default is 10 usec. This needs to be changed. Right now it is made same as what we have in Libra (10 usec) for 40Mhz clock ($25\text{ns} \times 4000 = 10,000\text{ns} = 10\text{usec}$). If the clock is 80Mhz, this should be $2 \times 400 = 800$
9	SW_MTU_NOT_A_BUG_FIX	if the interrupts are back to back, though it should not be, there is a corner case the system could hang. So configurable fix..

WCSS_A_MTU_TIMEOUT_LIMIT (cont.)

Bits	Name	Description
8	SW_MTU_FORGET_PKT_DET_TO	Since this logic is to take care of fsm lock or misbehavior of early pkt det, we don't want this to be enabled by default
7:0	SW_MTU_PKT_DET_TO_LIMIT	To make sure the fsm don't get in a loop while waiting for response time out, we use more reliable pkt_det from PHY and run a counter when the fsm is not in idle and the pkt_det is HIGH. When the counter reaches this limit, the fsm comes out and gives a time out interrupt to s/w. The default is f5. Basically a big value The limit is in micro seconds

0x0A081574 WCSS_A_MTU_CCA_FINAL_CONTROL_REG**Type:** RW**Reset State:** 0x00000000

this register contains the controls to select the final cca that needs to be used for a particular back_off engine

WCSS_A_MTU_CCA_FINAL_CONTROL_REG

Bits	Name	Description
23:0	SW_MTU_FINAL_CCA_SEL	3 bits for each back off. 2:0 for back off 0, 5:3 back off 1,... and so on 000 -- CCA 001 -- (CCA && early_pkt_det_n) 010 -- (CCA && pkt_det_n) 011 -- early_pkt_det_n 100 -- pkt_det_n 101 -- (CCA && (early_pkt_det_n ~last_slot_time)) 110 -- (CCA && pkt_det_n && (early_pkt_det_n ~last_slot_time))

0x0A08157C WCSS_A_MTU_EARLY_INTERRUPT_LIMITS**Type:** RW**Reset State:** 0x00050104

this register contains the time limits for early interrupt to s/w, txp back_off engine. The early interrupt to s/w is sw_mtu_early_sw_int_limit_us+sw_mtu_early_sw_int_limit_us_clks

WCSS_A_MTU_EARLY_INTERRUPT_LIMITS

Bits	Name	Description
21:16	SW_MTU_TXP_SIFS_WIDTH_LIMIT	sw_mtu_txp_sifs_flag will be set as per the limit. After this limit the flag will just follow the pkt_det
15:8	SW_MTU_EARLY_SW_INT_LIMIT_CLKS	This gives the delay in clks -- used by pifs and the back off interrupts See the comments in above field for mor info

WCSS_A_MTU_EARLY_INTERRUPT_LIMITS (cont.)

Bits	Name	Description
7:0	SW_MTU_EARLY_SW_INT_LIMIT_US	This gives the delay in microseconds -- used by back off interrupts basically an early slot pulse is generated whenever the the slot count == this limit and one_usec count == sw_mtu_early_sw_int_limit_clks. The sw_mtu_early_sw_int_limit_clks is used to provide a resolution of one clk. Since the one_usec counter is a down counter the programming should be in terms of delay. Basicall i we want .25 us early, we should program $1-.25 = .75 = 90$ clks(approx)

0x0A081580 WCSS_A_MTU_BTC_CONFIG_REGISTERS**Type:** RW**Reset State:** 0x00000000

this register contains the Controls for btc

WCSS_A_MTU_BTC_CONFIG_REGISTERS

Bits	Name	Description
25	SW_MTU_TX_GRANT_SEL	'0': select bt_active, '1': select lte_tx_grant signal for sw_mtu_btc_cca_control
24	SW_MTU_CONSIDER_QUATERNARY_CCA	If this is set rxp_mtu_quaternary_cca is considered in generation of mtu_btc_tx_rx_busy
23	SW_MTU_CONSIDER_TERTIARY_CCA	If this is set rxp_mtu_tertiary_cca is considered in generation of mtu_btc_tx_rx_busy
22	SW_MTU_BTC_PIFS_CONTROL	If this is set the final btc signals are considered in pifs. To consider both high and low prio sw_mtu_consider_low_pri_btc_active also need to be set
21:6	SW_MTU_BTC_CCA_CONTROL	This controls the ANDING of BTC to CCA of the 8 back-offs 2 bits for each back-off (Only 8 nack-offs are considered) 21:6 00 --> don't consider btc from mcu/btc 01 --> Just simply aND with CCA 10 --> Don't consider till the slot count = 1
5	SW_MTU_CONSIDER_SECONDARYCCA	If this is set rxp_mtu_secondary_cca is considered in generation of mtu_btc_tx_rx_busy
4	SW_MTU_CONSIDER_PRIMARYCCA	If this is set rxp_mtu_primary_cca is considered in generation of mtu_btc_tx_rx_busy
3	SW_MTU_CONSIDER_EARLYPKTDETN	If this is set rxp_mtu_early_pktdet_n is considered in generation of mtu_btc_tx_rx_busy
2	SW_MTU_CONSIDER_PKTDETN	If this is set rxp_mtu_pktdet_n is considered in generation of mtu_btc_tx_rx_busy
1	SW_MTU_CONSIDER_PHYTXIDLE	If this is set txp_mtu_phytx_idle is considered in generation of mtu_btc_tx_rx_busy

WCSS_A_MTU_BTC_CONFIG_REGISTERS (cont.)

Bits	Name	Description
0	SW_MTU_CONSIDER_NAV_ACTIVE	If this is set nav_active is considered in generation of mtu_btc_tx_rx_busy

0x0A08158C WCSS_A_MTU_MTU_FOR_HMAC_CONTROLS**Type:** RW**Reset State:** 0xFF181003

This register contains the new registers that are added for hmac -- gen5/6

WCSS_A_MTU_MTU_FOR_HMAC_CONTROLS

Bits	Name	Description
31:24	SW_MTU_HW_BACKOFF_VALID	if this bit is set the hw back-offs will be enabled. By default this bit is enabled One per backoff.
20	SW_MTU_ALLOW_PMU_DISABLE	When cleared, the tsf timer will be always running When set, the tsf timer will be run when pmu_mtu_tsf_timer_en is asserted.
19	SW_MTU_ALLOW_PMU_UPDATE	For UAPSD, we allowed PMU to be able to restore the tsf in MTU. This is made programmable to avoid any issues with this
17	SW_MTU_BTAMP_MODE	When set, indicates it's in bt-amp mode.
16	SW_MTU_SLR_LIMITS_ARE_VALID	SLR limits are valid only if this bit is set and the data rate is SLR
15:8	SW_MTU_SLR_EARLY_PKT_DET_MISS_LIMIT	this is used in respons_to(ack_to) logic for SLR if the system is expecting a response and if the early pkt_det is HIGH for this limit, an interrupt is generated (old name is cca_miss_limit) Units are 4 usec
7	SW_MTU_CONSIDER_LSIG_CCA	only when this bit is set, the lsig from phy is considered in MTU
6	SW_MTU_CONSIDER_LOW_PRI_BTC_ACTIVE	only when this bit is set, the mcu_mtu_bt_low_pri_active is considered in generation of final cca
5	SW_MTU_IBSS_VALID	If this bit is set the back-off 0 is assigned for beacon...
4	SW_MTU_DTIM_CNT_EN	Enables dtim counter. This bit needs to be set to enable dtim logic to be enabled
2:0	SW_RSP_TO_CONSIDER_VECTOR	This register contains valid vector for ack_to. Basically bit 0 -- corresponds to mtu_mcu_timeout_missing_early_pkt_det_p bit 1 -- corresponds to mtu_mcu_timeout_missing_push_p bit 2 -- corresponds to mtu_mcu_timeout_pkt_det_p

0x0A081590 WCSS_A_MTU_MTU_DTIM_CNT_AND_PERIOD**Type:** RW**Reset State:** 0x00000001

This register contains dtim_cnt dtim_period

WCSS_A_MTU_MTU_DTIM_CNT_AND_PERIOD

Bits	Name	Description
31:16	DTIM_CNT	Basically this is the internal dtim counter. basically whenever this counter reaches, dtim_period -1 is loaded. this keeps ++ at every tbtt
15:0	DTIM_PERIOD	This register contains the dtim period. The period is defined in number of beacons if this is 1, every beacon is DTIM. 2 means alternate beacons are dtim

0x0A081594 WCSS_A_MTU_DTIM_THRSH_CNT_AND_LIMIT**Type:** RW**Reset State:** 0x00000000

This register contains dtim_thrsh_limit and dtim_thrsh_limit

WCSS_A_MTU_DTIM_THRSH_CNT_AND_LIMIT

Bits	Name	Description
31:16	DTIM_THRSH_CNT	Internal counter ++ at every usec to keep track of the dtim_thrsh_limit. This counter is effective only when sw_mtu_dtim_cnt_en is 1
15:0	DTIM_THRSH_LIMIT	This register contains the dtim_thrsh_limit. This number indicates the time in usec. Basically this number indicates upto what time during the DTIM beacon, MC and BC can be ransmited

0x0A081598 WCSS_A_MTU_TBTT_L**Type:** RW**Reset State:** 0x7FFFFFFF

Lower 32 bits of tbtt register

WCSS_A_MTU_TBTT_L

Bits	Name	Description
31:0	TBTT_L	Lower 32 bits of TBTT register.

0x0A08159C WCSS_A_MTU_TBTT_H**Type:** RW**Reset State:** 0x00000000

Upper 32 bits of tbtt resgiter

WCSS_A_MTU_TBTT_H

Bits	Name	Description
31:0	TBTT_H	Upper 32 bits of TBTT register.

0x0A0815A0 WCSS_A_MTU_M_TBTT_L**Type:** RW**Reset State:** 0x7FFFFFFF

Lower 32 bits of multiple bssid tbtt register

WCSS_A_MTU_M_TBTT_L

Bits	Name	Description
31:0	M_TBTT_L	Lower 32 bits of TBTT register.

0x0A0815A4 WCSS_A_MTU_M_TBTT_H**Type:** RW**Reset State:** 0x00000000

Upper 32 bits of multiple bssid tbtt resgiter

WCSS_A_MTU_M_TBTT_H

Bits	Name	Description
31:0	M_TBTT_H	Upper 32 bits of TBTT register.

0x0A0815A8 WCSS_A_MTU_BCN_BSSID_INTV**Type:** RW**Reset State:** 0x00100064

Beacon Interval Register is programmed by s/w and it determined the period between two consecutive TBTT. This also contains the mbssid interval in usec

WCSS_A_MTU_BCN_BSSID_INTV

Bits	Name	Description
29	SW_MTU_MBSSID_ENABLE	Multiple bssid are enabled only when this bit is set
28	SW_MTU_TBTT_ENABLE	Beacons are enabled only when this bit is set
27:24	SW_MTU_MAX_BSSIDS	Beacons are enabled only when this bit is set
23:16	SW_MTU_BSSID_INTV	This bits determine the period between two consecutive beacons of different bssids. This value is in n 256 micro seconds. Each count is 256 usec
15:0	SW_MTU_BEACON_INTV	This bits determine the period between two consecutive beacon. This value is in ms message.

0x0A0815AC WCSS_A_MTU_VALID_BSSID_BITMAP**Type:** RW**Reset State:** 0x00070001

This register contains the valid bssids in the system

WCSS_A_MTU_VALID_BSSID_BITMAP

Bits	Name	Description
31:16	IBSS_BCN_CW_LIMIT	This register contains the cw limit for ibss
15:0	SW_MTU_VALID_BSSID_BITMAP	A 16 bit register indicates which bssid is enabled Bit 0 should be enabled for single bssid By default only one bssid is enabled message.

0x0A0815B0 WCSS_A_MTU_IBSS_BKOF_CNT**Type:** RW**Reset State:** 0x00000000

This register contains the bkof_cnt of ibss . The units are slot number.

WCSS_A_MTU_IBSS_BKOF_CNT

Bits	Name	Description
15:0	IBSS_BKOF_CNT	This register contains the bkof_counter value for the ibss_bkof_cnt this value = (lfsr_data & lfsr_value)

0x0A0815B4 WCSS_A_MTU_LFSR_DATA_1_0**Type:** R**Reset State:** 0x00000000

This register contains the lfsr_data of bkof 1 and 0.

WCSS_A_MTU_LFSR_DATA_1_0

Bits	Name	Description
31:16	LFSR_DATA_1	This register contains the lfsr_data value for the bkof_1
15:0	LFSR_DATA_0	This register contains the lfsr_data value for the bkof_0

0x0A0815B8 WCSS_A_MTU_LFSR_DATA_3_2**Type:** R**Reset State:** 0x00000000

This register contains the lfsr_data of bkof 3 and 2.

WCSS_A_MTU_LFSR_DATA_3_2

Bits	Name	Description
31:16	LFSR_DATA_3	This register contains the lfsr_data value for the bkof_3
15:0	LFSR_DATA_2	This register contains the lfsr_data value for the bkof_2

0x0A0815BC WCSS_A_MTU_LFSR_DATA_5_4**Type:** R**Reset State:** 0x00000000

This register contains the lfsr_data of bkof 5 and 4.

WCSS_A_MTU_LFSR_DATA_5_4

Bits	Name	Description
31:16	LFSR_DATA_5	This register contains the lfsr_data value for the bkof_5
15:0	LFSR_DATA_4	This register contains the lfsr_data value for the bkof_4

0x0A0815C0 WCSS_A_MTU_LFSR_DATA_7_6**Type:** R**Reset State:** 0x00000000

This register contains the lfsr_data of bkof 7 and 6.

WCSS_A_MTU_LFSR_DATA_7_6

Bits	Name	Description
31:16	LFSR_DATA_7	This register contains the lfsr_data value for the bkof_7
15:0	LFSR_DATA_6	This register contains the lfsr_data value for the bkof_6

0x0A0815C4 WCSS_A_MTU_LONG_SHORT_XMIT_LIMIT_BKOF_3_TO_0**Type:** R**Reset State:** 0x47474747

This register contains the sort and long retry limts for backoff cw adjustment

WCSS_A_MTU_LONG_SHORT_XMIT_LIMIT_BKOF_3_TO_0

Bits	Name	Description
31:0	SW_LONG_SHORT_XMIT_LIMIT_BKOF_3_TO_0	This register contains the short and long retrylimts for bkof-3 to 0. 3:0 is short, 7:4 is long for back off 0. 11:8 is short, 15:12 is long for back off 1. 19:16 is short, 23:20 is long for back off 2. 27:24 is short, 31:28 is long for back off 3.

0x0A0815C8 WCSS_A_MTU_LONG_SHORT_XMIT_LIMIT_BKOF_7_TO_4**Type:** R**Reset State:** 0x47474747

This register contains the sort and long retry limts for backoff cw adjustment

WCSS_A_MTU_LONG_SHORT_XMIT_LIMIT_BKOF_7_TO_4

Bits	Name	Description
31:0	SW_LONG_SHORT_XMIT_LIMIT_BKOF_7_TO_4	This register contains the short and long retrylimts for bkof-7 to 4. 3:0 is short, 7:4 is long for back off 4. 11:8 is short, 15:12 is long for back off 5. 19:16 is short, 23:20 is long for back off 6. 27:24 is short, 31:28 is long for back off 7.

0x0A0815CC WCSS_A_MTU_WARMUP_LIMIT**Type:** RW**Reset State:** 0x00000025

This register contains the threshold number for txp_mpi_rf_warmup.

WCSS_A_MTU_WARMUP_LIMIT

Bits	Name	Type	Description
11:8	TXP_MPI_RF_WARMUP_COUNTER	R	counter number of txp_mpi_rf_warmup high duration.
7	TXP_MPI_RF_WARMUP_LOW_FLAG	R	When assert, indicates the duration of txp_mpi_rf_warmup is less than sw_mtu_warmup_thrd_low.
6	TXP_MPI_RF_WARMUP_HIGH_FLAG	R	When assert, indicates the duration of txp_mpi_rf_warmup is longer than sw_mtu_warmup_thrd_high.
5:4	SW_MTU_WARMUP_THRD_LOW	RW	This register contains the lower limit value (in unit of usec) for txp_mpi_rf_warmup.
3:0	SW_MTU_WARMUP_THRD_HIGH	RW	This register contains the upper limit value (in unit of usec) for txp_mpi_rf_warmup.

0x0A0815D0 WCSS_A_MTU_ONE_SEC_LIMIT**Type:** RW**Reset State:** 0x000F423F

This register contains the threshold number for one_sec pulse

WCSS_A_MTU_ONE_SEC_LIMIT

Bits	Name	Description
19:0	SW_MTU_ONE_SEC_LIMIT	limit value to be programmed to get one sec pulse. Basically this is number of usec. this value is loaded into a counter and keep getting decremented at every one_usec_p.

0x0A0815D4 WCSS_A_MTU_MTU_GLOBAL_TIMER**Type:** RW**Reset State:** 0x00000000

This register contains a global timer to be used by all modules including s/w if it wants

WCSS_A_MTU_MTU_GLOBAL_TIMER

Bits	Name	Description
31:0	MTU_GLOBAL_TIMER	This is a global timer increments at every one usec. This is different from tsf timer

0x0A0815D8 WCSS_A_MTU_TSF_TIMER_FOR_SIM_BSS_LO**Type:** RW**Reset State:** 0x00000000

This register contains the lower 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid

WCSS_A_MTU_TSF_TIMER_FOR_SIM_BSS_LO

Bits	Name	Description
31:0	TSF_TIMER_FOR_SIM_BSS_LO	This register contains the lower 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid

0x0A0815DC WCSS_A_MTU_TSF_TIMER_FOR_SIM_BSS_HI**Type:** RW**Reset State:** 0x00000000

This register contains the uppder 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid

WCSS_A_MTU_TSF_TIMER_FOR_SIM_BSS_HI

Bits	Name	Description
31:0	TSF_TIMER_FOR_SIM_BSS_HI	This register contains the uppder 32 bits of the tsf timer used only during simultaneous bss and ibss mode This corresponds to BSS tsf during simultaneous mode. In none Simultaneous mode, this is not valid

0x0A0815E0 WCSS_A_MTU_SW_MTU_SIFS_LIMIT_FORINNAV**Type:** RW**Reset State:** 0x00000190

This is register that contains the SIFS Limit specified in number of clocks rather than in usec

WCSS_A_MTU_SW_MTU_SIFS_LIMIT_FORINNAV

Bits	Name	Description
14:0	SW_MTU_SIFS_LIMIT_FORINNAV	This is register that contains the SIFS Limit specified in number of clocks rather than in usec The default is 15 usec. This needs to be changed. Right now it is made same as what we have in Libra (14 usec) for 40Mhz clock ($25\text{ns} \times 560 = 14,000\text{ns} = 14\text{usec}$). If the clock is 80Mhz, this should be $2 \times 560 = 1130$

0x0A0815E4 WCSS_A_MTU_SW_MTU_P2P_GO_TSF_TIMER_LO

Type: RW

Reset State: 0x00000000

This is register that contains the lower 32 bits of the p2p group owner tsf timer

WCSS_A_MTU_SW_MTU_P2P_GO_TSF_TIMER_LO

Bits	Name	Description
31:0	P2P_GO_TSF_TIMER_LO	The lower 32 bits of the p2p group owner tsf timer In unit of us.

0x0A0815E8 WCSS_A_MTU_SW_MTU_P2P_GO_TSF_TIMER_HI

Type: RW

Reset State: 0x00000000

This is register that contains the upper 32 bits of the p2p group owner tsf timer

WCSS_A_MTU_SW_MTU_P2P_GO_TSF_TIMER_HI

Bits	Name	Description
31:0	P2P_GO_TSF_TIMER_HI	The upper 32 bits of the p2p group owner tsf timer In unit of us.

0x0A0815EC WCSS_A_MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_LO

Type: RW

Reset State: 0x00000000

This is register that contains the lower 32 bits of the p2p client owner tsf timer

WCSS_A_MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_LO

Bits	Name	Description
31:0	P2P_CLIENT_TSF_TIMER_LO	The lower 32 bits of the p2p client owner tsf timer In unit of us.

0x0A0815F0 WCSS_A_MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_HI**Type:** RW**Reset State:** 0x00000000

This is register that contains the upper 32 bits of the p2p client owner tsf timer

WCSS_A_MTU_SW_MTU_P2P_CLIENT_TSF_TIMER_HI

Bits	Name	Description
31:0	P2P_CLIENT_TSF_TIMER_HI	The upper 32 bits of the p2p client owner tsf timer In unit of us.

0x0A0815F4 WCSS_A_MTU_SW_MTU_P2P_CTRL**Type:** RW**Reset State:** 0x00000040

This is register that contains the control bits for p2p feature

WCSS_A_MTU_SW_MTU_P2P_CTRL

Bits	Name	Description
27	SW_MTU_BSS2_CLIENT_TSF_TIMER_EN	Set 1 to enable the bss2 client tsf timer
26	P2P_TSF_INSERTION_SEL_HI	upper bit to select the tsf value to be inserted in beacons in TPE
25	LTE_TSF_INSERTION_SEL_HI	upper bit to select the tsf value to be provided to lte csm
24	TSF_FOR_TBTT_SEL_HI	upper bit to select the tsf to be used for tbtt
23:21	TSF_FOR_MBSSID_TBTT_SEL	To select the tsf to be used for mbssid tbtt 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100 : BSS2 TSF
20:19	TSF_FOR_TBTT_SEL	Lower bits to select the tsf to be used for tbtt 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100 : BSS2 TSF

WCSS_A_MTU_SW_MTU_P2P_CTRL (cont.)

Bits	Name	Description
18:17	LTE_TSF_INSERTION_SEL	Lower bits to select the TSF value to be provided to lte csm 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100 : BSS2 TSF
16	SW_BEACON_TRANSMIT_EN	Writing a '1' to trigger a beacon transmission. Always read zero
15:8	P2P_TX_BOUNDARY_THR ESHOLD	The bcoff will be disabled after the transmit_boundary_timer reaches this value
6:4	GLOBAL_TIMER_SRC_SEL	To select the source for the global timer 3'b000: BSS TSF; 3'b001: IBSS TSF; 3'b010: P2P group owner TSF; 3'b011: P2P client TSF 3'b100: internal timer; 3'b101: BSS2 TSF
3:2	P2P_TSF_INSERTION_SEL	Lower bits to select the TSF value to be inserted in beacons in TPE 3'b00: BSS TSF; 3'b01: IBSS TSF; 3'b10: P2P group owner TSF; 3'b11: P2P client TSF 3'b100 : BSS2 TSF
1	P2P_CLIENT_TSF_TIMER_EN	Set to 1 to enable the p2p client timer
0	P2P_GO_TSF_TIMER_EN	Set to 1 to enable the p2p group owner timer

0x0A0815F8 WCSS_A_MTU_SW_MTU_P2P_TRANSMIT_BOUNDARY**Type:** RW**Reset State:** 0x00000000

This is register that contains the config bits of the transmit boundary timer

WCSS_A_MTU_SW_MTU_P2P_TRANSMIT_BOUNDARY

Bits	Name	Description
31	P2P_TRANSMIT_BOUNDARY_EN	Set 1 to enable the transmit boundary feature.
27:20	P2P_INT_BOUNDARY	When the counter reaches this value, an interrupt will be generated. In unit of us.
18:0	P2P_TRANSMIT_BOUNDARY	A down counter that SW can program so that no frame exchanges will go over this boundary. When value 0 is reached, no more transmissions happen, until a new none zero value is programmed or this feature is disabled. In unit of us.

0x0A0815FC WCSS_A_MTU_SW_MTU_P2P_WAIT_FOR_BEACON**Type:** RW**Reset State:** 0x00020000

This is register that contains the config bits of the wait for beacon timer

WCSS_A_MTU_SW_MTU_P2P_WAIT_FOR_BEACON

Bits	Name	Description
31	P2P_WAIT_FOR_BEACON_EN	Set 1 to enable the wait for beacon feature.
17:16	P2P_WAIT_FOR_BEACON_SEL	To select which beacon to wait for. 2'b00: IBSS beacon, 2'b01: BSS beacon, 2'b10: p2p client beacon, 2'b11: bss2 client beacon.
15:0	P2P_MAX_WAIT_DURATION	max duration of waiting for the p2p beacon. Start at p2p tbtt. In unit of us.

0x0A081600 WCSS_A_MTU_TERTIARY_CCA_HISTOGRAM_LO**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the lower 32 bits of tertiary_cca_histogram

WCSS_A_MTU_TERTIARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	TERTIARY_CCA_HISTOGRAM31TO0	the tertiary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A081604 WCSS_A_MTU_TERTIARY_CCA_HISTOGRAM_HI**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the higher 32 bits of tertiary_cca_histogram

WCSS_A_MTU_TERTIARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	TERTIARY_CCA_HISTOGRAM63TO32	the tertiary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A081608 WCSS_A_MTU_QUATERNARY_CCA_HISTOGRAM_LO**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the lower 32 bits of quaternary_cca_histogram

WCSS_A_MTU_QUATERNARY_CCA_HISTOGRAM_LO

Bits	Name	Description
31:0	QUATERNARY_CCA_HISTOGRAM31TO0	the quaternary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A08160C WCSS_A_MTU_QUATERNARY_CCA_HISTOGRAM_HI**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the higher 32 bits of quaternary_cca_histogram

WCSS_A_MTU_QUATERNARY_CCA_HISTOGRAM_HI

Bits	Name	Description
31:0	QUATERNARY_CCA_HISTOGRAM63TO32	the quaternary cca is sampled at every slot time and shifted through a shift register s/w can read the shift register value through this address

0x0A081610 WCSS_A_MTU_MTU_CCA_CONTROL**Type:** RW**Reset State:** 0x00001919

Contains the 3rd and 4th cca controls for mtu

WCSS_A_MTU_MTU_CCA_CONTROL

Bits	Name	Description
23:16	SW_MTU_RAW_CCA_SEL_NEW	Work with cca_control_reg.sw_mtu_raw_cca_sel to select the cca for backoffs. bit16 for bkof0, bit17 for bkof1 ...
15:8	SW_MTU_QUATERNARY_CCA_LIMIT	Whenever the quaternary cca is high for this limit (in us) time, mtu_mcu_quaternary_cca_to will be generated.
7:0	SW_MTU_TERTIARY_CCA_LIMIT	Whenever the tertiary cca is high for this limit (in us) time, mtu_mcu_tertiary_cca_to will be generated.

0x0A081614 WCSS_A_MTU_MTU_CCA_STATUS**Type:** R**Reset State:** 0x00000000

Contains the 3rd and 4th cca status for mtu

WCSS_A_MTU_MTU_CCA_STATUS

Bits	Name	Description
1	QUATERNARY_CCA_TO	the quaternary_cca_to is sampled and s/w can read its status through this register
0	TERTIARY_CCA_TO	the tertiary_cca_to is sampled and s/w can read its status through this register

0x0A081618 WCSS_A_MTU_ADD_TSF_TIMER_LO**Type:** RW**Reset State:** 0x00000000

This register contains the lower 32 bits of the value to be added to the tsf timer

WCSS_A_MTU_ADD_TSF_TIMER_LO

Bits	Name	Description
31:0	ADD_TSF_TIMER_LO	This register contains the lower 32 bits of the value to be added to the tsf timer

0x0A08161C WCSS_A_MTU_ADD_TSF_TIMER_HI**Type:** RW**Reset State:** 0x00000000

This register contains the upper 32 bits of the value to be added to the tsf timer

WCSS_A_MTU_ADD_TSF_TIMER_HI

Bits	Name	Description
31:0	ADD_TSF_TIMER_HI	This register contains the upper 32 bits of the value to be added to the tsf timer

0x0A081620 WCSS_A_MTU_TSF_TIMER_CTRL**Type:** R**Reset State:** 0x00000000

This register control the add function to the tsf timer

WCSS_A_MTU_TSF_TIMER_CTRL

Bits	Name	Description
0	ADD_TSF_TIMER	Write 1 to this bit so the sum of the add_tsf_timer_[hi lo] value and the current tsf timer will be loaded to the tsf timer.

0x0A081624 WCSS_A_MTU_MTU_LTE_CXM_TSF_LOW**Type:** R**Reset State:** 0x00000000

This register contains the lower 32-bits tsf value captured by the coex_frame_sync signal

WCSS_A_MTU_MTU_LTE_CXM_TSF_LOW

Bits	Name	Description
31:0	MTU_LTE_CXM_TSF_LOW	The lower 32-bits tsf value captured by the capture_clk signal

0x0A081628 WCSS_A_MTU_MTU_LTE_CXM_TSF_HIGH**Type:** R**Reset State:** 0x00000000

This register contains the upper 32-bits tsf value captured by the coex_frame_sync signal

WCSS_A_MTU_MTU_LTE_CXM_TSF_HIGH

Bits	Name	Description
31:0	MTU_LTE_CXM_TSF_HIGH	The upper 32-bits tsf value captured by the capture_clk signal

0x0A08162C WCSS_A_MTU_SW_SECONDARY_CCA_HISTOGRAM_MASK**Type:** RW**Reset State:** 0x0007F800

This register contains the mask bits of the secondary cca histogram for the bw signaling frame exchange

WCSS_A_MTU_SW_SECONDARY_CCA_HISTOGRAM_MASK

Bits	Name	Description
31:0	SW_SECONDARY_CCA_HISTOGRAM_MASK	The mask bits for the secondary cca histogram for 6mbps rts data (sampling rate is from sw_cca_histogram_mask_misc.cca_histogram_sampling_rate)

0x0A081630 WCSS_A_MTU_SW_TERTIARY_CCA_HISTOGRAM_MASK**Type:** RW**Reset State:** 0x0007F800

This register contains the mask bits of the tertiary cca histogram for the bw signaling frame exchange

WCSS_A_MTU_SW_TERTIARY_CCA_HISTOGRAM_MASK

Bits	Name	Description
31:0	SW_TERTIARY_CCA_HISTOGRAM_MASK	The mask bits for the tertiary cca histogram for 6mbps rts data (sampling rate is from sw_cca_histogram_mask_misc.cca_histogram_sampling_rate)

0x0A081634 WCSS_A_MTU_SW_QUATERNARY_CCA_HISTOGRAM_MASK**Type:** RW**Reset State:** 0x0007F800

This register contains the mask bits of the quaternary cca histogram for the bw signaling frame exchange

WCSS_A_MTU_SW_QUATERNARY_CCA_HISTOGRAM_MASK

Bits	Name	Description
31:0	SW_QUATERNARY_CCA_HISTOGRAM_MASK	The mask bits for the quaternary cca histogram for 6mbps rts data (sampling rate is from sw_cca_histogram_mask_misc.cca_histogram_sampling_rate)

0x0A081638 WCSS_A_MTU_SW_CCA_HISTOGRAM_MASK_MISC**Type:** RW**Reset State:** 0x00000302

This register contains the shift value of the cca histogram for the bw signaling frame exchange

WCSS_A_MTU_SW_CCA_HISTOGRAM_MASK_MISC

Bits	Name	Type	Description
13:8	SW_CCA_HISTOGRAM_SAMPLING_RATE	RW	cca histogram sampling rate in unit of usec
6	MTU_TPE_80MHZ_CCA_IS_IDLE_NON6MBPS	R	The 80mhz cca status (masked and shift)
5	MTU_TPE_40MHZ_CCA_IS_IDLE_NON6MBPS	R	The 40mhz cca status (masked and shift)
4	MTU_TPE_80MHZ_CCA_IS_IDLE_6MBPS	R	The 80mhz cca status (masked without shift)
3	MTU_TPE_40MHZ_CCA_IS_IDLE_6MBPS	R	The 40mhz cca status (masked without shift)
2:0	SW_CCA_HISTOGRAM_MASK_SHIFT	RW	Right shift the mask bits of the cca histogram for non-6mbps rts data

0x0A08163C WCSS_A_MTU_CCA_SECONDARY_HISTOGRAM**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the secondary cca histogram

WCSS_A_MTU_CCA_SECONDARY_HISTOGRAM

Bits	Name	Description
31:0	CCA_SECONDARY_HISTOGRAM	The secondary cca is sampled at every 2us time and shifted through a shift register

0x0A081640 WCSS_A_MTU_CCA_TERTIARY_HISTOGRAM**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the tertiary cca histogram

WCSS_A_MTU_CCA_TERTIARY_HISTOGRAM

Bits	Name	Description
31:0	CCA_TERTIARY_HISTOGRAM	The tertiary cca is sampled at every 3us time and shifted through a shift register

0x0A081644 WCSS_A_MTU_CCA_QUATERNARY_HISTOGRAM**Type:** R**Reset State:** 0xFFFFFFFF

This register contains the quaternary cca histogram

WCSS_A_MTU_CCA_QUATERNARY_HISTOGRAM

Bits	Name	Description
31:0	CCA_QUATERNARY_HISTOGRAM	The quaternary cca is sampled at every 3us time and shifted through a shift register

0x0A081648 WCSS_A_MTU_MTU_MISC_FOR_TVWS_1**Type:** RW**Reset State:** 0x00000000

This register contains the upper bits of the sifs/slot time related register bits for 11j/11af

WCSS_A_MTU_MTU_MISC_FOR_TVWS_1

Bits	Name	Description
31:28	SW_MTU_PUSH_MISS_LIMIT	The upper bits of sw_mtu_misc_limits.sw_mtu_push_miss_limit
27:24	SW_MTU_PKT_DET_TO_LIMIT	The upper bits of timeout_limit.sw_mtu_pkt_det_to_limit
23:20	SW_MTU_EARLY_PKT_DET_MISS_LIMIT	The upper bits of sw_mtu_bcn_slot_usec_sifs_limit.sw_mtu_early_pkt_det_miss_limit
19	SW_MTU_QUATERNARY_CCA_LIMIT	The upper bits of secpmdu cca limit for mtu_cca_control.sw_mtu_quaternary_cca_limit
18	SW_MTU_TERTIARY_CCA_LIMIT	The upper bits of secpmdu cca limit for mtu_cca_control.sw_mtu_tertiary_cca_limit
17	SW_MTU_SECONDARY_CCA_LIMIT	The upper bits of secpmdu cca limit for mtu_global_control.sw_mtu_secondary_cca_limit
16	SW_MTU_PIFS_LIMIT	The upper bits of pifs limit for eifs_pifs_slot_limit.sw_mtu_pifs_limit
15:0	DIFS_LIMIT_0TO7	The upper bits of difs limit for backoff0-7 [1:0] for bkof0, [3:2] for bkof1, [15:14] for bkof7

0x0A08164C WCSS_A_MTU_CCA_COUNTER3**Type:** RW**Reset State:** 0x00000000

this register contains the primary cca count. the primary cca is sampled at every us and incremented if the cca is LOW

WCSS_A_MTU_CCA_COUNTER3

Bits	Name	Description
31:0	CCA_COUNTER3	contains the cca primary counter. s/w write has higher periority over h/w update

0x0A081650 WCSS_A_MTU_CCA_COUNTER4**Type:** RW**Reset State:** 0x00000000

this register contains the cca count. the selection to the cca used by this counter is programmable - --

WCSS_A_MTU_CCA_COUNTER4

Bits	Name	Description
31:0	CCA_COUNTER4	depending on the cca_count4_sel-- a programmable bit, the enable to this counter is selected as shown below s/w write has higher periority over h/w update cca_term0 = ~rxp_mtu_secondary_cca; cca_term1 = ~rxp_mtu_secondary_cca & ~rxp_mtu_primary_cca; cca_term2 = rxp_mtu_secondary_cca & ~rxp_mtu_primary_cca; cca_term3 = ~rxp_mtu_secondary_cca cca_term4 = rxp_mtu_secondary_cca cca_term5 = ~cca_term1; cca_term6 = ~cca_term3; cca_term7 = ~cca_term4; cca_count3_en_temp = ~rxp_mtu_primary_cca; 3'b000: cca_count4_en_temp = cca_term0; 3'b001: cca_count4_en_temp = cca_term1; 3'b010: cca_count4_en_temp = cca_term2; 3'b011: cca_count4_en_temp = cca_term3; 3'b100: cca_count4_en_temp = cca_term4; 3'b101: cca_count4_en_temp = cca_term5; 3'b110: cca_count4_en_temp = cca_term6; 3'b111: cca_count4_en_temp = cca_term7; cca_count4_en_final = consider_rx_cca_only_345 ? (cca_count4_en_temp & ~txp_mtu_phytx_idle) : cca_count4_en_temp;

0x0A081654 WCSS_A_MTU_CCA_COUNTER5**Type:** RW**Reset State:** 0x00000000

this register contains the cca count. the selection to the cca used by this counter is programmable -
--

WCSS_A_MTU_CCA_COUNTER5

Bits	Name	Description
31:0	CCA_COUNTER5	depending on the cca_count5_sel-- a programmable bit, the enable to this counter is selected as shown below s/w write has higher periority over h/w update 3'b000: cca_count5_en_temp = ~rxp_mtu_primary_cca & ~rxp_mtu_secondary_cca & ~rxp_mtu_tertiary_cca & ~rxp_mtu_quaternary_cca; 3'b001: cca_count5_en_temp = ~rxp_mtu_tertiary_cca; 3'b010: cca_count5_en_temp = ~rxp_mtu_quaternary_cca; 3'b011: cca_count5_en_temp = ~rxp_mtu_tertiary_cca & ~rxp_mtu_quaternary_cca; 3'b100: cca_count5_en_temp = ~rxp_mtu_tertiary_cca 3'b101: cca_count5_en_temp = rxp_mtu_tertiary_cca & ~rxp_mtu_quaternary_cca; 3'b110: cca_count5_en_temp = rxp_mtu_tertiary_cca 3'b111: cca_count5_en_temp = 1'b0; cca_count5_en_final = consider_rx_cca_only_345 ? (cca_count5_en_temp & ~txp_mtu_phytx_idle) : cca_count5_en_temp;

0x0A081658 WCSS_A_MTU_BSS2_CLIENT_TSF_TIMER_LO

Type: RW

Reset State: 0x00000000

This register contains the lower 32 bits of the bss2 client tsf timer

WCSS_A_MTU_BSS2_CLIENT_TSF_TIMER_LO

Bits	Name	Description
31:0	BSS2_CLIENT_TSF_TIMER_LO	This register contains the lower 32 bits of bss2 client tsf timer

0x0A08165C WCSS_A_MTU_BSS2_CLIENT_TSF_TIMER_HI

Type: RW

Reset State: 0x00000000

This register contains the upper 32 bits of the bss2 client tsf timer

WCSS_A_MTU_BSS2_CLIENT_TSF_TIMER_HI

Bits	Name	Description
31:0	BSS2_CLIENT_TSF_TIMER_HI	This register contains the upper 32 bits of bss2 client tsf timer

0x0A081660 WCSS_A_MTU_QBOOST_CONTROL**Type:** RW**Reset State:** 0x00000000

This register contains the config bits for qboost

WCSS_A_MTU_QBOOST_CONTROL

Bits	Name	Description
15	QBOOST_EN	Set to 1 to enable the qboost feature
13:0	NAV_INCREASE_VALUE	In qboost, when the bmu_mtu_qboost_p signal is received, and the NAV counter value at that moment is smaller than this value, the NAV counter value gets set to the nav_increase_value

10.44 WCSS_A_PHYINT_PHYINT**0x0A015C00 WCSS_A_PHYINT_STATUS****Type:** RW**Reset State:** 0x0000

This register consolidates all the interrupt requests on Phy. All interrupt requests are active high. Interrupt bitfields ending in "_P" can be cleared by writing a "1" to the corresponding bit in this register. Interrupt bitfields not ending in "_P" must be cleared at source.

WCSS_A_PHYINT_STATUS

Bits	Name	Description
14	AGC_WATCHDOG_EXP	AGC FSM watchdog timer expired
13	PHYDBG_CAPTURE_DONE_P	Pronto2: When Phydbg completes a capture, it sets this interrupt. Useful for RTT3 channel-capture indication. Was: Txa header processor found a bad rate field from mpi data *** This interrupt does not exist in Gen5/6 ***
12	PMI_ALARM_P	The alarm condition in PMI
11	RCTL_ALARM_P	The alarm condition in RCTL
10	RBHPC_SOFEOTATN_P	The sof/eof interrupt from the RXB
9	TXCTL_ALARM_P	The interrupt from overall Tx Controller indicating error condition inside Phy TX
8	TACTL_ALARM_P	The interrupt from TACTL indicating error condition inside Phy Txa
7	MPI_MAXREQATN_P	The interrupt from MAC-Phy Interface (MPI) block indicating too many requests from txa or txb controller engines The threshold is configurable in mpi.reg

WCSS_A_PHYINT_STATUS (cont.)

Bits	Name	Description
6	MPI_WATCHDOG_P	The interrupt from MAC-Phy Interface (MPI) block indicating expiry of watchdog timer
5	MPI_TXPABORT_P	The interrupt from MAC-Phy Interface (MPI) block indicating Txp abort
4	TPC_ATN_P	The interrupt from Transmit Power Control (TPC) block signifying error in tpc loop convergence.
3	CAL_ATN_P	The interrupt from the Calibration (CAL) block signifying calibration failure.
2	AGC_RADARDET_P	Set whenever the AGC detects radar. *** This interrupt does not exist in Libra ***
1	AGC_CLRCHAN_P	Set whenever the channel is clear, i.e. CCA is high.
0	RFIF_CALIB_DONE_P	Interrupt from Iris on calibration completion. ** NOTE ** this bit is used for agc_pktdet_n interrupt in Virgo ** ** NOTE ** this bit was used for indicating vswr overload in Libra and Volans **

0x0A015C04 WCSS_A_PHYINT_FAST_MASK**Type:** RW**Reset State:** 0x0000

This register masks the Status register before the bits are combined to generate the fast interrupt to the embedded CPU. Setting a bit to "1" enables the interrupt, "0" masks the interrupt.

WCSS_A_PHYINT_FAST_MASK

Bits	Name	Description
14	AGC_WATCHDOG_EXP	Fast mask bit for bit[14] in STATUS register.
13	PHYDBG_CAPTURE_DONE_P	Fast mask bit for bit[13] in STATUS register.
12	PMI_ALARM_P	Fast mask bit for bit[12] in STATUS register.
11	RACTL_ALARM_P	Fast mask bit for bit[11] in STATUS register.
10	RBHPC_SOFEOFATN_P	Fast mask bit for bit[10] in STATUS register.
9	TXCTL_ALARM_P	Fast mask bit for bit[9] in STATUS register.
8	TACTL_ALARM_P	Fast mask bit for bit[8] in STATUS register.
7	MPI_MAXREQATN_P	Fast mask bit for bit[7] in STATUS register.
6	MPI_WATCHDOG_P	Fast mask bit for bit[6] in STATUS register.
5	MPI_TXPABORT_P	Fast mask bit for bit[5] in STATUS register.
4	TPC_ATN_P	Fast mask bit for bit[4] in STATUS register.

WCSS_A_PHYINT_FAST_MASK (cont.)

Bits	Name	Description
3	CAL_ATN_P	Fast mask bit for bit[3] in STATUS register.
2	AGC_RADARDET_P	Fast mask bit for bit[2] in STATUS register.
1	AGC_CLRCHAN_P	Fast mask bit for bit[1] in STATUS register.
0	RFIF_CALIB_DONE_P	Fast mask bit for bit[0] in STATUS register.

0x0A015C08 WCSS_A_PHYINT_SLOW_MASK**Type:** RW**Reset State:** 0x0000

This register masks the Status register before the bits are combined to generate the slow interrupt to the embedded CPU. Setting a bit to "1" enables the interrupt, "0" masks the interrupt.

WCSS_A_PHYINT_SLOW_MASK

Bits	Name	Description
14	AGC_WATCHDOG_EXP	Slow mask bit for bit[14] in STATUS register.
13	PHYDBG_CAPTURE_DONE_P	Slow mask bit for bit[13] in STATUS register.
12	PMI_ALARM_P	Slow mask bit for bit[12] in STATUS register.
11	RACTL_ALARM_P	Slow mask bit for bit[11] in STATUS register.
10	RBHPC_SOFEOFATN_P	Slow mask bit for bit[10] in STATUS register.
9	TXCTL_ALARM_P	Slow mask bit for bit[9] in STATUS register.
8	TACTL_ALARM_P	Slow mask bit for bit[8] in STATUS register.
7	MPI_MAXREQATN_P	Slow mask bit for bit[7] in STATUS register.
6	MPI_WATCHDOG_P	Slow mask bit for bit[6] in STATUS register.
5	MPI_TXPABORT_P	Slow mask bit for bit[5] in STATUS register.
4	TPC_ATN_P	Slow mask bit for bit[4] in STATUS register.
3	CAL_ATN_P	Slow mask bit for bit[3] in STATUS register.
2	AGC_RADARDET_P	Slow mask bit for bit[2] in STATUS register.
1	AGC_CLRCHAN_P	Slow mask bit for bit[1] in STATUS register.
0	RFIF_CALIB_DONE_P	Slow mask bit for bit[0] in STATUS register.

0x0A015C0C WCSS_A_PHYINT_HOST_MASK**Type:** RW**Reset State:** 0x0000

This register masks the Status register before the bits are combined to generate the PCI/USB interrupt to the Host processor. Setting a bit to "1" enables the interrupt, "0" masks the interrupt.

WCSS_A_PHYINT_HOST_MASK

Bits	Name	Description
14	AGC_WATCHDOG_EXP	Host mask bit for bit[14] in STATUS register.
13	PHYDBG_CAPTURE_DONE_P	Host mask bit for bit[13] in STATUS register.
12	PMI_ALARM_P	Host mask bit for bit[12] in STATUS register.
11	RACTL_ALARM_P	Host mask bit for bit[11] in STATUS register.
10	RBHPC_SOFEOFATN_P	Host interrupt mask bit for bit[10] in STATUS register.
9	TXCTL_ALARM_P	Host interrupt mask bit for bit[9] in STATUS register.
8	TACTL_ALARM_P	Host interrupt mask bit for bit[8] in STATUS register.
7	MPI_MAXREQATN_P	Host interrupt mask bit for bit[7] in STATUS register.
6	MPI_WATCHDOG_P	Host interrupt mask bit for bit[6] in STATUS register.
5	MPI_TXPABORT_P	Host interrupt mask bit for bit[5] in STATUS register.
4	TPC_ATN_P	Host interrupt mask bit for bit[4] in STATUS register.
3	CAL_ATN_P	Host interrupt mask bit for bit[3] in STATUS register.
2	AGC_RADARDET_P	Host interrupt mask bit for bit[2] in STATUS register.
1	AGC_CLRCHAN_P	Host interrupt mask bit for bit[1] in STATUS register.
0	RFIF_CALIB_DONE_P	Host interrupt mask bit for bit[0] in STATUS register.

10.45 WCSS_A_PMI_PMI**0x0A013800 WCSS_A_PMI_PMI_STATE****Type:** R**Reset State:** 0x00000000

Reflects the current value of the state machine.

WCSS_A_PMI_PMI_STATE

Bits	Name	Description
2:0	VALUE	PMI state.

0x0A013804 WCSS_A_PMI_RXA_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of single packets only.

WCSS_A_PMI_RXA_PKTS

Bits	Name	Description
15:0	COUNT	RXA single packet event counter.

0x0A01380C WCSS_A_PMI_RXB_PACKETS**Type:** W**Reset State:** 0x00000000

Counts number of RXB packets.

WCSS_A_PMI_RXB_PACKETS

Bits	Name	Description
15:0	COUNT	RXB packet start event counter.

0x0A013810 WCSS_A_PMI_RXA_DATA_VALID**Type:** W**Reset State:** 0x00000000

Counts number of RXA data valid pulses.

WCSS_A_PMI_RXA_DATA_VALID

Bits	Name	Description
15:0	COUNT	RXA data valid pulse counter.

0x0A013814 WCSS_A_PMI_RXB_DATA_VALID**Type:** W**Reset State:** 0x00000000

Counts number of RXB data valid pulses.

WCSS_A_PMI_RXB_DATA_VALID

Bits	Name	Description
15:0	COUNT	RXB data valid pulse counter.

0x0A013818 WCSS_A_PMI_RXP_SHUTOFF**Type:** W**Reset State:** 0x00000000

Counts number of RXP shutoff pulses.

WCSS_A_PMI_RXP_SHUTOFF

Bits	Name	Description
15:0	COUNT	RXP shutoff pulse counter.

0x0A01381C WCSS_A_PMI_RXP_MU_EOP**Type:** W**Reset State:** 0x00000000

Counts number of RXP MU end-of-packet pulses.

WCSS_A_PMI_RXP_MU_EOP

Bits	Name	Description
15:0	COUNT	RXP MU eop pulse counter.

0x0A013820 WCSS_A_PMI_PHY_STARTS**Type:** W**Reset State:** 0x00000000

Counts number of RXP start pulses issued.

WCSS_A_PMI_PHY_STARTS

Bits	Name	Description
15:0	COUNT	RXP start pulses counter.

0x0A013824 WCSS_A_PMI_PHY_DATA_VAL**Type:** W**Reset State:** 0x00000000

Counts number of RXP data valid pulses.

WCSS_A_PMI_PHY_DATA_VAL

Bits	Name	Description
15:0	COUNT	RXP data valid pulses counter.

0x0A013828 WCSS_A_PMI_PHY_ABORT**Type:** W**Reset State:** 0x00000000

Counts number of RXP abort pulses.

WCSS_A_PMI_PHY_ABORT

Bits	Name	Description
15:0	COUNT	RXP abort pulses counter.

0x0A01382C WCSS_A_PMI_PHY_INT**Type:** W**Reset State:** 0x00000000

Counts number of interrupt pulses.

WCSS_A_PMI_PHY_INT

Bits	Name	Description
15:0	COUNT	PHYINT interrupt pulses counter.

0x0A013830 WCSS_A_PMI_WATCHDOG_TIMEOUT_GENERAL**Type:** RW**Reset State:** 0x0000

Max duration of non-idle time for PMI state machine before abort generated. Duration defined as $(x \times 128 + 128)$ clocks, where x is the value in this register.

WCSS_A_PMI_WATCHDOG_TIMEOUT_GENERAL

Bits	Name	Description
15:0	VALUE	PMI state machine general timeout value (disabled by default).

0x0A013834 WCSS_A_PMI_WATCHDOG_TIMEOUT_11A**Type:** RW**Reset State:** 0x0015

Max duration of time between 11a data valids before abort generated. Duration defined as $(x \times 128 + 128)$ clocks, where x is the value in this register.

WCSS_A_PMI_WATCHDOG_TIMEOUT_11A

Bits	Name	Description
15:0	VALUE	PMI state machine 11a-dval timeout value (default value 21).

0x0A013838 WCSS_A_PMI_WATCHDOG_TIMEOUT_11B**Type:** RW**Reset State:** 0x002A

Max duration of time between 11b data valids before abort generated. Duration defined as $(x \times 128 + 128)$ clocks, where x is the value in this register.

WCSS_A_PMI_WATCHDOG_TIMEOUT_11B

Bits	Name	Description
15:0	VALUE	PMI state machine 11b-dval timeout value (default value 42).

0x0A01383C WCSS_A_PMI_DISABLE_FLAGS**Type:** RW**Reset State:** 0x0000

Various functionality enables.

WCSS_A_PMI_DISABLE_FLAGS

Bits	Name	Description
3	CRC_FORCE_NON_AMPD_U_FLAG	When asserted, this switch forces the crc checker to assume pactes are not AMPDUs. Used for testing 11ac packets generated by phydbg.
2	STATS_UPDATE_DISABLE_FLAG	When asserted, this switch disables updating of the stats APB registers in the PMI.
1	CRC_DISABLE_FLAG	When asserted, this switch disables CRC checking in the PMI.
0	RXP_DISABLE_FLAG	When asserted, this switch disables all output to the RXP.

0x0A013840 WCSS_A_PMI_CRC_FSM_RESET

Type: W

Reset State: 0x0000

Accessing this register will generate a pulse that resets the CRC FSM

WCSS_A_PMI_CRC_FSM_RESET

Bits	Name	Description
0	PULSE	

0x0A013844 WCSS_A_PMI_RXPKT_FILTER_LSW

Type: RW

Reset State: 0x0000

LS 2 bytes of the RX packet filter pattern for CRC check. All-zeros pattern disables filtering.

WCSS_A_PMI_RXPKT_FILTER_LSW

Bits	Name	Description
15:0	DATA	

0x0A013848 WCSS_A_PMI_RXPKT_FILTER_MSW

Type: RW

Reset State: 0x0000

MS 2 bytes of the RX packet filter pattern for CRC check. All-zeros pattern disables filtering.

WCSS_A_PMI_RXPKT_FILTER_MSW

Bits	Name	Description
15:0	DATA	

0x0A01384C WCSS_A_PMI_CRC_DONE**Type:** W**Reset State:** 0x00000000

Number of packets that completed the CRC check.

WCSS_A_PMI_CRC_DONE

Bits	Name	Description
15:0	COUNT	

0x0A013850 WCSS_A_PMI_CRC_PASS**Type:** W**Reset State:** 0x00000000

Number of packets that passed the CRC check.

WCSS_A_PMI_CRC_PASS

Bits	Name	Description
15:0	COUNT	

0x0A013854 WCSS_A_PMI_AMPDU_BAD**Type:** W**Reset State:** 0x00000000

Number of packets that failed the AMPDU CRC check.

WCSS_A_PMI_AMPDU_BAD

Bits	Name	Description
15:0	COUNT	

0x0A013858 WCSS_A_PMI_AMPDU_GOOD**Type:** W**Reset State:** 0x00000000

Number of packets that passed the AMPDU CRC check.

WCSS_A_PMI_AMPDU_GOOD

Bits	Name	Description
15:0	COUNT	

0x0A01385C WCSS_A_PMI_AMPDU_DONE**Type:** W**Reset State:** 0x00000000

Number of packets that completed the AMPDU CRC check.

WCSS_A_PMI_AMPDU_DONE

Bits	Name	Description
15:0	COUNT	

0x0A013860 WCSS_A_PMI_LAST_STATS0**Type:** R**Reset State:** 0x00000000

Last statistics data transferred to RXP, bits[15:0].

WCSS_A_PMI_LAST_STATS0

Bits	Name	Description
15:0	DATA	

0x0A013864 WCSS_A_PMI_LAST_STATS1**Type:** R**Reset State:** 0x00000000

Last statistics data transferred to RXP, bits[31:16].

WCSS_A_PMI_LAST_STATS1

Bits	Name	Description
15:0	DATA	

0x0A013868 WCSS_A_PMI_LAST_STATS2**Type:** R**Reset State:** 0x00000000

Last statistics data transferred to RXP, bits[47:32].

WCSS_A_PMI_LAST_STATS2

Bits	Name	Description
15:0	DATA	

0x0A01386C WCSS_A_PMI_LAST_STATS3**Type:** R**Reset State:** 0x00000000

Last statistics data transferred to RXP, bits[63:48].

WCSS_A_PMI_LAST_STATS3

Bits	Name	Description
15:0	DATA	

10.46 WCSS_A_QTA_QTA

0x0A080FC0 WCSS_A_QTA_INTR**Type:** RW**Reset State:** 0x00000000

Interrupt status register.

WCSS_A_QTA_INTR

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR	Receive FIFO Underflow interrupt status bit. Software must write a 1 to this bit to clear it.
25	RX_FIFO_OFLOW_INTR	Receive FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it.
24	RX_FIFO_RDY_INTR	Receive FIFO Ready interrupt status bit: Indicates when the Receive FIFO is ready to be drained of software characters. This interrupt is set every clock cycle while the FIFO fill level is greater than the Receive FIFO Trigger Level (rx_trig_level). Software must write a 1 to this bit to clear it.
17	TX_FIFO_OFLOW_INTR	Transmit FIFO Overflow interrupt status bit. Software must write a 1 to this bit to clear it.
16	TX_FIFO_RDY_INTR	Transmit FIFO Ready interrupt status bit: Indicates when the Transmit FIFO is ready to accept more software characters for transmission. This interrupt is set every clock cycle while the FIFO fill level is less than or equal to the Transmit FIFO Trigger Level (tx_trig_level). Software must write a 1 to this bit to clear it.
8	RX_HW_CHAR_INTR	Received Hardware Character interrupt status bit. Software must write a 1 to this bit to clear it.
1	PARITY_ERR_INTR	UART Parity Error interrupt status bit. Software must write a 1 to this bit to clear it.
0	FRAME_ERR_INTR	UART Frame Error interrupt status bit. Software must write a 1 to this bit to clear it.

0x0A080FC4 WCSS_A_QTA_INTR_EN**Type:** RW**Reset State:** 0x00000000

Interrupt enable register.

WCSS_A_QTA_INTR_EN

Bits	Name	Description
26	RX_FIFO_UFLOW_INTR_EN	Interrupt enable for the Receive FIFO Underflow interrupt.
25	RX_FIFO_OFLOW_INTR_EN	Interrupt enable for the Receive FIFO Overflow interrupt.
24	RX_FIFO_RDY_INTR_EN	Interrupt enable for the Receive FIFO Ready interrupt.
17	TX_FIFO_OFLOW_INTR_EN	Interrupt enable for the Transmit FIFO Overflow interrupt.
16	TX_FIFO_RDY_INTR_EN	Interrupt enable for the Transmit FIFO Ready interrupt.

WCSS_A_QTA_INTR_EN (cont.)

Bits	Name	Description
8	RX_HW_CHAR_INTR_EN	Interrupt enable for the Received Hardware Character interrupt.
1	PARITY_ERR_INTR_EN	Interrupt enable for the Parity Error interrupt.
0	FRAME_ERR_INTR_EN	Interrupt enable for the Frame Error interrupt.

0x0A080FC8 WCSS_A_QTA_UART_CTRL**Type:** RW**Reset State:** 0x03280060

UART control register.

WCSS_A_QTA_UART_CTRL

Bits	Name	Description
31:24	BAUD_RATE_NUMERATOR	Sets the numerator for the ratio of the system clock frequency to the baud rate.
23:16	BAUD_RATE_DENOMINATOR	Sets the denominator for the ratio of the system clock frequency to the baud rate.
6	TX_INV_EN	When set, enables the UART's serial TX output inverter.
5	RX_INV_EN	When set, enables the UART's serial RX input inverter.
4	POWER_DOWN	When set, puts the UART into power-down mode. The UART transmitter will complete its current transmission and then disable all further transmissions. The UART receiver will discard the current character being received and then ignore all further receptions.
3	PARITY_EN	Enables parity bit generation in the UART transmitter, and parity checking in the UART receiver.
2	PARITY_ODD	When parity is enabled, this bit specifies whether the parity is odd or even. When 1, the parity is odd; when 0, it is even.
1:0	NUM_STOPS	Specifies the number of stop bits (1-4) at the end of each character. The number of stop bits per character = num_stops + 1.

0x0A080FCC WCSS_A_QTA_HW_CTRL**Type:** RW**Reset State:** 0x00000014

Hardware layer control register.

WCSS_A_QTA_HW_CTRL

Bits	Name	Type	Description
31:24	LAST_RX_HW_CHAR	R	This field captures the last received hardware character that was passed on to the Signaling layer.
15	TX_BUFFER_STATE	R	State of the 1-character-deep Hardware TX Buffer. When 1, the buffer is full; when 0, the buffer is empty.
14:8	TX_BUFFER_CONTENTS	R	This field captures the hardware character presently stored in the TX Buffer. Resend bit excluded as only non-Resend-Requests are stored in this buffer.
7	RESEND_REQ_FLAG	R	Indicates the present state of the Resend Request flag. When set, it indicates that a Resend Request is pending transmission.
4	EXCLUSIVE_RESEND_EN	RW	Exclusive Resend Enable: When set, the QTA module will treat Signal State bits within Resend Request characters as invalid. When clear, the Signal State bits are valid regardless of whether the character is a Resend Request.
3	RESEND_REQ_PASSTHRU_EN	RW	Resend Request Pass-Through Enable: When set, the QTA module will pass received Resend Request characters through to the Signaling layer for processing. NB: This feature is unsupported for the WLAN version of the QTA module, because the Signaling interface for the WLAN version does not support Resend signaling.
2	RESEND_RESP_EN	RW	Resend Response Enable: When this bit is set, the QTA module will automatically respond to received Resend Requests by resending its last (non-Resend-Request) hardware character. Otherwise, the QTA module will not respond to Resend Requests received from the peer device.
1	RETRANSMIT	W	Retransmit TX Buffer contents: Writing a 1 to this bit causes the last (non-Resend-Request) hardware character to be re-transmitted. This bit is self-clearing.
0	RESEND_REQUEST	W	Send a Resend Request: Writing a 1 to this bit causes a Resend Request character to be queued for transmission. This bit is self-clearing.

0x0A080FD0 WCSS_A_QTA_HW_TX_BUFFER_MODIFY**Type:** W**Reset State:** 0x00000000

TX Buffer modify register.

WCSS_A_QTA_HW_TX_BUFFER_MODIFY

Bits	Name	Description
6:0	DATA	Data to be written to the TX Buffer. Writing to this register causes the contents of the TX Buffer to be modified to the value of the data field, and causes the TX buffer state to be set to full.

0x0A080FD4 WCSS_A_QTA_SW_CTRL**Type:** RW**Reset State:** 0x00000000

Software layer control register.

WCSS_A_QTA_SW_CTRL

Bits	Name	Type	Description
29:24	RX_FILL	R	Indicates the number of software characters presently queued in the Receive FIFO.
21	RX_FLUSH	W	Receive FIFO Flush: Writing a 1 to this bit flushes the contents of the Receive FIFO. This bit is self-clearing.
20:16	RX_TRIG_LEVEL	RW	Receive FIFO Trigger Level. See the rx_fifo_rdy_int interrupt status register description.
13:8	TX_FILL	R	Indicates the number of software characters presently queued in the Transmit FIFO.
5	TX_FLUSH	W	Transmit FIFO Flush: Writing a 1 to this bit flushes the contents of the Transmit FIFO. This bit is self-clearing.
4:0	TX_TRIG_LEVEL	RW	Transmit FIFO Trigger Level. See the tx_fifo_rdy_int interrupt status register description.

0x0A080FD8 WCSS_A_QTA_SW_TX_FIFO_IN**Type:** W**Reset State:** 0x00000000

Software Transmit FIFO write data register.

WCSS_A_QTA_SW_TX_FIFO_IN

Bits	Name	Description
7:0	DATA	Software character to be transmitted.

0x0A080FDC WCSS_A_QTA_SW_RX_FIFO_OUT**Type:** R**Reset State:** 0x00000000

Software Receive FIFO read data register.

WCSS_A_QTA_SW_RX_FIFO_OUT

Bits	Name	Description
7:0	DATA	Software character received.

10.47 WCSS_A_RACTL_RACTL**0x0A00F000 WCSS_A_RACTL_PTC_LOOP_EN****Type:** RW**Reset State:** 0x003F

This registers provides the enable signals for the amplitude, frequency and channel tracking functions within the RXA PTC module. When each bit is asserted, the corresponding tracking loop is enabled.

WCSS_A_RACTL_PTC_LOOP_EN

Bits	Name	Description
9	PTCPHASETRK_DSBL	Disables VHTLTF phase-tracking functionality
5	TIME_ADJ_EN	TDC timing adjustment enable.
4	PH_ADJ_EN	TDC phase adjustment enable.
3	CHAN_EN	Channel tracking enable. If asserted, PTC channel tracking loop will detect channel phase changes and modify the channel estimate samples received from the channel estimator module.
2	FREQ_EN	Frequency tracking enable. If asserted, PTC frequency tracking loop will track reference oscillator frequency drift and modify the phase of the incoming samples received from the phase imbalance corrector module.
1	AMP_EN_MIMO	Amplitude tracking enable for mimo symbols. If asserted, PTC amplitude tracking loop will track and modify the amplitude of the incoming samples received from the phase imbalance corrector module (mimo symbols only)
0	AMP_EN_SIMO	Amplitude tracking enable for simo symbols. If asserted, PTC amplitude tracking loop will track and modify the amplitude of the incoming samples received from the phase imbalance corrector module (simo symbols only)

0x0A00F004 WCSS_A_RACTL_PTC_LOOP_GAIN**Type:** RW**Reset State:** 0x002A

This registers provides the gain factors for the ampiltude, frequency and channel tracking functions within the RXA PTC module.

WCSS_A_RACTL_PTC_LOOP_GAIN

Bits	Name	Description
7:4	CHAN_GAIN	Channel tracking loop gain. 0x0: CGAIN_2 (gain = 2) 0x1: CGAIN_3 (gain = 3) 0x2: CGAIN_4 (gain = 4) 0x3: CGAIN_4TOO (gain = 4)
3:2	FREQ_GAIN	Frequency tracking loop gain. 0x0: FGNO_AVG (No averaging) 0x1: FGAIN_2 (gain = 2) 0x2: FGAIN_3 (gain = 3) 0x3: FGAIN_4 (gain = 4)
1:0	AMP_GAIN	Amplitude tracking loop gain. 0x0: AGNO_AVG (No averaging) 0x1: AGAIN_3 (gain = 3) 0x2: AGAIN_4 (gain = 4) 0x3: AGAIN_5 (gain = 5)

0x0A00F008 WCSS_A_RACTL_PTC_CHAN_FREQ**Type:** RW**Reset State:** 0x087E

This value represents the ratio of sampling frequency to RF channel frequency using 10-bit quantisation

WCSS_A_RACTL_PTC_CHAN_FREQ

Bits	Name	Description
11:0	PTC_CHAN_FREQ	Default setting = 12'd2174

0x0A00F00C WCSS_A_RACTL_RACTL_CFG**Type:** RW**Reset State:** 0x7D35

This register contains all the controls to enable various packet conditioning/decoding parameters

WCSS_A_RACTL_RACTL_CFG

Bits	Name	Description
14	UNSUPP_CHK_11AC_PAID_GIDMISM_EN	*** Added in Pronto2 *** When enabled and when unsupported conditions in 11ac happens either from gid and/or paid mismatch, MAC will get a new level signal indicating Ractl has entered deferral mode.
13	UNSUPP_CHK_11N11AC_GENERAL_EN	*** Added in Pronto2 *** When enabled and when general unsupported conditions in 11n and 11ac happens (-except- gid and/or paid mismatch), MAC will get a new level signal indicating Ractl has entered deferral mode.
12	NDP_EN_11N	This bit enables the checking of NDP(ZLF) packets in 11n
11	AC_DEMOD_EN	Enables reception of AC packets
10	SERVFLD_OLVD_EN	This bit enables service-field-overloading for bw-capability exchange in legacy rts/cts frames. Default enabled, pmi byte5[6:4] gets data from de-scrambler input.
9	BEHAV_11N_EN	When enabled, the signal-field check of 11ac will be similar to 11n, i.e. the crc failure will be treated as a packet-abort condition. Any other condition will qualify for unsupported packet and deferral will be based on Isig. If this bit is 0, irrespective of unsupported or crc-failed vhtsiga, deferral will be done based on Isig.
8	AC_QAM256_SUPP_EN	This bit enables declaration of 256 QAM as supported rate in 11AC
7	BW_MSB_CHECK_EN	Asserted to indicate the vhtsiga bits [2:0] will be checked against agc bw [2:0] settings. 0 => vhtsiga bits [1:0] will be checked against agc bw [1:0] settings. Note default changed in Pronto assuming the msb has been changed in the latest 11ac spec to be reserved and so should not be checked.
6	SU_AID_CHECK_EN	Asserted high to indicate that when SU VHTSIGA is received, the pAID bits will be checked against the PROG_P_AID register contents to decide whether the packet was meant for this SU station Default 0 => vhtsiga bits [21:13] 9 bits will NOT be checked against PROG_P_AID reg settings.
5	AC_VHTB_CHK_EN_MU	This bit enables the 11ac VHTSIGB checking in MU mode Note that the contents of VHTSIGB are used by RACTL/RAHDR in MU mode so checking CRC is preferable. Unlike SU where contents of VHTSIGB are ignored and thus an invalid-CRC VHTSIGB is not indicative of a faulty packet, A CRC-failed VHTSIGB in MU-case can be indicative of a faulty packet.
4	AC_MU_RXPSHUTOFF_EN	This bit enables the 11ac MU packets to be terminated by packet-completion-indication from RXP. By default, the min of effective length computed from Isig and vhtsigb is used to signal completion within Phy itself.
3	AC_VHTB_CHK_EN	This bit enables the 11ac VHTSIGB checking in SU mode
2	SERVICE_EN	This bit enables the SERVICE field content check in non-11ac packets

WCSS_A_RACTL_RACTL_CFG (cont.)

Bits	Name	Description
1	SOUNDING_BIT_CHK_EN	This bit enables checking of sounding bit in 11n htsg for unsupported htsg purpose (applies only to non-ndp packets)
0	LSIG_BIT3_CHK_EN	This bit enables checking the LSIG[3] bit which must be 1 for legacy packets, 11n mm and 11ac packets

0x0A00F010 WCSS_A_RACTL_RXA_ABORT**Type:** W**Reset State:** 0x0000

Writing any value to this register instructs the RX-A controller to abort the current packet and return the RXA module to idle mode.

WCSS_A_RACTL_RXA_ABORT

Bits	Name	Description
0	RXA_ABORT	Writing any value to this bit will trigger an abort of the RX-A module. Reading this register will return a 0 value.

0x0A00F014 WCSS_A_RACTL_RACTL_TOFFSET**Type:** RW**Reset State:** 0x0000

This register contains a timing offset value that is added to the timing correction value provided by the BTCF module. This addition takes place in the TDC module.

WCSS_A_RACTL_RACTL_TOFFSET

Bits	Name	Description
7:0	RACTL_TOFFSET	Timing offset value fed to the TDC module. Default setting = 8'h0.

0x0A00F018 WCSS_A_RACTL_RACTL_DELTAT_IN**Type:** RW**Reset State:** 0x0000

This register contains a value that is used in PTC as a timing offset with the existing timing offset inside PTC

WCSS_A_RACTL_RACTL_DELTAT_IN

Bits	Name	Description
15	APB_DT_OVERRIDE	If asserted, the RACTL module passes the APB timing offset value to the PTC module. ** This is not used in Pronto **
10:0	APB_DT	Default setting = 11'h0. **In pronto, this has been reused from existing dt_override register (meant for overriding BTCF deltat earlier)

0x0A00F01C WCSS_A_RACTL_RACTL_DELTAT_OUT**Type:** R**Reset State:** 0x00000000

This register allows the host to observe timing value that is fed to the TDC module

WCSS_A_RACTL_RACTL_DELTAT_OUT

Bits	Name	Description
8:0	TDC_DT	Current timing correction value being used by TDC module provided by PTC Note the current timing adjust value is in PTC_DELTAAMP_TIMINGOFFSET_OUT register

0x0A00F020 WCSS_A_RACTL_RACTL_DELTAF_IN**Type:** RW**Reset State:** 0x0000

Test frequency correction value that overrides the value provided by the BTCF module.

WCSS_A_RACTL_RACTL_DELTAF_IN

Bits	Name	Description
15	APB_DFUPDT_OVERRIDE	Use this to indicate PTC to use the initially received value rather than updating it.
14	APB_DFINIT_OVERRIDE	If asserted, the RACTL module passes the APB frequency error value to the TDC module instead of that received from BTCF.
9:0	APB_DF	Test frequency correction value that overrides the internally-calculated value. Default setting = 10'h0.

0x0A00F024 WCSS_A_RACTL_RACTL_DELTA_F_OUT**Type:** R**Reset State:** 0x00000000

Current frequency correction value being used by TDC module

WCSS_A_RACTL_RACTL_DELTA_F_OUT

Bits	Name	Description
11:0	PTC_DF	Current frequency correction value being used by TDC module

0x0A00F028 WCSS_A_RACTL_PTC_DELTAAMP_TIMINGOFFSET_OUT**Type:** R**Reset State:** 0x00000000

Current frequency correction value being used by PTC module

WCSS_A_RACTL_PTC_DELTAAMP_TIMINGOFFSET_OUT

Bits	Name	Description
9:8	PTC_DT	Current timing offset correction value being provided PTC to TDC
7:0	PTC_DA	Current amplitude correction value being used by PTC module

0x0A00F034 RESERVED**0x0A00F038 WCSS_A_RACTL_RACTL_PKT_COUNT****Type:** W**Reset State:** 0x00000000

Number of packet burst start signals received by the RACTL module

WCSS_A_RACTL_RACTL_PKT_COUNT

Bits	Name	Description
11:0	RACTL_SPKTCOUNT	Number of packet burst start signals received by the RACTL module from AGC

0x0A00F03C WCSS_A_RACTL_RACTL_SYMCOUNT**Type:** W**Reset State:** 0x00000000

Number of OFDM symbol start signals generated by the RACTL module

WCSS_A_RACTL_RACTL_SYMCOUNT

Bits	Name	Description
15:0	RACTL_SYMCOUNT	Number of OFDM symbol start signals generated by the RACTL module

0x0A00F040 WCSS_A_RACTL_RACTL_PKTCOUNT_AC20**Type:** W**Reset State:** 0x00000000

Number of AC20 packets detected by RACTL

WCSS_A_RACTL_RACTL_PKTCOUNT_AC20

Bits	Name	Description
7:0	AC20_SPKTCOUNT	

0x0A00F044 WCSS_A_RACTL_RACTL_PKTCOUNT_AC40**Type:** W**Reset State:** 0x00000000

Number of AC40 packets detected by RACTL

WCSS_A_RACTL_RACTL_PKTCOUNT_AC40

Bits	Name	Description
7:0	AC40_SPKTCOUNT	

0x0A00F048 WCSS_A_RACTL_RACTL_PKTCOUNT_AC80**Type:** W**Reset State:** 0x00000000

Number of AC80 packets detected by RACTL

WCSS_A_RACTL_RACTL_PKTCOUNT_AC80

Bits	Name	Description
7:0	AC80_SPKTCOUNT	

0x0A00F04C WCSS_A_RACTL_RACTL_PKTCOUNT_AC_SU**Type:** W**Reset State:** 0x00000000

Number of AC SU packets detected by RACTL

WCSS_A_RACTL_RACTL_PKTCOUNT_AC_SU

Bits	Name	Description
7:0	AC_SU_SPKTCOUNT	

0x0A00F050 WCSS_A_RACTL_RACTL_PKTCOUNT_AC_MU**Type:** W**Reset State:** 0x00000000

Number of AC MU packets detected by RACTL

WCSS_A_RACTL_RACTL_PKTCOUNT_AC_MU

Bits	Name	Description
7:0	AC_MU_SPKTCOUNT	

0x0A00F054 WCSS_A_RACTL_CHE_PKTCOUNT**Type:** W**Reset State:** 0x00000000

Number of packet burst start signals received by the CHE module

WCSS_A_RACTL_CHE_PKTCOUNT

Bits	Name	Description
7:0	CHE_SPKTCOUNT	Number of packet burst start signals received by the CHE module

0x0A00F058 WCSS_A_RACTL_PTC_PKTCount**Type:** W**Reset State:** 0x00000000

Number of packet burst start signals received by the PTC module

WCSS_A_RACTL_PTC_PKTCount

Bits	Name	Description
11:0	PTC_SPKTCOUNT	Number of packet burst start signals received by the PTC module (all packet types)

0x0A00F05C WCSS_A_RACTL_PTC_SYMCount**Type:** W**Reset State:** 0x00000000

Number of OFDM symbol start signals received by the PTC module

WCSS_A_RACTL_PTC_SYMCount

Bits	Name	Description
15:0	PTC_SYMCOUNT	Number of OFDM symbol start signals received by the PTC module

0x0A00F060 WCSS_A_RACTL_PTC_PKTCount_20M**Type:** W**Reset State:** 0x00000000

Number of packet burst start signals received by the PTC module in 20MHz modes

WCSS_A_RACTL_PTC_PKTCount_20M

Bits	Name	Description
11:0	PTC_SPKTCOUNT_20M	Number of packet burst start signals received by the PTC module in 20MHz modes (all packet types) This includes the 20M 11n packets falsely detected as 40M packets

0x0A00F064 WCSS_A_RACTL_PTC_PKTCount_40M**Type:** W**Reset State:** 0x00000000

Number of packet burst start signals received by the PTC module in 40MHz modes

WCSS_A_RACTL_PTC_PKTCount_40M

Bits	Name	Description
11:0	PTC_SPKTCOUNT_40M	Number of packet burst start signals received by the PTC module in 40MHz and 80MHz modes (all packet types) This includes the 40M 11n packets falsely detected as 80M packets

0x0A00F068 WCSS_A_RACTL_PTC_PKTCount_SIMO

Type: W

Reset State: 0x00000000

Number of packet burst start signals received by the PTC module in simo mode

WCSS_A_RACTL_PTC_PKTCount_SIMO

Bits	Name	Description
11:0	PTC_SPKTCOUNT_SIMO	Number of packet burst start signals received by the PTC module in simo modes. This includes the 20M and 40M 11n and legacy mode packets but does not include stbc mode packets

0x0A00F06C WCSS_A_RACTL_PTC_PKTCount_STBC

Type: W

Reset State: 0x00000000

Number of packet burst start signals received by the PTC module in stbc modes

WCSS_A_RACTL_PTC_PKTCount_STBC

Bits	Name	Description
11:0	PTC_SPKTCOUNT_STBC	Number of packet burst start signals received by the PTC module in stbc modes. This includes the 20M and 40M 11n mode packets.

0x0A00F070 WCSS_A_RACTL_PTC_PKTCount_GF

Type: W

Reset State: 0x00000000

Number of packet burst start signals received by the PTC module in all Greenfield modes

WCSS_A_RACTL_PTC_PKT_COUNT_GF

Bits	Name	Description
11:0	PTC_SPKTCOUNT_GF	Number of packet burst start signals received by the PTC module in all Greenfield modes.

0x0A00F074 WCSS_A_RACTL_PTC_PKT_COUNT_MM**Type:** W**Reset State:** 0x00000000

Number of packet burst start signals received by the PTC module in all Mixed-mode packets

WCSS_A_RACTL_PTC_PKT_COUNT_MM

Bits	Name	Description
11:0	PTC_SPKTCOUNT_MM	Number of packet burst start signals received by the PTC module in all Mixed-mode modes.

0x0A00F078 WCSS_A_RACTL_FFT_OPSCALE**Type:** RW**Reset State:** 0x0000

Amount of output attenuation to be applied by the FFT module

WCSS_A_RACTL_FFT_OPSCALE

Bits	Name	Description
1:0	FFT_OPSCALE	Amount of output attenuation to be applied by the FFT module 0x0: GAIN_1 (gain = 1) 0x1: GAIN_1_2 (gain = 1/2) 0x2: GAIN_1_4 (gain = 1/4) 0x3: GAIN_1_8 (gain = 1/8)

0x0A00F07C WCSS_A_RACTL_RACTL_STATE**Type:** R**Reset State:** 0x00000000

Current state of RACTL state machine

WCSS_A_RACTL_RACTL_STATE

Bits	Name	Description
14:10	PREV1_STATE	Previous-but-1 state of RACTL state machine
9:5	PREV0_STATE	Previous state of RACTL state machine
4:0	CURRENT_STATE	Current state of RACTL state machine

0x0A00F080 WCSS_A_RACTL_AGC_ABORT_COUNT**Type:** W**Reset State:** 0x00000000

Number of abort signals received from the AGC module

WCSS_A_RACTL_AGC_ABORT_COUNT

Bits	Name	Description
15:0	AGC_ABORTCOUNT	Number of abort signals received from the AGC module

0x0A00F084 WCSS_A_RACTL_SIGNAL_INVALID_COUNT_LSIG**Type:** W**Reset State:** 0x00000000

Number of packets received with invalid LEGACY SIGNAL field values

WCSS_A_RACTL_SIGNAL_INVALID_COUNT_LSIG

Bits	Name	Description
15:0	INVALID_SFPCOUNT	Number of packets received with invalid SIGNAL field values

0x0A00F088 WCSS_A_RACTL_SERV_INVALID_COUNT**Type:** W**Reset State:** 0x00000000

Number of packets received with invalid SERVICE field values

WCSS_A_RACTL_SERV_INVALID_COUNT

Bits	Name	Description
15:0	INVALID_SERVCOUNT	Number of packets received with invalid SERVICE field values

0x0A00F08C WCSS_A_RACTL_INTERRUPT_COUNT**Type:** W**Reset State:** 0x00000000

Combined number of interrupts received by RAHDR and RACTL

WCSS_A_RACTL_INTERRUPT_COUNT

Bits	Name	Description
15:0	INTERRUPT_COUNT	Total number of interrupts. For Volans: Does not include the NDP packets that qualify for CSI transfer. Does not include the "Unsupported configuration" (Note that for Volans, 1rx 4ss configuration is allowed.)

0x0A00F090 WCSS_A_RACTL_LAST_LS_SIGNAL**Type:** R**Reset State:** 0x0000

This register holds the LS 16 bits of the last decoded standard SIGNAL field value. On reset, the register is set to 0

WCSS_A_RACTL_LAST_LS_SIGNAL

Bits	Name	Description
15:0	VALUE	LS 16 bits of the last decoded standard SIGNAL field

0x0A00F094 WCSS_A_RACTL_LAST_MS_SIGNAL**Type:** R**Reset State:** 0x0000

This register holds the MS 16 bits of the last decoded standard SIGNAL field value. On reset, the register is set to 0

WCSS_A_RACTL_LAST_MS_SIGNAL

Bits	Name	Description
7:0	VALUE	MS 8 bits of the last decoded standard SIGNAL field

0x0A00F098 WCSS_A_RACTL_LAST_MCS**Type:** R**Reset State:** 0x00000000

The last MCS received by the controller

WCSS_A_RACTL_LAST_MCS

Bits	Name	Description
6:0	VALUE	

0x0A00F09C WCSS_A_RACTL_STROBE_UNSUPPHTSIG**Type:** W**Reset State:** 0x00000000

Initiates write of the 1st occurrence of unsupported htsig

WCSS_A_RACTL_STROBE_UNSUPPHTSIG

Bits	Name	Description
0	INITIATE	Write to this register to do only one write to registers 9C to A0 above.

0x0A00F0A0 WCSS_A_RACTL_LAST_UNSUPHTSIGNAL0**Type:** R**Reset State:** 0x0000

This register holds the LS 16 bits of the last decoded 'unsupported' HTSIG SIGNAL field value. On reset, the register is set to 0

WCSS_A_RACTL_LAST_UNSUPHTSIGNAL0

Bits	Name	Description
15:0	VALUE	LS 16 bits of the last decoded 'unsupported' HTSIG SIGNAL field

0x0A00F0A4 WCSS_A_RACTL_LAST_UNSUPHTSIGNAL1**Type:** R**Reset State:** 0x0000

This register holds bits[31:16] of the last decoded 'unsupported' HTSIG SIGNAL field value. On reset, the register is set to 0

WCSS_A_RACTL_LAST_UNSUPHTSIGNAL1

Bits	Name	Description
15:0	VALUE	bits [31:16] of the last decoded 'unsupported' HTSIG SIGNAL field

0x0A00F0A8 WCSS_A_RACTL_LAST_UNSUPHTSIGNAL2

Type: R

Reset State: 0x0000

This register holds bits [47:32] of the last decoded 'unsupported' HTSIG SIGNAL field value. On reset, the register is set to 0

WCSS_A_RACTL_LAST_UNSUPHTSIGNAL2

Bits	Name	Description
15:0	VALUE	MS 16 bits of the last decoded 'unsupported' HTSIG SIGNAL field

0x0A00F0AC WCSS_A_RACTL_LAST_MXED_SIG0

Type: R

Reset State: 0x0000

This register will be used to primarily diagnose 11n MM and 11AC packet demodulation issues.

WCSS_A_RACTL_LAST_MXED_SIG0

Bits	Name	Description
15:0	VALUE	

0x0A00F0B0 WCSS_A_RACTL_LAST_MXED_SIG1

Type: R

Reset State: 0x0000

This register will be used to primarily diagnose 11n MM and 11AC packet demodulation issues.

WCSS_A_RACTL_LAST_MXED_SIG1

Bits	Name	Description
15:0	VALUE	

0x0A00F0B4 WCSS_A_RACTL_LAST_MXED_SIG2**Type:** R**Reset State:** 0x0000

This register will be used to primarily diagnose 11n MM and 11AC packet demodulation issues.

WCSS_A_RACTL_LAST_MXED_SIG2

Bits	Name	Description
15:0	VALUE	

0x0A00F0B8 WCSS_A_RACTL_STATISTICS_SELECT**Type:** RW**Reset State:** 0x0000

This register selects the format of the 8-byte stats field appended to the end of a received packet

WCSS_A_RACTL_STATISTICS_SELECT

Bits	Name	Description
2:0	VALUE	Stats format selector 0x0: AGC_CONSOLIDATED1 ({bpcf_statword, agc_statword[31:0]}) 0x1: AGC_CONSOLIDATED2 ({bpcf_statword, agc_statword[63:32]}) 0x2: TDC_CONSOLIDATED ({bpcf_statword, tdc_statword}) 0x3: CAL_ONLY ({cal3_statdata, cal2_statdata, cal1_statdata, cal0_statdata} for Virgo, {cal1_statdata, cal0_statdata} for Spica) 0x4: KNOWN_PATTERN (64 hex) 0x5: FSCALE_CONSOLIDATED ({fscale_bpcf_gain3, fscale_bpcf_gain2, fscale_bpcf_gain1, fscale_bpcf_gain0, bpcf_statword, agc_statword[59:32]} for Virgo, {fscale_bpcf_gain1, fscale_bpcf_gain0, bpcf_statword, agc_statword[59:32]} for Spica)

0x0A00F0BC WCSS_A_RACTL_DAGC_TGTBO**Type:** RW**Reset State:** 0x001E

Fscale Target Backoff for Digital Gain computation. The gain is set this amount of dBs below the gain that would fully saturate the receiver. The backoff is specified in 0.5 dB steps.

WCSS_A_RACTL_DAGC_TGTBO

Bits	Name	Description
5:0	BACK_OFF	Backoff value. Default backoff is 30.

0x0A00F0C0 WCSS_A_RACTL_CMDWDFILL**Type:** RW**Reset State:** 0x0003

Sets the options for software to get sig,htsig,service field in the command word

WCSS_A_RACTL_CMDWDFILL

Bits	Name	Description
1	SERVICE_EN	Asserted to enable transmission of sig,htsig from RAHDR to PMI. Default is enable.
0	HDR_EN	Asserted to enable transmission of sig,htsig rom RAHDR to PMI. Default is enable.

0x0A00F0C4 WCSS_A_RACTL_RACTL_STATUS**Type:** RW**Reset State:** 0x0000**WCSS_A_RACTL_RACTL_STATUS**

Bits	Name	Type	Description
13	PKTABORTSCOPE_CLR	RW	Clear for bits [9:1]
12	PKT_PENDING_CLR	RW	Clear for bit 0.

WCSS_A_RACTL_RACTL_STATUS (cont.)

Bits	Name	Type	Description
9:1	PKTABORTSCOPE	R	When sampled, shows the reason for ractl packet abort 0 - ssf_invalid 1 - htsig_invalid 2 - not_avalid 3 - serv_invalid 4 - state machine watchdog expired 5 - unsupported mode with given antenna configuration (NOTE that for Volans, 1rx all streams are supported for CSI transfer. However, the definition of this bit has been retained) 6 - unsupported htsig (NOTE that for Volans, NDP packets are supported for CSI transfer. However, the definition of this bit has been retained) 7 - spare 8 - spare
0	PKT_PENDING	R	When sampled, shows if a packet is pending for processing by RACTL

0x0A00F0C8 WCSS_A_RACTL_NES2_MCSBOUND0**Type:** RW**Reset State:** 0x1715

Programmable lower and upper bounds of mcs fields to detect Nes of 2

WCSS_A_RACTL_NES2_MCSBOUND0

Bits	Name	Description
14:8	MCSUB0	Upper bound0. This value will be used with 11n40 flag to declare Nes of 2
6:0	MCSLB0	Lower bound0. This value will be used with 11n40 flag to declare Nes of 2

0x0A00F0CC WCSS_A_RACTL_NES2_MCSBOUND1**Type:** RW**Reset State:** 0x1F1C

Programmable lower and upper bounds of mcs fields to detect Nes of 2

WCSS_A_RACTL_NES2_MCSBOUND1

Bits	Name	Description
14:8	MCSUB1	Upper bound1. This value will be used with 11n40 flag to declare Nes of 2
6:0	MCSLB1	Lower bound1. This value will be used with 11n40 flag to declare Nes of 2

0x0A00F0D0 WCSS_A_RACTL_NES2_MCSBOUND2**Type:** RW**Reset State:** 0x3434

Programmable lower and upper bounds of mcs fields to detect Nes of 2

WCSS_A_RACTL_NES2_MCSBOUND2

Bits	Name	Description
14:8	MCSUB2	Upper bound2. This value will be used with 11n40 flag to declare Nes of 2
6:0	MCSLB2	Lower bound2. This value will be used with 11n40 flag to declare Nes of 2

0x0A00F0D4 WCSS_A_RACTL_NES2_MCSBOUND3**Type:** RW**Reset State:** 0x4C46

Programmable lower and upper bounds of mcs fields to detect Nes of 2

WCSS_A_RACTL_NES2_MCSBOUND3

Bits	Name	Description
14:8	MCSUB3	Upper bound3. This value will be used with 11n40 flag to declare Nes of 2
6:0	MCSLB3	Lower bound3. This value will be used with 11n40 flag to declare Nes of 2

0x0A00F0D8 WCSS_A_RACTL_LSIGLEN_LOWERBOUND**Type:** RW**Reset State:** 0x0149

Programmable lower bound of length field in LSIG to detect htsig in a MM packet

WCSS_A_RACTL_LSIGLEN_LOWERBOUND

Bits	Name	Description
9:5	LSIGLENLB_AC	The length field in the lsig is required to be equal to or more than this value to look for an vhtsiga in the next symbol
4:0	LSIGLENLB_N	The length field in the lsig is required to be equal to or more than this value to look for an htsig in the next symbol

0x0A00F0DC WCSS_A_RACTL_RACTL_INTR_EN**Type:** RW**Reset State:** 0x0060

The enables to report the interrupts to Phyint. Bit 0 is for enabling interrupt from rahdr and the other ones are in sequence corresponding to register RACTL_STATUS. By default, only watchdog-expiry and unsupported configuration-related interrupts are enabled

WCSS_A_RACTL_RACTL_INTR_EN

Bits	Name	Description
7	UNSUPHTSIG_INTRMASKEN	
6	UNSUPCFG_INTRMASKEN	
5	WATCHDOGEXP_INTRMASKEN	
4	SERVINVALID_INTRMASKEN	
3	NOTAVALID_INTRMASKEN	
2	HTSIG_INVALID_INTRMASKEN	
1	SSF_INVALID_INTRMASKEN	
0	RAHDR_INTRMASKEN	

0x0A00F0E0 WCSS_A_RACTL_RACTL_SUPP_BWMISMCOUNT**Type:** R**Reset State:** 0x00000000

RACTL counter to count the number of times rxa demodulated a packet at a lower bandwidth compared to that specified by agc. Note that counter is in hardware and the slave is only a readonly.

WCSS_A_RACTL_RACTL_SUPP_BWMISMCOUNT

Bits	Name	Description
14:10	BW80FOUND20MISM	The dynamic bandwidth setting is 80Mhz but 20M packet detected
9:5	BW80FOUND40MISM	The dynamic bandwidth setting is 80Mhz but 40M packet detected
4:0	BW40FOUND20MISM	The dynamic bandwidth setting is 40Mhz but 20M packet detected

0x0A00F0E4 WCSS_A_RACTL_PTC_TH**Type:** RW**Reset State:** 0x0088**WCSS_A_RACTL_PTC_TH**

Bits	Name	Description
7:4	IBPSK	
3:0	QBPSK	

0x0A00F0E8 WCSS_A_RACTL_BWMISMCNTRST**Type:** RW**Reset State:** 0x0000**WCSS_A_RACTL_BWMISMCNTRST**

Bits	Name	Description
1	RST_UNSUPP	Resets the counters which count the UNsupported bandwidth mismatches
0	RST_SUPP	Resets the counters which count the supported bandwidth mismatches

0x0A00F0F0 WCSS_A_RACTL_LMAP_OPSCALE1_SISO**Type:** RW**Reset State:** 0x28EC

This registers provides the rate-qam-size dependent output scaling to LMAP simo distance outputs

WCSS_A_RACTL_LMAP_OPSCALE1_SISO

Bits	Name	Description
14:12	SISO_MCS4_16QA3BY4	
11:9	SISO_MCS3_16QA1BY2	
8:6	SISO_MCS2_QPSK3BY4	
5:3	SISO_MCS1_QPSK1BY2	
2:0	SISO_MCS0_BPSK1BY2	

0x0A00F0F4 WCSS_A_RACTL_LMAP_OPSCALE2_SISO**Type:** RW**Reset State:** 0x0053

This registers provides the rate-qam-size dependent output scaling to LMAP simo distance outputs

WCSS_A_RACTL_LMAP_OPSCALE2_SISO

Bits	Name	Description
14:12	SISO_MCS9_256QA5BY6	
11:9	SISO_MCS8_256QA3BY4	
8:6	SISO_MCS7_64QA5BY6	
5:3	SISO_MCS6_64QA3BY4	
2:0	SISO_MCS5_64QA2BY3	

0x0A00F0F8 WCSS_A_RACTL_LMAP_OPSCALE1_STBC**Type:** RW**Reset State:** 0x26E4

This registers provides the rate-qam-size dependent output scaling to LMAP stbc distance outputs

WCSS_A_RACTL_LMAP_OPSCALE1_STBC

Bits	Name	Description
14:12	STBC_MCS4_16QA3BY4	
11:9	STBC_MCS3_16QA1BY2	
8:6	STBC_MCS2_QPSK3BY4	
5:3	STBC_MCS1_QPSK1BY2	
2:0	STBC_MCS0_BPSK1BY2	

0x0A00F0FC WCSS_A_RACTL_LMAP_OPSCALE2_STBC**Type:** RW**Reset State:** 0x0052

This registers provides the rate-qam-size dependent output scaling to LMAP stbc distance outputs

WCSS_A_RACTL_LMAP_OPSCALE2_STBC

Bits	Name	Description
14:12	STBC_MCS9_256QA5BY6	
11:9	STBC_MCS8_256QA3BY4	
8:6	STBC_MCS7_64QA5BY6	
5:3	STBC_MCS6_64QA3BY4	
2:0	STBC_MCS5_64QA2BY3	

0x0A00F100 WCSS_A_RACTL_LMAP_OPSCALE3**Type:** RW**Reset State:** 0x0109

This registers provides the rate-qam-size dependent output scaling to LMAP distance outputs

WCSS_A_RACTL_LMAP_OPSCALE3

Bits	Name	Description
8:6	LGCY_BPSK3BY4	
5:3	STBC_MCS10_256QA7BY8	
2:0	SISO_MCS10_256QA7BY8	

0x0A00F104 WCSS_A_RACTL_LMAP_TRK_CTRL**Type:** RW**Reset State:** 0x0005

This registers provides the channel tracking controls

WCSS_A_RACTL_LMAP_TRK_CTRL

Bits	Name	Description
2:1	LMAP_TRACK_GAIN	Programmable tracking loop gain. Default setting = 2'h2. 0x0: LOOPGAIN_8 (Loop gain = 1/8) 0x1: LOOPGAIN_16 (Loop gain = 1/16) 0x2: LOOPGAIN_32 (Loop gain = 1/32) 0x3: INVALID (Undefined)
0	LMAP_TRACK_EN	Channel tracking enable. If de-asserted, the channel tracking loop will not modify channel estimate samples received from the channel estimator module. Default setting = 1'b1.

0x0A00F108 WCSS_A_RACTL_LMAP_DUPCOMB**Type:** RW**Reset State:** 0x0000

This register holds 2 bits - one (bit 1) is applicable till the header is demodulated and the other (bit 0) for the data symbols in general. The value in bit 0 of this bit register specifies whether duplicate tones need to be combined in the RXA before simo slicer function in the data portions of the symbol. Note that the contents of this register is modified by ractl's mode detection logic such that HT-duplicate packets should always do MRC over duplicate tones irrespective of this setting. Stated otherwise, this register only affects legacy duplicate mode packets.

WCSS_A_RACTL_LMAP_DUPCOMB

Bits	Name	Description
1	DUPTONE_COMB_EN_SF	Off by default. When high, duplicate tones combining will take place only for signal fields (legacy or htsig) duplicate symbols. Note that due to hardware processing latencies, the settings of this bit will affect the duplicate combining of the service-data symbol of the legacy duplicate packet.
0	DUPTONE_COMB_EN	Off by default. When high, duplicate tones combining will take place only for legacy duplicate symbols. Note that due to hardware processing latencies, the settings of this bit will <u>not</u> affect the duplicate combining of the service-data symbol of the legacy duplicate packet.

0x0A00F10C WCSS_A_RACTL_LMAP_SNR_SEL**Type:** RW**Reset State:** 0x0001**WCSS_A_RACTL_LMAP_SNR_SEL**

Bits	Name	Description
0	ENABLE_SNRCOMP	When asserted, selects the LMAP SNR computation function. This is used in CSI report as well as per-symbol snr metric

0x0A00F110 WCSS_A_RACTL_RACTL_SPL**Type:** RW**Reset State:** 0x0006

This register holds some configuration bits to handle ractl-agc signalling of txop signal (only for MM packets and when LSIG and HTSIG both pass) and ractl-rahdr signalling to steer transfer of data to pmi.

WCSS_A_RACTL_RACTL_SPL

Bits	Name	Description
15	RESET_TXOP	Off by default. When high, the txop signal from ractl will be cleared. This clearing mechanism is devised since the txop signal is not cleared with regular clearing mechanism in ractl like agc_start and agc_abort
2	NDP_PMI_XFER	ON by default. When high, the command-word and statistics bytes go to pmi. When low, nothing goes.
1	TXOP_SIG_NDP	On by default. When low, specifies that txop signal need not be toggled at all for ndp (zlf) packets
0	TXOP_SIG_SUPPHTSIG	Off by default. When high, specifies that txop calculation to be done for supported htsig Note that txop calculation is always done on unsupported htsig.

0x0A00F114 WCSS_A_RACTL_WATCHDOG1**Type:** RW**Reset State:** 0x0000

Watchdog timer max values in header detection states Watchdog timer maxvalues in microsec

WCSS_A_RACTL_WATCHDOG1

Bits	Name	Description
15:12	WD_HTSIG	Watchdog timer maxvalue in HTSIG state; Minimum value 5. Value of 0 disables this timer.
11:8	WD_SF3	Watchdog timer maxvalue in SF3 state; Minimum value 5. Value of 0 disables this timer.
7:4	WD_SF2	Watchdog timer maxvalue in SF2 state; Minimum value 5. Value of 0 disables this timer.
3:0	WD_SF1	Watchdog timer maxvalue in SF1 state; Minimum value 5. Value of 0 disables this timer.

0x0A00F118 WCSS_A_RACTL_WATCHDOG2**Type:** RW**Reset State:** 0x0000

Watchdog timer max values in extra short and long training, servdata and recovery states
Watchdog timer maxvalues in microsec

WCSS_A_RACTL_WATCHDOG2

Bits	Name	Description
15:12	WD_WF	Watchdog timer maxvalue in WAITFINISH state; Minimum value 11. Value of 0 disables this timer.
11:8	WD_SERV	Watchdog timer maxvalue in SERV state; Minimum value 5. Value of 0 disables this timer.
7:4	WD_EXTRALTF	Watchdog timer maxvalue in extra LTF states; Minimum value 5. Value of 0 disables this timer.
3:0	WD_STS	Watchdog timer maxvalue in STS state; Minimum value 7. Value of 0 disables this timer.

0x0A00F11C WCSS_A_RACTL_WATCHDOG3**Type:** RW**Reset State:** 0x0000

Watchdog timer max values in data state and eopcount state Watchdog timer maxvalues in microsec

WCSS_A_RACTL_WATCHDOG3

Bits	Name	Description
15	WDEXP_ABORT_EN	Enable for generating internal ractl abort based on expiry of watchdog timers listed in the registers WATCHDOG1, WATCHDOG2 and WATCHDOG3
12:0	WD_DAT	Watchdog timer maxvalue in DATA and EOPCNT state. Value of 0 disables this timer.

0x0A00F120 WCSS_A_RACTL_RACTL_UNSUPP_BWMISMCOUNT**Type:** R**Reset State:** 0x00000000

RACTL counter to count the number of times rxa encountered packet at a higher bandwidth compared to that specified by agc. Note that counter is in hardware and the slave is only a readonly.

WCSS_A_RACTL_RACTL_UNSUPP_BWMISMCOUNT

Bits	Name	Description
14:10	BW20FOUND80MISM	The dynamic bandwidth setting is 20Mhz but 80M packet detected
9:5	BW40FOUND80MISM	The dynamic bandwidth setting is 40Mhz but 80M packet detected

WCSS_A_RACTL_RACTL_UNSUPP_BWMISM COUNT (cont.)

Bits	Name	Description
4:0	BW20FOUND40MISM	The dynamic bandwidth setting is 20Mhz but 40M packet detected

0x0A00F124 WCSS_A_RACTL_RACTL_LAST_BW**Type:** R**Reset State:** 0x00000000**WCSS_A_RACTL_RACTL_LAST_BW**

Bits	Name	Description
15:8	DYN	Most recent rightmost {prev4_dyn, prev3_dyn, prev2_dyn, prev1_dyn}
7:0	STATIC	Most recent rightmost {prev4_static, prev3_static, prev2_static, prev1_static}

0x0A00F130 WCSS_A_RACTL_RACTL_MINSNRSTATS**Type:** R**Reset State:** 0x00000000**WCSS_A_RACTL_RACTL_MINSNRSTATS**

Bits	Name	Description
7:0	STATS	Min-SNR provided by LMAP.

0x0A00F140 WCSS_A_RACTL_SIGNAL_INVALID_COUNT_HTSIG**Type:** W**Reset State:** 0x00000000

Number of packets received with invalid HT SIGNAL field values

WCSS_A_RACTL_SIGNAL_INVALID_COUNT_HTSIG

Bits	Name	Description
15:0	INVALID_SFCOUNT	Number of packets received with invalid SIGNAL field values

0x0A00F144 WCSS_A_RACTL_RXFIR_SCALING_COEFF**Type:** RW**Reset State:** 0x0001**WCSS_A_RACTL_RXFIR_SCALING_COEFF**

Bits	Name	Description
0	DC_NOTCH_EN	When high, selects rxfir scaling coefficients (to be used by FFT) appropriate with rxfir operation WITH dc notch. Note to use this register bit with appropriate AGC bit settings

0x0A00F148 WCSS_A_RACTL_CSI_CODEBOOK_SNR_TH**Type:** RW**Reset State:** 0x0000**WCSS_A_RACTL_CSI_CODEBOOK_SNR_TH**

Bits	Name	Description
7:0	VALUE	Threshold used to compare against the lmap min SNR for adaptive codebook determination. Program $\text{snr_th} = (\text{snr_db} - 22) * 4$, where snr_db is the signed SNR threshold in dB. snr_db range is -10 dB to 53.75 dB, corresponding to snr_th range is -128 to 127. Use with CSI_CONFIG reg below and $\text{adaptive_codebook_en} = 1$

0x0A00F14C WCSS_A_RACTL_CSI_CONFIG**Type:** RW**Reset State:** 0x61C3**WCSS_A_RACTL_CSI_CONFIG**

Bits	Name	Description
15	CSI_ABORT_CLR	When set to 1, CSI abort counter is cleared
14	CSI_XFER_EN	When set to 1, CSI-transfer is enabled. This influences CHE and PHYCSXI functionality for CSI transfer
13	CSI_WATCHDOG_EN	When set to 1, the watchdog timer in PHYCSXI is on and expires after 10 usec (max possible CSI xfer time) Note - has power impact. Switch this off if power-saving is desired.
12	NOTSOUNDINGPPDU_GEN ERATE_CSI	When set to 1, generate CSI report for nonsounding valid PPDU (MCS < 8 length > 0, not_sounding is 1)

WCSS_A_RACTL_CSI_CONFIG (cont.)

Bits	Name	Description
9	ADAPTIVE_CODEBOOK_EN	When set to 1, the SNR being used as a part of feedback report is used against a SNR threshold (see above reg CSI_CODEBOOK_SNR_TH) If threshold crossed, use codebook value 0, otherwise use codebook value 1. Note that when adaptive_codebook selection is used, the supported codebook values for 11n are 1 and 3 only. By default the codebook values from this register bits above are used.
8	CODEBOOK_11AC	SU: 0 => 2 (psi) and 4 (phi) bits, 1 => 4 (psi) and 6 (phi) bits MU: 0 => 5 (psi) and 7 (phi) bits, 1 => 7 (psi) and 9 (phi) bits
7:6	CODEBOOK_11N	0 => 1 (psi) and 3 (phi) bits, 1 => 2 (psi) and 4 (phi) bits, 2 => 3 (psi) and 5 (phi) bits, 3 => 4 (psi) and 6 (phi) bits
5:4	NG_11AC	0x0: NG_52 (Ng=1 => No grouping (52, 108, 234 sc) -- 30, 58, 122 sc for dsnr) 0x1: NG_30 (Ng=2 => 30, 58, 122 sc -- 16, 30, 62 for dsnr) 0x2: NG_16 (Ng=4 => 16, 30, 62 sc -- 10, 16, 32 for dsnr) 0x3: NG_RESVD
3:2	NG_11N	0x0: NG_56 (Ng=1 => No grouping (56 sc)) 0x1: NG_30 (Ng=2 => 30 sc) 0x2: NG_16 (Ng=4 => 16 sc) 0x3: NG_RESVD
1:0	NB_11N	0x0: NB_4 (Nb=4) 0x1: NB_5 (Nb=5) 0x2: NB_6 (Nb=6) 0x3: NB_8 (Nb=8)

0x0A00F150 WCSS_A_RACTL_BF_GAIN_DENOM**Type:** RW**Reset State:** 0x00D3**WCSS_A_RACTL_BF_GAIN_DENOM**

Bits	Name	Description
8:0	VALUE	The numerator comes from CHE. The denominator will be subtracted from numerator to provide bf_gain value The beamforming gain denominator should be programmed $(10 \cdot \log_{10}(2^{22}) - \text{tdc.target_dagc_bo}) \cdot 4$. Units: 0.25 dB.

0x0A00F154 WCSS_A_RACTL_CSI_STATS1**Type:** W**Reset State:** 0x00000000

Number of CSI transfers initiated by RACTL in various cases

WCSS_A_RACTL_CSI_STATS1

Bits	Name	Description
11:0	MACREQ_NDP_SOUNDING	Counts the number of MAC-requested CSI transfers for NDP sounding packets. These packets will have MCS between 8 and 31 and non-STBC packets. The HTSIG is 'unsupported' type [Case2 - (mcs_ge8_n_lt32 & length_0 & not_sounding_0 & stbc_0 & ndp_sounding_cfg_modf)] It also covers the 11ac ndp packet counters too.

0x0A00F158 WCSS_A_RACTL_CSI_STATS2

Type: R

Reset State: 0x00000000

Number of CSI aborts initiated by RACTL in various cases

WCSS_A_RACTL_CSI_STATS2

Bits	Name	Description
7:0	ABORTCNT	

0x0A00F15C WCSS_A_RACTL_CHE_SMOOTHING

Type: RW

Reset State: 0x003D

WCSS_A_RACTL_CHE_SMOOTHING

Bits	Name	Description
15	DSBL_PPDU	When dsbl is high, disables smoothing of channel-estimate for packets with payload.
14	DSBL_NDP	When dsbl is high, disables smoothing of channel-estimate for packets without payload (i.e. for 11n and 11ac ndp packets)
7:0	NOISE_OFFSET	When dsbl (above) is low, the rms error between smoothed and unsmoothed channel estimates is compared with the difference of noise stimate and agc rssi and decision made to use smoothing or not. Stated otherwise - smoothing is applied on channel estimate when the $N < TH$, where N is the noise estimate and TH is this register expressed in 0.25 dB steps.

0x0A00F160 WCSS_A_RACTL_PKTCNT_SMOOTHED**Type:** RW**Reset State:** 0x0000

Number of packets with smoothing done

WCSS_A_RACTL_PKTCNT_SMOOTHED

Bits	Name	Type	Description
15	CLR_CNT	RW	Clears the above counters
14:8	SMOOTHED	R	Packets where smoothed channel-estimated generated
6:0	SMOOTH_CANDIDATE	R	Packets candidate for smoothing

0x0A00F164 WCSS_A_RACTL_RACTL_CRCCHKCFG**Type:** RW**Reset State:** 0x0004**WCSS_A_RACTL_RACTL_CRCCHKCFG**

Bits	Name	Description
2:1	CRCCHK_EN_VHTSIGB	Do CRC-field check in VHTSIGB over VHTSIGB only (==2'd0) Do CRC-field check in VHTSIGB over VHTSIGA and VHTSIGB (==2'd1) Do CRC-field check in VHTSIGB over LSIG and VHTSIGA and VHTSIGB (==2'd2 or 2'd3)
0	CRCCHK_EN_VHTSIGA	Do CRC-field check of VHTSIGA over VHTSIGA only (==0) or check over LSIG and VHTSIGA (==1)

0x0A00F16C WCSS_A_RACTL_FORCE_DBGPKTTYPE**Type:** RW**Reset State:** 0x0000

Forces the packet-type of received packet based on forced Ibpsk or Qbpskchecks in RACTL main FSM Note that the following packet-types will be inferred from the combination of symtype checks: {sym0_Ibpskforce, sym1_Ibpskforce, sym2_Ibpskforce} implies Legacy 6 mbps {sym0_Ibpskforce, sym1_Ibpskforce, sym2_Qbpskforce} implies 11AC {sym0_Ibpskforce, sym1_Qbpskforce, Not applicable } implies 11n_MM {sym0_Qbpskforce, Not applicable , Not applicable } implies 11n_GF

WCSS_A_RACTL_FORCE_DBGPKTTYPE

Bits	Name	Description
15:0	COUNT	Number of long Start-of-Frame delimiters detected

0x0A01440C WCSS_A_RBAPB_IGN_ILL_PLCP**Type:** RW**Reset State:** 0x00FB

This register is used to enable checking of the following fields of the PLCP header: CRC16, Rate field and Service Field. These correctness check are all described in standard IEEE802.11b. The CRC16 should check, the service field should have its reserved bits set to zero and the rate field should contain one of the supported rates (in multiples of 100 kbit/s): 8'd10, 8'd20, 8'd55 or 8'd110.

WCSS_A_RBAPB_IGN_ILL_PLCP

Bits	Name	Description
10	IGN_SIG	Used to ignore check for valid signal fields and pass packets with signal field errors Valid rate fields contents are 10, 20, 55 and 110 (decimal), denoting 1,2, 5.5 and 11 Mbit/s. 0x0: ENABLE (Enable signal field check) 0x1: IGNORE (Ignore signal field check)

WCSS_A_RBAPB_IGN_ILL_PLCP (cont.)

Bits	Name	Description
9	IGN_SVC	Used to ignore check for valid service fields and pass packets with signal field errors. A valid service field has all bits equal to zero for 1, 2 and 5.5 Mbit/s mode. The most significant bit may be non-zero in 11 Mbit/s mode. 0x0: ENABLE (Enable service field check) 0x1: IGNORE (Ignore service field check)
8	IGN_CRC	Used to ignore CRC check and pass packets with PLCP CRC errors. 0x0: ENABLE (Enable CRC16 check) 0x1: IGNORE (Ignore CRC16 check)
7:0	SVC_MASK	Service Field Mask. The field is applied using a logical 'and' to the service field before the illegal service field check is applied. By default the 'coupled clocks' bit is masked out, in order not to reject packets transmitted by products with uncoupled clocks or products which couple clocks only for higher bit rates.

0x0A014410 WCSS_A_RBAPB_COUNT_PLCP_CRC_ERRORS**Type:** W**Reset State:** 0x00000000

Counter number of CRC errors.

WCSS_A_RBAPB_COUNT_PLCP_CRC_ERRORS

Bits	Name	Description
15:0	COUNT	CRC error counter.

0x0A014414 WCSS_A_RBAPB_COUNT_PLCP_SIG_ERRORS**Type:** W**Reset State:** 0x00000000

Counter number of signal field errors.

WCSS_A_RBAPB_COUNT_PLCP_SIG_ERRORS

Bits	Name	Description
15:0	COUNT	Illegal signal field counter.

0x0A014418 WCSS_A_RBAPB_COUNT_PLCP_SVC_ERRORS**Type:** W**Reset State:** 0x00000000

Counter number of service field errors.

WCSS_A_RBAPB_COUNT_PLCP_SVC_ERRORS

Bits	Name	Description
15:0	COUNT	Illegals service field counter.

0x0A01441C WCSS_A_RBAPB_COUNT_RX_BYTES**Type:** W**Reset State:** 0x00000000

Counts number of payload bytes received by the RXB receiver (output by the header processor).

WCSS_A_RBAPB_COUNT_RX_BYTES

Bits	Name	Description
15:0	COUNT	Byte counter.

0x0A014420 WCSS_A_RBAPB_COUNT_MPI_SOF**Type:** W**Reset State:** 0x00000000

Counts number of Start-Of_Frame signals generated by header processor and sent to MPI.

WCSS_A_RBAPB_COUNT_MPI_SOF

Bits	Name	Description
15:0	COUNT	rbhdr_mpi_sof event counter.

0x0A014424 WCSS_A_RBAPB_COUNT_MPI_EOF**Type:** W**Reset State:** 0x00000000

Counts number of End-Of_Frame signals generated by header processor and sent to MPI.

WCSS_A_RBAPB_COUNT_MPI_EOF

Bits	Name	Description
15:0	COUNT	rbhdr_mpi_eof event counter.

0x0A014428 WCSS_A_RBAPB_SFD_DET_TMO**Type:** RW**Reset State:** 0x007D

SFD Detetction threshold is specified in microseconds. Power-on reset value is 125 decimal. Includes demodulation and descrambling delay. This register is used to lead a timer that aborts the SFD detection process. It should be as set as low as possible to reduce the receiver dead time to a minimum.

WCSS_A_RBAPB_SFD_DET_TMO

Bits	Name	Description
7:0	TIME	SFD detection timeout. 0x7D: POR (power-on reset value)

0x0A01442C WCSS_A_RBAPB_SLR_SFD_DET_TMO**Type:** RW**Reset State:** 0x01F4

SFD Detetction threshold is specified in microseconds. Power-on reset value is 500 decimal. Includes demodulation and descrambling delay. This register is used to set a timer that aborts the SFD detection process for SLR packets. It should be as set as low as possible to reduce the receiver dead time to a minimum.

WCSS_A_RBAPB_SLR_SFD_DET_TMO

Bits	Name	Description
8:0	TIME	SLR SFD detection timeout. 0x1F4: POR (power-on reset value)

0x0A014430 WCSS_A_RBAPB_COUNT_RXB_START**Type:** W**Reset State:** 0x00000000

Counts number of RXB_START events received by the RXB controler.

WCSS_A_RBAPB_COUNT_RXB_START

Bits	Name	Description
15:0	COUNT	RXB_START Counter

0x0A014438 WCSS_A_RBAPB_COUNT_RXB_ABORT**Type:** W**Reset State:** 0x00000000

Counts number of RXB_ABORT events received by the RXB controller.

WCSS_A_RBAPB_COUNT_RXB_ABORT

Bits	Name	Description
15:0	COUNT	RXB_ABORT event counter.

0x0A01443C WCSS_A_RBAPB_RXB_RESET**Type:** W**Reset State:** 0x00000000

Resets RXB controller state machine.

WCSS_A_RBAPB_RXB_RESET

Bits	Name	Description
0	RST	Reset RXB.

0x0A014440 WCSS_A_RBAPB_CONTROL_BARKER_TIMING_TRACKING**Type:** RW**Reset State:** 0x0006

Control Barker timing tracking.

WCSS_A_RBAPB_CONTROL_BARKER_TIMING_TRACKING

Bits	Name	Description
2	FEEDBACK	Enable Barker timing tracking. 0x0: DISABLE (do not use timing tracking feedback) 0x1: ENABLE (use timing tracking feedback)

WCSS_A_RBAPB_CONTROL_BARKER_TIMING_TRACKING (cont.)

Bits	Name	Description
1:0	THRESHOLD	Timing error threshold.

0x0A014448 WCSS_A_RBAPB_CMF_PLL_COEFF_A**Type:** RW**Reset State:** 0x02DE

CMF PLL Loop Coefficient A

WCSS_A_RBAPB_CMF_PLL_COEFF_A

Bits	Name	Description
9:0	COEFF_A	default value -290

0x0A01444C WCSS_A_RBAPB_CMF_PLL_COEFF_B**Type:** RW**Reset State:** 0x0127

CMF PLL Loop Coefficient B

WCSS_A_RBAPB_CMF_PLL_COEFF_B

Bits	Name	Description
9:0	COEFF_B	default value 295

0x0A014450 WCSS_A_RBAPB_CMF_PLL_COEFF_A_SLR_TRACK**Type:** RW**Reset State:** 0x0378

CMF PLL Loop Coefficient A used for SLR packets after SFD has been detected

WCSS_A_RBAPB_CMF_PLL_COEFF_A_SLR_TRACK

Bits	Name	Description
9:0	COEFF_A_TRACK	default value -136

0x0A014454 WCSS_A_RBAPB_CMF_PLL_COEFF_B_SLR_TRACK**Type:** RW**Reset State:** 0x008A

CMF PLL Loop Coefficient B used for SLR packets after SFD has been detected

WCSS_A_RBAPB_CMF_PLL_COEFF_B_SLR_TRACK

Bits	Name	Description
9:0	COEFF_B_TRACK	default value 138

0x0A014458 WCSS_A_RBAPB_ANTENNA_DIVERSITY_MODE**Type:** RW**Reset State:** 0x0000

This register defines the behaviour of the antenna diversity logic.

WCSS_A_RBAPB_ANTENNA_DIVERSITY_MODE

Bits	Name	Description
1:0	VALUE	Antenna diversity selector mode field 0x0: DISABLE (no diversity switching) 0x1: ALWAYS (always switch to diversity mode) 0x2: SNR_SWITCH (switch to diversity mode if SNR exceeds threshold) 0x3: RESV (reserved)

0x0A01445C WCSS_A_RBAPB_SNR_THRESHOLD**Type:** RW**Reset State:** 0x0019

This threshold is used to decide whether the SNR of the current packet is sufficient to support diversity

WCSS_A_RBAPB_SNR_THRESHOLD

Bits	Name	Description
5:0	VALUE	SNR threshold value

0x0A014460 WCSS_A_RBAPB_SNR_AVERAGER_GAIN**Type:** RW**Reset State:** 0x0028

Barker and CCK demod SNR averager loop gain

WCSS_A_RBAPB_SNR_AVERAGER_GAIN

Bits	Name	Description
5:4	RBCKK_HANDOFF	CCK demod SNR averager loop gain - default value = 2^6
3:2	RBBRK_HANDOFF	Barker demod SNR averager loop gain after antenna diversity selection - default value = 2^6
1:0	RBBRK_ANTSEL	Barker demod SNR averager loop gain during antenna diversity selection - default value = 2^4

0x0A014464 WCSS_A_RBAPB_LMS_AVERAGER_SHIFT**Type:** RW**Reset State:** 0x0014

Channel equaliser averager loop gain

WCSS_A_RBAPB_LMS_AVERAGER_SHIFT

Bits	Name	Description
5:3	SLR	LMS averager loop gain - range $2^{(0-7)}$, default value = 2^2
2:0	NON_SLR	LMS averager loop gain - range $2^{(0-7)}$, default value = 2^4

0x0A014468 WCSS_A_RBAPB_COUNT_DYNSEL_ANT0**Type:** W**Reset State:** 0x00000000

Counts the number of times antenna0 is selected when dynamic antenna selection is enabled.

WCSS_A_RBAPB_COUNT_DYNSEL_ANT0

Bits	Name	Description
15:0	COUNT	antenna0 event counter.

0x0A01446C WCSS_A_RBAPB_COUNT_DYNSEL_ANT1**Type:** W**Reset State:** 0x00000000

Counts the number of times antenna1 is selected when dynamic antenna selection is enabled.

WCSS_A_RBAPB_COUNT_DYNSEL_ANT1

Bits	Name	Description
15:0	COUNT	antenna1 event counter.

0x0A014470 WCSS_A_RBAPB_COUNT_DYNSEL_2ANT**Type:** W**Reset State:** 0x00000000

Counts the number of times both antennae are selected when dynamic antenna selection is enabled.

WCSS_A_RBAPB_COUNT_DYNSEL_2ANT

Bits	Name	Description
15:0	COUNT	both antennae event counter.

10.49 WCSS_A_RFIF_RFIF**0x0A015000 WCSS_A_RFIF_RF_BUS_CONTROL****Type:** RW**Reset State:** 0x0209

This set of registers are used to adjust timing parameters used, and to issue special commands, over the RF bus interface.

WCSS_A_RFIF_RF_BUS_CONTROL

Bits	Name	Description
11:8	IRIS_ASYNC_CAP_DLY	Iris begins driving asynchronous signals to Riva at the completion of an RF command. This field is used to delay the sampling of this data after a command has completed. The default value represents a delay of approx. 25 ns ((2+1) x 120M clocks - spec requirement) when bit 3 of this register is 0. The delay changes to be in units of 60M clocks after completion of a register read command when bit 3 in this register is 1.

WCSS_A_RFIF_RF_BUS_CONTROL (cont.)

Bits	Name	Description
7	ENABLE_80M_IRIS_CLK_OVERRIDE	This bit is used to override the control of the 80M clock used for RF calibration mode. When disabled, the clock enable for the 80M Iris clock is automatically disabled when we observe a calibration done signal from Iris (software must still enable the clock via bit 6 below). If there are any issues with this automatic clock disabling feature, this override bit can be enabled to re-activate manual control of disabling the 80M clock via bit 6 below. 0x0: OVERRIDE_DISABLED (RF 80M calibration clock override is disabled) 0x1: OVERRIDE_ENABLED (RF 80M calibration clock override is enabled)
6	ENABLE_80M_IRIS_CLK	This bit is used to enable/disable the 80M clock used for RF calibration mode. During RF calibration mode, an 80 MHz clock must be fed out on the cmd_clk signal, and it is this bit that is used to enable/disable that clock. Bit 2 in this register is used to select this clock as the source to Iris. Bit 2 must be set first, followed by this bit. And after RF calibration, this bit must be disabled first, followed by bit 2. 0x0: DISABLED (RF 80M calibration clock is disabled) 0x1: ENABLED (RF 80M calibration clock is enabled)
5:4	SET_RF_BUS_RD_DELAY	Controls the delay value used by the RF bus interface state machine for register reads. By default (2'b00), the RF bus interface state machine inserts 3 cmd_clk cycles before it samples the read data (on the 4th cmd_clk cycle). Each value set in this register increases the delay inserted by the RF bus interface state machine before it samples the read data, by 1/2 cmd_clk cycle - i.e. 2'b01 causes the insertion of 3.5 cmd_clk cycles, and 2'b10 causes the insertion of 4 cmd_clk cycles. 0x0: DEFAULT (Default 3 cmd_clk RF bus interface read delay) 0x1: HALF_CYCLE (Extra half cmd_clk cycle RF bus interface read delay) 0x2: ONE_CYCLE (Extra one cmd_clk cycle RF bus interface read delay) 0x3: INVALID (Invalid setting - defaults to 3 cmd_clk cycle read delay mode)
3	SET_RF_BUS_FREQ	Controls the frequency setting of the RF bus interface cmd_clk signal. For Riva, two RF bus frequency values are supported - 60 MHz (default) and 30 MHz. When set to 1, this bit sets the RF bus frequency to be 30 MHz. When 0, the default mode of 60 MHz is selected. 0x0: V_60M_MODE (RF bus interface frequency set to 60 MHz) 0x1: V_30M_MODE (RF bus interface frequency set to 30 MHz)

WCSS_A_RFIF_RF_BUS_CONTROL (cont.)

Bits	Name	Description
2	ENABLE_RF_CALIBRATION	This bit is used to enable/disable the RF calibration mode. During RF calibration mode, an 80 MHz clock must be fed out on the cmd_clk signal, and it is this bit that is used to enable the selection of the 80 MHz clock onto cmd_clk. The entire RF calibration mode is under software control - software needs to set this bit when the 80 MHz clock is required, and disable this bit when calibration is complete. 0x0: DISABLED (RF calibration mode disabled) 0x1: ENABLED (RF calibration mode enabled)
1	RESERVED	reserved
0	ENABLE_RF_BUS	This bit enables/disables access to the RF bus. When this bit is 0 (disabled), the RF bus pins are not driven by internal RFIF logic, but may be used to drive debug data over the RF bus. The ENABLE_DEBUG_MODE bit must be set for the debug mode to be in effect. To avoid any pin conflict, debug data is only driven on the RF bus pins, when both ENABLE_DEBUG_MODE is set and ENABLE_RF_BUS is disabled. 0x0: DISABLED (RF bus interface access disabled) 0x1: ENABLED (RF bus interface access enabled)

0x0A015004 WCSS_A_RFIF_RF_BUS_STATUS**Type:** R**Reset State:** 0x0000

These registers capture the status of the RF bus interface state machine and controlling logic.

WCSS_A_RFIF_RF_BUS_STATUS

Bits	Name	Description
4	CALIB_DONE	Holds the current state of the Iris calibration mode done signal. When calibration mode is selected, this signal will reset to 0. On completion of calibration, this signal will capture the done signal returned from Iris.
3:0	RF_BUS_SM_STATE	Current state of the RF bus interface state machine.

0x0A015008 WCSS_A_RFIF_ARB_CONTROL**Type:** RW**Reset State:** 0x000F

This set of registers are used by the arbitration module to enable/disable data path access to the RF bus interface.

WCSS_A_RFIF_ARB_CONTROL

Bits	Name	Description
3	ENABLE_TXGAIN_COMMA NDS	Enables/disables the Tx gain commands coming from the TXFIR. 0x0: DISABLED (TX Gain commands issued to RF bus interface are disabled) 0x1: ENABLED (TX Gain commands issued to RF bus interface are enabled)
2	ENABLE_RXGAIN_COMMA NDS	Enables/disables the Rx gain commands coming from the AGC. 0x0: DISABLED (RX Gain commands issued to RF bus interface are disabled) 0x1: ENABLED (RX Gain commands issued to RF bus interface are enabled)
1	ENABLE_PHYHW_COMMA NDS	This bit enables/disables accesses by PHY H/W over the RF bus interface. 0x0: DISABLED (PHY H/W sourced accesses to/from RF bus interface are disabled) 0x1: ENABLED (PHY H/W sourced accesses to/from RF bus interface are enabled)
0	ENABLE_RFAPB_COMMAN DS	This bit enables/disables accesses by the RFAPB interface over the RF bus interface. 0x0: DISABLED (RFAPB sourced accesses to/from RF bus interface are disabled) 0x1: ENABLED (RFAPB sourced accesses to/from RF bus interface are enabled)

0x0A01500C WCSS_A_RFIF_ARB_COMMAND**Type:** RW**Reset State:** 0x000F

This set of registers are used by the arbitration module to issue RF commands requested by software over the RF interface bus.

WCSS_A_RFIF_ARB_COMMAND

Bits	Name	Description
6:4	RF_CMD_DATA_WRD1	This field holds the first data word of the software requested RF command. Currently the only commands with data supported are the RF clock enable command, and the RF reset command, of which both require only a single data word. The encoding definitions provided are for the clock enable command only. The RF reset command data word should be set to all zero. 0x0: DISABLE_19P2 (Disables Iris clock and selects 19.2M input from PMIC) 0x1: ENABLE_19P2 (Enables Iris clock and selects 19.2M input from PMIC) 0x2: DISABLE_38P4 (Disables Iris clock and selects 38.4M input from PMIC) 0x3: ENABLE_38P4 (Enables Iris clock and selects 38.4M input from PMIC) 0x4: RESERVED_WRD4 (Reserved) 0x5: RESERVED_WRD5 (Reserved) 0x6: DISABLE_48 (Disables Iris clock and selects 48M XO input) 0x7: ENABLE_48 (Enables Iris clock and selects 48M XO input)
3:1	RF_CMD	This field holds the RF_CMD to be issued. Default command is set to RF_RESET command. 0x0: CLOCK_ENABLE_CMD (Iris clock enable command. Used to enable/disable clocks and set frequency) 0x1: MODE_CMD (Iris mode command. Used to control TX and RX enable.) 0x2: RESERVED_CMD2 (Command not supported.) 0x3: RESERVED_CMD3 (Command not supported.) 0x4: RESERVED_CMD4 (Command not supported.) 0x5: RESERVED_CMD5 (Command not supported.) 0x6: RESERVED_CMD6 (Command not supported.) 0x7: RESET_CMD (Iris reset command. Resets Iris.)
0	ISSUE_RF_CMD	This bit is used to initiate an RF command over the RF bus interface. Writing a 1 to this bit requests the arbiter to issue the command loaded in the RF_CMD field. Note that only RF commands with 1 data word are currently supported by this means. When issuing a command (by writing a 1 to this bit), the value in this bit will clear to zero to indicate that the current command is in progress. When the command has completed, the value of this bit will return to 1. Reading this bit returns the status described in the encoding section. 0x0: CMD_IN_PROGRESS (RF command has been requested and the command is in progress.) 0x1: IDLE (RF command is complete, or waiting for new RF command.)

0x0A015010 WCSS_A_RFIF_ARB_STATUS**Type:** R**Reset State:** 0x0000

These registers hold the current status of the arbitration module, and are used for debug and status checking.

WCSS_A_RFIF_ARB_STATUS

Bits	Name	Description
15:12	RXGAIN_ABORTED_CMDS	Holds the number of RXGAIN commands aborted (by request).
11:8	RFAPB_DROPPED_CMDS	Holds the number of commands dropped because RFAPB accesses are disabled.
7:4	BLOCKED_CMDS	Holds the total number of RF commands blocked because the RF Bus has not been enabled.
3:0	ARB_SM_STATE	Captures the current state of the Arbitration state machine module. Used for debugging purposes.

0x0A015014 WCSS_A_RFIF_BT_CTRL_CFG**Type:** RW**Reset State:** 0x0003

This register configures the behavior of the BT input signals with regards to the PHY.

WCSS_A_RFIF_BT_CTRL_CFG

Bits	Name	Description
2	BT_RX_SHARING_EN	Enables simultaneous RX sharing of antenna with the BT device.
1	BT_MEDIUM_SHUTDOWN	Controls whether or not the bt_medium input is used to shutdown the PHY. 1 means it will, 0 means it won't.
0	BT_TX_SHUTDOWN	Controls whether or not the bt_tx input is used to shutdown the PHY. 1 means it will, 0 means it won't.

0x0A015018 WCSS_A_RFIF_TX_EN_CFG**Type:** RW**Reset State:** 0x0000

This register controls the behaviour of the TX_EN signal.

WCSS_A_RFIF_TX_EN_CFG

Bits	Name	Description
1	TX_OVERRIDE_VAL	If the Tx enable override is enabled, then this is the overriding value for the Tx.
0	OVERRIDE_EN	Setting this bit to 1 enables the override of the Tx enable.

0x0A01501C WCSS_A_RFIF_RESET_CTRL**Type:** RW**Reset State:** 0x0000

Reset control register.

WCSS_A_RFIF_RESET_CTRL

Bits	Name	Description
4	STATS_RESET	Setting this to 1 resets all of the current debug statistics counters.
3	PHYHW_SM_RESET	Setting this to 1 resets all of the PHY H/W interface state machines.
2	RF_BUS_IF_SM_RESET	Setting this to 1 resets the RF bus interface state machine. This should only be used if hang has somehow occurred in this state machine.
1	ARB_SM_RESET	Setting this to 1 resets the arbitration state machine. This should only be used if hang has somehow occurred in this state machine.
0	RFAPB_SM_RESET	Setting this to 1 resets the RFAPB state machine. This should only be used if hang has somehow occurred in this state machine.

0x0A015020 WCSS_A_RFIF_PHY_HW_STATUS**Type:** R**Reset State:** 0x0000

These registers hold the current status of the PHY HW module, and are used for debug and status checking.

WCSS_A_RFIF_PHY_HW_STATUS

Bits	Name	Description
15:10	PHYHW_DROPPED_CMDS	Holds the number of commands dropped because PHY H/W and/or TX & RX gain commands are disabled.

WCSS_A_RFIF_PHY_HW_STATUS (cont.)

Bits	Name	Description
9:8	MODE_SM_STATE	Captures the current state of the MODE state machine module. Used for debugging purposes.
7:5	REG_RDWR_SM_STATE	Captures the current state of the Register read/write state machine module. Used for debugging purposes.
4:3	TXGAIN_SM_STATE	Captures the current state of the TXGAIN state machine module. Used for debugging purposes.
2:0	RXGAIN_SM_STATE	Captures the current state of the RXGAIN state machine module. Used for debugging purposes.

0x0A015024 WCSS_A_RFIF_RFAPB_STATUS**Type:** R**Reset State:** 0x0000

Captures current status of the RFAPB module.

WCSS_A_RFIF_RFAPB_STATUS

Bits	Name	Description
2:0	RFAPB_SM_STATE	Captures the current state of the RFAPB state machine module. Used for debugging purposes.

0x0A015028 WCSS_A_RFIF_ERROR_CONDS**Type:** RW**Reset State:** 0x0000

Captures error conditions if they occur.

WCSS_A_RFIF_ERROR_CONDS

Bits	Name	Description
0	WR_FIFO_RD_EMPTY_ER R	This condition indicates that the write data fifo (data to be written to IRIS) became empty. This should never occur. A write of 1 will clear this condition.

0x0A01502C WCSS_A_RFIF_HKADC_RD_ADDR**Type:** RW**Reset State:** 0x0535

Specifies the Iris read address for HKADC operations.

WCSS_A_RFIF_HKADC_RD_ADDR

Bits	Name	Description
10:0	RD_ADDR	This field contains the read address for HKADC operations.

0x0A015030 WCSS_A_RFIF_HKADC_WR_ADDR

Type: RW

Reset State: 0x0534

Specifies the Iris write address for HKADC operations.

WCSS_A_RFIF_HKADC_WR_ADDR

Bits	Name	Description
10:0	WR_ADDR	This field contains the write address for HKADC operations.

0x0A015034 WCSS_A_RFIF_HKADC_CONV_TIMER

Type: RW

Reset State: 0x007F

Specifies the time in units of 12.5ns (80MHz) that the RFIF will wait for the HKADC conversion to occur, before issuing a read to read the data from Iris.

WCSS_A_RFIF_HKADC_CONV_TIMER

Bits	Name	Description
6:0	WAIT_CNT	Total time to wait for the HKADC conversion to complete (in units of 12.5ns).

0x0A015400+ WCSS_A_RFIF_RX_GAINn_0, n=[0..47] 0x10*n

Type: RW

Reset State: 0x0000

Read write interface to the RX Gain look up Table

WCSS_A_RFIF_RX_GAINn_0

Bits	Name	Description
15:0	RXGAIN_VALUE_0	

0x0A015404+ WCSS_A_RFIF_RX_GAINn_1, n=[0..47]
0x10*n
Type: RW**Reset State:** 0x0000

Read write interface to the RX Gain look up Table

WCSS_A_RFIF_RX_GAINn_1

Bits	Name	Description
15:0	RXGAIN_VALUE_1	

0x0A015408+ WCSS_A_RFIF_RX_GAINn_2, n=[0..47]
0x10*n
Type: RW**Reset State:** 0x0000

Read write interface to the RX Gain look up Table

WCSS_A_RFIF_RX_GAINn_2

Bits	Name	Description
6:0	RXGAIN_VALUE_2	

0x0A015800+ WCSS_A_RFIF_TX_GAINn_0, n=[0..31]
0x20*n
Type: RW**Reset State:** 0x0000

Read write interface to the TX Gain look up Table

WCSS_A_RFIF_TX_GAINn_0

Bits	Name	Description
15:0	TXGAIN_VALUE_0	

**0x0A015804+ WCSS_A_RFIF_TX_GAINn_1, n=[0..31]
0x20*n****Type:** RW**Reset State:** 0x0000

Read write interface to the TX Gain look up Table

WCSS_A_RFIF_TX_GAINn_1

Bits	Name	Description
15:0	TXGAIN_VALUE_1	

**0x0A015808+ WCSS_A_RFIF_TX_GAINn_2, n=[0..31]
0x20*n****Type:** RW**Reset State:** 0x0000

Read write interface to the TX Gain look up Table

WCSS_A_RFIF_TX_GAINn_2

Bits	Name	Description
15:0	TXGAIN_VALUE_2	

**0x0A01580C+ WCSS_A_RFIF_TX_GAINn_3, n=[0..31]
0x20*n****Type:** RW**Reset State:** 0x0000

Read write interface to the TX Gain look up Table

WCSS_A_RFIF_TX_GAINn_3

Bits	Name	Description
15:0	TXGAIN_VALUE_3	

**0x0A015810+ WCSS_A_RFIF_TX_GAINn_4, n=[0..31]
0x20*n****Type:** RW**Reset State:** 0x0000

Read write interface to the TX Gain look up Table

WCSS_A_RFIF_TX_GAINn_4

Bits	Name	Description
15:0	TXGAIN_VALUE_4	

0x0A015814+ WCSS_A_RFIF_TX_GAINn_5, n=[0..31]
0x20*n

Type: RW

Reset State: 0x0000

Read write interface to the TX Gain look up Table

WCSS_A_RFIF_TX_GAINn_5

Bits	Name	Description
10:0	TXGAIN_VALUE_5	

10.50 WCSS_A_RPE_RPE

0x0A082400 WCSS_A_RPE_MEM_BASE_ADDR

Type: RW

Reset State: 0x00000000

It gives the base address of the memory where all bitmaps and related flags are stored per station and per queue basis

WCSS_A_RPE_MEM_BASE_ADDR

Bits	Name	Description
31:0	CFG_BASEADDR	Base address for the RPE data descriptor memory

0x0A082404 WCSS_A_RPE_FULLSTATE_STATIONS_QUEUES

Type: RW

Reset State: 0x00080006

This register indicates the max number of stations we are associated with and the max number of Queues per station

WCSS_A_RPE_FULLSTATE_STATIONS_QUEUES

Bits	Name	Description
19:16	CFG_FULLSTATE_QUEUES	Max number of Queues per station default value 8 indicates 8 queues qids 0-7
4:0	CFG_FULLSTATE_STATIONS	The number here indicates the number of stations default value 6 indicates station ids 0- 5

0x0A082408 WCSS_A_RPE_SM_STUCK_CNT_VALUE**Type:** RW**Reset State:** 0x00000600

The register has the time out value used by RPE when any statemachine hangs

WCSS_A_RPE_SM_STUCK_CNT_VALUE

Bits	Name	Description
11:0	SM_STUCK_CNT_VALUE	This value indicates the timeout value in terms of number of clock cycles for pronto it is 40Mhz

0x0A08240C WCSS_A_RPE_RPE_CONFIG**Type:** RW**Reset State:** 0x00000080

gives some configurations for RPE

WCSS_A_RPE_RPE_CONFIG

Bits	Name	Description
27	RPE_CLEAR_COUNTERS	writing 1 will clear all counters, HW will make it zero
19:16	RESERVED	reserved
14:8	RSRC_ENTRY_DIS	This field controls the number of resorces used for fragmentation. one resource is always used. (for only 2 resources are used only bit 0 is useful here) These seven bits can be used to turn of any resource table entry for fragment gathering. Each bit indicates the resource table entry number. bit 8 is for resource table 1, resource table 0 is always on. Resource entries should be on/off sequentially only, not randomly. for example 7'b0001111 is okay 7'b0101011 is not okay

WCSS_A_RPE_RPE_CONFIG (cont.)

Bits	Name	Description
7	OUOFORD_PKT_FWD	Whenever a window moves due to one of internal flushing events (internal events described in bitfield 1) then the BA bitmap does not change but reorder bitmap changes if any packets that arrive in reorder for the holes then those packets need to be forwarded when this bit is set else they are dropped 1: Drop out of order packets arriving in reorder 0: Forward out of order packets packets arriving in reorder
5	NONFRAG_FLUSH_DIS	1'b1: When set resource entries for frag pkts are not flushed when non-frag packets are received for a staid/qid which has valid entry 1'b0: When non-frag pkts are received for a staid/qid which has valid resource entry then that resource is flushed
4	HOST_BAR_DROP_DIS	1'b1: when set then the BAR packets which have same sequence number as next expected packet will be dropped by RPE and not host 1'b0: The BAR packet which has same sequence number as next expected packet will be sent to host with opcode DROP_CUR and host will drop the packet
3	BDPDU_NOTAVAIL_DROP_DIS	This is mostly relevant fragmented packets since we create frag BD. set to 1'b1: the packets will not be dropped when bmu indicates no bdpdu is avail, then we will wait for it to beavailable and will not drop the packet. 1'b0: default we will drop the packets when bdpdu is notavailable
2	REORDER_DIS	when set the h/w buffer reordering support is disabled(Feature that was in Libra also)
0	LRU_OR_RR	This register should always be set to Zero Initiall it was reserved for LRU which was not implemented. No one should touch this register. If it is set to 1-> RPE will not work

0x0A082410 WCSS_A_RPE_ROUTING_FLAG**Type:** RW**Reset State:** 0x00FF0003

This register will allow you to program routing table for RPE

WCSS_A_RPE_ROUTING_FLAG

Bits	Name	Description
23:16	ROUTING_DROP_PACKET	All the BAD (error) packets will be pushed to this WQ default value gives the DROP wq == decimal 255 -- duplicate det packets during bit map updated -- duplicate or flushing fragments -- out of order etc -- ...
7:0	ROUTING_GOOD_PACKET	All good packets will be forwarded to WQ programmed in this feild Defalut WQ is DPU

0x0A082414 WCSS_A_RPE_SW_FLUSH_BITMAP_CACHE**Type:** RW**Reset State:** 0x00000000

This register allows s/w to flush the caches for fullstate or partialstate bitmaps

WCSS_A_RPE_SW_FLUSH_BITMAP_CACHE

Bits	Name	Description
4	CFG_FLUSH_PARTIALSTATE_CACHE	Writing to this will flush the bitmap maintained in the cache set to 1'b1: fullstate bitmap in the cache is written to memory after the flush H/W will invalidate the cache
0	CFG_FLUSH_FULLSTATE_CACHE	Writing to this will flush the fullstate bitmap maintained in the cache set to 1'b1: fullstate bitmap in the cache is written to memory after the flush H/W will invalidate the cache

0x0A082418 WCSS_A_RPE_FULLSTATE_BITMAP_CACHE_DW1**Type:** R**Reset State:** 0x00000000

when read it gives the lower 32 bits of fullstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_fullstate_bitmap

WCSS_A_RPE_FULLSTATE_BITMAP_CACHE_DW1

Bits	Name	Description
31:0	BITMAP_CACHE_DW1	Indicates following fields ENTRY_VAL 0 RSVD 6:1 REORDR_BUF 7 RETRY_CHK 8 FLUSH_FRAG 9 ORDR_CHK 10 FRAG_CHK 11 IEEE_2K_CHK 12 WIN_SIZE 18:13 SSN_VAL 19 SSN 31:20

0x0A08241C WCSS_A_RPE_FULLSTATE_BITMAP_CACHE_DW2**Type:** R**Reset State:** 0x00000000

when read it gives the middle 32 bits 63:32 of fullstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_fullstate_bitmap

WCSS_A_RPE_FULLSTATE_BITMAP_CACHE_DW2

Bits	Name	Description
31:0	BITMAP_CACHE_DW2	This is the actual bitmap which shows lower 32 bits 31:0

0x0A082420 WCSS_A_RPE_FULLSTATE_BITMAP_CACHE_DW3**Type:** R**Reset State:** 0x00000000

when read it gives the upper 32 bits 95:64 of fullstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_fullstate_bitmap

WCSS_A_RPE_FULLSTATE_BITMAP_CACHE_DW3

Bits	Name	Description
31:0	BITMAP_CACHE_DW3	This is bitmap which shows upper 32 bits

0x0A082424 WCSS_A_RPE_STATIONID_QID_4_FULLSTATE_BITMAP**Type:** R**Reset State:** 0x00000000

when read it gives you which station/qid the above bitmap belongs to

WCSS_A_RPE_STATIONID_QID_4_FULLSTATE_BITMAP

Bits	Name	Description
19:16	QID_4_FULLSTATE_BITMAP	Qid for the fullstatebitmap in cache
4:0	STATIONID_4_FULLSTATE_BITMAP	Station id for the fullstatebitmap in cache

0x0A082428 WCSS_A_RPE_PARTIALSTATE_BITMAP_CACHE_DW1**Type:** R**Reset State:** 0x00000000

when read it gives the lower 32 bits 31:0 of partialstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_partialstate_bitmap

WCSS_A_RPE_PARTIALSTATE_BITMAP_CACHE_DW1

Bits	Name	Description
31:0	BITMAP_CACHE_DW1	Indicates following fields ENTRY_VAL 0 RSVD 6:1 REORDR_BUF 7 RETRY_CHK 8 FLUSH_FRAG 9 ORDR_CHK 10 FRAG_CHK 11 IEEE_2K_CHK 12 WIN_SIZE 18:13 SSN_VAL 19 SSN 31:20

0x0A08242C WCSS_A_RPE_PARTIALSTATE_BITMAP_CACHE_DW2**Type:** R**Reset State:** 0x00000000

when read it gives the middle 32 bits 63:32 of partialstate bitmap that is in the cache. The staid/qid of this cache is in register stationid_qid_4_partialstate_bitmap

WCSS_A_RPE_PARTIALSTATE_BITMAP_CACHE_DW2

Bits	Name	Description
31:0	BITMAP_CACHE_DW2	This is the actual bitmap which shows lower 32 bits

0x0A082430 WCSS_A_RPE_PARTIALSTATE_BITMAP_CACHE_DW3**Type:** R**Reset State:** 0x00000000

when read it gives you upper 32 bits of partialstate bitmap

WCSS_A_RPE_PARTIALSTATE_BITMAP_CACHE_DW3

Bits	Name	Description
31:0	BITMAP_CACHE_DW3	This is bitmap which shows upper 32 bits

0x0A082434 WCSS_A_RPE_STATIONID_QID_4_PARTIALSTATE_BITMAP**Type:** R**Reset State:** 0x00000000

when read it gives you which station/qid the above bitmap belongs to

WCSS_A_RPE_STATIONID_QID_4_PARTIALSTATE_BITMAP

Bits	Name	Description
19:16	QID_4_PARTIALSTATE_BITMAP	Qid for the partialstatebitmap in cache
4:0	STATIONID_4_PARTIALSTATE_BITMAP	Station id for the partialstatebitmap in cache

0x0A082438 WCSS_A_RPE_FRAGMENT_RESRC_ENTRY1_DW1**Type:** R**Reset State:** 0x00000000

when read it gives you lower 32 bits of 1st resource of the 8 MPDUs maintained in RPE

WCSS_A_RPE_FRAGMENT_RESRC_ENTRY1_DW1

Bits	Name	Description
31:0	RESRC1_DW1	Indicates following fields ENTRY_VAL 0 STAID 8:1 QID 13:9 SSN 25:14 FRAG_NUM 29:26 LRU_ORDR 30 RSRC_ENA 31

0x0A08243C WCSS_A_RPE_FRAGMENT_RESRC_ENTRY1_DW2**Type:** R**Reset State:** 0x00000000

when read it gives you upper 32 bits of 1st resource of the 8 MPDUs maintained in RPE

WCSS_A_RPE_FRAGMENT_RESRC_ENTRY1_DW2

Bits	Name	Description
31:0	RESRC1_DW2	Indicates following fields BD_INDX 19:0 RSVD 31:20

0x0A082440 WCSS_A_RPE_FRAGMENT_RESRC_ENTRY2_DW1**Type:** R**Reset State:** 0x00000000

when read it gives you lower 32 bits of 2nd resource of the 8 MPDUs maintained in RPE

WCSS_A_RPE_FRAGMENT_RESRC_ENTRY2_DW1

Bits	Name	Description
31:0	RESRC2_DW1	Indicates following fields ENTRY_VAL 0 STAID 8:1 QID 13:9 SSN 25:14 FRAG_NUM 29:26 LRU_ORDR 30 RSRC_ENA 31

0x0A082444 WCSS_A_RPE_FRAGMENT_RESRC_ENTRY2_DW2**Type:** R**Reset State:** 0x00000000

when read it gives you upper 32 bits of 2nd resource of the 8 MPDUs maintained in RPE

WCSS_A_RPE_FRAGMENT_RESRC_ENTRY2_DW2

Bits	Name	Description
31:0	RESRC2_DW2	Indicates following fields BD_INDX 19:0 RSVD 31:20

0x0A082478 WCSS_A_RPE_ERR_INT_ENABLE**Type:** RW**Reset State:** 0x00000000

This register allows you to enable any error interrupt

WCSS_A_RPE_ERR_INT_ENABLE

Bits	Name	Description
8	B_2K_JUMP_SN_IN_BASES SION_INT_EN	When a 1 is written to this bit will enable interrupt whenever AMPDU packet is received whose SN has 2k jump
7	B_2K_JUMP_SSN_IN_BAR_ INT_EN	When a 1 is written to this bit will enable interrupt whenever BAR frame whose SSN has 2k jump
6	BAR_IN_NON_BASESSION _INT_EN	When a 1 is written to this bit will enable interrupt whenever BAR frames are received in BA session
5	FRAGPKT_IN_BASESSION _INT_EN	When a 1 is written to this bit will enable interrupt whenever fragmented packets are received in BA session
4	BU_SM_STUCK_ERR_INT_ EN	When a 1 is written to this bit will enable interrupt when bitmap update state machine is hung
3	DD_SM_STUCK_ERR_INT_ EN	When a 1 is written to this bit will enable interrupt when duplicate detect state machine is hung
2	BMU_BD_AVAIL_ERR_INT_ ENABLE	When a 1 is written to this bit will enable interrupt due to noavailable Bd/PDU in BMU
1	GBI_ERR_INT_EN	When a 1 is written to this bit will enable interrupt due to gbi error
0	GAM_ERR_INT_EN	When a 1 is written to this bit will enable interrupt due to gam error

0x0A08247C WCSS_A_RPE_ERR_INT_STATUS**Type:** RW**Reset State:** 0x00000000

This register status of error interrupt

WCSS_A_RPE_ERR_INT_STATUS

Bits	Name	Type	Description
31:28	REASON_CODE	R	Gives the reason for which the above 4 BA session related interrupts have occurred 4'b0000 : No error 4'b0001 : Fragmented packets received in BA session 4'b0010 : BAR frame received in NON BA session 4'b0100 : BAR frame received with a 2k jump in SSN 4'b1000 : AMPDU frame received with 2k jump in Seq Number
24:21	INT_QID	RW	gives QID of for which above interrupt occurred, if two interrupts happen one after another later one will overwrite the old one. Reason code will indicate which one of the interrupt was caused by this qid
20:16	INT_STAID	RW	gives STAID of for which above interrupt occurred, if two interrupts happen one after another later one will overwrite the old one. Reason code will indicate which interrupt was caused by this STAID
8	B_2K_JUMP_SN_IN_BASE SSION_INT_STATUS	RW	When this bit is set it indicates that a AMPDU packet is received whose SN has 2k jump Writing a 1 will clear this interrupt and the reason code
7	B_2K_JUMP_SSN_IN_BAR _INT_STATUS	RW	When this bit is set it indicates that a BAR frame is received whose SSN has 2k jump Writing a 1 will clear this interrupt and the reason code
6	BAR_IN_NON_BASESESSION _INT_STATUS	RW	When this bit is set it indicates that a BAR frame is received in a non BA session. Writing a 1 will clear this interrupt and the reason code
5	FRAGPKT_IN_BASESESSION _INT_STATUS	RW	When this bit is 1 it will indicate that fragmented packets are received in BA session. Writing a 1 will clear this interrupt and the reason code
4	BU_SM_STUCK_ERR_INT_ STATUS	RW	When this bit is 1 indicates bitmap update state machine is hung writing a 1 to this bit will clear the interrupt
3	DD_SM_STUCK_ERR_INT_ STATUS	RW	When this bit is 1 indicates duplicate detect state machine is hung writing a 1 to this bit will clear the interrupt
2	BMU_BD_AVAIL_ERR_INT_ STATUS	RW	When this bit is 1 indicates BMU has ran out of BDs writing a 1 to this bit will clear the interrupt
1	GBI_ERR_INT_STATUS	RW	When this bit is 1 indicates gbi error interrupt has occurred writing a 1 to this bit will clear the interrupt
0	GAM_ERR_INT_STATUS	RW	When this bit is 1 indicates gam error interrupt has occurred writing a 1 to this bit will clear the interrupt

0x0A082480 WCSS_A_RPE_CUR_STATE_BU_DD**Type:** R**Reset State:** 0x00010001

gives current state of state machine bitmap update and duplicate detect This register can be used to check the state if bit 5 or 6 in err_int_status is set

WCSS_A_RPE_CUR_STATE_BU_DD

Bits	Name	Description
28:16	CUR_STATE_BU	current status of bitmap update state machine
7:0	CUR_STATE_DD	current status of duplicate detect state machine

0x0A082484 WCSS_A_RPE_CUR_STATE_RA_RR

Type: R

Reset State: 0x00010001

gives current state of state machine reassembly and reorder This register can be used to check the state if bit 3 or 4 in err_int_status is set

WCSS_A_RPE_CUR_STATE_RA_RR

Bits	Name	Description
27:16	CUR_STATE_RA	current status of reassembly state machine
3:0	CUR_STATE_RR	current status of reorder state machine

0x0A082488 WCSS_A_RPE_CUR_STATE_DMA

Type: R

Reset State: 0x00000001

gives current state of state machine DMA control This register can be used to check the state if bit 7 in err_int_status is set

WCSS_A_RPE_CUR_STATE_DMA

Bits	Name	Description
15:0	CUR_STATE_DMA	current status of DMA control state machine

0x0A08248C WCSS_A_RPE_SEND_PKT_STATS

Type: RW

Reset State: 0x00000000

This registers gives count of all packets sent it rolls over after reaching max count

WCSS_A_RPE_SEND_PKT_STATS

Bits	Name	Description
31:0	SEND_PKT_STATS	gives stats for sent packets

0x0A082490 WCSS_A_RPE_DROP_PKT_STATS**Type:** RW**Reset State:** 0x00000000

This register gives count of all packets dropped by RPE it rolls over after reaching max count

WCSS_A_RPE_DROP_PKT_STATS

Bits	Name	Description
31:0	DROP_PKT_STATS	gives stats for drop packets

0x0A082494 WCSS_A_RPE_GET_BMU_FAIL_STATS**Type:** R**Reset State:** 0x00000000

This registers gives statistics for how many times get bmu failed it rolls over after reaching max count

WCSS_A_RPE_GET_BMU_FAIL_STATS

Bits	Name	Description
15:0	GET_BMU_FAIL_STATS	Gives stats for get bmu failures

0x0A082500 WCSS_A_RPE_RPE_BITMAP_DUPLICATE_CNTR**Type:** R**Reset State:** 0x00000000

Gives the number of bitmap updates and duplicate detect received from RXP

WCSS_A_RPE_RPE_BITMAP_DUPLICATE_CNTR

Bits	Name	Description
28:16	BITMAP_UPDATE_CNTR	Counter value for bitmap update and it rolls over after reaching max cnt
11:0	DUPLICATE_DETECT_CNTR	Counter value for duplicate detect and it rolls over after reaching max cnt

0x0A082504 WCSS_A_RPE_RPE_SW_FLUSH_RSRC_ENTRY**Type:** RW**Reset State:** 0x00000000

This register allows sw flush any fragment resources SW can program staid and qid for which if an resource entry for reassembly exists then it needs to be flushed

WCSS_A_RPE_RPE_SW_FLUSH_RSRC_ENTRY

Bits	Name	Type	Description
19:16	SW_FLUSH_RSRC_ENTRY_QUEUE	RW	This register gives queue id along with above station for which entry needs to be flushed
12:8	SW_FLUSH_RSRC_STAID	RW	This register indicates the station for which sw wants to flush any resource held for this staion
1	SW_FLUSH_RSRC_ENTRY_STATUS	R	This gives staus of flush if high that means it is still oongoing when it is zero it indicates we are ready for another flush
0	SW_FLUSH_RSRC_ENTRY	RW	writing 1 to this bit and then writing staid and qid in this same register will aloow H/w to flush any resource held for this staion and queue this bit is automatically cleared when flush is done

0x0A082508 WCSS_A_RPE_RPE_SW_BLOCK_PKTS**Type:** RW**Reset State:** 0x00000000

This register gives staid and qid for which all packets needs to be blocked. blocking means all packets to that staid/qid will be dropped If there are any packets in reorder buffer before block s/w needs to forward forward them using fwd dpu feature by sw

WCSS_A_RPE_RPE_SW_BLOCK_PKTS

Bits	Name	Description
19:16	SW_BLOCK_QID	This register gives queue id along with above station for which packets needs to be blocked
12:8	SW_BLOCK_STAID	This register indicates the station for which sw wants to block any packets coming in to this staion and the qid given below
0	SW_BLOCK_REQ	writing 1 to this bit and then writing staid and qid in this same register will make RPE drop any packets coming to this particular staid and qid

0x0A08250C WCSS_A_RPE_REORDER_BITMAP_CACHE_DW1**Type:** R**Reset State:** 0x00000000

when read it gives the lower 32 bits of reorder bitmap

WCSS_A_RPE_REORDER_BITMAP_CACHE_DW1

Bits	Name	Description
31:0	REORDER_CACHE_DW1	This is the actual reorder bitmap which shows lower 32 bits

0x0A082510 WCSS_A_RPE_REORDER_BITMAP_CACHE_DW2**Type:** R**Reset State:** 0x00000000

when read it gives the middle 32 bits of reorder bitmap

WCSS_A_RPE_REORDER_BITMAP_CACHE_DW2

Bits	Name	Description
31:0	REORDER_CACHE_DW2	This is the actual reorder bitmap which shows upper 32 bits

0x0A082514 WCSS_A_RPE_REORDER_BITMAP_CACHE_DW3**Type:** R**Reset State:** 0x00000000

when read it gives the upper 32 bits of reorder bitmap

WCSS_A_RPE_REORDER_BITMAP_CACHE_DW3

Bits	Name	Description
31:0	BITMAP_CACHE_DW3	[11:0] reorder SSN [12] reorder SSN val [18:13]reorder window size [31:19] reserved

10.51 WCSS_A_RXACLKCTRL_RXACLKCTRL**0x0A016000 WCSS_A_RXACLKCTRL_ROOT_CLK_EN****Type:** RW**Reset State:** 0x0000**WCSS_A_RXACLKCTRL_ROOT_CLK_EN**

0	RACTL	

0x0A01600C WCSS_A_RXCLKCTRL_DYN_ANTSW_CLK_CTRL_DISABLE**Type:** RW**Reset State:** 0x0000**WCSS_A_RXCLKCTRL_DYN_ANTSW_CLK_CTRL_DISABLE**

Bits	Name	Description
0	ANTSW_CTRL	

0x0A016010 WCSS_A_RXCLKCTRL_MAIN1_FAST_CLK_CTRL**Type:** RW**Reset State:** 0x0152

Control for the auxiliary fast clock coming to Phy from external clock control logic.

WCSS_A_RXCLKCTRL_MAIN1_FAST_CLK_CTRL

Bits	Name	Description
12	DBG_FORCE_FAST_ALWAYS	This is a debug-only mode configuration. Should always be left at 0 for normal purposes. When high, forces the fast_clk to be the source of clock for ALL 11AC packet types.
11	COMPLIANT_BEHAV	This bit when set to 1 enforces phy-mac interface signalling (related to 256qam processing) to comply with other modes (11a, 11n and 11ac) at the cost of increased latency in 20M and 40M modes depending on tx_bw setting. The following applies to how the clkdivratio for 20M packets is decided in compliant_behav case: *** The design forces this value to 1 when tx_bw_config is 1 or more. *** The value is forced to 0 when tx_bw_config is 0. The following applies to how the clkdivratio for 40M packets is decided- *** The design forces the value to 1 if tx_bw_config is 1. Otherwise a value of 1 or 2 can be used. When this bit is set to 0, all 256QAM STBC 20M packets will get 160MHz fastclk; all 256QAM STBC 40M packets will get either 160 or 320 MHz clock depending on extnclkdivmode40 above.

WCSS_A_RXCLKCTRL_MAIN1_FAST_CLK_CTRL (cont.)

Bits	Name	Description
10:5	CLKCHGDLY	Specifies the delay (in number of 80MHz clocks) between assertion of fast_clk_en in ractl (in main2 domain) to when the processing of MCS 8 and 9 STBC data-symbols is going to start. This delay is required so as to allow multi-cycle operation of the enable. This delay should include CDC delays inside PHY as well as clock-generation delay. Tune this to the minimum required delay.
4:3	EXTNCLKDIVMODE40	This divmode determines the frequency of the clock being used by functional logic to demodulate 40MHz MCS8 and 9 STBC pkts. A value of 2 implies the clk used has same freq as that of the input fast clk. A value of 1 implies the clk used has one-half freq as that of the input fast clk. A value of 0 implies the clk used has one-quarter freq as that of the input fast clk. Compare this with the clock-division mechanism based on channel bandwidth configuration. Note that setting the value to < 2 will increase the latency of 40M packets to > 11 usec.
2:1	EXTNCLKDIVMODE20	This divmode determines the frequency of the clock being used by functional logic to demodulate 20MHz MCS8 and 9 STBC pkts. A value of 2 implies the clk used has same freq as that of the input fast clk. A value of 1 implies the clk used has one-half freq as that of the input fast clk. A value of 0 implies the clk used has one-quarter freq as that of the input fast clk. Compare this with the clock-division mechanism based on channel bandwidth configuration. Note that setting the value to 0 will increase the latency of 20M packets to > 12 usec so a value of 0 should never be used. A value of 2 is usable at the expense of power consumption penalty. *** NOT actually used ***
0	FORCE_CLK_DISABLE	When high, forcefully disables the clock to save power. When low, the functional logic decides the duration of the enable. Note that functional logic will ensure this clock is enabled only when STBC data symbols in 11AC MCS8 and MCS9 packets mode are being demodulated by RX.

0x0A016428 WCSS_A_RXCLKCTRL_ADC_FIFO_SYNC_RST**Type:** RW**Reset State:** 0x0000**WCSS_A_RXCLKCTRL_ADC_FIFO_SYNC_RST**

Bits	Name	Description
0	RST	This has been mainly added to reset the FIFO to a known state after the clocks on wr and rd side have been running. Mainly for external ADC-clock modes. This must be resetted manually before setting again.

10.53 WCSS_A_RXP_RXP**0x0A080800 WCSS_A_RXP_CONFIG****Type:** RW**Reset State:** 0x09000100

It contains RXP Configuration registers. These configurations (with the exception of soft abort and mask_subsq_fcs_err_within_ampdu) can be changed at any time by SW but HW will only take effect during the gap of packets so that SW will not corrupt packets during configuration.

WCSS_A_RXP_CONFIG

Bits	Name	Description
31:24	PHY_CMD_MIN_SIZE	RXP requires atleast minimum of 9 cmd bytes for processing packet if it is not 9 then packets will be dropped, but it can be configured to whatever value

WCSS_A_RXP_CONFIG (cont.)

Bits	Name	Description
23:19	RESERVED	reserved for future use
18	CFG_BDPDU_CLEAN_DIS	When gam error occurs it is catastrophic so we will reset the system But just to be safe RXP will clean up all BD/PDUs, this needs some extra state machine check. when this bit is set it will disable the BD/PDU cleanup and SW can go ahead and clean it after reset
17	CFG_MPR_IE_LENCHK_DISS	For the newly added IE parsing of channel switch and quiet element there is a lenchk done to make sure Channel switch is indeed 3bytes and quiet element is indeed 6 bytes setting this bit to 1 this check can be disabled
16	CFG_FLT_UNPROT_ACTION_RMF_DIS	All action frames are supposed to be RMF frames(encrypted management frames) But some action frames can be unprotected, in those cases RXP sets RMF bit in BD to 0 so DPU can bypass the decryption and pass it to host SW by writing 1 to this bit this feature can be disabled, so that all action frames will have RMF set to 1 and DPU can drop the unprotected RMF frames and firmware can process these packets from Error WQ.
15	CFG_11AC_AMPDU_EOP_INDICATION_EN	If set, RXP will generate 11ac ampdu end of packet signal to PHY. By default, it will NOT generate this eop signal. If 11ac_eop is generated to PHY, PHY will stop receiving the current packet. This is used to save power in case of MU-MIMO packets
14	CFG_MPR_DISABLE_WAIT_FOR_FILTER_IDLE	When set, this will disable the 'wait for filter to finish, when eop is received' function. This is a bug fix. This configuration bit will allow the bug fix to be disabled and the rxp logic to be reverted to the original implementation. This allows for backwards compatibility.
13	RRI_CLEAR_ON_FCS_FAIL	If set, this will enable RRI regeneration when the first RRI got followed by and FCS err.
12	MASK_SUBSQ_FCS_ERR_WITHIN_AMPDU	If set, this will mask out fcs error notification to the MTU after an MPDU within an AMPDU passes FCS check. This is to prevent doing EIFS in this case.
11	SOFT_PMI_ABORT_EN	Soft PMI abort enable.
10	CFG_HAS_FCS_EN	If set, RXP will enable writing 4-byte fcs into BD/PDU and RXP flag has_fcs flag will be set to 1. By default, the RXP DMA will NOT write fcs into BD/PDU and MPDU length does not include the 4-byte fcs.

WCSS_A_RXP_CONFIG (cont.)

Bits	Name	Description
9	CFG_RSV_BMU_EN	If set, RXP will enable sending reservation command to BMU. By default, the RXP DMA will NOT send reservation command to BMU at start of packet.
8	CFG_HAS_PHY_CMD	If set, RXP will write PHY Command into BD. By default, the PHY Command will not be put into BD so that SW can adjust the "mpdu_header_start_offset" to save the BD space for MPDU data. Note that the TimeStamp will be in BD in any case.
7	CFG_PHY_PROTOCOL_CHK_DIS	When set it disables RXP from doing any PHY protocol check Like checking PHY cmd length and stats length endcomment bitfield [6] cfg_disable_dlm_proc configuration 1'b0 bitfieldComment If set to disable, the Delimiter Processing is disabled for A-MPDU packets and the whole A-MPDU packet will be sent to mCPU without MPDU Processing. The byp_dlm_proc and byp_mpdu_proc will be asserted for A-MPDU packets. By default, Delimiter Processing is enabled. Note: This cfg_disable_dlm_proc will affect only A-MPDU packets, but not MPDU packets.
5	CFG_DISABLE_MPDU_PROC	If set to disable, the MPDU Processing is disabled for MPDU packets and the MPDU packets will be sent to mCPU without MPDU processing. This means NO FCS check, NO address filtering, and NO binary search. The packets are assumed passing MPDU processing. By default, MPDU Processing is enabled. Note: This cfg_disable_mpdu_proc will affect only MPDU packets, but not A-MPDU packets. This means MPDU within A-MPDU will be processed normally (without bypass) if cfg_disable_dlm_proc is not asserted for A-MPDU packets.
4	CFG_DISABLE_FCS_CHECK	If set to disable, the FCS Check is disabled and all packets will be treated as passing FCS Check. By default, it is enabled and RXP will check FCS on MPDU packets. The counter associated with this config is fcs_err_cnt. If not disabled, this counter will increment if a packet has FCS error.
3	CFG_MAX_PKTLEN_CHECK_EN	The max packet length check enable bit. By default, the max_pktlen check is disabled. If set, it will check MPDU packet length against max_pktlen register and check A-MPDU packet length against max_len_ampdu register. But it will not affect max_len_mpdu_in_ampdu which is checked in delimiter processing and can be disabled by asserting cfg_disable_dlm_proc.
2	CFG_ADDR_FILTER_EN	If set, the Address Filter will be enabled. By default, it is disabled and all packets will be treated as passing Address Filtering.

WCSS_A_RXP_CONFIG (cont.)

Bits	Name	Description
1	CFG_GEN_SHUTOFF_EN	If set, RXP will generate shutoff signal to PHY. By default, it will NOT generate shutoff signal. If shutoff is generated to PHY, PHY will stop receiving the current packet. This is used to save power.
0	CFG_RXP_EN	If enabled, RXP will receive packets from PHY. By default, the RXP is disabled and will not receive any packet from PHY. This bit can be changed at any time, but will only take effect when there is start pulse from PHY.

0x0A080808 WCSS_A_RXP_MAX_PKTLEN**Type:** RW**Reset State:** 0x00000040

The Max MPDU Packet Length in terms of the number bytes. It includes mac_header+payload+fcs, but does not include PHY data.

WCSS_A_RXP_MAX_PKTLEN

Bits	Name	Description
6:0	MAX_PKTLEN	The Max MPDU Packet Length in terms of the number 128 bytes.

0x0A08080C WCSS_A_RXP_SW_BD_REG**Type:** RW**Reset State:** 0x00000000

Register used by SW to write a DWord to BD

WCSS_A_RXP_SW_BD_REG

Bits	Name	Description
31:0	SW_BD_REG	SW mainly uses this register to write to location 38 in DWORD

0x0A080810 WCSS_A_RXP_MPDU_HEADER_START_OFFSET**Type:** RW**Reset State:** 0x00000040

The MPDU header start offset in BD which is in the unit of data word (4-byte).

WCSS_A_RXP_MPDU_HEADER_START_OFFSET

Bits	Name	Description
7:2	MPDU_HEADER_START_OFFSET	MPDU header start offset in BD. Note that the programmable bits are [7:2] and the lower [1:0] bits are always 2'b00 to guarantee the offset address is 4-byte aligned. If bit[7] is 0, the MPDU header starts at BD, but if bit[7] is 1, the MPDU header starts at PDU. Note that It is not valid to have the value of 6'h3f for bit[7:2] (or 8'hfc for bit[7:0]). The default value is 6'ha which means the offset address of 8'h28. In this case, the PHY Cmd bytes will not be written in BD so that the MPDU header can start right after TimeStamp field. However, for diagnostic purpose, the PHY Cmd can be written into BD by setting cfg_has_phy_cmd bit in config register so that this offset value will be adjusted to 6'h10 which means the offset address of 8'h40.

0x0A08082C WCSS_A_RXP_SEARCH_ADDR1_PTR

Type: RW

Reset State: 0x00000000

SW can set the addr1 pointers of Binary Search.

WCSS_A_RXP_SEARCH_ADDR1_PTR

Bits	Name	Description
16	ADDR1_POINTERS_VALID	When set, the pointers are valid.
13:8	ADDR1_SEARCH_HI_PTR	Indicate the addr1 pointer of Binary Search upper bound.
5:0	ADDR1_SEARCH_LO_PTR	Indicate the addr1 pointer of Binary Search lower bound.

0x0A080830 WCSS_A_RXP_SEARCH_ADDR2_PTR

Type: RW

Reset State: 0x00000000

SW can set the addr2 pointers of Binary Search.

WCSS_A_RXP_SEARCH_ADDR2_PTR

Bits	Name	Description
16	ADDR2_POINTERS_VALID	When set, the pointers are valid.
13:8	ADDR2_SEARCH_HI_PTR	Indicate the addr2 pointer of Binary Search upper bound.
5:0	ADDR2_SEARCH_LO_PTR	Indicate the addr2 pointer of Binary Search lower bound.

0x0A080834 WCSS_A_RXP_SEARCH_ADDR3_PTR**Type:** RW**Reset State:** 0x00000000

SW can set the addr3 pointers of Binary Search.

WCSS_A_RXP_SEARCH_ADDR3_PTR

Bits	Name	Description
16	ADDR3_POINTERS_VALID	When set, the pointers are valid.
13:8	ADDR3_SEARCH_HI_PTR	Indicate the addr3 pointer of Binary Search upper bound.
5:0	ADDR3_SEARCH_LO_PTR	Indicate the addr3 pointer of Binary Search lower bound.

0x0A080838 WCSS_A_RXP_SEARCH_TABLE_CMD**Type:** RW**Reset State:** 0x00000000

This is action register for indirect access to Binary Search Table. When SW writes to this action register, it will trigger the interaction between Search_Table_Data[0-1] registers and Binary Search Table. For writing data into memory table, it is important for SW to write into Search_Table_Data[0-1] registers before Search_Table_Cmd. For reading data from memory table, SW only needs to write into Search_Table_Cmd and the read data will be available in Search_Table_Data[0-1] registers.

WCSS_A_RXP_SEARCH_TABLE_CMD

Bits	Name	Type	Description
9	STATUS	R	read only: If set to 1 a binary search table read or write is ongoing. SW should read and make sure this bit is 0 before issuing another cmd write into this register.
8	WRITE	RW	Indicate write/read. If 1, write. If 0, read.
4:0	TABLE_PTR	RW	Indicate the action should take effect on this entry number in Binary Search Table.

0x0A08083C WCSS_A_RXP_SEARCH_TABLE_DATA0**Type:** RW**Reset State:** 0x00000000

This is data register 0 for indirect access to Binary Search Table. There are totally 3 Data registers for Binary Search address Table.

WCSS_A_RXP_SEARCH_TABLE_DATA0

Bits	Name	Description
31:0	MAC_ADDR	MAC_Addr[31:0] portion of MAC_Addr[47:0]. Note: The order is Little Endian: MAC_Addr[31:0] = {Byte_3, Byte_2, Byte_1, Byte_0}

0x0A080840 WCSS_A_RXP_SEARCH_TABLE_DATA1**Type:** RW**Reset State:** 0x00000000

This is data register 1 for indirect access to Binary Search Table. There are totally 3 Data registers for Binary Search address Table.

WCSS_A_RXP_SEARCH_TABLE_DATA1

Bits	Name	Description
31:29	DPU_MAN_MC_BC_SIG	This feild is used to configure the DPU signature for Management mc/bc packets
28	RSVD	reserved for future use

WCSS_A_RXP_SEARCH_TABLE_DATA1 (cont.)

Bits	Name	Description
27	VALID	Set when the sta address is valid
26	RMF	Set when robust managemnt frmases require BIP or decryption
25	FRAME_TRANSLATION	This bit is used to decide if a per station frame translation is required. When this bit is set and the bit in type/subtype is set then those packets for that station will require frame translation, so FT bit in BD will be set
24	DROP	When set, on a address hit, the frame will be dropped. The setting of this bit is only valid when 'valid configuration' is set
23:16	ADDR_ID	The addr_id[7:0].
15:0	MAC_ADDR	MAC_Addr[47:32] portion of MAC_Addr[47:0]. Note: The order is Little Endian: MAC_Addr[47:32] = {Byte_5, Byte_4}

0x0A080844 WCSS_A_RXP_MAX_LEN_AMPDU**Type:** RW**Reset State:** 0x0000FFFF

The Max Length for A-MPDU packet.

WCSS_A_RXP_MAX_LEN_AMPDU

Bits	Name	Description
16:0	MAX_LEN	The Max Length for A-MPDU packet.

0x0A080848 WCSS_A_RXP_MAX_LEN_MPDU_IN_AMPDU**Type:** RW**Reset State:** 0x00000FFF

The Max Length for MPDU in A-MPDU packet. This is used for delimiter processing to determine whether it finds a good delimiter.

WCSS_A_RXP_MAX_LEN_MPDU_IN_AMPDU

Bits	Name	Description
13:0	MAX_LEN	The Max Length for MPDU in A-MPDU packet.

0x0A08084C WCSS_A_RXP_DMA_MAX_RSV_PDU**Type:** RW**Reset State:** 0x00000008

The Max number of PDUs that RXP DMA can reserve at a time. The is to avoid the scenario that RXP drop big packet just because it fails to reserve a huge number of PDUs at the start of the packet.

WCSS_A_RXP_DMA_MAX_RSV_PDU

Bits	Name	Description
3:0	MAX_RSV_PDU	The Max number of PDUs that RXP DMA can reserve at a time.

0x0A080850 WCSS_A_RXP_DMA_BURST_THRESHOLD**Type:** RW**Reset State:** 0x00000008

The data word threshold that RXP DMA control can start burst MPDU data to MIF. The data unit is 1 word (or 4 bytes). By default, the threshold is 8 words (or 32 bytes). RXP MPDU data is accumulated in DMA FIFO. The DMA control will not send data to MIF if the number of data word in DMA FIFO does not reach the threshold. This is to used to control the burstness of RXP data on AHB.

WCSS_A_RXP_DMA_BURST_THRESHOLD

Bits	Name	Description
5:0	BURST_THRESHOLD	The data word threshold that DMA can start burst MPDU data to MIF.

0x0A080854 WCSS_A_RXP_CLEAR_STATS**Type:** RW**Reset State:** 0x00000000

This register is used to clear all stats.

WCSS_A_RXP_CLEAR_STATS

Bits	Name	Description
0	CLEAR_STATS	When set, all statistics counters will be cleared When set, the HW will automatically clear this bit.

0x0A080858 WCSS_A_RXP_PHY_MPDU_CNT

Type: R

Reset State: 0x00000000

The number of MPDU packets are received from PHY.

WCSS_A_RXP_PHY_MPDU_CNT

Bits	Name	Description
31:0	PHY_MPDU_CNT	PHY MPDU Cnt.

0x0A08085C WCSS_A_RXP_PHY_AMPDU_CNT

Type: R

Reset State: 0x00000000

The number of A-MPDU packets are received from PHY.

WCSS_A_RXP_PHY_AMPDU_CNT

Bits	Name	Description
31:0	PHY_AMPDU_CNT	PHY A-MPDU Cnt.

0x0A080864 WCSS_A_RXP_PHY_ABORT_CNT

Type: R

Reset State: 0x00000000

The number of aborted packets from PHY.

WCSS_A_RXP_PHY_ABORT_CNT

Bits	Name	Description
7:0	PHY_ABORT_CNT	PHY Abort Packet Cnt.

0x0A080868 WCSS_A_RXP_PHY_SHUTOFF_CNT**Type:** R**Reset State:** 0x00000000

The number of shutoff pulses are generated by RXP to PHY.

WCSS_A_RXP_PHY_SHUTOFF_CNT

Bits	Name	Description
15:8	PHY_11AC_EOP_CNT	This is also logically a shutoff count, but this is RXP shutting of due of EOF bit set in the 11ac AMPDU indicating end of useful AMPDU data. PHY will stop giving anymore data.
7:0	PHY_SHUTOFF_CNT	PHY Shutoff Cnt. This is number of packets that RXP terminated due to packet error or early beacon termination

0x0A08086C WCSS_A_RXP_DLM_FIFO_FULL_CNT**Type:** R**Reset State:** 0x00000000

The number of packets have error because DLM FIFO is full.

WCSS_A_RXP_DLM_FIFO_FULL_CNT

Bits	Name	Description
7:0	DLM_FIFO_FULL_CNT	DLM FIFO Full Cnt.

0x0A080870 WCSS_A_RXP_DLM_ERR_CNT**Type:** R**Reset State:** 0x00000000

The number of packets have error because Delimiter is bad. When a error is detected in the A-MPDU delimiter this count is incremented. But when RXP starts searching for the next A-MPDU

delimiter, this count is NOT incremented. The implementation uses 'seen_dlm_err' flag. This flag is cleared for the first delimiter or after a good delimiter is found. It is set after a bad delimiter is found. If this flag is set, then don't increment the counter. This will increment: - Whenever the next delimiter (using the previous good delimiter information) is not found in the expected location, or is bad.

WCSS_A_RXP_DLM_ERR_CNT

Bits	Name	Description
7:0	DLM_ERR_CNT	DLM Error Cnt.

0x0A080874 WCSS_A_RXP_FAIL_FILTER_CNT

Type: R

Reset State: 0x00000000

The number of packets have failed Address Filtering.

WCSS_A_RXP_FAIL_FILTER_CNT

Bits	Name	Description
15:0	FAIL_FILTER_CNT	Fail Address Filter Cnt.

0x0A080878 WCSS_A_RXP_FAIL_MAX_PKTLEN_CNT

Type: R

Reset State: 0x00000000

The number of packets have failed Max MPDU or AMPDU packet length check.

WCSS_A_RXP_FAIL_MAX_PKTLEN_CNT

Bits	Name	Description
7:0	FAIL_MAX_PKTLEN_CNT	Fail Max MPDU or AMPDU Packet Length Check Cnt.

0x0A08087C WCSS_A_RXP_FCS_ERR_CNT

Type: R

Reset State: 0x00000000

The number of packets have FCS error.

WCSS_A_RXP_FCS_ERR_CNT

Bits	Name	Description
31:0	FCS_ERR_CNT	FCS Error Cnt.

0x0A080880 WCSS_A_RXP_DMA_SEND_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are sent to CPU by RXP Write DMA.

WCSS_A_RXP_DMA_SEND_CNT

Bits	Name	Description
31:0	DMA_SEND_CNT	The number of packets are sent to CPU by RXP Write DMA. All packets in current system are all pushed by RXP refer to rpe dma send cnt for that. This counter increments only if RXP pushes packets directly to DXE

0x0A080884 WCSS_A_RXP_DMA_DROP_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped by RXP Write DMA. This could increment due to: Failed filter PHY Abort AFTER the 9th command word BD/PDU errors If packet with command phase shorter or longer than actual command length specified is sent, the RXP will increment dma_drop_cnt instead of phy_err_drop_cnt (unless actual command phase < 9 words, in which case phy_err_drop_cnt will be incremented) Will NOT increment if end of psdu (as defined in psdu length by PHY command) occurs during search for next delimiter in AMPDU; this is because a new packet is not found, so there should not be a drop)

WCSS_A_RXP_DMA_DROP_CNT

Bits	Name	Description
15:0	DMA_DROP_CNT	The number of packets are dropped by RXP Write DMA. Drop due to filter error, packet len error or Get bmu error any packet dropped at DMA due to any of above errors, these can be drop at DMA marked packets which may have filter fail errors

0x0A080888 WCSS_A_RXP_DMA_GET_BMU_FAIL_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped due to insufficient BD/PDUs BMU BD or PDU.

WCSS_A_RXP_DMA_GET_BMU_FAIL_CNT

Bits	Name	Description
15:0	DMA_GET_BMU_FAIL_CNT	DMA No BMU BD/PDU Cnt.

0x0A080890 WCSS_A_RXP_TYPE_SUBTYPE_FILTER_CNT**Type:** R**Reset State:** 0x00000000

The number of packets dropped because of their type/subtype

WCSS_A_RXP_TYPE_SUBTYPE_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A080894 WCSS_A_RXP_INCORRECT_LENGTH_FILTER_CNT**Type:** R**Reset State:** 0x00000000

The length of the frame was not sufficient to do all the address filter checks. This may increment if dlm_fifo_full occurs.

WCSS_A_RXP_INCORRECT_LENGTH_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A080898 WCSS_A_RXP_ADDR1_BLOCK_FILTER_CNT**Type:** R**Reset State:** 0x00000000

Number of frames blocked based on the address one

WCSS_A_RXP_ADDR1_BLOCK_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A08089C WCSS_A_RXP_ADDR1_HIT_NO_PASS_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

WCSS_A_RXP_ADDR1_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808A0 WCSS_A_RXP_ADDR1_DROP_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

WCSS_A_RXP_ADDR1_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808A4 WCSS_A_RXP_ADDR2_HIT_NO_PASS_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

WCSS_A_RXP_ADDR2_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808A8 WCSS_A_RXP_ADDR2_DROP_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

WCSS_A_RXP_ADDR2_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808AC WCSS_A_RXP_ADDR3_HIT_NO_PASS_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

WCSS_A_RXP_ADDR3_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808B0 WCSS_A_RXP_ADDR3_DROP_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

WCSS_A_RXP_ADDR3_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808B4 WCSS_A_RXP_MPDU_IN_AMPDU_CNT**Type:** R**Reset State:** 0x00000000

The number of MPDU packets are split from A-MPDU packets.

WCSS_A_RXP_MPDU_IN_AMPDU_CNT

Bits	Name	Description
31:0	MPDU_IN_AMPDU_CNT	The number of MPDU packets are split from A-MPDU packets.

0x0A0808B8 WCSS_A_RXP_PHY_ERR_DROP_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped by RXP PHY Processing because of some apparent PHY protocol errors, such as: PHY Cmd Len is smaller than 9 bytes. PHY Cmd Len is larger than 28 bytes. PHY Stats Len is not equal to 8 bytes. Exception - if packet with command phase shorter longer than actual command length is sent, the RXP will increment dma_drop_cnt instead (however, if actual command length is < 9, this will be counted as a phy_err_drop) Note: The packets are dropped before reaching RXP Write DMA.

WCSS_A_RXP_PHY_ERR_DROP_CNT

Bits	Name	Description
7:0	PHY_ERR_DROP_CNT	The number of packets are dropped by RXP PHY Processing.

0x0A0808BC WCSS_A_RXP_RADAR_DETECT_STATUS**Type:** RW**Reset State:** 0x00000000

Radar detect status register. Pointers in radar detect circular buffer. Equal pointers means that the buffer is empty. There can be 0-63 entries in this circular buffer.

WCSS_A_RXP_RADAR_DETECT_STATUS

Bits	Name	Type	Description
24	RDR_DETECT_INT	R	status of the radar detect interrupt signal
21:16	NR_ENTRIES	R	Number of entries filled in radar detect circular buffer. (0-63)
13:8	TAIL_PTR	RW	tail pointer of radar detect circular buffer
5:0	HEAD_PTR	RW	head pointer of radar detect circular buffer

0x0A0808C0 WCSS_A_RXP_RADAR_DETECT_CONTROL**Type:** RW**Reset State:** 0x00000000

Radar detect control register.

WCSS_A_RXP_RADAR_DETECT_CONTROL

Bits	Name	Description
8	RADAR_DETECT_ENABLE	Enable/disable storing of radar detect logs
5:0	MIN_NR_LOGS_GEN_INT	Minimum number of stored logs to generate radar detect interrupt. 0 is a special case, which means to disable the interrupt.

0x0A0808C4 WCSS_A_RXP_RADAR_DETECT_LLOGS**Type:** RW**Reset State:** 0x00000000

Radar detect lower word register.

WCSS_A_RXP_RADAR_DETECT_LLOGS

Bits	Name	Description
31:0	RADAR_DETECT_LDATAL	On read, the lower 4 bytes from the radar detect log as pointed by the tail pointer is returned. On write, the lower 4 bytes are written into the location pointed by the head pointer.

0x0A0808C8 WCSS_A_RXP_RADAR_DETECT_ULOGS**Type:** RW**Reset State:** 0x00000000

Radar detect upper word register.

WCSS_A_RXP_RADAR_DETECT_ULOGS

Bits	Name	Description
31:0	RADAR_DETECT_UDATAL	On read, the lower 4 bytes from the radar detect log as pointed by the tail pointer is returned. After the read, the tail pointer is increased by one, except if that would cause it to become greater than the head pointer. On write, the lower 4 bytes are written into the location pointed by the head pointer. After the write, the head pointer is increased by one. If this would cause the head pointer to become equal to the tail pointer, the tail pointer would also be incremented.

0x0A0808CC WCSS_A_RXP_RADAR_DETECT_LOGS**Type:** RW**Reset State:** 0x00000000

Radar detect logs counter register

WCSS_A_RXP_RADAR_DETECT_LOGS

Bits	Name	Type	Description
31	RADAR_DETECT_LOGS_CNT_CLEAR	RW	When set, clears count of PHY written radar detect logs. This bit will automatically be cleared by HW.
15:0	RADAR_DETECT_LOGS_CNT	R	Number of radar detect logs received from PHY.

0x0A0808D0 WCSS_A_RXP_SOFT_PMI_ABORT**Type:** RW**Reset State:** 0x00000000

Soft PMI Abort register

WCSS_A_RXP_SOFT_PMI_ABORT

Bits	Name	Description
0	SOFT_PMI_ABORT	Write only bit; when 1 is written to this bit, and soft_pmi_abort_en is 1, then a soft PHY abort will be generated. Error counters will be incremented as if an actual abort had occurred.

0x0A0808D4 WCSS_A_RXP_START_ERR_CNT**Type:** R**Reset State:** 0x00000000

The number of start errors on the PMI interface (pmi_rxp_starts received while still waiting for previous packet to complete).

WCSS_A_RXP_START_ERR_CNT

Bits	Name	Description
7:0	PHY_START_ERR_CNT	PHY Start Error Cnt.

0x0A0808D8 WCSS_A_RXP_CCA_AND_EXT_TIMEOUT**Type:** RW**Reset State:** 0x3C064090

Configuration bits for cca extensions and timeout functionality.

WCSS_A_RXP_CCA_AND_EXT_TIMEOUT

Bits	Name	Description
31:21	CCA_PKTDET_6US_EXT_VALUE	This is extension of packet detect, which is done only for 11b packets for 80Mhz clock : 11'd480 for 160Mhz clock : 11'd960 for 320Mhz clock : 11'd1920

WCSS_A_RXP_CCA_AND_EXT_TIMEOUT (cont.)

Bits	Name	Description
20:10	CCA_PKTDET_EXT_VALUE	This is an additional extension of packet detect, if this is not needed it should be programmed to 1, otherwise HW will use the default value of 11'd400 80Mhz clocks 80Hmz clock : 11'd400 160Mhz clock: 11'd800 320Mhz clock: 11'd1600
9	CCA_PKDET_EXTENTION_ALLOWED	when set it allows for 6us extn on ofdm packets
8:4	FLT_TIMEOUT_TIME	This value represent that maximum time (in 256 OR 4096 120MHZ clk cycle units) that the rxp filter will wait for two sequential MPDU header bytes to be received. If this time is not met, the rxp filter will drop the frame by indicating that the filter is done, but the frame does not pass the filter. The 'timeout_error_cnt' register contents will increase by 1.
2	CCA_PKDET_EXTENTION_OLDLOGIC_DIS	when packet det gets deasserted 5us extension is done, and at the end of 5us we look for commandbyte 6 for packet type whether it is ofdm and then do 6us additional extension. But PHY may not always give this info within 5us hence ofdm signal is used for this (which is the new logic). This logic is only enabled when you write 1 to this bit
1	FLT_TIMEOUT_COUNT_UNIT	When clear, the timeout will count in 256 clk cycle units When set, the timeout counter will count in 4096 clk cycle units
0	FLT_TIMEOUT_CHECK_DISABLED	When set, the rxp filter timeout check is disabled

0x0A0808DC WCSS_A_RXP_TIMEOUT_ERROR_CNT**Type:** R**Reset State:** 0x00000000

Number of times the rxp filter encounters a timeout As a result of this, the frame will be dropped

WCSS_A_RXP_TIMEOUT_ERROR_CNT

Bits	Name	Description
7:0	TIMEOUT_COUNT	Number of times the rxp filter encounters a timeout

0x0A0808E0 WCSS_A_RXP_STALL_TIMEOUT_CNT**Type:** R**Reset State:** 0x00000000

Number of times stall timeout occurs. As a result of this, the frame will be dropped

WCSS_A_RXP_STALL_TIMEOUT_CNT

Bits	Name	Description
7:0	STALL_TIMEOUT_COUNT	Number of times the PMI interface encounters a stall timeout

0x0A0808EC WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ**Type:** RW**Reset State:** 0x00000000

NAV control register and response requested register. The NAV PHY delay compensation can be programmed here. Also the control of how the NAV needs to be updated, or not at all, when the CCA was not asserted when a frame got received (and dropped) is configured here.

WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ

Bits	Name	Description
25	CFG_FLT_RESPONSE_REQ_WITH_HT_CONTROL	When set and the Reponse interrupt is generated, and the incoming frame has an HT control field (this is: incoming frame is QoS data frame and has the 'order' bit in the frame control field set), the response interrupt is only generated after the HT control field has been fully received and will be located in the reponse_header_info5 field. Setting this bit will also enable the generation of the 'HTC present' reporting in the enhanced_sequence_number_message_type set 1: Will enable RXP to process frames with HTC feild set 0: RXP will ignore HTC feild hence whenever this bit is zero block_frames_with_ht_control_field(extra frame filter register) should be 1
24:21	CFG_FLT_NAV_RESERVED	reserved bits
20	CFG_FLT_NAV_DELAY_COMPENSATION_VALUE_EN	When set, enables the NAV delay compensation functionality. This is, the NAV update value given to the MTU is compensated for the PHY delay. The compensation value is given in the bits: cfg_ft_nav_delay_compensation_value
19:16	CFG_FLT_NAV_DELAY_COMPENSATION_VALUE	NAV compensation value in usec.

WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ (cont.)

Bits	Name	Description
10	CFG_FLT_REGISTER_CCA_AT_START_OF_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal at the start of the cca observe time. This sampled CCA is later used to determine if an NAV update is needed or NOT. The cca observe time is configured with other bits in this register.
9	CFG_FLT_REGISTER_CCA_AT_END_OF_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal at the end of the cca observe time. This sampled CCA is later used to determine if an NAV update is needed or NOT. The cca observe time is configured with other bits in this register.
8	CFG_FLT_REGISTER_CCA_DURING_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal during the entire duration of the cca observe time. If the cca goes low anywhere during this time, this is recorded and fixed. In that case, even if the CCA went high a little later, the sampled CCA value that is later used to determine if an NAV update is needed or NOT, will have a low value. The cca observe time is configured with other bits in this register.
7	CFG_FLT_REGISTER_CCA_LEVEL_DURING_DATA_TIME	When NOT set: no action When set: The 'data reception time' as indicated by pktDET_n being low, is part of the cca observe time.
6	CFG_FLT_REGISTER_CCA_LEVEL_DURING_PREAMBLE_TIME	When NOT set: no action When set: The 'data reception time' as determined by early_pktDET_n being low, is part of the cca observe time.
5	CFG_FLT_SKIP_DIFS_WHEN_NAV_UPDATE_MASKED	When NOT set: no action When set: When the RXP filter drops a frame and the NAV update is masked (due to enabling the NAV update masking features in this register), the 'skip_difs' signal to the MTU will be set.
4	CFG_FLT_NO_NAV_UPDATE_ON_DROP_AND_BELOW_CCA	When NOT set: no action When set: When the RXP filter drops a frame due to any reason, AND the cca at the sample point was high, the RXP will NOT generate a NAV update based on the dropped frame.
3	CFG_FLT_NO_NAV_UPDATE_ON_EXPLICIT_DROP_AND_BELOW_CCA	When NOT set: no action When set: When the RXP filter drops a frame due to an explicit drop configuration in the address table, AND the cca at the sample point was high, the RXP will NOT generate a NAV update based on the dropped frame.
2	CFG_FLT_NO_NAV_UPDATE_ON_EXPLICIT_DROP	When NOT set: no action When set: When the RXP filter drops a frame due to an explicit drop configuration in the address table, the RXP will not generate a NAV update based on the dropped frame. The setting of the CCA is NOT taken into account

WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ (cont.)

Bits	Name	Description
1	CFG_FLT_CLEAR_SKIP_NEXT_DIFS_ON_EARLY_PKT_DET	When NOT set: no action When set: The RXP filter can generate a signal to the MTU to skip DIFS. See other register bits to enable this. This 'skip' signal will be cleared when early_pkt_det_n gets asserted.
0	CFG_FLT_CLEAR_SKIP_NEXT_DIFS_ON_CCA	When NOT set: no action When set: The RXP filter can generate a signal to the MTU to skip DIFS. See other register bits to enable this. This 'skip' signal will be cleared when primary cca gets asserted.

0x0A0808F0 WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0**Type:** RW**Reset State:** 0x00000000

Control overwrite functionality for what was programmed in type/subtype config table (upper 32 bits)

WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0

Bits	Name	Description
31:0	CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0	Control some overwrite functionality for whatever was programmed in the Type/subtype configuration table. When set, a frame of the corresponding type should be dropped.

0x0A0808F4 WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1**Type:** RW**Reset State:** 0x00000000

Control overwrite functionality for what was programmed in type/subtype config table (lower 32 bits)

WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1

Bits	Name	Description
31:0	CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1	Control some overwrite functionality for whatever was programmed in the Type/subtype configuration table. When set, a frame of the corresponding type should be dropped.

0x0A080900 WCSS_A_RXP_FRAME_FILTER_CONFIG**Type:** RW**Reset State:** 0x00000000

This is a register set of 64 sequential word addresses: Each of these 64 words represent the filter configuration for a incoming frame type/subtype The register programming address per type/subtype is created as follows: ("This registers address" + {Type [b3, b2], Subtype [b7,b6,b5,b4], 2'b00}) where 'Type [b3,b2]' and 'Subtype [b7,b6,b5,b4]' are the IEEE standard encodings for the frames. A summary of the bit funtions is as follows:

WCSS_A_RXP_FRAME_FILTER_CONFIG

Bits	Name	Description
21	G5_DROP_AT_DMA	When set, the RXP will drop the incoming frame (even when the CRC and filter function passes) at the RXP DMA engine. This feature is usefull to prevent that control frames like the TRS, ACK etc, get unnecessarily written into memory
20	NONHT_BW_INDICATION_ENABLE	when set then the this particular type/subtype will need to be checked for bw information. If bit 0 of TA is checked to see if BW information is valid.
19	ROUTING_FLAG_SEL	when set : rxp will use dpu routing flag that is programmed in config3 bits 29:24 when not set : rxp will use dpu routing flag that is programmed in config3 bits 21:16
18	FRAME_TRANSLATION_REQ_EN	When set Frame translation by UMA is enabled
17	PM_BIT_EVAL_REQUIRED_ENABLE	when this bit is set the pm bit is evaluated for this type/subtype packet
16	RESERVED3	It is reserved for future use, it is read writable
15	ADDR3_ACCEPT_REMAINING_ENABLE	when enabled, and no hit was found for the Addr3 binary search, the incoming frame for this type/subtype will pass the Addr3 filter. The ADDR3 index code returned is 255 for multicast/broadcast and 254 for unicast.
14	ADDR3_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr3 is submitted to the RXP Addr3 binary search filter. When not enabled, Addr3 filtering is NOT done, The returned ADDR3 index code is 253 and the 'Addr3_index_invalid' bit in the RXP status flags in the BD will be set

WCSS_A_RXP_FRAME_FILTER_CONFIG (cont.)

Bits	Name	Description
13	ADDR2_ACCEPT_REMAINING_ENABLE	when enabled, and no hit was found for the Addr2 binary search, the incoming frame for this type/subtype will pass the Addr2 filter. The ADDR2 index code returned is 255 for multicast/broadcast and 254 for unicast.
12	ADDR2_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr2 is submitted to the RXP Addr2 binary search filter. When not enabled, Addr2 filtering is NOT done, The returned ADDR2 index code is 253 and the 'Addr2_index_invalid' bit in the RXP status flags in the BD will be set
11	ADDR1_ACCEPT_REMAINING_UNICAST_ENABLE	when enabled, and no hit was found for the unicast address in the Addr1 binary search, the incoming unicast frame for this type/subtype will pass the Addr1 filter. The index code returned is: 254
10	ADDR1_ACCEPT_REMAINING_MULTICAST_ENABLE	when enabled, and no hit was found for the multicast/broadcast address in the Addr1 binary search, the incoming multicast/broadcast frame for this type/subtype will pass the Addr1 filter. The index code returned is: 255.
9	ADDR1_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr1 is submitted to the RXP Addr1 binary search filter. When not enabled, Addr1 filtering is NOT done, The returned ADDR1 index code is 253 and the 'Addr1_index_invalid' bit in the RXP status flags in the BD will be set
8	ADDR1_BLOCK_UNICAST_ENABLE	when enabled, a unicast frame for this type/subtype will not pass the filter.
7	ADDR1_BLOCK_MULTICAST_ENABLE	when enabled, a multicast frame for this type/subtype will not pass the filter.
6	ADDR1_BLOCK_BROADCAST_ENABLE	when enabled, a broadcast frame for this type/subtype will not pass the filter.
5	RESERVED4	It is reserved for future use, it is read writable
4	RESERVED5	It is reserved for future use, it is read writable
3	RESERVED6	It is reserved for future use, it is read writable
2	RESERVED7	It is reserved for future use, it is read writable

WCSS_A_RXP_FRAME_FILTER_CONFIG (cont.)

Bits	Name	Description
1	BLOCK_RECEPTION_ENABLE	When enabled, all frames of this type/subtype will be blocked and will NOT pass the type/subtype/address filter check.
0	RESERVED8	It is reserved for future use, it is read writable

0x0A080A04 WCSS_A_RXP_STALL_TIMEOUT**Type:** RW**Reset State:** 0x00012000

Stall timeout functionality - allows RXP to return to idle if PMI interface stalls.

WCSS_A_RXP_STALL_TIMEOUT

Bits	Name	Description
16	STALL_TIMEOUT_EN	Enable stall timeout functionality on the MPI.
15:0	STALL_TIMEOUT_TIME	Number of cycles of no activity during PMI transaction before stall timeout occurs.

0x0A080A50 WCSS_A_RXP_CONFIG2**Type:** RW**Reset State:** 0x010381DF

It contains RXP Configuration registers, related to gen5_6 functionality added

WCSS_A_RXP_CONFIG2

Bits	Name	Description
31	CFG_DLM_MPDULEN_MSBITS_DIS	for 11ac the the Delimiter now holds mpdu length more than 4k. enabling this bit will allow rxp to apture those bits in MSB of mpdu length for 11ac only
30	CFG_MPR_NEED_MRQ_STATS	By default all the values in stat bytes will go in the BD in PHY stats location When this bit is set then the dynamic stats bus(link adaptation related info) will get over written on bytes 6 and 7 of PHY stats
29	CFG_FLT_VERSION_CHECKING_DIS	when set it will disable version checking for all packets. By default version checking is always done

WCSS_A_RXP_CONFIG2 (cont.)

Bits	Name	Description
28	NAV_UPDATE_DOES_NOT_EXCLUDE_SELF	When set, the NAV will also be set for frames destined to this STA. When NOT set, the NAV is only set for unicast frames received that are destined for other STAs. For both settings the NAV will be set for all BC/MC frames.
27	MASK_OUT_AMSDU_FRAMES_IN_AMPDU_ENABLE	When set, and amsdu frames embedded in AMPDU frames are received, the amsdu frames will be dropped.
26	ADDR2_AUTH_EXTRACT_ENABLE	When set, the RXP will extract the 'authentication' setting from the addr 2 binary search entry (bit 2 of the 3 bit wide DPU tag entry), and insert it in the BE. In this mode, the DPU tag when based on the ADDR 2 DPU TAG entry will only be 2 bits wide instead of the regular 3 bits.
25	PASS_LSIG_PROT_INFO_TO_TPE_ENABLE	When set, the RXP will pass the setting of the LSIG protection signal to the TPE together with the other response required info.
24	DEFAULT_PUSH_WQ_OVERRWRITE_ENABLE	When set, the RXP will by default push frames to WQ indicated in "default_push_wq". When NOT set, the RXP will by default push frames to WQ 2.
23:16	DEFAULT_PUSH_WQ	Field is only used when
15	BD_CLEAR_ENABLE_ENABLE	When set, the RXP will clear (set to zero) the bytes located in the BD between the PMI command bytes and the MPDU header bytes.
14	FILTER_RPE_TRACE_ENABLE	When set, the RXP filter interaction result with the RPE will be passed on to the BMU. That can result in the BMU pushing this info into the BMU HW tracing list.
13	DMA_RPE_TRACE_ENABLE	When set, the RXP DMA interaction result with the RPE will be passed on to the BMU. That can result in the BMU pushing this info into the BMU HW tracing list.
12	CFG_FLT_DEFAULT_ROUTING_DIS	By default rxp uses the <code>cfgflt_dpu_man_rtg_flg</code> , <code>cfgflt_dpu_data_rtg_flag</code> to fill in dpu routing flags. If this bit is set then RXP will use the per type/subtype routing selection.
11	CFG_FLT_PHY_ABORT_DISABLE	By default phy abort is enabled when this bit is set it is disabled. By default PHY RX will be aborted (shutdown) when the frame does not pass the type/subtype/address filter. This will save extra power.
10	CFG_FLT_NAV_SET_ENABLE_ON_ABORT	When enabled and the incoming frame does not pass the type/subtype/address filter and is aborted before the FCS is calculated, update the NAV.
9	CFG_FLT_NAV_CLEAR_ENABLE_ON_ABORT	When enabled, and the incoming frame does not pass the type/subtype/address filter and is aborted before the FCS is calculated, the NAV will be cleared.

WCSS_A_RXP_CONFIG2 (cont.)

Bits	Name	Description
8	CFG_FLT_HW_SW_BASED_RESPONSE_SELECTION_ENABLE	when set, the response generation path: SW based or HW based is controlled based on programming in the type/subtype configuration table, done through register "frame_filter_config". Note that if this control is required, the 'cfgflt_generate_hw_response_enabled' should be cleared, otherwise this programming is overruled. When 'cfgflt_hw_sw_based_response_selection_enable' is set, 'cfgflt_generate_hw_response_enabled' is clear and 'G5_generate_HW_Response' for an incoming frame is set, the RXP will generate a pulse to the TPE to generate a response frame if also the following conditions are met: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame When 'cfgflt_hw_sw_based_response_selection_enable' is set, 'cfgflt_generate_hw_response_enabled' is clear and 'G5_generate_SW_RRI' for an incoming frame is set, the RXP will generate the RRI interrupt ,so that SW can start generating the response frame, if also the following conditions are met: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame
7	CFG_FLT_FILTER_GO_TO_IDLE_ON_CLEAR_ENABLED	Gen 4 workaround: When set, and the MPDU PROC statemachine signals 'clear' to the filter, the filter will return to its idle state, forcing it to break of all interaction with other modules
6	CFG_MPR_BMU_BA_UPDATE_ENABLED	When set, enables the rxp interface with the BMU for Block Ack update
5	CFG_MPDU_PROC_WAIT_FOR_IDLE_FILTER_ENABLED	When set, enables bug fix from gen 4. This forces the MPDU PROC statemachine to wait for the rxp filter to get into an idle state before aborting a frame.
4	CFG_MPR_TPE_INTERFACE_ENABLED	When set to 1 the interface to the TPE is enabled
3	CFG_FLT_GENERATE_HW_RESPONSE_ENABLED	When set to 1 the global hw response generation logic within the RXP filter is enabled for the following conditions: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame
2	BMU_PWR_UPDATE_ENABLED	When set, enables the rxp interface with the BMU for power management updates related to PWR Mgt bit in frame control field, PS POLL reception and APSD trigger frame reception
1	CFG_BD_DPU_SOFTMACFIELDS_UPDATE_ENABLED	when you write a 1 the DPU related fields that softmac updates is enabled
0	CFG_RPE_INTERFACE_ENABLED	when you write a 1 rpe interface is enabled That means duplicate detect interface function from the rxp filter is enabled as well as the bitmap update function from teh rxp dma controller

0x0A080A54 WCSS_A_RXP_CONFIG3**Type:** RW**Reset State:** 0x07180200

It contains RXP Configuration registers, related to gen5_6 functionality added

WCSS_A_RXP_CONFIG3

Bits	Name	Description
29:24	CFG_FLT_DPU_MAN_RTG_FLG	This is the routing flag to which DPU will push management packets to, this is the value that is in the dpu_routing feild feild in RXBD for management packets
21:16	CFG_FLT_DPU_DATA_RTG_FLG	This is the routing flag to which DPU will push data packets to, this is the value that is in the dpu_routing feild feild in RXBD for data packets
14	CFG_RSSI_MODE_SEL	This bit selects the two modes of rssi data collection when this bit is 1'b0 : select Mode 0, the byte2(RxFIR0) and Byte3(RxFIR1) of PHY STATS are selected to be stored when this bit is 1'b1 : select Mode 1, the greater of Byte2 and Byte3 and Byte4(SNR) of PHY stats are selected to be stored
11:0	CFG_FLT_RPE_HANDSHAKE_TIMEOUT_VALUE	The RXP filter interacts with the RPE. At the start of this interaction a timeout counter is initialized. This register provides the timeout value for this interaction in number of clk cycles

0x0A080A58 WCSS_A_RXP_SEARCH_TABLE_DATA2**Type:** RW**Reset State:** 0x00000000

This is data register 2 for indirect access to Binary Search Table. It contains all the DPU related configurations that the RXP will insert into the BD There are totally 3 Data registers for Binary Search address Table.

WCSS_A_RXP_SEARCH_TABLE_DATA2

Bits	Name	Description
31:29	DPU_MC_BC_TAG	ThE DPU routing flag that will be inserted in the BD
28:21	DPU_MAN_MC_BC_DESCR_IPTOR_INDEX	ThE DPU descriptor index that will be inserted in the BD for mc/bc management packets
20	DPU_NE	When set, the RXP will set the 'ne' field in the bd to 1'b1
19	WEP_KEY_ID_EXTRACT_ENABLE	When set, the RXP filter will extract the Key id from encrypted frames (assuming that the encryption is wep)
18:16	DPU_TAG	ThE DPU routing flag that will be inserted in the BD

WCSS_A_RXP_SEARCH_TABLE_DATA2 (cont.)

Bits	Name	Description
15:8	DPU_MC_BC_DPU_DESC	This feild contains dpu descriptor index for BC/MC QoS/NonQoS frames RXP will insert this field in the DPU descriptor field in the BD.
7:0	DPU_DESCRIPTOR_INDEX	ThE DPU descriptor index that will be inserted in the BD for unicast data or unicast robust management frames(RMF)

0x0A080A5C WCSS_A_RXP_BEACON_TSF_TIM_EXTRACT_CTRL**Type:** RW**Reset State:** 0x00000003

This is controls what information needs to be extracted from the beacon and under what condition

WCSS_A_RXP_BEACON_TSF_TIM_EXTRACT_CTRL

Bits	Name	Description
31	BSS2_BEACON_PARSE_EN	when this bit is set it indicates that we can receive a client2 bss beacons so the beacon parsing checks whether received beacon is for BSS,P2P or BSS2(BSS CLient2) mode and accordingly TSF comparison and update is done 1'b0: no BSS beacons for client2 allowed 1'b1: BSS beacons for client2 allowed
30	EARLY_TIM_PROCESS	when this bit is set then the tim not set interrupt is generated immediatly after TIM bit is received and will not wait for the FCS complete
29	P2P_BEACON_PARS_EN	when this bit is set then the system is indicating that we can receive p2p beacons so the beacon parsing checks whether received beacon is for P2P or BSS mode and accordingly TSF comparison and update is done 1'b0: no P2P beacons allowed, only BSS beacons allowed 1'b1: P2P/BSS beacons allowed
28	SIM_IBSS_BSS_BEACON_PARS_EN	when this bit is set then the system is indicating that there is IBSS/BSS co-existance so the beacon parsing checks whether received beacon is for IBSS or BSS mode and accordingly TSF comparison and update is done 1'b1: IBSS/BSS beacons allowed 1'b0: no IBSS beacons allowed only BSS beacons allowed NOTE: when bit[29:28] = 2'b11 P2P/IBSS/BSS beacons allowed
27	BEACON_CFP_AWARENESS_ENABLE	When set, and beacon processing is enabled, the beacon will also be evaluated for the presence of the CF parameter set. If present, the CFP remaining duration period is extracted and the NAV is set to that value.
26:16	ASSOCIATION_ID	The association id of the station. This field is used to know which tim bit from the TIM element is related to this station

WCSS_A_RXP_BEACON_TSF_TIM_EXTRACT_CTRL (cont.)

Bits	Name	Description
15:8	CFG_MPR_SSID_LENGTH	When 'enable_beacon_ssid_check' is set and 'enable_beacon_partial_ssid_check_ok' is NOT set, RXP will check the SSID length field of the received beacon. That length field will need to have the same value as this register, otherwise the beacon filter will indicate a mismatch. When 'enable_beacon_ssid_check' is set and 'enable_beacon_partial_ssid_check_ok' is set as well, this length field indicates how many sequential bytes in a row of the beacon SSID field, starting from the first byte of the SSID field received, will have to match the programmed SSID bytes, in order for the beacon to pass the filter. Note that in this case, the SSID length field itself does not necessarily need to match, except that the length field in the beacon needs to be larger than the value programmed here.
5	ENABLE_BEACON_SSID_CHECK	When set, the tsf update (based on IBSS or BSS rules) or tim field extraction will only happen if the incoming beacon has an SSID 3 field which matches the contents of the 'SSID_field' register, and 'SSID_length' field in this register
2	DISABLE_BEACON_DTIM_PARSING	When set, RXP will not generate wakeup pulse if broadcast packets are pending
1	ENABLE_BEACON_TIM_PARSING	When set, beacon tim field extraction and TIM field interrupt pulse generation is enabled
0	ENABLE_BEACON_TSF_PARSING	When set, beacon timestamp extraction and TSF update are enabled

0x0A080A60 WCSS_A_RXP_TSF_COMPENSATION1_VALUE**Type:** RW**Reset State:** 0x00000000

This register contains offset values to add the received TSF value to compensate for the delay in the PHY receive chain

WCSS_A_RXP_TSF_COMPENSATION1_VALUE

Bits	Name	Description
31:24	TSF_11B_11MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 11Mbps
23:16	TSF_11B_5_5MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 5.5Mbps
15:8	TSF_11B_2MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 2Mbps
7:0	TSF_11B_1MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 1Mbps

0x0A080A64 WCSS_A_RXP_TSF_COMPENSATION2_VALUE**Type:** RW**Reset State:** 0x00000000

This register contains offset values to add the received TSF value to compensate for the delay in the PHY receive chain

WCSS_A_RXP_TSF_COMPENSATION2_VALUE

Bits	Name	Description
23:16	TSF_11AG_OTHER_RATE_COMP_VALUE	The TSF compensation value when the beacon is received at any other 11a or 11g rate
15:8	TSF_11AG_54MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at an 11a or 11g rate of 54Mbps
7:0	TSF_11AG_6MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at an 11a or 11g rate of 6Mbps

0x0A080A68 WCSS_A_RXP_SSID_VALUES_B0_B3**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 0 - 3

WCSS_A_RXP_SSID_VALUES_B0_B3

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B0_B3	The SSID bytes, in LE format

0x0A080A6C WCSS_A_RXP_SSID_VALUES_B4_B7**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 4 - 7

WCSS_A_RXP_SSID_VALUES_B4_B7

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B4_B7	The SSID bytes, in LE format

0x0A080A70 WCSS_A_RXP_SSID_VALUES_B8_B11**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 8 - 11

WCSS_A_RXP_SSID_VALUES_B8_B11

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B8_11	The SSID bytes, in LE format

0x0A080A74 WCSS_A_RXP_SSID_VALUES_B12_B15**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 12 - 15

WCSS_A_RXP_SSID_VALUES_B12_B15

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B12_15	The SSID bytes, in LE format

0x0A080A78 WCSS_A_RXP_SSID_VALUES_B16_B19**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 16 - 19

WCSS_A_RXP_SSID_VALUES_B16_B19

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B16_19	The SSID bytes, in LE format

0x0A080A7C WCSS_A_RXP_SSID_VALUES_B20_B23**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 20 - 23

WCSS_A_RXP_SSID_VALUES_B20_B23

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B20_23	The SSID bytes, in LE format

0x0A080A80 WCSS_A_RXP_SSID_VALUES_B24_B27

Type: RW

Reset State: 0x00000000

This register contains SSID bytes 24 - 27

WCSS_A_RXP_SSID_VALUES_B24_B27

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B24_27	The SSID bytes, in LE format

0x0A080A84 WCSS_A_RXP_SSID_VALUES_B28_B31

Type: RW

Reset State: 0x00000000

This register contains SSID bytes 28 - 31

WCSS_A_RXP_SSID_VALUES_B28_B31

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B28_31	The SSID bytes, in LE format

0x0A080A88 WCSS_A_RXP_BEACON_ADDR2_LOW_FIELD

Type: RW

Reset State: 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR2_LOW_FIELD

Bits	Name	Description
31:0	BEACON_ADDR2_LSB_BYTES	The 4 LS Bytes of the addr2, LE format

0x0A080A8C WCSS_A_RXP_BEACON_ADDR2_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 2 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR2_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_ADDR2_MSB_BYTES	The 2 MS Bytes of the addr2, LE format

0x0A080A90 WCSS_A_RXP_BEACON_ADDR3_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR3_LOW_FIELD

Bits	Name	Description
31:0	BEACON_ADDR3_LSB_BYTES	The 4 LS Bytes of the addr3, LE format

0x0A080A94 WCSS_A_RXP_BEACON_ADDR3_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR3_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_ADDR3_MSB_BYTES	The 2 MS Bytes of the addr3, LE format

0x0A080A98 WCSS_A_RXP_FLT_DUPL_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped at the rxp filter because the RPE indicated to the RXP filter that the frame was a duplicate

WCSS_A_RXP_FLT_DUPL_CNT

Bits	Name	Description
7:0	FLT_DUPL_DROPPED_COUNT	number of frames dropped

0x0A080A9C WCSS_A_RXP_FLT_RPE_HANDSHAKE_TIMEOUT_CNT**Type:** R**Reset State:** 0x00000000

Number of times that the handshake between the rxp filter and the RPE timedout

WCSS_A_RXP_FLT_RPE_HANDSHAKE_TIMEOUT_CNT

Bits	Name	Description
19:16	DMA_RPE_TIMEOUT_COUNT	number of timeouts that occurred on the RXP DMA <-> RPE interface
3:0	FLT_RPE_TIMEOUT_COUNT	number of timeouts that occurred on the RXP Filter <-> RPE interface

0x0A080B00 WCSS_A_RXP_QID_MAPPING0**Type:** RW**Reset State:** 0x00000008

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING0

Bits	Name	Description
4:0	MAN_AND_DATA_QID	When the incoming frame is a management frame or plain (NON QoS) data frame, the contents of this register represents the qid assigned to this type of frames

0x0A080B04 WCSS_A_RXP_QID_MAPPING1**Type:** RW**Reset State:** 0x03020100

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING1

Bits	Name	Description
28:24	QOS_TID3_QID	When the incoming frame is a QoS data frame with TID set to 3, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID2_QID	When the incoming frame is a QoS data frame with TID set to 2, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID1_QID	When the incoming frame is a QoS data frame with TID set to 1, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID0_QID	When the incoming frame is a QoS data frame with TID set to 0, the contents of this register represents the qid assigned to this type of frames

0x0A080B08 WCSS_A_RXP_QID_MAPPING2**Type:** RW**Reset State:** 0x07060504

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING2

Bits	Name	Description
28:24	QOS_TID7_QID	When the incoming frame is a QoS data frame with TID set to 7, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID6_QID	When the incoming frame is a QoS data frame with TID set to 6, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID5_QID	When the incoming frame is a QoS data frame with TID set to 5, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID4_QID	When the incoming frame is a QoS data frame with TID set to 4, the contents of this register represents the qid assigned to this type of frames

0x0A080B0C WCSS_A_RXP_QID_MAPPING3**Type:** RW**Reset State:** 0x00000000

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING3

Bits	Name	Description
28:24	QOS_TID11_QID	When the incoming frame is a QoS data frame with TID set to 11, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID10_QID	When the incoming frame is a QoS data frame with TID set to 10, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID9_QID	When the incoming frame is a QoS data frame with TID set to 9, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID8_QID	When the incoming frame is a QoS data frame with TID set to 8, the contents of this register represents the qid assigned to this type of frames

0x0A080B10 WCSS_A_RXP_QID_MAPPING4**Type:** RW**Reset State:** 0x00000000

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING4

Bits	Name	Description
28:24	QOS_TID15_QID	When the incoming frame is a QoS data frame with TID set to 15, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID14_QID	When the incoming frame is a QoS data frame with TID set to 14, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID13_QID	When the incoming frame is a QoS data frame with TID set to 13, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID12_QID	When the incoming frame is a QoS data frame with TID set to 12, the contents of this register represents the qid assigned to this type of frames

0x0A080B14 WCSS_A_RXP_PUSH_WQ_CTRL**Type:** RW**Reset State:** 0x02020202

Controls how frames that fall in the unicast other of multicast 'other categories' get routed through the system

WCSS_A_RXP_PUSH_WQ_CTRL

Bits	Name	Description
31:24	ADDR2_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 2, the frame will be routed to this WQ.
23:16	ADDR2_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 2, the frame will be routed to this WQ.
15:8	ADDR1_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 1 (multicast other), the frame will be routed to this WQ.
7:0	ADDR1_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 1 (unicast other), the frame will be routed to this WQ.

0x0A080B18 WCSS_A_RXP_PUSH_WQ_CTRL2**Type:** RW**Reset State:** 0x00020202

Controls how frames that fall in the unicast other of multicast 'other categories' get routed through the system

WCSS_A_RXP_PUSH_WQ_CTRL2

Bits	Name	Description
23:16	UNFILTERED_FRAME_PUSH_WQ_INDEX	When the incoming frame will does not get processed in any address filtering, all three staid indexes are invalid and set to 253, the frame will be routed to this WQ
15:8	ADDR3_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 3, the frame will be routed to this WQ.
7:0	ADDR3_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 3, the frame will be routed to this WQ.

0x0A080B1C WCSS_A_RXP_EXTRA_FRAME_FILTER_CONTROL**Type:** RW**Reset State:** 0x000001DD

additional control for how frames are filtered

WCSS_A_RXP_EXTRA_FRAME_FILTER_CONTROL

Bits	Name	Description
15:9	RESERVED	Reserved for future filter functions
8	BLOCK_FRAMES_WITH_HT_CONTROL_FIELD	When set, frames that have a HT-control field present as specified in 11n are blocked from being received
7	BLOCK_MULTI_TID_BLOCK_ACK_REQ	When set, the multi TID block ACK Request variant as specified in 11n is blocked from being received
6	BLOCK_RESERVED_BLOCK_ACK_REQ	When set, the reserved block ACK Request variant as specified in 11n is blocked from being received
5	BLOCK_COMPRESSED_BLOCK_ACK_REQ	When set, the compressed block ACK Request variant as specified in 11n is blocked from being received
4	BLOCK_BASIC_BLOCK_ACK_REQ	When set, the basic block ACK Request variant as specified in 11n is blocked from being received
3	BLOCK_MULTI_TID_BLOCK_ACK	When set, the multi TID block ACK variant as specified in 11n is blocked from being received
2	BLOCK_RESERVED_BLOCK_ACK	When set, the reserved block ACK variant as specified in 11n is blocked from being received
1	BLOCK_COMPRESSED_BLOCK_ACK	When set, the compressed block ACK variant as specified in 11n is blocked from being received
0	BLOCK_BASIC_BLOCK_ACK	When set, the basic block ACK variant as specified in 11n is blocked from being received

0x0A080B20 WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

interrupt Enables for RXP errors

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE

Bits	Name	Description
27	DMA_GAM_ERROR	Write 1 to enable this interrupt, so that whenever there is error on the AHB bus (gam error) an interrupt will be generated to firmware.
26	RXP_SYSTEM_OUT_OF_MEMORY_FIRMWARE	Write 1 to enable this interrupt, so that whenever system runs out of memory this interrupt will be set. this is duplicate the one in bit 13 goes to host and this interrupt goes to firware only
25	P2P_BEACON_CTWING_DETECT_INT	when set enables this interrupt The NOA CTWin value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
24	P2P_BEACON_OPPPS_CHNG_DETECT_INT_EN	when set enables this interrupt The NOA OppPS value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated this interrupt goes to firmware only --NOTE---- This interrupt is overloaded with NDPA received interrupt for ECO as partial fix for addr3 issue in VHTCB, to enable NDPA interrupt set bit 17 in spare_and_clkgate_dis register.
23	P2P_TIM_BIT_CLEAR_INT	When set, p2p beacon has tim bit clear this interrupt goes to firmware only
22	P2P_TIM_BIT_SET_INT	When set, tim bit set in p2p beacon this interrupt goes to firmware only
21	P2P_TIM_BEACON_CRC_ERROR_INT	When set, p2p beacon has CRC error this interrupt goes to firmware only
20	P2P_TIM_BASED_BROADCAST_FRAMES_PENDING_INTERRUPT	When set, indicates tim bit indicates broadcast frames are pending from a p2p beacon this interrupt goes to firmware only
19	P2P_BEACON_NOA_ABSENT_INT_EN	When set, P2P beacon which has no NOA element interrupt will be enabled this interrupt goes to firmware only
18	P2P_BEACON_NOA_INDEX_EQUAL_ONE_DETECT_INT_EN	when set, P2P beacon NOA index value equal to one interrupt will be enabled this interrupt goes to firmware only
17	P2P_BEACON_NOA_INDEX_CHANGE_DETECT_INT_EN	The NOA, index feild is compared with the index value programmed in p2p_parsing_control register if there is any change the this interrupt is generated When set, P2p Beacon NOA index value change detect interrupt is enabled this interrupt goes to firmware only
16	RXP_RADAR_INTERRUPT	When set, radar detect interrupt will be generated

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
15	RXP_MORE_DATA_SET_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is SET an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. this interrupt goes to host only
14	RXP_RMF_FRAME_LEN_ERROR	Write 1 to enable this interrupt, whenever we receive a RMF BC/MC frame with frame less than 48bytes(which is minimum) then this interrupt is generated. this interrupt goes to host only
13	RXP_SYSTEM_OUT_OF_MEMORY	Write 1 to enable this interrupt, so that whenever system runs out of memory this interrupt will be set. this interrupt goes to host only
12	RXP_MORE_DATA_CLEAR_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. this interrupt goes to host only
11	RXP_ADDR2_MISS_INTERRUPT	When set, and a frame is received that has an addr2 miss (and addr 1 is a hit), an 'addr2 miss interrupt will be generated. this interrupt goes to host only
10	RXP_MISSED_EOSP_INT	When set, interrupt is generated when at least one other frame with EOSP got received while the first EOSP frame reception got reported this interrupt goes to firmware only
9	RXP_EOSP_INT	When set, the EOSP interrupt will get generated if eossp frame is received this interrupt goes to firmware only
8	TIM_BIT_CLEAR_INT	When set, beacon has tim bit clear this interrupt goes to firmware only
7	TIM_BIT_SET_INT	When set, tim bit set in beacon this interrupt goes to firmware only
6	TIM_BEACON_CRC_ERROR_INTERRUPT	When set, beacon has CRC error this interrupt goes to firmware only
5	TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending this interrupt goes to host only
4	ASYNC_FIFO_FULL_ERROR_INTERRUPT_ENABLE	When set, and the async fifo gets full, an interrupt will be generated this interrupt goes to host only
3	GET_BMU_ERR_INTERRUPT_ENABLE	When set, and the interaction with the bmu causes an error, an interrupt will be generated this interrupt goes to host only
2	INVALID_RATE_INDEX_INTERRUPT_ENABLE	When set, and an invalid rate index is generated based on information from the PHY, an interrupt will be generated this interrupt goes to host only
1	RPE_DUPL_INTERFACE_TIMEOUT_INTERRUPT_ENABLE	When set, the rpe duplicate detect interface handshake timeout error interrupt generation is enabled this interrupt goes to host only
0	RPE_BITMAP_INTERFACE_TIMEOUT_INTERRUPT_ENABLE	When set, the rpe bitmap interface handshake timeout error interrupt generation is enabled this interrupt goes to host only

0x0A080B24 WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

RXP combined interrupt status, writing 1 to any bit will clear the corresponding interrupt

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS

Bits	Name	Description
31	DROP_RPE_FIFO_FULL	whenever a frame is dropped due to system out of memory this bit will indicate if there was a rpe fifo full that caused this packet drop 1: if syste_out_of memory is set and this bit is one packet dropped due RPE fifo full 0: if syste_out_of memory is set and this bit is zero then there may BMU BD/PDU issue Writing 1 to this bit will clear this status
30	PACKET_PRIORITY	whenever a frame is dropped due to system out of memory this bit will indicate what was the priority of the frame that was dropped 1: high priority frame dropped 0: Low priority frame dropped Writing 1 to this bit will clear this status
27	DMA_GAM_ERROR	when set indicates there is error on the AHB bus (gam error) writing 1 to this bit will clear the interrupt
26	RXP_SYSTEM_OUT_OF_MEMORY_FIRMWARE_INT	when set it indicates system is running out of memory, which allows software to indicate to AP to back off on sending frames by sending frames with PM bit set Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
25	P2P_BEACON_CTWING_DETECT_INT	The NOA CTWin value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
24	P2P_BEACON_OPPPS_CHNG_DETECT_INT	The NOA OppPS value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated this interrupt goes to firmware only
23	P2P_TIM_BIT_CLEAR_INT	When set, p2p beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
22	P2P_TIM_BIT_SET_INT	When set, tim bit set in p2p beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
21	P2P_TIM_BEACON_CRC_ERROR_INT	When set, p2p beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
20	P2P_TIM_BASED_BROADCAST_FRAMES_PENDING_INTERRUPT	When set, indicates tim bit in p2p beacon indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
19	P2P_BEACON_NOA_ABSENT_INT	When set, P2P beacon which has no NOA element interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
18	P2P_BEACON_NOA_INDEX_EQUAL_ONE_DETECT_INT	when set, indicates P2P beacon NOA index value equal to one interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
17	P2P_BEACON_NOA_IDX_CHNG_DETECT_INT	The NOA, index feild is compared with the index value programmed in p2p_parsing_control register if there is any change the this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
16	RXP_RADAR_INTERRUPT	When set, radar detect interrupt will be generated Writing 1 to this bit will clear this interrupt
15	RXP_MORE_DATA_SET_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is SET an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
14	RXP_RMF_FRAME_LEN_ERR_INT	When set it indicates that we have received a RMF BC/MC frame with frame less than 48bytes(which is minimum) then this interrupt is generated. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
13	RXP_SYSTEM_OUT_OF_MEMORY_INT	when set it indicates system is running out of memory, which allows software to indicate to AP to back off on sending frmaes by sending frames with PM bit set Writing 1 to this bit will clear this interrupt this interrupt goes to host only
12	RXP_MORE_DATA_CLEAR_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
11	RXP_ADDR2_MISS_INTERRUPT	When set, and a frame is received that has an addr2 miss (and addr 1 is a hit), an 'addr2 miss interrupt will be generated. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
10	RXP_MISSED_EOSP_INT	When set, interrupt is generated when at least one other frame with EOSP got received while the first EOSP frame reception got reported Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
9	RXP_EOSP_INT	When set, the EOSP interrupt will get generated if eosps frame is received Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
8	TIM_BIT_CLEAR_INT	When set, beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
7	TIM_BIT_SET_INT	When set, tim bit set in beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
6	TIM_BEACON_CRC_ERROR_INT	When set, beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
5	TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
4	ASYNC_FIFO_FULL_ERR_INT	When set, and the async fifo got full Writing 1 to this bit will clear this interrupt this interrupt goes to host only
3	GET_BMU_ERR_INT	When set, the interaction with the bmu caused an error Writing 1 to this bit will clear this interrupt this interrupt goes to host only
2	INVALID_RATE_INDEX_INT	When set, an invalid rate index is generated based on information from the PHY Writing 1 to this bit will clear this interrupt this interrupt goes to host only
1	RPE_DUPL_INTERFACE_TIMEOUT_INT	When set, the rpe duplicate detect interface handshake timeout error has been detected Writing 1 to this bit will clear this interrupt this interrupt goes to host only
0	RPE_BITMAP_INTERFACE_TIMEOUT_INT	When set, the rpe bitmap interface handshake timeout error has been detected Writing 1 to this bit will clear this interrupt this interrupt goes to host only

0x0A080B28 WCSS_A_RXP_DEFAULT_HW_INSERT_DPU_PARAM**Type:** RW**Reset State:** 0x00000000

DPU related parameters to be put in the BD when the "bd_dpu_softmacfields_update_enable" is set and the frame that is received does not cause a hit in the filter, but falls in the unicast/multicast others category, and is still allowed to come in.

WCSS_A_RXP_DEFAULT_HW_INSERT_DPU_PARAM

Bits	Name	Description
14:7	DPU_ROUTING_FLAG	The setting for the DPU_routing_flag bits in the BD
6:4	DPU_TAG	The setting for the DPU TAG bits in the BD
3:1	RX_KEY_ID_BITS	The setting for the RX KEY ID bits in the BD
0	NE_BIT	The setting for the NE bit in the BD

0x0A080B44 WCSS_A_RXP_PSPOLL_NAV_VALUE**Type:** RW**Reset State:** 0x00000000

indicates the NAV value that will be passed on to the MTU when a PSPOLL frame is received

WCSS_A_RXP_PSPOLL_NAV_VALUE

Bits	Name	Description
7:0	PSPOLL_NAV_VALUE	The NAV value that will be passed on to the MTU when a PSPOLL frame is received

0x0A080B48 WCSS_A_RXP_PMU_INTERFACE_CONTROL**Type:** RW**Reset State:** 0x00000000

Controls the PMU interfacing for Beacon Mode Power Save.

WCSS_A_RXP_PMU_INTERFACE_CONTROL

Bits	Name	Description
10	PMU_SLEEP_PULSE_GENERATED	When set, a sleep pulse has been generated to the PMU Write 0 to clear this bit
9	WAKEUP_ON_BC_TIM_SET_PULSE_GENERATED	When set, a wakeup pulse has been generated to the PMU indicating a beacon is received with the broadcast tim bit set Write 0 to clear this bit
8	WAKEUP_ON_STA_TIM_SET_PULSE_GENERATED	When set, a wakeup pulse has been generated to the PMU indicating a beacon is received with the STA tim bit set Write 0 to clear this bit
3	SLEEP_ON_BC_TIM_CLEAR	When set, a sleep pulse will be generated to the PMU when a beacon is received with the broadcast tim bit clear NOTE: when both 'pmu_sleep_on_sta_tim_clear' and 'sleep_on_bc_tim_clear' are set, both requirements need to be met in order to generate the sleep pulse
2	PMU_SLEEP_ON_STA_TIM_CLEAR	When set, a sleep pulse will be generated to the PMU when a beacon is received with the sta tim bit clear
1	WAKEUP_ON_SBC_TIM_SET	When set, a wakeup pulse will be generated to the PMU when a beacon is received with the broadcast tim bit set
0	WAKEUP_ON_STA_TIM_SET	When set, a wakeup pulse will be generated to the PMU when a beacon is received with the STA tim bit set

0x0A080B50 WCSS_A_RXP_RATE_INDEX_HISTORY**Type:** R**Reset State:** 0x00000000

Gives an overview of the rate indexes of the last 2 frames received

WCSS_A_RXP_RATE_INDEX_HISTORY

Bits	Name	Description
24:16	PREVIOUS_RECEIVED_RATE_INDEX	The rate index of the previous frame received
8:0	LAST_RECEIVED_RATE_INDEX	The rate index of the last frame received

0x0A080B58 WCSS_A_RXP_ADDR2_MISS_INFO**Type:** R**Reset State:** 0x00000000

The lowest 32 bits of the addr 2 received that caused an addr 2 miss interrupt

WCSS_A_RXP_ADDR2_MISS_INFO

Bits	Name	Description
31:0	ADDR2_BIT31_0	The lowest 32 bits of the addr 2 received

0x0A080B5C WCSS_A_RXP_ADDR2_MISS_CTRL**Type:** R**Reset State:** 0x00000000

Addr 2 miss interrupt control and status

WCSS_A_RXP_ADDR2_MISS_CTRL

Bits	Name	Description
23:16	ADDR1_INDEX	The corresponding addr 1 index of the frame received
15:0	ADDR2_BIT47_32	The upper 16 bits of the addr 2 received

0x0A080B60 WCSS_A_RXP_EOSP_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

EOSP interrupt control and status

WCSS_A_RXP_EOSP_INT_CONTROL

Bits	Name	Description
31	EOSP_INT_ENABLE	When set, and a frame is received that passes the filter and the EOSP bit in the QoS control field is set, an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields in this register.
30	EOSP_INT_STATUS	When set, the EOSP interrupt got generated
29	EOSP_INT_MISSED	When set, at least one other frame with EOSP set got received while the first EOSP frame reception got reported
27:24	TID	The tid of the qos control field
23:16	ADDR3_INDEX	The Addr 3 index of the frame received
15:8	ADDR2_INDEX	The Addr 2 index of the frame received
7:0	ADDR1_INDEX	The Addr 1 index of the frame received

0x0A080B64 WCSS_A_RXP_MORE_DATA_CLEAR_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

More data bit clear interrupt control and status

WCSS_A_RXP_MORE_DATA_CLEAR_INT_CONTROL

Bits	Name	Description
31	MORE_DATA_CLEAR_INT_ENABLE	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields in this register.
30	MORE_DATA_CLEAR_INT_STATUS	When set, the more data bit clear interrupt got generated
29	MORE_DATA_INT_MISSED	When set, at least one other frame with more data bit clear got received before SW got to process the interrupt. while the first EOSP frame reception got reported

WCSS_A_RXP_MORE_DATA_CLEAR_INT_CONTROL (cont.)

Bits	Name	Description
28	QOS_FRAME	when set indicates it is a qos frame
27:24	TID	tid of qos control feild
23:16	ADDR3_INDEX	The Addr 3 index of the frame received
15:8	ADDR2_INDEX	The Addr 2 index of the frame received
7:0	ADDR1_INDEX	The Addr 1 index of the frame received

0x0A080B6C WCSS_A_RXP_CONFIG4**Type:** RW**Reset State:** 0x00000000

It contains RXP Configuration registers.

WCSS_A_RXP_CONFIG4

Bits	Name	Description
28	WLAN_RX_GRANT	This bit gives status of wlan_rx_grant. Write 1 to this bit to clear it 0: No rx grant generated 1: rx grant is generated
27	WLAN_RX_GRANT_ENAB LE	This bit is used to enable the wlan_rx grant feature 0: disable the WLAN_RX_Grants control of WLAN RX 1: enable the WLAN_RX_Grants control of WLAN RX
26:11	TID_PRIORITY	This bit gives priority for frames on a tid basis this is used in support for Better Qos By default TID 6 and 7 have high priority 1: High priority 0: Low priority
10	MANAGEMENT_PRIORITY	This bit gives priority for management frames this is used in support for Better Qos 1: High priority 0: Low priority
9	NONQOS_PRIORITY	This bit gives priority for non qos frames this is used in support for Better Qos 1: High priority 0: Low priority
8:1	UNKNOWN_MC_STAID	when bit 0 is set then that means we are continuing address2 look up for an unknown multicast so the staid assigned for these types of packet should be set here

WCSS_A_RXP_CONFIG4 (cont.)

Bits	Name	Description
0	CFG_FLT_ADDR1_BC_ENTRY_PRESENT	When this bit is set it indicates that a broadcast entry is present in address 1 when it is set it allows RXP to accept unknown multicast packets and continue address2 lookup

0x0A080B74 WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the p2p beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_LOW_FIELD

Bits	Name	Description
31:0	BEACON_P2P_CLIENT_ADDR_LSB_BYTES	The 4 LS Bytes of the addr2, LE format

0x0A080B78 WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_P2P_CLIENT_ADDR_MSB_BYTES	The 2 MS Bytes of the addr2, LE format

0x0A080B7C WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL**Type:** RW**Reset State:** 0x09000000

This register contains all the configurations necessary for handling p2p beacon

WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL

Bits	Name	Description
31:24	OUI_TYPE_VALUE	This is the OUI type value in P2P IE in the beacon. By default it is 09 indicating it is P2P version 1.0
23:16	NOA_INDEX_VALUE	The Index field value of NOA subelement in P2P element in beacon RXP will parse the beacon for this index field and if there is any change in value an interrupt is generated.
15:5	P2P_ASSOCIATION_ID	The association id of the station for p2p beacons. This field is used to know which tim bit from the TIM element is related to this station
2	P2P_BEACON_NOA_PARSING_DIS	as long as pronto is configured to receive p2p beacons noa parsing will be done. NOA parsing can be disabled by writing 1 to this bit

0x0A080B80 WCSS_A_RXP_MORE_DATA_SET_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

More data bit set interrupt related status

WCSS_A_RXP_MORE_DATA_SET_INT_CONTROL

Bits	Name	Description
29	MORE_DATA_INT_MISSED	When set, at least one other frame with more data bit set got received before SW got to process the interrupt.
28	QOS_FRAME	when set indicates it is a qos frame
27:24	TID	tid of qos control field
23:16	ADDR3_INDEX	The Addr 3 index of the frame received
15:8	ADDR2_INDEX	The Addr 2 index of the frame received
7:0	ADDR1_INDEX	The Addr 1 index of the frame received

0x0A080B84 WCSS_A_RXP_RULE1_CNTR_CTRL**Type:** RW**Reset State:** 0x00000000

Has all controls to generate rule1 counter

WCSS_A_RXP_RULE1_CNTR_CTRL

Bits	Name	Description
31:28	RULE1_QID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_qid_en is valid
27:24	RULE1_QID_EN	Only the bit that are set here are considered for counting Program all the qid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule1_qid_mask are set to 0 are ignored.
23:20	RULE1_STAID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_staid_en is valid
19:16	RULE1_STAID_EN	Program all the staid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule1_staid_mask are set to 0 are ignored
15:10	RULE1_TYPESUBTYPE_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_typesubtype_en is valid bits[15:14] = FC type bits[13:10] = FC subtype
9:4	RULE1_TYPESUBTYPE_EN	Program all the type/subtype bit values that needs to be considered for counting. The setting of the bits whose corresponding bits in the rule1_typesubtype_mask are set to 0 are ignored. bits[9:8] = FC type bits[7:4] = FC subtype
3	RULE1_HT_PRESENT_MASK	When set, ht present/or not present check is enabled
2	RULE1_HT_PRESENT_EN	program the requirement of HT being present or not. This field is ignored if bit rule1_ht_present_mask is not set.
0	RULE1_CNTR_EN	when set enables the counter

0x0A080B88 WCSS_A_RXP_RULE2_CNTR_CTRL**Type:** RW**Reset State:** 0x00000000

Has all controls to generate rule1 counter

WCSS_A_RXP_RULE2_CNTR_CTRL

Bits	Name	Description
31:28	RULE2_QID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_qid_en is valid
27:24	RULE2_QID_EN	Only the bit that are set here are considered for counting Program all the qid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule2_qid_mask are set to 0 are ignored.
23:20	RULE2_STAID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_staid_en is valid
19:16	RULE2_STAID_EN	Program all the staid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule2_staid_mask are set to 0 are ignored
15:10	RULE2_TYPESUBTYPE_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_typesubtype_en is valid bits[15:14] = FC type bits[13:10] = FC subtype
9:4	RULE2_TYPESUBTYPE_EN	Program all the type/subtype bit values that needs to be considered for counting. The setting of the bits whose corresponding bits in the rule2_typesubtype_mask are set to 0 are ignored. bits[9:8] = FC type bits[7:4] = FC subtype
3	RULE2_HT_PRESENT_MASK	When set, ht present/or not present check is enabled
2	RULE2_HT_PRESENT_EN	program the requirement of HT being present or not. This field is ignored if bit rule2_ht_present_mask is not set.
0	RULE2_CNTR_EN	when set enables the counter

0x0A080B8C WCSS_A_RXP_RULE1_CNTR**Type:** R**Reset State:** 0x00000000

Rule 1 counter, if all conditions in rule1_ctrl pass then this counter gets incremented

WCSS_A_RXP_RULE1_CNTR

Bits	Name	Description
7:0	RULE1_CNTR	This counter indicates number of packets received which passes rule 1 control conditions

0x0A080B90 WCSS_A_RXP_RULE2_CNTR**Type:** R**Reset State:** 0x00000000

Rule 2 counter, if all conditions in rule2_ctrl pass then this counter gets incremented

WCSS_A_RXP_RULE2_CNTR

Bits	Name	Description
7:0	RULE2_CNTR	This counter indicates number of packets received which passes rule 2 control conditions

0x0A080B94 WCSS_A_RXP_DROP_DUE_TO_DROP_AT_DMA_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped by RXP due to drop at DMA bit set in type/subtype filter(these are mostly control packets)

WCSS_A_RXP_DROP_DUE_TO_DROP_AT_DMA_CNT

Bits	Name	Description
15:0	DROP_DUE_TO_DROP_DMA_CMD_CNT	The number of packets are dropped by RXP due to drop at DMA bit being set these are usually all control packets.

0x0A080B98 WCSS_A_RXP_RX_TIME_CNTR**Type:** R**Reset State:** 0x00000000

The number of early pkt detect at every usec

WCSS_A_RXP_RX_TIME_CNTR

Bits	Name	Description
23:0	RX_TIME_CNT	The number of usec that have early pkt detect high

0x0A080BA0 WCSS_A_RXP_NDP_PKT_CNTR**Type:** R**Reset State:** 0x00000000

The number of NDP pkts received

WCSS_A_RXP_NDP_PKT_CNTR

Bits	Name	Description
15:0	NDP_PKT_CNT	Number of NDP packets received

0x0A080BA4 WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL2**Type:** RW**Reset State:** 0x00000000

This register contains some more configurations necessary for handling p2p beacon

WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL2

Bits	Name	Description
7	NOA_OPPPS_VALUE	This value is set by SW, set 1 indicates group owner is using opportunistic power save, set to 0 indicates that it is disabled This valuw is compared to that in the beacon any change in this will generate a interrupt

WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL2 (cont.)

Bits	Name	Description
6:0	NOA_CTWIN_VALUE	Client Traffic window of value 0-6 is programmed in this register RXP will parse the beacon for this n CTWin of NOA element and if there is any change in value an interrupt is generated. This value is a period of time in TU after TBTT during which P2P group owner is present

0x0A080BA8 WCSS_A_RXP_BSS2_BEACON_PARSE_CONTROL**Type:** RW**Reset State:** 0x28250000

This register contains all the configurations necessary for handling bss2 beacon

WCSS_A_RXP_BSS2_BEACON_PARSE_CONTROL

Bits	Name	Description
31:24	IE_EID1	These bits can be programmed to any IE(except zero length IEs) in the beacon that needs to be parsed By default it is "Quiet" IE. Also the programmed in this register can not be same as IE_eid0
23:16	IE_EID0	These bits can be programmed to any IE(except zero length IE) in the beacon that needs to be parsed By default it is "Channel Switch" IE. Also the programmed in this register can not be same as IE_eid1
13	IE_EID1_PARSE_ENABLE	SW need to set this bit whenever SW wants to enable the parsing of the IE programmed in bits [31:24]
12	IE_EID0_PARSE_ENABLE	SW need to set this bit whenever SW wants to enable the parsing of the IE programmed in bits [23:16]
10:0	BSS2_ASSOCIATION_ID	The association id of the station for bss2 beacons. This field is used to know which tim bit from the TIM element is related to this station

0x0A080BAC WCSS_A_RXP_BEACON_BSS2_ADDR_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the bss2 beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_BSS2_ADDR_LOW_FIELD

Bits	Name	Description
31:0	BEACON_BSS2_CLIENT_ADDR_LSB_BYTES	The 4 LS Bytes of the addr2, LE format

0x0A080BB0 WCSS_A_RXP_BEACON_BSS2_CLIENT_ADDR_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_BSS2_CLIENT_ADDR_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_BSS2_CLIENT_ADDR_MSB_BYTES	The 2 MS Bytes of the addr2, LE format

0x0A080BB4 WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

interrupt Enables for RXP errors

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_ENABLE

Bits	Name	Description
15	P2P_EID1_ABSENT_INTERRUPT	When set, enables interrupt when received beacon is p2p beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
14	P2P_EID0_ABSENT_INTERRUPT	When set, enables interrupt when received beacon is p2p beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
13	P2P_EID1_PRESENT_INTERRUPT	When set, enables interrupt when received beacon is p2p beacon and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
12	P2P_EID0_PRESENT_INT_EN	When set, enables interrupt when received beacon is p2p beacon and has found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
11	BSS_EID1_ABSENT_INT_EN	When set, received beacon is Bss beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
10	BSS_EID0_ABSENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
9	BSS_EID1_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon and has found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
8	BSS_EID0_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon and has found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
7	BSS2_EID1_ABSENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client 2 and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
6	BSS2_EID0_ABSENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client2 and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
5	BSS2_EID1_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client2 and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
4	BSS2_EID0_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client2 and has IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
3	BSS2_TIM_BIT_CLEAR_INT_EN	When set, it enables the beacon has tim bit clear interrupt this interrupt goes to firmware only
2	BSS2_TIM_BIT_SET_INT_EN	When set, it enables tim bit set in beacon this interrupt goes to firmware only
1	BSS2_TIM_BEACON_CRC_ERR_INT_EN	When set, it enables the beacon has CRC error int this interrupt goes to firmware only
0	BSS2_TIM_BASED_BROADCAST_FRAMES_PENDING_INT_EN	When set, enables interrupt for detecting tim bit which indicates broadcast frames are pending this interrupt goes to firmware only

0x0A080BB8 WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

RXP combined interrupt status, writing 1 to any bit will clear the corresponding interrupt

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS

Bits	Name	Type	Description
31:27	DMA_STATE_ON_GAME_ERROR	R	gives status of dma statemachine when gam error occurred
15	P2P_EID1_ABSENT_INT	RW	When set, received beacon is p2p beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
14	P2P_EID0_ABSENT_INT	RW	When set, received beacon is p2p beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
13	P2P_EID1_PRESENT_INT	RW	When set, received beacon is p2p beacon and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS (cont.)

Bits	Name	Type	Description
12	P2P_EID0_PRESENT_INT	RW	When set, received beacon is p2p beacon and has IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
11	BSS_EID1_ABSENT_INT	RW	When set, received beacon is Bss beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
10	BSS_EID0_ABSENT_INT	RW	When set, received beacon is Bss beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
9	BSS_EID1_PRESENT_INT	RW	When set, received beacon is Bss beacon and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
8	BSS_EID0_PRESENT_INT	RW	When set, received beacon is Bss beacon and has IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
7	BSS2_EID1_ABSENT_INT	RW	When set, received beacon is Bss beacon for client 2 and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
6	BSS2_EID0_ABSENT_INT	RW	When set, received beacon is Bss beacon for client2 and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
5	RXP_BSS2_EID1_PRESEN T_INT	RW	When set, received beacon is Bss beacon for client2 and has found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS (cont.)

Bits	Name	Type	Description
4	RXP_BSS2_EID0_PRESENT_INT	RW	When set, received beacon is Bss beacon for client2 and has found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
3	BSS2_TIM_BIT_CLEAR_INT	RW	When set, beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
2	BSS2_TIM_BIT_SET_INT	RW	When set, tim bit set in beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
1	BSS2_TIM_BEACON_CRC_ERR_INT	RW	When set, beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
0	BSS2_TIM_BASED_BROADCAST_FRAMES_PENDING_INT	RW	When set, indicates tim bit indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

0x0A080BBC WCSS_A_RXP_RXP_QBOOST_CONTROL**Type:** RW**Reset State:** 0x00000000

Qboost control register

WCSS_A_RXP_RXP_QBOOST_CONTROL

Bits	Name	Description
15:8	QBOOST_STAID	When Qboost is enabled the STAID programmed here is staid of the address2 we are associated with
4	QBOOST_QOS_ACK_POLICY_NORMAL	when this bit is set and the incoming frame is a QoS frame, the ACK policy shall be set to Normal (or implicit BA request) in order for the frame to be considered as a Qboost candidate trigger frame
3	QBOOST_PWR_STATE_CHANGE_EN	when this bit is set, the Power State bit in the incoming shall NOT be set, in order for the frame to be considered as a Qboost candidate trigger frame
2	QBOOST_QOSNULL_PKT_EN	when this bit is set qos NULL packets will be subject to Qboost

WCSS_A_RXP_RXP_QBOOST_CONTROL (cont.)

Bits	Name	Description
1	QBOOST_BAR_PKT_EN	when this bit is set bar packets will be subject to Qboost
0	QBOOST_QOSDATA_PKT_EN	when this bit is set qos data packets will be subject to Qboost

0x0A080BC0 WCSS_A_RXP_RXP_P2P_CHANNELSWITCH_BODY**Type:** R**Reset State:** 0x00000000

This register has contents of Channel switch announcement IE for a p2p beacon

WCSS_A_RXP_RXP_P2P_CHANNELSWITCH_BODY

Bits	Name	Description
23:0	RXP_P2P_CHANNELSWITCH_IE_BODY	This register has contents of channel switch IE Bits [7:0] : Has Channel switch count field of CS IE Bits [15:8] : Has New Channel number field of CS IE Bits [23:16] : Has Channel switch Mode field of CS IE

0x0A080BC4 WCSS_A_RXP_RXP_BSS_CHANNELSWITCH_BODY**Type:** R**Reset State:** 0x00000000

This register has contents of Channel switch announcement IE for a bss beacon

WCSS_A_RXP_RXP_BSS_CHANNELSWITCH_BODY

Bits	Name	Description
23:0	RXP_BSS_CHANNELSWITCH_IE_BODY	This register has contents of channel switch IE Bits [7:0] : Has Channel switch count field of CS IE Bits [15:8] : Has New Channel number field of CS IE Bits [23:16] : Has Channel switch Mode field of CS IE

WCSS_A_RXP_RXP_BSS2_QUIETIE_MSBYTES

Bits	Name	Description
15:0	RXP_BSS2_QUIETIE_MSB	This register has upper 2 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [7:0] : Has field Quiet period Bits [15:8] : Has field Quiet count

10.54 WCSS_A_RXP_RXP**0x0A080800 WCSS_A_RXP_CONFIG****Type:** RW**Reset State:** 0x09000100

It contains RXP Configuration registers. These configurations (with the exception of soft abort and mask_subsq_fcs_err_within_ampdu) can be changed at any time by SW but HW will only take effect during the gap of packets so that SW will not corrupt packets during configuration.

WCSS_A_RXP_CONFIG

Bits	Name	Description
31:24	PHY_CMD_MIN_SIZE	RXP requires atleast minimum of 9 cmd bytes for processing packet if it is not 9 then packets will be dropped, but it can be configured to whatever value
23:19	RESERVED	reserved for future use
18	CFG_BDPDU_CLEAN_DIS	When gam error occurs it is catastrophic so we will reset the system But just to be safe RXP will clean up all BD/PDUs, this needs some extra state machine check. when this bit is set it will disable the BD/PDU cleanup and SW can go ahead and clean it after reset
17	CFG_MPR_IE_LENCHK_DIS	For the newly added IE parsing of channel switch and quiet element there is a lenchk done to make sure Channel switch is indeed 3bytes and quiet element is indeed 6 bytes setting this bit to 1 this check can be disabled

WCSS_A_RXP_CONFIG (cont.)

Bits	Name	Description
16	CFG_FLT_UNPROT_ACTION_RMF_DIS	All action frames are supposed to be RMF frames(encrypted management frames) But some action frames can be unprotected, in those cases RXP sets RMF bit in BD to 0 so DPU can bypass the decryption and pass it to host SW by writing 1 to this bit this feature can be disabled, so that all action frames will have RMF set to 1 and DPU can drop the unprotected RMF frames and firmware can process these packets from Error WQ.
15	CFG_11AC_AMPDU_EOP_INDICATION_EN	If set, RXP will generate 11ac ampdu end of packet signal to PHY. By default, it will NOT generate this eop signal. If 11ac_eop is generated to PHY, PHY will stop receiving the current packet. This is used to save power in case of MU-MIMO packets
14	CFG_MPR_DISABLE_WAIT_FOR_FILTER_IDLE	When set, this will disable the 'wait for filter to finish, when eop is received' function. This is a bug fix. This configuration bit will allow the bug fix to be disabled and the rxp logic to be reverted to the original implementation. This allows for backwards compatibility.
13	RRI_CLEAR_ON_FCS_FAIL	If set, this will enable RRI regeneration when the first RRI got followed by and FCS err.
12	MASK_SUBSQ_FCS_ERR_WITHIN_AMPDU	If set, this will mask out fcs error notification to the MTU after an MPDU within an AMPDU passes FCS check. This is to prevent doing EIFS in this case.
11	SOFT_PMI_ABORT_EN	Soft PMI abort enable.
10	CFG_HAS_FCS_EN	If set, RXP will enable writing 4-byte fcs into BD/PDU and RXP flag has_fcs flag will be set to 1. By default, the RXP DMA will NOT write fcs into BD/PDU and MPDU length does not include the 4-byte fcs.
9	CFG_RSV_BMU_EN	If set, RXP will enable sending reservation command to BMU. By default, the RXP DMA will NOT send reservation command to BMU at start of packet.
8	CFG_HAS_PHY_CMD	If set, RXP will write PHY Command into BD. By default, the PHY Command will not be put into BD so that SW can adjust the "mpdu_header_start_offset" to save the BD space for MPDU data. Note that the TimeStamp will be in BD in any case.

WCSS_A_RXP_CONFIG (cont.)

Bits	Name	Description
7	CFG_PHY_PROTOCOL_CHK_DIS	When set it disables RXP from doing any PHY protocol check Like checking PHY cmd length and stats length endcomment bitfield [6] cfg_disable_dlm_proc configuration 1'b0 bitfieldComment If set to disable, the Delimiter Processing is disabled for A-MPDU packets and the whole A-MPDU packet will be sent to mCPU without MPDU Processing. The byp_dlm_proc and byp_mpdu_proc will be asserted for A-MPDU packets. By default, Delimiter Processing is enabled. Note: This cfg_disable_dlm_proc will affect only A-MPDU packets, but not MPDU packets.
5	CFG_DISABLE_MPDU_PROC	If set to disable, the MPDU Processing is disabled for MPDU packets and the MPDU packets will be sent to mCPU without MPDU processing. This means NO FCS check, NO address filtering, and NO binary search. The packets are assumed passing MPDU processing. By default, MPDU Processing is enabled. Note: This cfg_disable_mpdu_proc will affect only MPDU packets, but not A-MPDU packets. This means MPDU within A-MPDU will be processed normally (without bypass) if cfg_disable_dlm_proc is not asserted for A-MPDU packets.
4	CFG_DISABLE_FCS_CHECK	If set to disable, the FCS Check is disabled and all packets will be treated as passing FCS Check. By default, it is enabled and RXP will check FCS on MPDU packets. The counter associated with this config is fcs_err_cnt. If not disabled, this counter will increment if a packet has FCS error.
3	CFG_MAX_PKTLEN_CHECK_EN	The max packet length check enable bit. By default, the max_pktlen check is disabled. If set, it will check MPDU packet length against max_pktlen register and check A-MPDU packet length against max_len_ampdu register. But it will not affect max_len_mpdu_in_ampdu which is checked in delimiter processing and can be disabled by asserting cfg_disable_dlm_proc.
2	CFG_ADDR_FILTER_EN	If set, the Address Filter will be enabled. By default, it is disabled and all packets will be treated as passing Address Filtering.
1	CFG_GEN_SHUTOFF_EN	If set, RXP will generate shutoff signal to PHY. By default, it will NOT generate shutoff signal. If shutoff is generated to PHY, PHY will stop receiving the current packet. This is used to save power.
0	CFG_RXP_EN	If enabled, RXP will receive packets from PHY. By default, the RXP is disabled and will not receive any packet from PHY. This bit can be changed at any time, but will only take effect when there is start pulse from PHY.

0x0A080808 WCSS_A_RXP_MAX_PKTLEN**Type:** RW**Reset State:** 0x00000040

The Max MPDU Packet Length in terms of the number bytes. It includes mac_header+payload+fcs, but does not include PHY data.

WCSS_A_RXP_MAX_PKTLEN

Bits	Name	Description
6:0	MAX_PKTLEN	The Max MPDU Packet Length in terms of the number 128 bytes.

0x0A08080C WCSS_A_RXP_SW_BD_REG**Type:** RW**Reset State:** 0x00000000

Register used by SW to write a DWord to BD

WCSS_A_RXP_SW_BD_REG

Bits	Name	Description
31:0	SW_BD_REG	SW mainly uses this register to write to location 38 in DWORD

0x0A080810 WCSS_A_RXP_MPDU_HEADER_START_OFFSET**Type:** RW**Reset State:** 0x00000040

The MPDU header start offset in BD which is in the unit of data word (4-byte).

WCSS_A_RXP_MPDU_HEADER_START_OFFSET

Bits	Name	Description
7:2	MPDU_HEADER_START_OFFSET	MPDU header start offset in BD. Note that the programmable bits are [7:2] and the lower [1:0] bits are always 2'b00 to guarantee the offset address is 4-byte aligned. If bit[7] is 0, the MPDU header starts at BD, but if bit[7] is 1, the MPDU header starts at PDU. Note that It is not valid to have the value of 6'h3f for bit[7:2] (or 8'hfc for bit[7:0]). The default value is 6'ha which means the offset address of 8'h28. In this case, the PHY Cmd bytes will not be written in BD so that the MPDU header can start right after TimeStamp field. However, for diagnostic purpose, the PHY Cmd can be written into BD by setting cfg_has_phy_cmd bit in config register so that this offset value will be adjusted to 6'h10 which means the offset address of 8'h40.

0x0A08082C WCSS_A_RXP_SEARCH_ADDR1_PTR**Type:** RW**Reset State:** 0x00000000

SW can set the addr1 pointers of Binary Search.

WCSS_A_RXP_SEARCH_ADDR1_PTR

Bits	Name	Description
16	ADDR1_POINTERS_VALID	When set, the pointers are valid.
13:8	ADDR1_SEARCH_HI_PTR	Indicate the addr1 pointer of Binary Search upper bound.
5:0	ADDR1_SEARCH_LO_PTR	Indicate the addr1 pointer of Binary Search lower bound.

0x0A080830 WCSS_A_RXP_SEARCH_ADDR2_PTR**Type:** RW**Reset State:** 0x00000000

SW can set the addr2 pointers of Binary Search.

WCSS_A_RXP_SEARCH_ADDR2_PTR

Bits	Name	Description
16	ADDR2_POINTERS_VALID	When set, the pointers are valid.
13:8	ADDR2_SEARCH_HI_PTR	Indicate the addr2 pointer of Binary Search upper bound.
5:0	ADDR2_SEARCH_LO_PTR	Indicate the addr2 pointer of Binary Search lower bound.

0x0A080834 WCSS_A_RXP_SEARCH_ADDR3_PTR**Type:** RW**Reset State:** 0x00000000

SW can set the addr3 pointers of Binary Search.

WCSS_A_RXP_SEARCH_ADDR3_PTR

Bits	Name	Description
16	ADDR3_POINTERS_VALID	When set, the pointers are valid.
13:8	ADDR3_SEARCH_HI_PTR	Indicate the addr3 pointer of Binary Search upper bound.
5:0	ADDR3_SEARCH_LO_PTR	Indicate the addr3 pointer of Binary Search lower bound.

0x0A080838 WCSS_A_RXP_SEARCH_TABLE_CMD**Type:** RW**Reset State:** 0x00000000

This is action register for indirect access to Binary Search Table. When SW writes to this action register, it will trigger the interaction between Search_Table_Data[0-1] registers and Binary Search Table. For writing data into memory table, it is important for SW to write into Search_Table_Data[0-1] registers before Search_Table_Cmd. For reading data from memory table, SW only needs to write into Search_Table_Cmd and the read data will be available in Search_Table_Data[0-1] registers.

WCSS_A_RXP_SEARCH_TABLE_CMD

Bits	Name	Type	Description
9	STATUS	R	read only: If set to 1 a binary search table read or write is ongoing. SW should read and make sure this bit is 0 before issuing another cmd write into this register.
8	WRITE	RW	Indicate write/read. If 1, write. If 0, read.
4:0	TABLE_PTR	RW	Indicate the action should take effect on this entry number in Binary Search Table.

0x0A08083C WCSS_A_RXP_SEARCH_TABLE_DATA0**Type:** RW**Reset State:** 0x00000000

This is data register 0 for indirect access to Binary Search Table. There are totally 3 Data registers for Binary Search address Table.

WCSS_A_RXP_SEARCH_TABLE_DATA0

Bits	Name	Description
31:0	MAC_ADDR	MAC_Addr[31:0] portion of MAC_Addr[47:0]. Note: The order is Little Endian: MAC_Addr[31:0] = {Byte_3, Byte_2, Byte_1, Byte_0}

0x0A080840 WCSS_A_RXP_SEARCH_TABLE_DATA1**Type:** RW**Reset State:** 0x00000000

This is data register 1 for indirect access to Binary Search Table. There are totally 3 Data registers for Binary Search address Table.

WCSS_A_RXP_SEARCH_TABLE_DATA1

Bits	Name	Description
31:29	DPU_MAN_MC_BC_SIG	This feild is used to configure the DPU signature for Management mc/bc packets
28	RSVD	reserved for future use

WCSS_A_RXP_SEARCH_TABLE_DATA1 (cont.)

Bits	Name	Description
27	VALID	Set when the sta address is valid
26	RMF	Set when robust managemnt frmases require BIP or decryption
25	FRAME_TRANSLATION	This bit is used to decide if a per station frame translation is required. When this bit is set and the bit in type/subtype is set then those packets for that station will require frame translation, so FT bit in BD will be set
24	DROP	When set, on a address hit, the frame will be dropped. The setting of this bit is only valid when 'valid configuration' is set
23:16	ADDR_ID	The addr_id[7:0].
15:0	MAC_ADDR	MAC_Addr[47:32] portion of MAC_Addr[47:0]. Note: The order is Little Endian: MAC_Addr[47:32] = {Byte_5, Byte_4}

0x0A080844 WCSS_A_RXP_MAX_LEN_AMPDU**Type:** RW**Reset State:** 0x0000FFFF

The Max Length for A-MPDU packet.

WCSS_A_RXP_MAX_LEN_AMPDU

Bits	Name	Description
16:0	MAX_LEN	The Max Length for A-MPDU packet.

0x0A080848 WCSS_A_RXP_MAX_LEN_MPDU_IN_AMPDU**Type:** RW**Reset State:** 0x00000FFF

The Max Length for MPDU in A-MPDU packet. This is used for delimiter processing to determine whether it finds a good delimiter.

WCSS_A_RXP_MAX_LEN_MPDU_IN_AMPDU

Bits	Name	Description
13:0	MAX_LEN	The Max Length for MPDU in A-MPDU packet.

0x0A08084C WCSS_A_RXP_DMA_MAX_RSV_PDU**Type:** RW**Reset State:** 0x00000008

The Max number of PDUs that RXP DMA can reserve at a time. The is to avoid the scenario that RXP drop big packet just because it fails to reserve a huge number of PDUs at the start of the packet.

WCSS_A_RXP_DMA_MAX_RSV_PDU

Bits	Name	Description
3:0	MAX_RSV_PDU	The Max number of PDUs that RXP DMA can reserve at a time.

0x0A080850 WCSS_A_RXP_DMA_BURST_THRESHOLD**Type:** RW**Reset State:** 0x00000008

The data word threshold that RXP DMA control can start burst MPDU data to MIF. The data unit is 1 word (or 4 bytes). By default, the threshold is 8 words (or 32 bytes). RXP MPDU data is accumulated in DMA FIFO. The DMA control will not send data to MIF if the number of data word in DMA FIFO does not reach the threshold. This is to used to control the burstness of RXP data on AHB.

WCSS_A_RXP_DMA_BURST_THRESHOLD

Bits	Name	Description
5:0	BURST_THRESHOLD	The data word threshold that DMA can start burst MPDU data to MIF.

0x0A080854 WCSS_A_RXP_CLEAR_STATS**Type:** RW**Reset State:** 0x00000000

This register is used to clear all stats.

WCSS_A_RXP_CLEAR_STATS

Bits	Name	Description
0	CLEAR_STATS	When set, all statistics counters will be cleared When set, the HW will automatically clear this bit.

0x0A080858 WCSS_A_RXP_PHY_MPDU_CNT

Type: R

Reset State: 0x00000000

The number of MPDU packets are received from PHY.

WCSS_A_RXP_PHY_MPDU_CNT

Bits	Name	Description
31:0	PHY_MPDU_CNT	PHY MPDU Cnt.

0x0A08085C WCSS_A_RXP_PHY_AMPDU_CNT

Type: R

Reset State: 0x00000000

The number of A-MPDU packets are received from PHY.

WCSS_A_RXP_PHY_AMPDU_CNT

Bits	Name	Description
31:0	PHY_AMPDU_CNT	PHY A-MPDU Cnt.

0x0A080864 WCSS_A_RXP_PHY_ABORT_CNT

Type: R

Reset State: 0x00000000

The number of aborted packets from PHY.

WCSS_A_RXP_PHY_ABORT_CNT

Bits	Name	Description
7:0	PHY_ABORT_CNT	PHY Abort Packet Cnt.

0x0A080868 WCSS_A_RXP_PHY_SHUTOFF_CNT**Type:** R**Reset State:** 0x00000000

The number of shutoff pulses are generated by RXP to PHY.

WCSS_A_RXP_PHY_SHUTOFF_CNT

Bits	Name	Description
15:8	PHY_11AC_EOP_CNT	This is also logically a shutoff count, but this is RXP shutting of due of EOF bit set in the 11ac AMPDU indicating end of useful AMPDU data. PHY will stop giving anymore data.
7:0	PHY_SHUTOFF_CNT	PHY Shutoff Cnt. This is number of packets that RXP terminated due to packet error or early beacon termination

0x0A08086C WCSS_A_RXP_DLM_FIFO_FULL_CNT**Type:** R**Reset State:** 0x00000000

The number of packets have error because DLM FIFO is full.

WCSS_A_RXP_DLM_FIFO_FULL_CNT

Bits	Name	Description
7:0	DLM_FIFO_FULL_CNT	DLM FIFO Full Cnt.

0x0A080870 WCSS_A_RXP_DLM_ERR_CNT**Type:** R**Reset State:** 0x00000000

The number of packets have error because Delimiter is bad. When a error is detected in the A-MPDU delimiter this count is incremented. But when RXP starts searching for the next A-MPDU

delimiter, this count is NOT incremented. The implementation uses 'seen_dlm_err' flag. This flag is cleared for the first delimiter or after a good delimiter is found. It is set after a bad delimiter is found. If this flag is set, then don't increment the counter. This will increment: - Whenever the next delimiter (using the previous good delimiter information) is not found in the expected location, or is bad.

WCSS_A_RXP_DLM_ERR_CNT

Bits	Name	Description
7:0	DLM_ERR_CNT	DLM Error Cnt.

0x0A080874 WCSS_A_RXP_FAIL_FILTER_CNT

Type: R

Reset State: 0x00000000

The number of packets have failed Address Filtering.

WCSS_A_RXP_FAIL_FILTER_CNT

Bits	Name	Description
15:0	FAIL_FILTER_CNT	Fail Address Filter Cnt.

0x0A080878 WCSS_A_RXP_FAIL_MAX_PKTLEN_CNT

Type: R

Reset State: 0x00000000

The number of packets have failed Max MPDU or AMPDU packet length check.

WCSS_A_RXP_FAIL_MAX_PKTLEN_CNT

Bits	Name	Description
7:0	FAIL_MAX_PKTLEN_CNT	Fail Max MPDU or AMPDU Packet Length Check Cnt.

0x0A08087C WCSS_A_RXP_FCS_ERR_CNT

Type: R

Reset State: 0x00000000

The number of packets have FCS error.

WCSS_A_RXP_FCS_ERR_CNT

Bits	Name	Description
31:0	FCS_ERR_CNT	FCS Error Cnt.

0x0A080880 WCSS_A_RXP_DMA_SEND_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are sent to CPU by RXP Write DMA.

WCSS_A_RXP_DMA_SEND_CNT

Bits	Name	Description
31:0	DMA_SEND_CNT	The number of packets are sent to CPU by RXP Write DMA. All packets in current system are all pushed by RXP refer to rpe dma send cnt for that. This counter increments only if RXP pushes packets directly to DXE

0x0A080884 WCSS_A_RXP_DMA_DROP_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped by RXP Write DMA. This could increment due to: Failed filter PHY Abort AFTER the 9th command word BD/PDU errors If packet with command phase shorter or longer than actual command length specified is sent, the RXP will increment dma_drop_cnt instead of phy_err_drop_cnt (unless actual command phase < 9 words, in which case phy_err_drop_cnt will be incremented) Will NOT increment if end of psdu (as defined in psdu length by PHY command) occurs during search for next delimiter in AMPDU; this is because a new packet is not found, so there should not be a drop)

WCSS_A_RXP_DMA_DROP_CNT

Bits	Name	Description
15:0	DMA_DROP_CNT	The number of packets are dropped by RXP Write DMA. Drop due to filter error, packet len error or Get bmu error any packet dropped at DMA due to any of above errors, these can be drop at DMA marked packets which may have filter fail errors

0x0A080888 WCSS_A_RXP_DMA_GET_BMU_FAIL_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped due to insufficient BD/PDUs BMU BD or PDU.

WCSS_A_RXP_DMA_GET_BMU_FAIL_CNT

Bits	Name	Description
15:0	DMA_GET_BMU_FAIL_CNT	DMA No BMU BD/PDU Cnt.

0x0A080890 WCSS_A_RXP_TYPE_SUBTYPE_FILTER_CNT**Type:** R**Reset State:** 0x00000000

The number of packets dropped because of their type/subtype

WCSS_A_RXP_TYPE_SUBTYPE_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A080894 WCSS_A_RXP_INCORRECT_LENGTH_FILTER_CNT**Type:** R**Reset State:** 0x00000000

The length of the frame was not sufficient to do all the address filter checks. This may increment if dlm_fifo_full occurs.

WCSS_A_RXP_INCORRECT_LENGTH_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A080898 WCSS_A_RXP_ADDR1_BLOCK_FILTER_CNT**Type:** R**Reset State:** 0x00000000

Number of frames blocked based on the address one

WCSS_A_RXP_ADDR1_BLOCK_FILTER_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A08089C WCSS_A_RXP_ADDR1_HIT_NO_PASS_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

WCSS_A_RXP_ADDR1_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808A0 WCSS_A_RXP_ADDR1_DROP_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

WCSS_A_RXP_ADDR1_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808A4 WCSS_A_RXP_ADDR2_HIT_NO_PASS_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

WCSS_A_RXP_ADDR2_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808A8 WCSS_A_RXP_ADDR2_DROP_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

WCSS_A_RXP_ADDR2_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808AC WCSS_A_RXP_ADDR3_HIT_NO_PASS_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got a hit in the binary search table but were instructed to be dropped because of the drop setting in the binary search table

WCSS_A_RXP_ADDR3_HIT_NO_PASS_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808B0 WCSS_A_RXP_ADDR3_DROP_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped because there was no hit in the binary search table

WCSS_A_RXP_ADDR3_DROP_CNT

Bits	Name	Description
7:0	DROPPED_COUNT	number of frames dropped

0x0A0808B4 WCSS_A_RXP_MPDU_IN_AMPDU_CNT**Type:** R**Reset State:** 0x00000000

The number of MPDU packets are split from A-MPDU packets.

WCSS_A_RXP_MPDU_IN_AMPDU_CNT

Bits	Name	Description
31:0	MPDU_IN_AMPDU_CNT	The number of MPDU packets are split from A-MPDU packets.

0x0A0808B8 WCSS_A_RXP_PHY_ERR_DROP_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped by RXP PHY Processing because of some apparent PHY protocol errors, such as: PHY Cmd Len is smaller than 9 bytes. PHY Cmd Len is larger than 28 bytes. PHY Stats Len is not equal to 8 bytes. Exception - if packet with command phase shorter longer than actual command length is sent, the RXP will increment dma_drop_cnt instead (however, if actual command length is < 9, this will be counted as a phy_err_drop) Note: The packets are dropped before reaching RXP Write DMA.

WCSS_A_RXP_PHY_ERR_DROP_CNT

Bits	Name	Description
7:0	PHY_ERR_DROP_CNT	The number of packets are dropped by RXP PHY Processing.

0x0A0808BC WCSS_A_RXP_RADAR_DETECT_STATUS**Type:** RW**Reset State:** 0x00000000

Radar detect status register. Pointers in radar detect circular buffer. Equal pointers means that the buffer is empty. There can be 0-63 entries in this circular buffer.

WCSS_A_RXP_RADAR_DETECT_STATUS

Bits	Name	Type	Description
24	RDR_DETECT_INT	R	status of the radar detect interrupt signal
21:16	NR_ENTRIES	R	Number of entries filled in radar detect circular buffer. (0-63)
13:8	TAIL_PTR	RW	tail pointer of radar detect circular buffer
5:0	HEAD_PTR	RW	head pointer of radar detect circular buffer

0x0A0808C0 WCSS_A_RXP_RADAR_DETECT_CONTROL**Type:** RW**Reset State:** 0x00000000

Radar detect control register.

WCSS_A_RXP_RADAR_DETECT_CONTROL

Bits	Name	Description
8	RADAR_DETECT_ENABLE	Enable/disable storing of radar detect logs
5:0	MIN_NR_LOGS_GEN_INT	Minimum number of stored logs to generate radar detect interrupt. 0 is a special case, which means to disable the interrupt.

0x0A0808C4 WCSS_A_RXP_RADAR_DETECT_LLOGS**Type:** RW**Reset State:** 0x00000000

Radar detect lower word register.

WCSS_A_RXP_RADAR_DETECT_LLOGS

Bits	Name	Description
31:0	RADAR_DETECT_LDATA	On read, the lower 4 bytes from the radar detect log as pointed by the tail pointer is returned. On write, the lower 4 bytes are written into the location pointed by the head pointer.

0x0A0808C8 WCSS_A_RXP_RADAR_DETECT_ULOGS**Type:** RW**Reset State:** 0x00000000

Radar detect upper word register.

WCSS_A_RXP_RADAR_DETECT_ULOGS

Bits	Name	Description
31:0	RADAR_DETECT_UDATA	On read, the lower 4 bytes from the radar detect log as pointed by the tail pointer is returned. After the read, the tail pointer is increased by one, except if that would cause it to become greater than the head pointer. On write, the lower 4 bytes are written into the location pointed by the head pointer. After the write, the head pointer is increased by one. If this would cause the head pointer to become equal to the tail pointer, the tail pointer would also be incremented.

0x0A0808CC WCSS_A_RXP_RADAR_DETECT_LOGS**Type:** RW**Reset State:** 0x00000000

Radar detect logs counter register

WCSS_A_RXP_RADAR_DETECT_LOGS

Bits	Name	Type	Description
31	RADAR_DETECT_LOGS_CNT_CLEAR	RW	When set, clears count of PHY written radar detect logs. This bit will automatically be cleared by HW.
15:0	RADAR_DETECT_LOGS_CNT	R	Number of radar detect logs received from PHY.

0x0A0808D0 WCSS_A_RXP_SOFT_PMI_ABORT**Type:** RW**Reset State:** 0x00000000

Soft PMI Abort register

WCSS_A_RXP_SOFT_PMI_ABORT

Bits	Name	Description
0	SOFT_PMI_ABORT	Write only bit; when 1 is written to this bit, and soft_pmi_abort_en is 1, then a soft PHY abort will be generated. Error counters will be incremented as if an actual abort had occurred.

0x0A0808D4 WCSS_A_RXP_START_ERR_CNT**Type:** R**Reset State:** 0x00000000

The number of start errors on the PMI interface (pmi_rxp_starts received while still waiting for previous packet to complete).

WCSS_A_RXP_START_ERR_CNT

Bits	Name	Description
7:0	PHY_START_ERR_CNT	PHY Start Error Cnt.

0x0A0808D8 WCSS_A_RXP_CCA_AND_EXT_TIMEOUT**Type:** RW**Reset State:** 0x3C064090

Configuration bits for cca extensions and timeout functionality.

WCSS_A_RXP_CCA_AND_EXT_TIMEOUT

Bits	Name	Description
31:21	CCA_PKTDET_6US_EXT_VALUE	This is extension of packet detect, which is done only for 11b packets for 80Mhz clock : 11'd480 for 160Mhz clock : 11'd960 for 320Mhz clock : 11'd1920

WCSS_A_RXP_CCA_AND_EXT_TIMEOUT (cont.)

Bits	Name	Description
20:10	CCA_PKTDET_EXT_VALUE	This is an additional extension of packet detect, if this is not needed it should be programmed to 1, otherwise HW will use the default value of 11'd400 80Mhz clocks 80Hmz clock : 11'd400 160Mhz clock: 11'd800 320Mhz clock: 11'd1600
9	CCA_PKDET_EXTENTION_ALLOWED	when set it allows for 6us extn on ofdm packets
8:4	FLT_TIMEOUT_TIME	This value represent that maximum time (in 256 OR 4096 120MHZ clk cycle units) that the rxp filter will wait for two sequential MPDU header bytes to be received. If this time is not met, the rxp filter will drop the frame by indicating that the filter is done, but the frame does not pass the filter. The 'timeout_error_cnt' register contents will increase by 1.
2	CCA_PKDET_EXTENTION_OLDLOGIC_DIS	when packet det gets deasserted 5us extension is done, and at the end of 5us we look for commandbyte 6 for packet type whether it is ofdm and then do 6us additional extension. But PHY may not always give this info within 5us hence ofdm signal is used for this (which is the new logic). This logic is only enabled when you write 1 to this bit
1	FLT_TIMEOUT_COUNT_UNIT	When clear, the timeout will count in 256 clk cycle units When set, the timeout counter will count in 4096 clk cycle units
0	FLT_TIMEOUT_CHECK_DISABLED	When set, the rxp filter timeout check is disabled

0x0A0808DC WCSS_A_RXP_TIMEOUT_ERROR_CNT**Type:** R**Reset State:** 0x00000000

Number of times the rxp filter encounters a timeout As a result of this, the frame will be dropped

WCSS_A_RXP_TIMEOUT_ERROR_CNT

Bits	Name	Description
7:0	TIMEOUT_COUNT	Number of times the rxp filter encounters a timeout

0x0A0808E0 WCSS_A_RXP_STALL_TIMEOUT_CNT**Type:** R**Reset State:** 0x00000000

Number of times stall timeout occurs. As a result of this, the frame will be dropped

WCSS_A_RXP_STALL_TIMEOUT_CNT

Bits	Name	Description
7:0	STALL_TIMEOUT_COUNT	Number of times the PMI interface encounters a stall timeout

0x0A0808EC WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ**Type:** RW**Reset State:** 0x00000000

NAV control register and response requested register. The NAV PHY delay compensation can be programmed here. Also the control of how the NAV needs to be updated, or not at all, when the CCA was not asserted when a frame got received (and dropped) is configured here.

WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ

Bits	Name	Description
25	CFG_FLT_RESPONSE_REQ_WITH_HT_CONTROL	When set and the Reponse interrupt is generated, and the incoming frame has an HT control field (this is: incoming frame is QoS data frame and has the 'order' bit in the frame control field set), the response interrupt is only generated after the HT control field has been fully received and will be located in the reponse_header_info5 field. Setting this bit will also enable the generation of the 'HTC present' reporting in the enhanced_sequence_number_message_type set 1: Will enable RXP to process frames with HTC feild set 0: RXP will ignore HTC feild hence whenever this bit is zero block_frames_with_ht_control_field(extra frame filter register) should be 1
24:21	CFG_FLT_NAV_RESERVED	reserved bits
20	CFG_FLT_NAV_DELAY_COMPENSATION_VALUE_EN	When set, enables the NAV delay compensation functionality. This is, the NAV update value given to the MTU is compensated for the PHY delay. The compensation value is given in the bits: cfg_ft_nav_delay_compensation_value
19:16	CFG_FLT_NAV_DELAY_COMPENSATION_VALUE	NAV compensation value in usec.

WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ (cont.)

Bits	Name	Description
10	CFG_FLT_REGISTER_CCA_AT_START_OF_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal at the start of the cca observe time. This sampled CCA is later used to determine if an NAV update is needed or NOT. The cca observe time is configured with other bits in this register.
9	CFG_FLT_REGISTER_CCA_AT_END_OF_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal at the end of the cca observe time. This sampled CCA is later used to determine if an NAV update is needed or NOT. The cca observe time is configured with other bits in this register.
8	CFG_FLT_REGISTER_CCA_DURING_OBSERVE_TIME	When NOT set: no action When set: The RXP filter samples the setting of the primary cca signal during the entire duration of the cca observe time. If the cca goes low anywhere during this time, this is recorded and fixed. In that case, even if the CCA went high a little later, the sampled CCA value that is later used to determine if an NAV update is needed or NOT, will have a low value. The cca observe time is configured with other bits in this register.
7	CFG_FLT_REGISTER_CCA_LEVEL_DURING_DATA_TIME	When NOT set: no action When set: The 'data reception time' as indicated by pktDET_n being low, is part of the cca observe time.
6	CFG_FLT_REGISTER_CCA_LEVEL_DURING_PREAMBLE_TIME	When NOT set: no action When set: The 'data reception time' as determined by early_pktDET_n being low, is part of the cca observe time.
5	CFG_FLT_SKIP_DIFS_WHEN_NAV_UPDATE_MASKED	When NOT set: no action When set: When the RXP filter drops a frame and the NAV update is masked (due to enabling the NAV update masking features in this register), the 'skip_difs' signal to the MTU will be set.
4	CFG_FLT_NO_NAV_UPDATE_ON_DROP_AND_BELOW_CCA	When NOT set: no action When set: When the RXP filter drops a frame due to any reason, AND the cca at the sample point was high, the RXP will NOT generate a NAV update based on the dropped frame.
3	CFG_FLT_NO_NAV_UPDATE_ON_EXPLICIT_DROP_AND_BELOW_CCA	When NOT set: no action When set: When the RXP filter drops a frame due to an explicit drop configuration in the address table, AND the cca at the sample point was high, the RXP will NOT generate a NAV update based on the dropped frame.
2	CFG_FLT_NO_NAV_UPDATE_ON_EXPLICIT_DROP	When NOT set: no action When set: When the RXP filter drops a frame due to an explicit drop configuration in the address table, the RXP will not generate a NAV update based on the dropped frame. The setting of the CCA is NOT taken into account

WCSS_A_RXP_CFG_FLT_NAV_CONTROL_RESPONSE_REQ (cont.)

Bits	Name	Description
1	CFG_FLT_CLEAR_SKIP_NEXT_DIFS_ON_EARLY_PKT_DET	When NOT set: no action When set: The RXP filter can generate a signal to the MTU to skip DIFS. See other register bits to enable this. This 'skip' signal will be cleared when early_pkt_det_n gets asserted.
0	CFG_FLT_CLEAR_SKIP_NEXT_DIFS_ON_CCA	When NOT set: no action When set: The RXP filter can generate a signal to the MTU to skip DIFS. See other register bits to enable this. This 'skip' signal will be cleared when primary cca gets asserted.

0x0A0808F0 WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0**Type:** RW**Reset State:** 0x00000000

Control overwrite functionality for what was programmed in type/subtype config table (upper 32 bits)

WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0

Bits	Name	Description
31:0	CFG_FLT_TYPE_SUBTYPE_RX_DISABLE0	Control some overwrite functionality for whatever was programmed in the Type/subtype configuration table. When set, a frame of the corresponding type should be dropped.

0x0A0808F4 WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1**Type:** RW**Reset State:** 0x00000000

Control overwrite functionality for what was programmed in type/subtype config table (lower 32 bits)

WCSS_A_RXP_CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1

Bits	Name	Description
31:0	CFG_FLT_TYPE_SUBTYPE_RX_DISABLE1	Control some overwrite functionality for whatever was programmed in the Type/subtype configuration table. When set, a frame of the corresponding type should be dropped.

0x0A080900 WCSS_A_RXP_FRAME_FILTER_CONFIG**Type:** RW**Reset State:** 0x00000000

This is a register set of 64 sequential word addresses: Each of these 64 words represent the filter configuration for a incoming frame type/subtype. The register programming address per type/subtype is created as follows: ("This registers address" + {Type [b3, b2], Subtype [b7,b6,b5,b4], 2'b00}) where 'Type [b3,b2]' and 'Subtype [b7,b6,b5,b4]' are the IEEE standard encodings for the frames. A detailed description of the RXP filter specification can be found in the NOVA MAC architecture document. A summary of the bit functions is as follows:

WCSS_A_RXP_FRAME_FILTER_CONFIG

Bits	Name	Description
21	G5_DROP_AT_DMA	When set, the RXP will drop the incoming frame (even when the CRC and filter function passes) at the RXP DMA engine. This feature is useful to prevent that control frames like the TRS, ACK etc, get unnecessarily written into memory
20	NONHT_BW_INDICATION_ENABLE	when set then this particular type/subtype will need to be checked for bw information. If bit 0 of TA is checked to see if BW information is valid.
19	ROUTING_FLAG_SEL	when set : rxp will use dpv routing flag that is programmed in config3 bits 29:24 when not set : rxp will use dpv routing flag that is programmed in config3 bits 21:16
18	FRAME_TRANSLATION_REQ_EN	When set Frame translation by UMA is enabled
17	PM_BIT_EVAL_REQUIRED_ENABLE	when this bit is set the pm bit is evaluated for this type/subtype packet
16	RESERVED3	It is reserved for future use, it is read writable
15	ADDR3_ACCEPT_REMAINING_ENABLE	when enabled, and no hit was found for the Addr3 binary search, the incoming frame for this type/subtype will pass the Addr3 filter. The ADDR3 index code returned is 255 for multicast/broadcast and 254 for unicast.
14	ADDR3_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr3 is submitted to the RXP Addr3 binary search filter. When not enabled, Addr3 filtering is NOT done, The returned ADDR3 index code is 253 and the 'Addr3_index_invalid' bit in the RXP status flags in the BD will be set

WCSS_A_RXP_FRAME_FILTER_CONFIG (cont.)

Bits	Name	Description
13	ADDR2_ACCEPT_REMAINING_ENABLE	when enabled, and no hit was found for the Addr2 binary search, the incoming frame for this type/subtype will pass the Addr2 filter. The ADDR2 index code returned is 255 for multicast/broadcast and 254 for unicast.
12	ADDR2_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr2 is submitted to the RXP Addr2 binary search filter. When not enabled, Addr2 filtering is NOT done, The returned ADDR2 index code is 253 and the 'Addr2_index_invalid' bit in the RXP status flags in the BD will be set
11	ADDR1_ACCEPT_REMAINING_UNICAST_ENABLE	when enabled, and no hit was found for the unicast address in the Addr1 binary search, the incoming unicast frame for this type/subtype will pass the Addr1 filter. The index code returned is: 254
10	ADDR1_ACCEPT_REMAINING_MULTICAST_ENABLE	when enabled, and no hit was found for the multicast/broadcast address in the Addr1 binary search, the incoming multicast/broadcast frame for this type/subtype will pass the Addr1 filter. The index code returned is: 255.
9	ADDR1_BINARY_SEARCH_FILTER_ENABLE	When enabled, Addr1 is submitted to the RXP Addr1 binary search filter. When not enabled, Addr1 filtering is NOT done, The returned ADDR1 index code is 253 and the 'Addr1_index_invalid' bit in the RXP status flags in the BD will be set
8	ADDR1_BLOCK_UNICAST_ENABLE	when enabled, a unicast frame for this type/subtype will not pass the filter.
7	ADDR1_BLOCK_MULTICAST_ENABLE	when enabled, a multicast frame for this type/subtype will not pass the filter.
6	ADDR1_BLOCK_BROADCAST_ENABLE	when enabled, a broadcast frame for this type/subtype will not pass the filter.
5	RESERVED4	It is reserved for future use, it is read writable
4	RESERVED5	It is reserved for future use, it is read writable
3	RESERVED6	It is reserved for future use, it is read writable
2	RESERVED7	It is reserved for future use, it is read writable

WCSS_A_RXP_FRAME_FILTER_CONFIG (cont.)

Bits	Name	Description
1	BLOCK_RECEPTION_ENABLE	When enabled, all frames of this type/subtype will be blocked and will NOT pass the type/subtype/address filter check.
0	RESERVED8	It is reserved for future use, it is read writable

0x0A080A04 WCSS_A_RXP_STALL_TIMEOUT**Type:** RW**Reset State:** 0x00012000

Stall timeout functionality - allows RXP to return to idle if PMI interface stalls.

WCSS_A_RXP_STALL_TIMEOUT

Bits	Name	Description
16	STALL_TIMEOUT_EN	Enable stall timeout functionality on the MPI.
15:0	STALL_TIMEOUT_TIME	Number of cycles of no activity during PMI transaction before stall timeout occurs.

0x0A080A50 WCSS_A_RXP_CONFIG2**Type:** RW**Reset State:** 0x010381DF

It contains RXP Configuration registers, related to gen5_6 functionality added

WCSS_A_RXP_CONFIG2

Bits	Name	Description
31	CFG_DLM_MPDULEN_MSB ITS_DIS	for 11ac the the Delimiter now holds mpdu length more than 4k. enabling this bit will allow rxp to apture those bits in MSB of mpdu length for 11ac only
30	CFG_MPR_NEED_MRQ_ST ATS	By default all the values in stat bytes will go in the BD in PHY stats location When this bit is set then the dynamic stats bus(link adaptation related info) will get over written on bytes 6 and 7 of PHY stats

WCSS_A_RXP_CONFIG2 (cont.)

Bits	Name	Description
29	CFG_FLT_VERSION_CHEC K_DIS	when set it will disable version checking for all packets. By default version checking is always done
28	NAV_UPDATE_DOES_NOT _EXCLUDE_SELF	When set, the NAV will also be set for frames destined to this STA. When NOT set, the NAV is only set for unicast frames received that are destined for other STAs. For both settings the NAV will be set for all BC/MC frames.
27	MASK_OUT_AMSDU_FRAM ES_IN_AMPDU_ENABLE	When set, and amsdu frames embedded in AMPDU frames are received, the amsdu frames will be dropped
26	ADDR2_AUTH_EXTRACT_E NABLE	When set, the RXP will extract the 'authentication setting from the addr 2 binary search entry (bit 2 of the 3 bit wide DPU tag entry), and insert in the BE. In this mode, the DPU tag when based on the ADDR 2 DPU TAG entry will only be 2 bits wide instead of the regular 3 bits.
25	PASS_LSIG_PROT_INFO_T O_TPE_ENABLE	When set, the RXP will pass the setting of the LSIG protection signal to the TPE together with the other response required info.
24	DEFAULT_PUSH_WQ_OVE RWRITE_ENABLE	When set, the RXP will by default push frames to WQ indicated in "default_push_wq". When NOT set, the RXP will by default push frames to WQ 2.
23:16	DEFAULT_PUSH_WQ	Field is only used when
15	BD_CLEAR_ENABLE_ENAB LE	When set, the RXP will clear (set to zero) the bytes located in the BD between the PMI command bytes and the MPDU header bytes.
14	FILTER_RPE_TRACE_ENA BLE	When set, the RXP filter interaction result with the RPE will be passed on to the BMU. That can result in the BMU pushing this info into the BMU HW tracing list
13	DMA_RPE_TRACE_ENABL E	When set, the RXP DMA interaction result with the RPE will be passed on to the BMU. That can result in the BMU pushing this info into the BMU HW tracing list
12	CFG_FLT_DEFAULT_ROUTI NG_DIS	By default rxp uses the cfgflt_dpu_man_rtg_flg, cfgflt_dpu_data_rtg_flg to fill in dpu routing flags. If this bit is set then RXP will use the per type/subtype routing selection

WCSS_A_RXP_CONFIG2 (cont.)

Bits	Name	Description
11	CFG_FLT_PHY_ABORT_DS	by default phy abort is enabled when this bit is set it is disabled By default PHY RX will be aborted (shutdown) when the frame does not pass the type/subtype/address filter. This will save extra power
10	CFG_FLT_NAV_SET_ENABLE_ON_ABORT	When enabled and the incoming frame does not pass the type/subtype/address filter and is aborted before the FCS is calculated, update the NAV,
9	CFG_FLT_NAV_CLEAR_ENABLE_ON_ABORT	When enabled, and the incoming frame does not pass the type/subtype/address filter and is aborted before the FCS is calculated, the NAV will be cleared.
8	CFG_FLT_HW_SW_BASED_RESPONSE_SELECTION_ENABLE	when set, the response generation path: SW based or HW based is controlled based on programming in the type/subtype configuration table, done through register "frame_filter_config". Note that if this control is required, the 'cfgflt_generate_hw_response_enabled' should be cleared, otherwise this programming is overruled. When 'cfgflt_hw_sw_based_response_selection_enable' is set, 'cfgflt_generate_hw_response_enabled' is clear and 'G5_generate_HW_Response' for an incoming frame is set, the RXP will generate a pulse to the TPE to generate a response frame if also the following conditions are met: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame When 'cfgflt_hw_sw_based_response_selection_enable' is set, 'cfgflt_generate_hw_response_enabled' is clear and 'G5_generate_SW_RRI' for an incoming frame is set, the RXP will generate the RRI interrupt ,so that SW can start generating the response frame, if also the following conditions are met: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame
7	CFG_FLT_FILTER_GO_TO_IDLE_ON_CLEAR_ENABLED	Gen 4 workaround: When set, and the MPDU PROC statemachine signals 'clear' to the filter, the filter will return to its idle state, forcing it to break of all interaction with other modules
6	CFG_MPR_BMU_BA_UPDATE_ENABLED	When set, enables the rxp interface with the BMU for Block Ack update
5	CFG_MPDU_PROC_WAIT_FOR_IDLE_FILTER_ENABLED	When set, enables bug fix from gen 4. This forces the MPDU PROC statemachine to wait for the rxp filter to get into an idle state before aborting a frame.

WCSS_A_RXP_CONFIG2 (cont.)

Bits	Name	Description
4	CFG_MPR_TPE_INTERFAC E_ENABLED	When set to 1 the interface to the TPE is enabled
3	CFG_FLT_GENERATE_HW _RESPONSE_ENABLED	When set to 1 the global hw response generation logic within the RXP filter is enabled for the following conditions: addr1 is a unicast address, caused a hit in the addr. lookup table AND incoming frame is a: Management frame OR data frame OR QoS data frame with ack policy set to normal OR RTS frame OR PSPOLL frame OR BAR_frame
2	BMU_PWR_UPDATE_ENAB LED	When set, enables the rxp interface with the BMU for power management updates related to PWR Mgt bit in frame control field, PS POLL reception and APSD trigger frame reception
1	CFG_BD_DPU_SOFTMACFI ELDS_UPDATE_ENABLE	when you write a 1 the DPU related fields that softmac updates is enabled
0	CFG_RPE_INTERFACE_EN ABLE	when you write a 1 rpe interface is enabled That means duplicate detect interface function from the rxp filter is enabled as well as the bitmap update function from teh rxp dma controller

0x0A080A54 WCSS_A_RXP_CONFIG3**Type:** RW**Reset State:** 0x07180200

It contains RXP Configuration registers, related to gen5_6 functionality added

WCSS_A_RXP_CONFIG3

Bits	Name	Description
29:24	CFG_FLT_DPU_MAN_RTG_ FLG	This is the routing flag to which DPU will push management packets to, this is the value that is in the dpu_routing feild feild in RXBD for management packets
21:16	CFG_FLT_DPU_DATA_RTG_ FLG	This is the routing flag to which DPU will push data packets to, this is the value that is in the dpu_routing feild feild in RXBD for data packets
14	CFG_RSSI_MODE_SEL	This bit selects the two modes of rssi data collection when this bit is 1'b0 : select Mode 0, the byte2(RxFIR0) and Byte3(RxFIR1) of PHY STATS are selected to be stored when this bit is 1'b1 : select Mode 1, the greater of Byte2 and Byte3 and Byte4(SNR) of PHY stats are selected to be stored

WCSS_A_RXP_CONFIG3 (cont.)

Bits	Name	Description
11:0	CFG_FLT_RPE_HANDSHAKE_TIMEOUT_VALUE	The RXP filter interacts with the RPE. At the start of this interaction a timeout counter is initialized. This register provides the timeout value for this interaction in number of clk cycles

0x0A080A58 WCSS_A_RXP_SEARCH_TABLE_DATA2**Type:** RW**Reset State:** 0x00000000

This is data register 2 for indirect access to Binary Search Table. It contains all the DPU related configurations that the RXP will insert into the BD. There are totally 3 Data registers for Binary Search address Table.

WCSS_A_RXP_SEARCH_TABLE_DATA2

Bits	Name	Description
31:29	DPU_MC_BC_TAG	The DPU routing flag that will be inserted in the BD
28:21	DPU_MAN_MC_BC_DESCRIPTOR_INDEX	The DPU descriptor index that will be inserted in the BD for mc/bc management packets
20	DPU_NE	When set, the RXP will set the 'ne' field in the bd to 1'b1
19	WEP_KEY_ID_EXTRACT_ENABLE	When set, the RXP filter will extract the Key id from encrypted frames (assuming that the encryption is wep)
18:16	DPU_TAG	The DPU routing flag that will be inserted in the BD
15:8	DPU_MC_BC_DPU_DESC	This field contains dpu descriptor index for BC/MC QoS/NonQoS frames RXP will insert this field in the DPU descriptor field in the BD.
7:0	DPU_DESCRIPTOR_INDEX	The DPU descriptor index that will be inserted in the BD for unicast data or unicast robust management frames(RMF)

0x0A080A5C WCSS_A_RXP_BEACON_TSF_TIM_EXTRACT_CTRL**Type:** RW**Reset State:** 0x00000003

This controls what information needs to be extracted from the beacon and under what condition

WCSS_A_RXP_BEACON_TSF_TIM_EXTRACT_CTRL

Bits	Name	Description
31	BSS2_BEACON_PARSE_EN	when this bit is set it indicates that we can receive a client2 bss beacons so the beacon parsing checks whether received beacon is for BSS,P2P or BSS2(BSS CLient2) mode and accordingly TSF comparison and update is done 1'b0: no BSS beacons for client2 allowed 1'b1: BSS beacons for client2 allowed
30	EARLY_TIM_PROCESS	when this bit is set then the tim not set interrupt is generated immediatly after TIM bit is received and will not wait for the FCS complete
29	P2P_BEACON_PARS_EN	when this bit is set then the system is indicating that we can receive p2p beacons so the beacon parsing checks whether received beacon is for P2P or BSS mode and accordingly TSF comparison and update is done 1'b0: no P2P beacons allowed, only BSS beacons allowed 1'b1: P2P/BSS beacons allowed
28	SIM_IBSS_BSS_BEACON_PARS_EN	when this bit is set then the system is indicating that there is IBSS/BSS co-existence so the beacon parsing checks whether received beacon is for IBSS or BSS mode and accordingly TSF comparison and update is done 1'b1: IBSS/BSS beacons allowed 1'b0: no IBSS beacons allowed only BSS beacons allowed NOTE: when bit[29:28] = 2'b11 P2P/IBSS/BSS beacons allowed
27	BEACON_CFP_AWARENESS_ENABLE	When set, and beacon processing is enabled, the beacon will also be evaluated for the presence of the CF parameter set. If present, the CFP remaining duration period is extracted and the NAV is set to that value.
26:16	ASSOCIATION_ID	The association id of the station. This field is used to know which tim bit from the TIM element is related to this station
15:8	CFG_MPR_SSID_LENGTH	When 'enable_beacon_ssid_check' is set and 'enable_beacon_partial_ssid_check_ok' is NOT set, RXP will check the SSID length field of the received beacon. That length field will need to have the same value as this register, otherwise the the beacon filter will indicate a mismatch. When 'enable_beacon_ssid_check' is set and 'enable_beacon_partial_ssid_check_ok' is set as well, this length field indicates how many sequential bytes in a row of the beacon SSID field, starting from the first byte of the SSID field recieved, will have to match the programmed SSID bytes, in order for the beacon to pass the filter. Note that in this case, the SSID length field itself does not necessarily need to match, except that the length field in the beacon needs to be larger then the value programmed here.

WCSS_A_RXP_BEACON_TSF_TIM_EXTRACT_CTRL (cont.)

Bits	Name	Description
5	ENABLE_BEACON_SSID_CHECK	When set, the tsf update (based on IBSS or BSS rules) or tim field extraction will only happen if the incoming beacon has an SSID 3 field which matches the contents of the 'SSID_field' register, and 'SSID_length' field in this register
2	DISABLE_BEACON_DTIM_PARSING	When set, RXP will not generate wakeup pulse if broadcast packets are pending
1	ENABLE_BEACON_TIM_PARSING	When set, beacon tim field extraction and TIM field interrupt pulse generation is enabled
0	ENABLE_BEACON_TSF_PARSING	When set, beacon timestamp extraction and TSF update are enabled

0x0A080A60 WCSS_A_RXP_TSF_COMPENSATION1_VALUE**Type:** RW**Reset State:** 0x00000000

This register contains offset values to add the received TSF value to compensate for the delay in the PHY receive chain

WCSS_A_RXP_TSF_COMPENSATION1_VALUE

Bits	Name	Description
31:24	TSF_11B_11MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 11Mbps
23:16	TSF_11B_5_5MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 5.5Mbps
15:8	TSF_11B_2MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 2Mbps
7:0	TSF_11B_1MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at a 11b rate of 1Mbps

0x0A080A64 WCSS_A_RXP_TSF_COMPENSATION2_VALUE**Type:** RW**Reset State:** 0x00000000

This register contains offset values to add the received TSF value to compensate for the delay in the PHY receive chain

WCSS_A_RXP_TSF_COMPENSATION2_VALUE

Bits	Name	Description
23:16	TSF_11AG_OTHER_RATE_COMP_VALUE	The TSF compensation value when the beacon is received at any other 11a or 11g rate
15:8	TSF_11AG_54MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at an 11a or 11g rate of 54Mbps
7:0	TSF_11AG_6MBPS_COMP_VALUE	The TSF compensation value when the beacon is received at an 11a or 11g rate of 6Mbps

0x0A080A68 WCSS_A_RXP_SSID_VALUES_B0_B3**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 0 - 3

WCSS_A_RXP_SSID_VALUES_B0_B3

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B0_B3	The SSID bytes, in LE format

0x0A080A6C WCSS_A_RXP_SSID_VALUES_B4_B7**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 4 - 7

WCSS_A_RXP_SSID_VALUES_B4_B7

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B4_B7	The SSID bytes, in LE format

0x0A080A70 WCSS_A_RXP_SSID_VALUES_B8_B11**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 8 - 11

WCSS_A_RXP_SSID_VALUES_B8_B11

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B8_11	The SSID bytes, in LE format

0x0A080A74 WCSS_A_RXP_SSID_VALUES_B12_B15**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 12 - 15

WCSS_A_RXP_SSID_VALUES_B12_B15

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B12_15	The SSID bytes, in LE format

0x0A080A78 WCSS_A_RXP_SSID_VALUES_B16_B19**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 16 - 19

WCSS_A_RXP_SSID_VALUES_B16_B19

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B16_19	The SSID bytes, in LE format

0x0A080A7C WCSS_A_RXP_SSID_VALUES_B20_B23**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 20 - 23

WCSS_A_RXP_SSID_VALUES_B20_B23

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B20_23	The SSID bytes, in LE format

0x0A080A80 WCSS_A_RXP_SSID_VALUES_B24_B27**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 24 - 27

WCSS_A_RXP_SSID_VALUES_B24_B27

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B24_27	The SSID bytes, in LE format

0x0A080A84 WCSS_A_RXP_SSID_VALUES_B28_B31**Type:** RW**Reset State:** 0x00000000

This register contains SSID bytes 28 - 31

WCSS_A_RXP_SSID_VALUES_B28_B31

Bits	Name	Description
31:0	SSID_VALUES_BYTES_B28_31	The SSID bytes, in LE format

0x0A080A88 WCSS_A_RXP_BEACON_ADDR2_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR2_LOW_FIELD

Bits	Name	Description
31:0	BEACON_ADDR2_LSB_BYTES	The 4 LS Bytes of the addr2, LE format

0x0A080A8C WCSS_A_RXP_BEACON_ADDR2_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 2 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR2_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_ADDR2_MSB_BYTES	The 2 MS Bytes of the addr2, LE format

0x0A080A90 WCSS_A_RXP_BEACON_ADDR3_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR3_LOW_FIELD

Bits	Name	Description
31:0	BEACON_ADDR3_LSB_BYTES	The 4 LS Bytes of the addr3, LE format

0x0A080A94 WCSS_A_RXP_BEACON_ADDR3_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_ADDR3_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_ADDR3_MSB_BYTES	The 2 MS Bytes of the addr3, LE format

0x0A080A98 WCSS_A_RXP_FLT_DUPL_CNT**Type:** R**Reset State:** 0x00000000

Number of frames that got dropped at the rxp filter because the RPE indicated to the RXP filter that the frame was a duplicate

WCSS_A_RXP_FLT_DUPL_CNT

Bits	Name	Description
7:0	FLT_DUPL_DROPPED_COUNT	number of frames dropped

0x0A080A9C WCSS_A_RXP_FLT_RPE_HANDSHAKE_TIMEOUT_CNT**Type:** R**Reset State:** 0x00000000

Number of times that the handshake between the rxp filter and the RPE timedout

WCSS_A_RXP_FLT_RPE_HANDSHAKE_TIMEOUT_CNT

Bits	Name	Description
19:16	DMA_RPE_TIMEOUT_COUNT	number of timeouts that occurred on the RXP DMA <-> RPE interface
3:0	FLT_RPE_TIMEOUT_COUNT	number of timeouts that occurred on the RXP Filter <-> RPE interface

0x0A080B00 WCSS_A_RXP_QID_MAPPING0**Type:** RW**Reset State:** 0x00000008

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING0

Bits	Name	Description
4:0	MAN_AND_DATA_QID	When the incoming frame is a management frame or plain (NON QoS) data frame, the contents of this register represents the qid assigned to this type of frames

0x0A080B04 WCSS_A_RXP_QID_MAPPING1**Type:** RW**Reset State:** 0x03020100

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING1

Bits	Name	Description
28:24	QOS_TID3_QID	When the incoming frame is a QoS data frame with TID set to 3, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID2_QID	When the incoming frame is a QoS data frame with TID set to 2, the contents of this register represents the qid assigned to this type of frames

WCSS_A_RXP_QID_MAPPING1 (cont.)

Bits	Name	Description
12:8	QOS_TID1_QID	When the incoming frame is a QoS data frame with TID set to 1, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID0_QID	When the incoming frame is a QoS data frame with TID set to 0, the contents of this register represents the qid assigned to this type of frames

0x0A080B08 WCSS_A_RXP_QID_MAPPING2**Type:** RW**Reset State:** 0x07060504

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING2

Bits	Name	Description
28:24	QOS_TID7_QID	When the incoming frame is a QoS data frame with TID set to 7, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID6_QID	When the incoming frame is a QoS data frame with TID set to 6, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID5_QID	When the incoming frame is a QoS data frame with TID set to 5, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID4_QID	When the incoming frame is a QoS data frame with TID set to 4, the contents of this register represents the qid assigned to this type of frames

0x0A080B0C WCSS_A_RXP_QID_MAPPING3**Type:** RW**Reset State:** 0x00000000

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING3

Bits	Name	Description
28:24	QOS_TID11_QID	When the incoming frame is a QoS data frame with TID set to 11, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID10_QID	When the incoming frame is a QoS data frame with TID set to 10, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID9_QID	When the incoming frame is a QoS data frame with TID set to 9, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID8_QID	When the incoming frame is a QoS data frame with TID set to 8, the contents of this register represents the qid assigned to this type of frames

0x0A080B10 WCSS_A_RXP_QID_MAPPING4**Type:** RW**Reset State:** 0x00000000

Controls how incoming data flows get mapped to a qid

WCSS_A_RXP_QID_MAPPING4

Bits	Name	Description
28:24	QOS_TID15_QID	When the incoming frame is a QoS data frame with TID set to 15, the contents of this register represents the qid assigned to this type of frames
20:16	QOS_TID14_QID	When the incoming frame is a QoS data frame with TID set to 14, the contents of this register represents the qid assigned to this type of frames
12:8	QOS_TID13_QID	When the incoming frame is a QoS data frame with TID set to 13, the contents of this register represents the qid assigned to this type of frames
4:0	QOS_TID12_QID	When the incoming frame is a QoS data frame with TID set to 12, the contents of this register represents the qid assigned to this type of frames

0x0A080B14 WCSS_A_RXP_PUSH_WQ_CTRL**Type:** RW**Reset State:** 0x02020202

Controls how frames that fall in the unicast other of multicast 'other categories' get routed through the system

WCSS_A_RXP_PUSH_WQ_CTRL

Bits	Name	Description
31:24	ADDR2_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 2, the frame will be routed to this WQ.
23:16	ADDR2_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 2, the frame will be routed to this WQ.
15:8	ADDR1_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 1 (multicast other), the frame will be routed to this WQ.
7:0	ADDR1_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 1(unicast other), the frame will be routed to this WQ.

0x0A080B18 WCSS_A_RXP_PUSH_WQ_CTRL2**Type:** RW**Reset State:** 0x00020202

Controls how frames that fall in the unicast other of multicast 'other categories' get routed through the system

WCSS_A_RXP_PUSH_WQ_CTRL2

Bits	Name	Description
23:16	UNFILTERED_FRAME_PUSH_WQ_INDEX	When the incoming frame will does not get processed in any address filtering, all three staid indexes are invalid and set to 253, the frame will be routed to this WQ
15:8	ADDR3_255_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 255 for addr 3, the frame will be routed to this WQ.
7:0	ADDR3_254_CATEGORY_PUSH_WQ_INDEX	When the incoming frame will end up with staid 254 for addr 3, the frame will be routed to this WQ.

0x0A080B1C WCSS_A_RXP_EXTRA_FRAME_FILTER_CONTROL**Type:** RW**Reset State:** 0x000001DD

additional control for how frames are filtered

WCSS_A_RXP_EXTRA_FRAME_FILTER_CONTROL

Bits	Name	Description
15:9	RESERVED	Reserved for future filter functions
8	BLOCK_FRAMES_WITH_HT_CONTROL_FIELD	When set, frames that have a HT-control field present as specified in 11n are blocked from being received
7	BLOCK_MULTI_TID_BLOCK_ACK_REQ	When set, the multi TID block ACK Request variant as specified in 11n is blocked from being received
6	BLOCK_RESERVED_BLOCK_ACK_REQ	When set, the reserved block ACK Request variant as specified in 11n is blocked from being received
5	BLOCK_COMPRESSED_BLOCK_ACK_REQ	When set, the compressed block ACK Request variant as specified in 11n is blocked from being received
4	BLOCK_BASIC_BLOCK_ACK_REQ	When set, the basic block ACK Request variant as specified in 11n is blocked from being received
3	BLOCK_MULTI_TID_BLOCK_ACK	When set, the multi TID block ACK variant as specified in 11n is blocked from being received
2	BLOCK_RESERVED_BLOCK_ACK	When set, the reserved block ACK variant as specified in 11n is blocked from being received
1	BLOCK_COMPRESSED_BLOCK_ACK	When set, the compressed block ACK variant as specified in 11n is blocked from being received
0	BLOCK_BASIC_BLOCK_ACK	When set, the basic block ACK variant as specified in 11n is blocked from being received

0x0A080B20 WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

interrupt Enables for RXP errors

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE

Bits	Name	Description
27	DMA_GAM_ERROR	Write 1 to enable this interrupt, so that whenever there is error on the AHB bus (gam error) an interrupt will be generated to firmware.
26	RXP_SYSTEM_OUT_OF_MEMORY_FIRMWARE	Write 1 to enable this interrupt, so that whenever system runs out of memory this interrupt will be set. this is duplicate the one in bit 13 goes to host and this interrupt goes to firware only
25	P2P_BEACON_CTWING_DETECT_INT	when set enables this interrupt The NOA CTWin value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
24	P2P_BEACON_OPPPS_CHNG_DETECT_INT_EN	when set enables this interrupt The NOA OppPS value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated this interrupt goes to firmware only --NOTE---- This interrupt is overloaded with NDPA received interrupt for ECO as partial fix for addr3 issue in VHTCB, to enable NDPA interrupt set bit 17 in spare_and_clkgate_dis register.
23	P2P_TIM_BIT_CLEAR_INT	When set, p2p beacon has tim bit clear this interrupt goes to firmware only
22	P2P_TIM_BIT_SET_INT	When set, tim bit set in p2p beacon this interrupt goes to firmware only
21	P2P_TIM_BEACON_CRC_ERROR_INT	When set, p2p beacon has CRC error this interrupt goes to firmware only
20	P2P_TIM_BASED_BROADCAST_FRAMES_PENDING_INTERRUPT	When set, indicates tim bit indicates broadcast frames are pending from a p2p beacon this interrupt goes to firmware only
19	P2P_BEACON_NOA_ABSENT_INT_EN	When set, P2P beacon which has no NOA element interrupt will be enabled this interrupt goes to firmware only
18	P2P_BEACON_NOA_INDEX_EQUAL_ONE_DETECT_INT_EN	when set, P2P beacon NOA index value equal to one interrupt will be enabled this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
17	P2P_BEACON_NOA_INDX_CHNG_DETECT_INT_EN	The NOA, index feild is compared with the index value programmed in p2p_parsing_control register if there is any change the this interrupt is generated When set, P2p Beacon NOA index value change detect interrupt is enabled this interrupt goes to firmware only
16	RXP_RADAR_INTERRUPT	When set, radar detect interrupt will be generated
15	RXP_MORE_DATA_SET_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is SET an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. this interrupt goes to host only
14	RXP_RMF_FRAME_LEN_ERR	Write 1 to enable this interrupt, whenever we receive a RMF BC/MC frame with frame less than 48bytes(which is minimum) then this interrupt is generated. this interrupt goes to host only
13	RXP_SYSTEM_OUT_OF_MEMORY	Write 1 to enable this interrupt, so that whenever system runs out of memory this interrupt will be set. this interrupt goes to host only
12	RXP_MORE_DATA_CLEAR_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. this interrupt goes to host only
11	RXP_ADDR2_MISS_INTERRUPT	When set, and a frame is received that has an addr2 miss (and addr 1 is a hit), an 'addr2 miss interrupt will be generated. this interrupt goes to host only
10	RXP_MISSED_EOSP_INT	When set, interrupt is generated when at least one other frame with EOSP got received while the first EOSP frame reception got reported this interrupt goes to firmware only
9	RXP_EOSP_INT	When set, the EOSP interrupt will get generated if eossp frame is receieved this interrupt goes to firmware only
8	TIM_BIT_CLEAR_INT	When set, beacon has tim bit clear this interrupt goes to firmware only
7	TIM_BIT_SET_INT	When set, tim bit set in beacon this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
6	TIM_BEACON_CRC_ERR_INT	When set, beacon has CRC error this interrupt goes to firmware only
5	TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending this interrupt goes to host only
4	ASYNC_FIFO_FULL_ERR_INT_ENABLE	When set, and the async fifo gets full, an interrupt will be generated this interrupt goes to host only
3	GET_BMU_ERR_INT_ENABLE	When set, and the interaction with the bmu causes an error, an interrupt will be generated this interrupt goes to host only
2	INVALID_RATE_INDEX_INT_ENABLE	When set, and an invalid rate index is generated based on information from the PHY, an interrupt will be generated this interrupt goes to host only
1	RPE_DUPL_INTERFACE_TIMEOUT_INT_ENABLE	When set, the rpe duplicate detect interface handshake timeout error interrupt generation is enabled this interrupt goes to host only
0	RPE_BITMAP_INTERFACE_TIMEOUT_INT_ENABLE	When set, the rpe bitmap interface handshake timeout error interrupt generation is enabled this interrupt goes to host only

0x0A080B24 WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

RXP combined interrupt status, writing 1 to any bit will clear the corresponding interrupt

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS

Bits	Name	Description
31	DROP_RPE_FIFO_FULL	whenever a frame is dropped due to system out of memory this bit will indicate if there was a rpe fifo full that caused this packet drop 1: if syste_out_of memory is set and this bit is one packet dropped due RPE fifo full 0: if syste_out_of memory is set and this bit is zero then there may BMU BD/PDU issue Writing 1 to this bit will clear this status

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
30	PACKET_PRIORITY	whenever a frame is dropped due to system out of memory this bit will indicate what was the priority of the frame that was dropped 1: high priority frame dropped 0: Low priority frame dropped Writing 1 to this bit will clear this status
27	DMA_GAM_ERROR	when set indicates there is error on the AHB bus (gam error) writing 1 to this bit will clear the interrupt
26	RXP_SYSTEM_OUT_OF_MEMORY_FIRMWARE_INT	when set it indicates system is running out of memory, which allows software to indicate to AP to back off on sending frames by sending frames with PM bit set Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
25	P2P_BEACON_CTWING_DETECT_INT	The NOA CTWin value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
24	P2P_BEACON_OPPPS_CHNG_DETECT_INT	The NOA OppPS value is compared with the value programmed in p2p_parsing_control2 register if there is any change then this interrupt is generated this interrupt goes to firmware only
23	P2P_TIM_BIT_CLEAR_INT	When set, p2p beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
22	P2P_TIM_BIT_SET_INT	When set, tim bit set in p2p beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
21	P2P_TIM_BEACON_CRC_ERROR_INT	When set, p2p beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
20	P2P_TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit in p2p beacon indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
19	P2P_BEACON_NOA_ABSENT_INT	When set, P2P beacon which has no NOA element interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
18	P2P_BEACON_NOA_INDEX_EQ_ONE_DETECT_INT	when set, indicates P2P beacon NOA index value equal to one interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
17	P2P_BEACON_NOA_INDX_CHNG_DETECT_INT	The NOA, index feild is compared with the index value programmed in p2p_parsing_control register if there is any change the this interrupt is generated Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
16	RXP_RADAR_INTERRUPT	When set, radar detect interrupt will be generated Writing 1 to this bit will clear this interrupt
15	RXP_MORE_DATA_SET_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is SET an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
14	RXP_RMF_FRAME_LEN_ERR_INT	When set it indicates that we have received a RMF BC/MC frame with frame less than 48bytes(which is minimum) then this interrupt is generated. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
13	RXP_SYSTEM_OUT_OF_MEMORY_INT	when set it indicates system is running out of memory, which allows software to indicate to AP to back off on sending frmaes by sending frames with PM bit set Writing 1 to this bit will clear this interrupt this interrupt goes to host only
12	RXP_MORE_DATA_CLEAR_INTERRUPT	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields more_data_int_control register. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
11	RXP_ADDR2_MISS_INTERRUPT	When set, and a frame is received that has an addr2 miss (and addr 1 is a hit), an 'addr2 miss interrupt will be generated. Writing 1 to this bit will clear this interrupt this interrupt goes to host only
10	RXP_MISSED_EOSP_INT	When set, interrupt is generated when at least one other frame with EOSP got received while the first EOSP frame reception got reported Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
9	RXP_EOSP_INT	When set, the EOSP interrupt will get generated if eosp frame is receieved Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED_INTERRUPT_STATUS (cont.)

Bits	Name	Description
8	TIM_BIT_CLEAR_INT	When set, beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
7	TIM_BIT_SET_INT	When set, tim bit set in beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
6	TIM_BEACON_CRC_ERR_INT	When set, beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
5	TIM_BASED_BROADCAST_FRAMES_PENDING_INT	When set, indicates tim bit indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
4	ASYNC_FIFO_FULL_ERR_INT	When set, and the async fifo got full Writing 1 to this bit will clear this interrupt this interrupt goes to host only
3	GET_BMU_ERR_INT	When set, the interaction with the bmu caused an error Writing 1 to this bit will clear this interrupt this interrupt goes to host only
2	INVALID_RATE_INDEX_INT	When set, an invalid rate index is generated based on information from the PHY Writing 1 to this bit will clear this interrupt this interrupt goes to host only
1	RPE_DUPL_INTERFACE_TIMEOUT_INT	When set, the rpe duplicate detect interface handshake timeout error has been detected Writing 1 to this bit will clear this interrupt this interrupt goes to host only
0	RPE_BITMAP_INTERFACE_TIMEOUT_INT	When set, the rpe bitmap interface handshake timeout error has been detected Writing 1 to this bit will clear this interrupt this interrupt goes to host only

0x0A080B28 WCSS_A_RXP_DEFAULT_HW_INSERT_DPU_PARAM**Type:** RW**Reset State:** 0x00000000

DPU related parameters to be put in the BD when the "bd_dpu_softmacfields_update_enable" is set and the frame that is received does not cause a hit in the filter, but falls in the unicast/multicast others category, and is still allowed to come in.

WCSS_A_RXP_DEFAULT_HW_INSERT_DPU_PARAM

Bits	Name	Description
14:7	DPU_ROUTING_FLAG	The setting for the DPU_routing_flag bits in the BD
6:4	DPU_TAG	The setting for the DPU TAG bits in the BD
3:1	RX_KEY_ID_BITS	The setting for the RX KEY ID bits in the BD
0	NE_BIT	The setting for the NE bit in the BD

0x0A080B44 WCSS_A_RXP_PSPOLL_NAV_VALUE**Type:** RW**Reset State:** 0x00000000

indicates the NAV value that will be passed on to the MTU when a PSPOLL frame is received

WCSS_A_RXP_PSPOLL_NAV_VALUE

Bits	Name	Description
7:0	PSPOLL_NAV_VALUE	The NAV value that will be passed on to the MTU when a PSPOLL frame is received

0x0A080B48 WCSS_A_RXP_PMU_INTERFACE_CONTROL**Type:** RW**Reset State:** 0x00000000

Controls the PMU interfacing for Beacon Mode Power Save.

WCSS_A_RXP_PMU_INTERFACE_CONTROL

Bits	Name	Description
10	PMU_SLEEP_PULSE_GENERATED	When set, a sleep pulse has been generated to the PMU Write 0 to clear this bit
9	WAKEUP_ON_BC_TIM_SET_PULSE_GENERATED	When set, a wakeup pulse has been generated to the PMU indicating a beacon is received with the broadcast tim bit set Write 0 to clear this bit

WCSS_A_RXP_PMU_INTERFACE_CONTROL (cont.)

Bits	Name	Description
8	WAKEUP_ON_STA_TIM_SET_PULSE_GENERATED	When set, a wakeup pulse has been generated to the PMU indicating a beacon is received with the STA tim bit set Write 0 to clear this bit
3	SLEEP_ON_BC_TIM_CLEAR	When set, a sleep pulse will be generated to the PMU when a beacon is received with the broadcast tim bit clear NOTE: when both 'pmu_sleep_on_sta_tim_clear' and 'sleep_on_bc_tim_clear' are set, both requirements need to be met in order to generate the sleep pulse
2	PMU_SLEEP_ON_STA_TIM_CLEAR	When set, a sleep pulse will be generated to the PMU when a beacon is received with the sta tim bit clear
1	WAKEUP_ON_SBC_TIM_SET	When set, a wakeup pulse will be generated to the PMU when a beacon is received with the broadcast tim bit set
0	WAKEUP_ON_STA_TIM_SET	When set, a wakeup pulse will be generated to the PMU when a beacon is received with the STA tim bit set

0x0A080B50 WCSS_A_RXP_RATE_INDEX_HISTORY**Type:** R**Reset State:** 0x00000000

Gives an overview of the rate indexes of the last 2 frames received

WCSS_A_RXP_RATE_INDEX_HISTORY

Bits	Name	Description
24:16	PREVIOUS_RECEIVED_RATE_INDEX	The rate index of the previous frame received
8:0	LAST_RECEIVED_RATE_INDEX	The rate index of the last frame received

0x0A080B58 WCSS_A_RXP_ADDR2_MISS_INFO**Type:** R**Reset State:** 0x00000000

The lowest 32 bits of the addr 2 received that caused an addr 2 miss interrupt

WCSS_A_RXP_ADDR2_MISS_INFO

Bits	Name	Description
31:0	ADDR2_BIT31_0	The lowest 32 bits of the addr 2 received

0x0A080B5C WCSS_A_RXP_ADDR2_MISS_CTRL**Type:** R**Reset State:** 0x00000000

Addr 2 miss interrupt control and status

WCSS_A_RXP_ADDR2_MISS_CTRL

Bits	Name	Description
23:16	ADDR1_INDEX	The corresponding addr 1 index of the frame received
15:0	ADDR2_BIT47_32	The upper 16 bits of the addr 2 received

0x0A080B60 WCSS_A_RXP_EOSP_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

EOSP interrupt control and status

WCSS_A_RXP_EOSP_INT_CONTROL

Bits	Name	Description
31	EOSP_INT_ENABLE	When set, and a frame is received that passes the filter and the EOSP bit in the QoS control field is set, an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields in this register.
30	EOSP_INT_STATUS	When set, the EOSP interrupt got generated
29	EOSP_INT_MISSED	When set, at least one other frame with EOSP set got received while the first EOSP frame reception got reported
27:24	TID	The tid of the qos control field

WCSS_A_RXP_EOSP_INT_CONTROL (cont.)

Bits	Name	Description
23:16	ADDR3_INDEX	The Addr 3 index of the frame received
15:8	ADDR2_INDEX	The Addr 2 index of the frame received
7:0	ADDR1_INDEX	The Addr 1 index of the frame received

0x0A080B64 WCSS_A_RXP_MORE_DATA_CLEAR_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

More data bit clear interrupt control and status

WCSS_A_RXP_MORE_DATA_CLEAR_INT_CONTROL

Bits	Name	Description
31	MORE_DATA_CLEAR_INT_ENABLE	When set, and a frame is received that passes the filter, is a management, data or QoS data frame and the more data bit in the frame is NOT set an interrupt pulse will be generated. That status info of the corresponding frame is captured in the other fields in this register.
30	MORE_DATA_CLEAR_INT_STATUS	When set, the more data bit clear interrupt got generated
29	MORE_DATA_INT_MISSED	When set, at least one other frame with more data bit clear got received before SW got to process the interrupt. while the first EOSP frame reception got reported
28	QOS_FRAME	when set indicates it is a qos frame
27:24	TID	tid of qos control feild
23:16	ADDR3_INDEX	The Addr 3 index of the frame received
15:8	ADDR2_INDEX	The Addr 2 index of the frame received
7:0	ADDR1_INDEX	The Addr 1 index of the frame received

0x0A080B6C WCSS_A_RXP_CONFIG4**Type:** RW**Reset State:** 0x00000000

It contains RXP Configuration registers.

WCSS_A_RXP_CONFIG4

Bits	Name	Description
28	WLAN_RX_GRANT	This bit gives status of wlan_rx_grant. Write 1 to this bit to clear it 0: No rx grant generated 1: rx grant is generated
27	WLAN_RX_GRANT_ENABLE	This bit is used to enable the wlan_rx grant feature 0: disable the WLAN_RX_Grants control of WLAN RX 1: enable the WLAN_RX_Grants control of WLAN RX
26:11	TID_PRIORITY	This bit gives priority for frames on a tid basis this is used in support for Better Qos By default TID 6 and 7 have high priority 1: High priority 0: Low priority
10	MANAGEMENT_PRIORITY	This bit gives priority for management frames this is used in support for Better Qos 1: High priority 0: Low priority
9	NONQOS_PRIORITY	This bit gives priority for non qos frames this is used in support for Better Qos 1: High priority 0: Low priority
8:1	UNKNOWN_MC_STAID	when bit 0 is set then that means we are continuing address2 look up for an unknown multicast so the staid assigned for these types of packet should be set here
0	CFG_FLT_ADDR1_BC_ENTRY_PRESENT	When this bit is set it indicates that a broadcast entry is present in address 1 when it is set it allows RXP to accept unknown multicast packets and continue address2 lookup

0x0A080B74 WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the p2p beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_LOW_FIELD

Bits	Name	Description
31:0	BEACON_P2P_CLIENT_ADDR_LSB_BYTES	The 4 LS Bytes of the addr2, LE format

0x0A080B78 WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_P2P_CLIENT_ADDR_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_P2P_CLIENT_ADDR_MSB_BYTES	The 2 MS Bytes of the addr2, LE format

0x0A080B7C WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL**Type:** RW**Reset State:** 0x09000000

This register contains all the configurations necessary for handling p2p beacon

WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL

Bits	Name	Description
31:24	OUI_TYPE_VALUE	This is the OUI type value in P2P IE in the beacon. By default it is 09 indicating it is P2P version 1.0
23:16	NOA_INDEX_VALUE	The Index field value of NOA subelement in P2P element in beacon RXP will parse the beacon for this index field and if there is any change in value an interrupt is generated.
15:5	P2P_ASSOCIATION_ID	The association id of the station for p2p beacons. This field is used to know which tim bit from the TIM element is related to this station
2	P2P_BEACON_NOA_PARSING_DIS	as long as pronto is configured to receive p2p beacons noa parsing will be done. NOA parsing can be disabled by writing 1 to this bit

0x0A080B80 WCSS_A_RXP_MORE_DATA_SET_INT_CONTROL**Type:** RW**Reset State:** 0x00000000

More data bit set interrupt related status

WCSS_A_RXP_MORE_DATA_SET_INT_CONTROL

Bits	Name	Description
29	MORE_DATA_INT_MISSED	When set, at least one other frame with more data bit set got received before SW got to process the interrupt.
28	QOS_FRAME	when set indicates it is a qos frame
27:24	TID	tid of qos control feild
23:16	ADDR3_INDEX	The Addr 3 index of the frame received
15:8	ADDR2_INDEX	The Addr 2 index of the frame received
7:0	ADDR1_INDEX	The Addr 1 index of the frame received

0x0A080B84 WCSS_A_RXP_RULE1_CNTR_CTRL**Type:** RW**Reset State:** 0x00000000

Has all controls to generate rule1 counter

WCSS_A_RXP_RULE1_CNTR_CTRL

Bits	Name	Description
31:28	RULE1_QID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_qid_en is valid
27:24	RULE1_QID_EN	Only the bit that are set here are considered for counting Program all the qid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule1_qid_mask are set to 0 are ignored.

WCSS_A_RXP_RULE1_CNTR_CTRL (cont.)

Bits	Name	Description
23:20	RULE1_STAID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_staid_en is valid
19:16	RULE1_STAID_EN	Program all the staid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule1_staid_mask are set to 0 are ignored
15:10	RULE1_TYPESUBTYPE_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule1_typesubtype_en is valid bits[15:14] = FC type bits[13:10] = FC subtype
9:4	RULE1_TYPESUBTYPE_EN	Program all the type/subtype bit values that needs to be considered for counting. The setting of the bits whose corresponding bits in the rule1_typesubtype_mask are set to 0 are ignored. bits[9:8] = FC type bits[7:4] = FC subtype
3	RULE1_HT_PRESENT_MASK	When set, ht present/or not present check is enabled
2	RULE1_HT_PRESENT_EN	program the requirement of HT being present or not. This field is ignored if bit rule1_ht_present_mask is not set.
0	RULE1_CNTR_EN	when set enables the counter

0x0A080B88 WCSS_A_RXP_RULE2_CNTR_CTRL**Type:** RW**Reset State:** 0x00000000

Has all controls to generate rule1 counter

WCSS_A_RXP_RULE2_CNTR_CTRL

Bits	Name	Description
31:28	RULE2_QID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_qid_en is valid

WCSS_A_RXP_RULE2_CNTR_CTRL (cont.)

Bits	Name	Description
27:24	RULE2_QID_EN	Only the bit that are set here are considered for counting Program all the qid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule2_qid_mask are set to 0 are ignored.
23:20	RULE2_STAID_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_staid_en is valid
19:16	RULE2_STAID_EN	Program all the staid bit values that needs to be considered for counting The setting of the bits whose corresponding bits in the rule2_staid_mask are set to 0 are ignored
15:10	RULE2_TYPESUBTYPE_MASK	Only the bit that are set here are considered for counting when mask is set for any bit the corresponding bit in rule2_typesubtype_en is valid bits[15:14] = FC type bits[13:10] = FC subtype
9:4	RULE2_TYPESUBTYPE_EN	Program all the type/subtype bit values that needs to be considered for counting. The setting of the bits whose corresponding bits in the rule2_typesubtype_mask are set to 0 are ignored. bits[9:8] = FC type bits[7:4] = FC subtype
3	RULE2_HT_PRESENT_MASK	When set, ht present/or not present check is enabled
2	RULE2_HT_PRESENT_EN	program the requirement of HT being present or not. This field is ignored if bit rule2_ht_present_mask is not set.
0	RULE2_CNTR_EN	when set enables the counter

0x0A080B8C WCSS_A_RXP_RULE1_CNTR**Type:** R**Reset State:** 0x00000000

Rule 1 counter, if all conditions in rule1_ctrl pass then this counter gets incremented

WCSS_A_RXP_RULE1_CNTR

Bits	Name	Description
7:0	RULE1_CNTR	This counter indicates number of packets received which passes rule 1 control conditions

0x0A080B90 WCSS_A_RXP_RULE2_CNTR**Type:** R**Reset State:** 0x00000000

Rule 2 counter, if all conditions in rule2_ctrl pass then this counter gets incremented

WCSS_A_RXP_RULE2_CNTR

Bits	Name	Description
7:0	RULE2_CNTR	This counter indicates number of packets received which passes rule 2 control conditions

0x0A080B94 WCSS_A_RXP_DROP_DUE_TO_DROP_AT_DMA_CNT**Type:** R**Reset State:** 0x00000000

The number of packets are dropped by RXP due to drop at DMA bit set in type/subtype filter(these are mostly control packets)

WCSS_A_RXP_DROP_DUE_TO_DROP_AT_DMA_CNT

Bits	Name	Description
15:0	DROP_DUE_TO_DROP_DMA_CMD_CNT	The number of packets are dropped by RXP due to drop at DMA bit being set these are usually all control packets.

0x0A080B98 WCSS_A_RXP_RX_TIME_CNTR**Type:** R**Reset State:** 0x00000000

The number of early pkt detect at every usec

WCSS_A_RXP_RX_TIME_CNTR

Bits	Name	Description
23:0	RX_TIME_CNT	The number of usec that have early pkt detect high

0x0A080BA0 WCSS_A_RXP_NDP_PKT_CNTR**Type:** R**Reset State:** 0x00000000

The number of NDP pkts received

WCSS_A_RXP_NDP_PKT_CNTR

Bits	Name	Description
15:0	NDP_PKT_CNT	Number of NDP packets received

0x0A080BA4 WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL2**Type:** RW**Reset State:** 0x00000000

This register contains some more configurations necessary for handling p2p beacon

WCSS_A_RXP_P2P_BEACON_PARSE_CONTROL2

Bits	Name	Description
7	NOA_OPPPS_VALUE	This value is set by SW, set 1 indicates group owner is using opportunistic power save, set to 0 indicates that it is disabled This valuw is compared to that in the beacon any change in this will generate a interrupt
6:0	NOA_CTWIN_VALUE	Client Traffic window of value 0-6 is programmed in this register RXP will parse the beacon for this n CTWin of NOA element and if there is any change in value an interrupt is generated. This value is a period of time in TU after TBTT during which P2P group owner is present

0x0A080BA8 WCSS_A_RXP_BSS2_BEACON_PARSE_CONTROL**Type:** RW**Reset State:** 0x28250000

This register contains all the configurations necessary for handling bss2 beacon

WCSS_A_RXP_BSS2_BEACON_PARSE_CONTROL

Bits	Name	Description
31:24	IE_EID1	These bits can be programmed to any IE(except zero length IEs) in the beacon that needs to be parsed By default it is "Quiet" IE. Also the programmed in this register can not be same as IE_eid0
23:16	IE_EID0	These bits can be programmed to any IE(except zero length IE) in the beacon that needs to be parsed By default it is "Channel Switch" IE.Also the programmed in this register can not be same as IE_eid1
13	IE_EID1_PARSE_ENABLE	SW need to set this bit whenever SW wants to enable the parsing of the IE programmed in bits [31:24]
12	IE_EID0_PARSE_ENABLE	SW need to set this bit whenever SW wants to enable the parsing of the IE programmed in bits [23:16]
10:0	BSS2_ASSOCIATION_ID	The association id of the station for bss2 beacons. This field is used to know which tim bit from the TIM element is related to this station

0x0A080BAC WCSS_A_RXP_BEACON_BSS2_ADDR_LOW_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the lowest 4 bytes of the address 2 field of the bss2 beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_BSS2_ADDR_LOW_FIELD

Bits	Name	Description
31:0	BEACON_BSS2_CLIENT_ADDR_LSB_BYTES	The 4 LS Bytes of the addr2, LE format

0x0A080BB0 WCSS_A_RXP_BEACON_BSS2_CLIENT_ADDR_HIGH_FIELD**Type:** RW**Reset State:** 0x00000000

This register contains the highest 2 bytes of the address 3 field of the beacon, in case a match function is enabled

WCSS_A_RXP_BEACON_BSS2_CLIENT_ADDR_HIGH_FIELD

Bits	Name	Description
15:0	BEACON_BSS2_CLIENT_ADDR_MSB_BYTES	The 2 MS Bytes of the addr2, LE format

0x0A080BB4 WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

interrupt Enables for RXP errors

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_ENABLE

Bits	Name	Description
15	P2P_EID1_ABSENT_INT_EN	When set, enables interrupt when received beacon is p2p beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
14	P2P_EID0_ABSENT_INT_EN	When set, enables interrupt when received beacon is p2p beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
13	P2P_EID1_PRESENT_INT_EN	When set, enables interrupt when received beacon is p2p beacon and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
12	P2P_EID0_PRESENT_INT_EN	When set, enables interrupt when received beacon is p2p beacon and has found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
11	BSS_EID1_ABSENT_INT_EN	When set, received beacon is Bss beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
10	BSS_EID0_ABSENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPE2_INTERRUPT_ENABLE (cont.)

Bits	Name	Description
9	BSS_EID1_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon and has found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
8	BSS_EID0_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon and has found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
7	BSS2_EID1_ABSENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client 2 and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
6	BSS2_EID0_ABSENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client2 and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
5	BSS2_EID1_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client2 and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] this interrupt goes to firmware only
4	BSS2_EID0_PRESENT_INT_EN	When set, enables interrupt when received beacon is Bss beacon for client2 and has IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] this interrupt goes to firmware only
3	BSS2_TIM_BIT_CLEAR_INT_EN	When set, it enables the beacon has tim bit clear interrupt this interrupt goes to firmware only
2	BSS2_TIM_BIT_SET_INT_EN	When set, it enables tim bit set in beacon this interrupt goes to firmware only
1	BSS2_TIM_BEACON_CRC_ERR_INT_EN	When set, it enables the beacon has CRC error int this interrupt goes to firmware only
0	BSS2_TIM_BASED_BROADCAST_FRAMES_PENDING_INT_EN	When set, enables interrupt for detecting tim bit which indicates broadcast frames are pending this interrupt goes to firmware only

0x0A080BB8 WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

RXP combined interrupt status, writing 1 to any bit will clear the corresponding interrupt

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS

Bits	Name	Type	Description
31:27	DMA_STATE_ON_GAMERR OR	R	gives status of dma statemachine when gam error occured
15	P2P_EID1_ABSENT_INT	RW	When set, received beacon is p2p beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
14	P2P_EID0_ABSENT_INT	RW	When set, received beacon is p2p beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
13	P2P_EID1_PRESENT_INT	RW	When set, received beacon is p2p beacon and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
12	P2P_EID0_PRESENT_INT	RW	When set, received beacon is p2p beacon and has IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
11	BSS_EID1_ABSENT_INT	RW	When set, received beacon is Bss beacon and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
10	BSS_EID0_ABSENT_INT	RW	When set, received beacon is Bss beacon and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS (cont.)

Bits	Name	Type	Description
9	BSS_EID1_PRESENT_INT	RW	When set, received beacon is Bss beacon and has IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
8	BSS_EID0_PRESENT_INT	RW	When set, received beacon is Bss beacon and has IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
7	BSS2_EID1_ABSENT_INT	RW	When set, received beacon is Bss beacon for client 2 and has reached end of beacon and has not found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
6	BSS2_EID0_ABSENT_INT	RW	When set, received beacon is Bss beacon for client2 and has reached end of the beacon and has not found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
5	RXP_BSS2_EID1_PRESEN T_INT	RW	When set, received beacon is Bss beacon for client2 and has found IE with EID1 programmed in bss2_beacon_extract_control register feild [31:24] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
4	RXP_BSS2_EID0_PRESEN T_INT	RW	When set, received beacon is Bss beacon for client2 and has found IE with EID0 programmed bss2_beacon_extract_control register feild [23:15] Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
3	BSS2_TIM_BIT_CLEAR_IN T	RW	When set, beacon has tim bit clear Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
2	BSS2_TIM_BIT_SET_INT	RW	When set, tim bit set in beacon Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only
1	BSS2_TIM_BEACON_CRC_ ERR_INT	RW	When set, beacon has CRC error Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

WCSS_A_RXP_RXP_GROUPED2_INTERRUPT_STATUS (cont.)

Bits	Name	Type	Description
0	BSS2_TIM_BASED_BROADCAST_FRAMES_PENDING_INT	RW	When set, indicates tim bit indicates broadcast frames are pending Writing 1 to this bit will clear this interrupt this interrupt goes to firmware only

0x0A080BBC WCSS_A_RXP_RXP_QBOOST_CONTROL**Type:** RW**Reset State:** 0x00000000

Qboost control register

WCSS_A_RXP_RXP_QBOOST_CONTROL

Bits	Name	Description
15:8	QBOOST_STAID	When Qboost is enabled the STAID programmed here is staid of the address2 we are associated with
4	QBOOST_QOS_ACK_POL_NORMAL	when this bit is set and the incoming frame is a QoS frame, the ACK policy shall be set to Normal (or implicit BA request) in order for the frame to be considered as a Qboost candidate trigger frame
3	QBOOST_PWR_STATE_CHK_EN	when this bit is set, the Power State bit in the incoming shall NOT be set, in order for the frame to be considered as a Qboost candidate trigger frame
2	QBOOST_QOSNULL_PKT_EN	when this bit is set qos NULL packets will be subject to Qboost
1	QBOOST_BAR_PKT_EN	when this bit is set bar packets will be subject to Qboost
0	QBOOST_QOSDATA_PKT_EN	when this bit is set qos data packets will be subject to Qboost

0x0A080BC0 WCSS_A_RXP_RXP_P2P_CHANNELSWITCH_BODY**Type:** R**Reset State:** 0x00000000

This register has contents of Channel switch announcement IE for a p2p beacon

WCSS_A_RXP_RXP_P2P_CHANNELSWITCH_BODY

Bits	Name	Description
23:0	RXP_P2P_CHANNELSWITCH_IE_BODY	This register has contents of channel switch IE Bits [7:0] : Has Channel switch count field of CS IE Bits [15:8] : Has New Channel number field of CS IE Bits [23:16] : Has Channel switch Mode field of CS IE

0x0A080BC4 WCSS_A_RXP_RXP_BSS_CHANNELSWITCH_BODY**Type:** R**Reset State:** 0x00000000

This register has contents of Channel switch announcement IE for a bss beacon

WCSS_A_RXP_RXP_BSS_CHANNELSWITCH_BODY

Bits	Name	Description
23:0	RXP_BSS_CHANNELSWITCH_IE_BODY	This register has contents of channel switch IE Bits [7:0] : Has Channel switch count field of CS IE Bits [15:8] : Has New Channel number field of CS IE Bits [23:16] : Has Channel switch Mode field of CS IE

0x0A080BC8 WCSS_A_RXP_RXP_BSS2_CHANNELSWITCH_BODY**Type:** R**Reset State:** 0x00000000

This register has contents of Channel switch announcement IE for a bss2 beacon

WCSS_A_RXP_RXP_BSS2_CHANNELSWITCH_BODY

Bits	Name	Description
23:0	RXP_BSS2_CHANNELSWITCH_IE_BODY	This register has contents of channel switch IE Bits [7:0] : Has Channel switch count field of CS IE Bits [15:8] : Has New Channel number field of CS IE Bits [23:16] : Has Channel switch Mode field of CS IE

0x0A080BCC WCSS_A_RXP_RXP_P2P_QUIETIE_LSBYTES**Type:** R**Reset State:** 0x00000000

This register has contents of quiet element IE for a p2p beacon

WCSS_A_RXP_RXP_P2P_QUIETIE_LSBYTES

Bits	Name	Description
31:0	RXP_P2P_QUIETIE_LSB	This register has lower 4 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [15:0] : Has feild Quiet offset Bits [31:16] : Has field Quiet Duration

0x0A080BD0 WCSS_A_RXP_RXP_BSS_QUIETIE_LSBYTES**Type:** R**Reset State:** 0x00000000

This register has contents of quiet element IE for a bss beacon

WCSS_A_RXP_RXP_BSS_QUIETIE_LSBYTES

Bits	Name	Description
31:0	RXP_BSS_QUIETIE_LSB	This register has lower 4 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [15:0] : Has feild Quiet offset Bits [31:16] : Has field Quiet Duration

0x0A080BD4 WCSS_A_RXP_RXP_BSS2_QUIETIE_LSBYTES**Type:** R**Reset State:** 0x00000000

This register has contents of quiet element IE for a bss2 beacon

WCSS_A_RXP_RXP_BSS2_QUIETIE_LSBYTES

Bits	Name	Description
31:0	RXP_BSS2_QUIETIE_LSB	This register has lower 4 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [15:0] : Has feild Quiet offset Bits [31:16] : Has field Quiet Duration

0x0A080BD8 WCSS_A_RXP_RXP_P2P_QUIETIE_MSBYTES**Type:** R**Reset State:** 0x00000000

This register has contents of quiet element IE for a p2p beacon

WCSS_A_RXP_RXP_P2P_QUIETIE_MSBYTES

Bits	Name	Description
15:0	RXP_P2P_QUIETIE_MSB	This register has upper 2 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [7:0] : Has field Quiet period Bits [15:8] : Has field Quiet count

0x0A080BDC WCSS_A_RXP_RXP_BSS_QUIETIE_MSBYTES**Type:** R**Reset State:** 0x00000000

This register has contents of quiet element IE for a bss beacon

WCSS_A_RXP_RXP_BSS_QUIETIE_MSBYTES

Bits	Name	Description
15:0	RXP_BSS_QUIETIE_MSB	This register has upper 2 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [7:0] : Has field Quiet period Bits [15:8] : Has field Quiet count

0x0A080BE0 WCSS_A_RXP_RXP_BSS2_QUIETIE_MSBYTES**Type:** R**Reset State:** 0x00000000

This register has contents of quiet element IE for a bss2 beacon

WCSS_A_RXP_RXP_BSS2_QUIETIE_MSBYTES

Bits	Name	Description
15:0	RXP_BSS2_QUIETIE_MSB	This register has upper 2 bytes of contents of Quiet Element IE refer to following byte descriptions for correct byte positions Bits [7:0] : Has field Quiet period Bits [15:8] : Has field Quiet count

10.55 WCSS_A_TAQAM_TAQAM

0x0A012C00 WCSS_A_TAQAM_SCALE_BPSK

Type: RW

Reset State: 0x007F

Amplitude scale factor for BPSK modulation

WCSS_A_TAQAM_SCALE_BPSK

Bits	Name	Description
8:0	REG	

0x0A012C08 WCSS_A_TAQAM_SCALE_QPSK

Type: RW

Reset State: 0x005A

Amplitude scale factor for QPSK modulation

WCSS_A_TAQAM_SCALE_QPSK

Bits	Name	Description
8:0	REG	

0x0A012C0C WCSS_A_TAQAM_SCALE_QAM16

Type: RW

Reset State: 0x0050

Amplitude scale factor for 16QAM modulation

WCSS_A_TAQAM_SCALE_QAM16

Bits	Name	Description
8:0	REG	

0x0A012C10 WCSS_A_TAQAM_SCALE_QAM64

Type: RW

Reset State: 0x004E

Amplitude scale factor for 64QAM modulation

WCSS_A_TAQAM_SCALE_QAM64

Bits	Name	Description
8:0	REG	

0x0A012C14 WCSS_A_TAQAM_SCALE_QAM256

Type: RW

Reset State: 0x004E

Amplitude scale factor for 256QAM modulation

WCSS_A_TAQAM_SCALE_QAM256

Bits	Name	Description
8:0	REG	

0x0A012C18 WCSS_A_TAQAM_SCALE_LEGACY20

Type: RW

Reset State: 0x0089

Amplitude scale factor for legacy packets and 11n/ac legacy symbols

WCSS_A_TAQAM_SCALE_LEGACY20

Bits	Name	Description
8:0	REG	

0x0A012C1C WCSS_A_TAQAM_SCALE_LEGACY40

Type: RW

Reset State: 0x0060

Amplitude scale factor for legacy 40MHz duplicate packets and 11n/ac 40MHz legacy symbols

WCSS_A_TAQAM_SCALE_LEGACY40

Bits	Name	Description
8:0	REG	

0x0A012C20 WCSS_A_TAQAM_SCALE_LEGACY80**Type:** RW**Reset State:** 0x0085

Amplitude scale factor for legacy 80MHz duplicate packets and 11n/ac 80MHz legacy symbols

WCSS_A_TAQAM_SCALE_LEGACY80

Bits	Name	Description
8:0	REG	

0x0A012C24 WCSS_A_TAQAM_SCALE_HT20**Type:** RW**Reset State:** 0x0085

Amplitude scale factor for (V)HT-LTF, HT-SIG in GF mode, VHT-SIG-B and Data 11n/ac 20MHz symbols

WCSS_A_TAQAM_SCALE_HT20

Bits	Name	Description
8:0	REG	

0x0A012C28 WCSS_A_TAQAM_SCALE_HT40**Type:** RW**Reset State:** 0x005B

Amplitude scale factor for (V)HT-LTF, HT-SIG in GF mode, VHT-SIG-B and Data 11n/ac 40MHz symbols

WCSS_A_TAQAM_SCALE_HT40

Bits	Name	Description
8:0	REG	

0x0A012C2C WCSS_A_TAQAM_SCALE_HT80**Type:** RW**Reset State:** 0x007B

Amplitude scale factor for VHT-LTF, VHT-SIG-B and Data 11ac 80MHz symbols

WCSS_A_TAQAM_SCALE_HT80

Bits	Name	Description
8:0	REG	

0x0A012C30 WCSS_A_TAQAM_AC**Type:** RW**Reset State:** 0x03E7

Programmable features to mitigate risk of spec change

WCSS_A_TAQAM_AC

Bits	Name	Description
9	SB_ROT_EN	
8	CYC_ROT_EN	
7:0	PILOT80	

10.56 WCSS_A_TBAPB_TBAPB**0x0A012800 WCSS_A_TBAPB_CRC16_CTRL****Type:** RW**Reset State:** 0x0000

Controls CRC16 generator operation that calculates IEEE802.11b PLCP header CRC. For debugging purposes.

WCSS_A_TBAPB_CRC16_CTRL

Bits	Name	Description
0	DIS	When set disables CRC16 calculation. Should be 0 (enabled) for normal operation. 0x0: ENABLE (CRC16 calculation enabled) 0x1: DISABLE (CRC16 calculation disabled)

0x0A012804 WCSS_A_TBAPB_SCRAMBLE_CTRL**Type:** RW**Reset State:** 0x0000

Controls data scrambler operation that scrambled IEEE802.11b frame. For debugging purposes.

WCSS_A_TBAPB_SCRAMBLE_CTRL

Bits	Name	Description
0	DIS	When set disables data scrambling by bypassing scrambler. Should be 0 (enabled) for normal operation. 0x0: ENABLE (scrambler enabled) 0x1: DISABLE (scrambler bypassed)

0x0A01280C WCSS_A_TBAPB_LINEAR_DELAY_ANT1

Type: RW

Reset State: 0x0002

Stores the select for the delay diversity value to be applied to txb chain2 samples in barker and cck modulated data

WCSS_A_TBAPB_LINEAR_DELAY_ANT1

Bits	Name	Description
7:6	CCK11DIVDLY	0 implies no delay to chain2 cck11 modulated data 1 implies 1 delay (1 20MHz sample) to chain2 cck11 modulated data 2 implies 2 delays 3 implies 3 delays
5:3	CCK5DIVDLY	0 implies no delay to chain2 cck5 modulated data 1 implies 1 delay (1 20MHz sample) to chain2 cck5 modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays
2:0	BRKDIVDLY	0 implies no delay to chain2 barker modulated data 1 implies 1 delay (1 20MHz sample) to chain2 barker modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays

0x0A012810 WCSS_A_TBAPB_LINEAR_DELAY_ANT2

Type: RW

Reset State: 0x0004

Stores the select for the delay diversity value to be applied to txb chain3 samples in barker and cck modulated data

WCSS_A_TBAPB_LINEAR_DELAY_ANT2

Bits	Name	Description
7:6	CCK11DIVDLY	0 implies no delay to chain3 cck11 modulated data 1 implies 1 delay (1 20MHz sample) to chain3 cck11 modulated data 2 implies 2 delays 3 implies 3 delays
5:3	CCK5DIVDLY	0 implies no delay to chain3 cck5 modulated data 1 implies 1 delay (1 20MHz sample) to chain3 cck5 modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays
2:0	BRKDIVDLY	0 implies no delay to chain3 barker modulated data 1 implies 1 delay (1 20MHz sample) to chain3 barker modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays

0x0A012814 WCSS_A_TBAPB_LINEAR_DELAY_ANT3**Type:** RW**Reset State:** 0x0006

Stores the select for the delay diversity value to be applied to txb chain4 samples in barker and cck modulated data

WCSS_A_TBAPB_LINEAR_DELAY_ANT3

Bits	Name	Description
7:6	CCK11DIVDLY	0 implies no delay to chain4 cck11 modulated data 1 implies 1 delay (1 20MHz sample) to chain4 cck11 modulated data 2 implies 2 delays 3 implies 3 delays
5:3	CCK5DIVDLY	0 implies no delay to chain4 cck5 modulated data 1 implies 1 delay (1 20MHz sample) to chain4 cck5 modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays
2:0	BRKDIVDLY	0 implies no delay to chain4 barker modulated data 1 implies 1 delay (1 20MHz sample) to chain4 barker modulated data 2 implies 2 delays 3 implies 3 delays 4 implies 4 delays 5 implies 5 delays 6 implies 6 delays 7 implies 7 delays

10.57 WCSS_A_TDC_TDC

0x0A014C00 WCSS_A_TDC_TDCSYM_IN

Type: W

Reset State: 0x00000000

Number of multiples of 80 baseband samples received by the TDC module (from the AGC module)

WCSS_A_TDC_TDCSYM_IN

Bits	Name	Description
15:0	TDCSYM_IN	Number of multiples of 80 baseband samples received by the TDC module (from the AGC module)

0x0A014C04 WCSS_A_TDC_TDCSYM_OUT

Type: W

Reset State: 0x00000000

Number of symbol start pulses received by the TDC module (from the RACTL module)

WCSS_A_TDC_TDCSYM_OUT

Bits	Name	Description
15:0	TDCSYM_OUT	Number of symbol start pulses received by the TDC module (from the RACTL module)

0x0A014C08 WCSS_A_TDC_TDCPKT_IN

Type: W

Reset State: 0x00000000

Number of packet start signals received by the TDC module

WCSS_A_TDC_TDCPKT_IN

Bits	Name	Description
15:0	TDCPKT_IN	Number of packet start signals received by the TDC module

0x0A014C0C WCSS_A_TDC_CWDET_COUNT**Type:** W**Reset State:** 0x00000000

Number of times that the CW detector was triggered

WCSS_A_TDC_CWDET_COUNT

Bits	Name	Description
15:0	CW_COUNT	Number of times that the CW detector was triggered

0x0A014C10 WCSS_A_TDC_CWDET_STATUS**Type:** R**Reset State:** 0x00000000

Indicates whether CW has been detected by CWDET module, and if so at what location.

WCSS_A_TDC_CWDET_STATUS

Bits	Name	Description
6	CWDET_EN	Indicates that CW notch is currently enabled.
5:0	CWDET_LOC	Location of last CW notch detected.

0x0A014C14 WCSS_A_TDC_CWDET_OVERRIDE**Type:** RW**Reset State:** 0x0000

Location of APB-programmable fixed CW notch

WCSS_A_TDC_CWDET_OVERRIDE

Bits	Name	Description
6	APB_MODE	APB control of CW notch_location signal. If this bit is set, the CW detector will override the calculated value of this signal with the APB-programmed value in the CWDET_NOTCH_LOC register. Default value = 1'b0;

WCSS_A_TDC_CWDET_OVERRIDE (cont.)

Bits	Name	Description
5:0	NOTCH_LOC	Location of APB-programmable fixed CW notch Default value = 6'h0

0x0A014C18 WCSS_A_TDC_CWDET_TRIGGER**Type:** W**Reset State:** 0x0000

This register manually triggers the update of the CW notch enable and location in the AGC

WCSS_A_TDC_CWDET_TRIGGER

Bits	Name	Description
0	TRIGGER	Writing any value to this register will pulse the cw_detected signal to the AGC if the APB_MODE bit has been set in the CWDET_NOTCH_LOC register

0x0A014C1C WCSS_A_TDC_APB_GAIN_THRESH_LLP64_1RX**Type:** RW**Reset State:** 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving non-11n or 20MHz 11n packets.

WCSS_A_TDC_APB_GAIN_THRESH_LLP64_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd23 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd23, will result in a backoff value of 12dB. To set a different backoff, set to: $\text{round}(16 + 2 * \log_2(175) - T * \log_2(10)/5)$, where T is the target backoff in dB

0x0A014C20 WCSS_A_TDC_APB_GAIN_THRESH_LLP128_1RX**Type:** RW**Reset State:** 0x0014

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n packets.

WCSS_A_TDC_APB_GAIN_THRESH_LL128_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: $\text{round}(14 + 2 * \log_2(175) - T * \log_2(10)/5)$, where T is the target backoff in dB

0x0A014C24 WCSS_A_TDC_APB_GAIN_THRESH_HTLTF64_1RX

Type: RW

Reset State: 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 20MHz 11n mixed-mode packets with 1 active chain.

WCSS_A_TDC_APB_GAIN_THRESH_HTLTF64_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd23 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd23, will result in a backoff value of 12dB. To set a different backoff, set to: $\text{round}(18 + 2 * \log_2(79) - T * \log_2(10)/5)$, where T is the target backoff in dB

0x0A014C28 WCSS_A_TDC_APB_GAIN_THRESH_HTLTF128_1RX

Type: RW

Reset State: 0x0014

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n mixed-mode packets with 1 active chain.

WCSS_A_TDC_APB_GAIN_THRESH_HTLTF128_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: $\text{round}(16+2*\log_2(79)-T*\log_2(10)/5)$, where T is the target backoff in dB

0x0A014C2C WCSS_A_TDC_APB_GAIN_THRESH_LLP256_1RX**Type:** RW**Reset State:** 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n packets.

WCSS_A_TDC_APB_GAIN_THRESH_LLP256_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: $\text{round}(14+2*\log_2(175)-T*\log_2(10)/5)$, where T is the target backoff in dB

0x0A014C30 WCSS_A_TDC_APB_GAIN_THRESH_VHTLTF256_1RX**Type:** RW**Reset State:** 0x0016

This register contains the desired value of the TDC power calculator for 1 active chain for an ideal target backoff when receiving 40MHz 11n mixed-mode packets with 1 active chain.

WCSS_A_TDC_APB_GAIN_THRESH_VHTLTF256_1RX

Bits	Name	Description
4:0	THRESH	Default value = 5'd21 Adjusting this value will result in a different peak-to-mean ratio for the input data to the RXA engine. The default value, 5'd21, will result in a backoff value of 12dB. To set a different backoff, set to: $\text{round}(16+2*\log_2(79)-T*\log_2(10)/5)$, where T is the target backoff in dB

0x0A014C34 WCSS_A_TDC_RAM_OVERFLOW**Type:** R**Reset State:** 0x00000000

Bit[0] of this register indicates the value of the TDC RAM overflow flag

WCSS_A_TDC_RAM_OVERFLOW

Bits	Name	Description
0	RAM_OVERFLOW	Bit[0] of this register indicates the value of the TDC RAM overflow flag

10.58 WCSS_A_TPC_TPC**0x0A010000 WCSS_A_TPC_TXPWR_OVERRIDE_11A0****Type:** RW**Reset State:** 0x0027

Register allows to override the automatic power control algorithm on transmit chains.

WCSS_A_TPC_TXPWR_OVERRIDE_11A0

Bits	Name	Description
10:6	RF_POWER	Override power control loop and write directly to the RF chip
5:0	FINE_POWER	Override power control loop and write directly to the gain multipliers

0x0A010004 WCSS_A_TPC_TXPWR_OVERRIDE_11B0**Type:** RW**Reset State:** 0x0027

Register allows to override the automatic power control algorithm on transmit chains.

WCSS_A_TPC_TXPWR_OVERRIDE_11B0

Bits	Name	Description
10:6	RF_POWER	Override power control loop and write directly to the RF chip

WCSS_A_TPC_TXPWR_OVERRIDE_11B0 (cont.)

Bits	Name	Description
5:0	FINE_POWER	Override power control loop and write directly to the gain multipliers

0x0A010008 WCSS_A_TPC_TXPWR_ENABLE**Type:** RW**Reset State:** 0x0003

controls the power gain mode.

WCSS_A_TPC_TXPWR_ENABLE

Bits	Name	Description
2	FIXED_RF_GAIN	fixed_rf_gain and en (clpc_en) are used to set the tpc mode. When fixed_rf_gain is set, a single rf gain value is used for the tx power control. CLPC Modes 1 and 2 require fixed_rf_gain be set. In Mode 1, rf gain will be static, in Mode 2, the gain value will be adjusted based on feedback from the PDADC.
1	OVERRIDE	When set the rf and digital gain values from the TXPWR_OVERRIDE register are used for all transmit power values.
0	EN	en (clpc_en) and fixed_rf_gain are used to set the tpc mode. When en is set, the gain LUTs will be updated based on the feedback from the PDADC. CLPC Modes 2 and 3 require en be set.

0x0A01000C WCSS_A_TPC_ADC_CTRL_GET_ADC**Type:** W**Reset State:** 0x00000000

ADC control port. Starts conversion.

WCSS_A_TPC_ADC_CTRL_GET_ADC

Bits	Name	Description
0	GET_ADC	Write to this register to get ADC readout (start the conversion). This register was used in Titan to perform temperature measurement. Not used in Taurus.

0x0A010010 WCSS_A_TPC_ADC_STATUS**Type:** R**Reset State:** 0x00000000

ADC status port, shows when ADC is ready (conversion finished).

WCSS_A_TPC_ADC_STATUS

Bits	Name	Description
2	FAILED	0x0: SUCCESS (Busy went low following successful adc conversion) 0x1: FAILURE (Busy went low following a power-adc response timeout)
1	BUSY_P	When 0, either failure happened or result of power measurement is available in SENSED_PWR register. 0x0: IDLE (Idle) 0x1: BUSY (ADC Busy in Power Measurement)
0	BUSY_T	Busy with a APB-initiated conversion. To be polled until 0. When 0, either failure happened or result of conversion is available in ADC_DATA register. 0x0: IDLE (Idle) 0x1: Reserved

0x0A010014 WCSS_A_TPC_MAN_TXPWR**Type:** W**Reset State:** 0x00000000

Manual TX gain command strobe.

WCSS_A_TPC_MAN_TXPWR

Bits	Name	Description
0	STRB	Write to this register to manually send out a TX gain command when in override mode.

0x0A010018 WCSS_A_TPC_MAX_RF_GAIN**Type:** RW**Reset State:** 0x001F

Contains the maximum RF gain to which the power control loop operates. This is different for the 2.4 vs. 5GHz bands.

WCSS_A_TPC_MAX_RF_GAIN

Bits	Name	Description
4:0	VALUE	Default 15, i.e. 20dBm (2.4GHz value) Should be set to 9 (16dBm) for 5GHz.

0x0A01001C WCSS_A_TPC_MIN_RF_GAIN

Type: RW

Reset State: 0x0000

Contains the minimum RF gain to which the power control loop operates. This is different for the 2.4 vs. 5GHz bands.

WCSS_A_TPC_MIN_RF_GAIN

Bits	Name	Description
4:0	VALUE	Default 15, i.e. 20dBm (2.4GHz value) Should be set to 9 (16dBm) for 5GHz.

0x0A010020 WCSS_A_TPC_MAX_DIGITAL_GAIN

Type: RW

Reset State: 0x000F

Max value of tx digital gain range.

WCSS_A_TPC_MAX_DIGITAL_GAIN

Bits	Name	Description
3:0	VALUE	Default value = 15

0x0A010024 WCSS_A_TPC_MID_DIGITAL_GAIN

Type: RW

Reset State: 0x0008

Mid value of tx digital gain range. Must be set to 1 or more!

WCSS_A_TPC_MID_DIGITAL_GAIN

Bits	Name	Description
3:0	VALUE	Default value = 8

0x0A010028 WCSS_A_TPC_MIN_DIGITAL_GAIN**Type:** RW**Reset State:** 0x0000

Min value of tx digital gain range.

WCSS_A_TPC_MIN_DIGITAL_GAIN

Bits	Name	Description
3:0	VALUE	Default value = 0

0x0A010030 WCSS_A_TPC_RC_DELAY**Type:** RW**Reset State:** 0x04B0

Contains the delay between the start of TX and the start of power measurement.

WCSS_A_TPC_RC_DELAY

Bits	Name	Description
12:0	DELAY	Default 1200, ie 15uS @ 80MHz clock. Value automatically adjusted for static bandwidth so that duration for given APB value is constant for all bandwidths

0x0A010034 WCSS_A_TPC_SENSED_PWR0**Type:** R**Reset State:** 0x00000000

Contains data from the Pwr ADCs which sensed the cygnus power during transmit operation

WCSS_A_TPC_SENSED_PWR0

Bits	Name	Description
10:0	VALUE	PWRADC0 readback during transmit.

0x0A010038 WCSS_A_TPC_ADCTIMEOUT**Type:** RW**Reset State:** 0x0900

Contains Pwr ADC response timeout value

WCSS_A_TPC_ADCTIMEOUT

Bits	Name	Description
15:0	VALUE	Specifies the number of operating clocks that power-adc state machine can be in non-idle state and beyond that point, the power-adc response failure will be declared and state machine will be brought to idle. Value automatically adjusted for static bandwidth so that duration for given APB value is constant for all bandwidths.

0x0A01003C WCSS_A_TPC_APBACCESS**Type:** RW**Reset State:** 0x0000

Selects APB access control

WCSS_A_TPC_APBACCESS

Bits	Name	Description
0	SELECT	Set this bit to high to enable APB access of TPC memory

0x0A010040 WCSS_A_TPC_PTADC_FSM_RST**Type:** W**Reset State:** 0x00000000

This register does the resetting of the state machine which interacts with power-adc analog interface

WCSS_A_TPC_PTADC_FSM_RST

Bits	Name	Description
0	RST	Write to this register to reset

0x0A010048 WCSS_A_TPC_PDADC_RANGE**Type:** RW**Reset State:** 0x0001

This register defines which portion of the 11-bit input PDADC sample is fed to the 8-bit LUT

WCSS_A_TPC_PDADC_RANGE

Bits	Name	Description
1:0	SELECT	2'h0 : selects bits [10:3] of input PDADC sample 2'h1 : selects bits [9:2] of input PDADC sample 2'h2 : selects bits [8:1] of input PDADC sample 2'h3 : selects bits [7:0] of input PDADC sample

0x0A01004C WCSS_A_TPC_PDADC_OFFSET**Type:** RW**Reset State:** 0x0000

Offset value to be subtracted from raw PDADC value

WCSS_A_TPC_PDADC_OFFSET

Bits	Name	Description
10:0	VALUE	

0x0A010050 WCSS_A_TPC_GAIN_OFFSET1**Type:** RW**Reset State:** 0x0000

Open Loop gain values for converting digital to an absolute digital gain value for the TXFIR fine gain block.

WCSS_A_TPC_GAIN_OFFSET1

Bits	Name	Description
11:6	OL_11B	

WCSS_A_TPC_GAIN_OFFSET1 (cont.)

Bits	Name	Description
5:0	OL_OFDM	

0x0A010054 WCSS_A_TPC_GAIN_OFFSET2**Type:** RW**Reset State:** 0x030C

Closed Loop gain values for converting digital to an absolute digital gain value for the TXFIR fine gain block.

WCSS_A_TPC_GAIN_OFFSET2

Bits	Name	Description
11:6	CL_11B	
5:0	CL_OFDM	

0x0A010058 WCSS_A_TPC_DEMANDED_PWR_RANGE**Type:** RW**Reset State:** 0x03E0

Selects a subrange of demanded power values over which CLPC is active. For demanded power levels outside this range, the TPC will operate in open-loop mode.

WCSS_A_TPC_DEMANDED_PWR_RANGE

Bits	Name	Description
9:5	MAX	Set max end of demanded power range
4:0	MIN	Set min end of demanded power range

0x0A01005C WCSS_A_TPC_LAST_DEMANDED_PWR**Type:** R**Reset State:** 0x00000000

Stored value of demanded power for the last transmitted packet

WCSS_A_TPC_LAST_DEMANDED_PWR

Bits	Name	Description
5	LOW_PWR	Low power setting for last transmitted packet
4:0	PWR_VALUE	Demanded power value for last transmitted packet

0x0A010800+ WCSS_A_TPC_POWERDET0_RAMn, n=[0..255]**0x4*n****Type:** RW**Reset State:** 0x00000000

Calibration data for the power detector

WCSS_A_TPC_POWERDET0_RAMn

Bits	Name	Description
5:0	POWER	

0x0A010C00+ WCSS_A_TPC_RF_GAIN_LUT0n, n=[0..31]**0x4*n****Type:** RW**Reset State:** 0x00000000

RF Course gain LUT

WCSS_A_TPC_RF_GAIN_LUT0n

Bits	Name	Description
4:0	RF_GAIN	

0x0A010C80+ WCSS_A_TPC_DIGITAL_GAIN_LUT0n, n=[0..31]**0x4*n****Type:** RW**Reset State:** 0x00000000

Digital fine gain LUT

WCSS_A_TPC_DIGITAL_GAIN_LUT0n

Bits	Name	Description
3:0	DIG_GAIN	

10.59 WCSS_A_TPE_TPE

0x0A082000 WCSS_A_TPE_EDCF_TXOP_0_1

Type: RW

Reset State: 0x06000600

edcf txop corresponds to back-offs 0 and 1

WCSS_A_TPE_EDCF_TXOP_0_1

Bits	Name	Description
31:16	EDCF_TXOP_1	TXOP that is used while transmitting mpdus from the q corresponds to back-off 1 This valus is in micro seconds.
15:0	EDCF_TXOP_0	TXOP that is used while transmitting mpdus from the q corresponds to back-off 0 This valus is in micro seconds.

0x0A082004 WCSS_A_TPE_EDCF_TXOP_2_3

Type: RW

Reset State: 0x06000600

edcf txop corresponds to back-offs 1 and 2

WCSS_A_TPE_EDCF_TXOP_2_3

Bits	Name	Description
31:16	EDCF_TXOP_3	TXOP that is used while transmitting mpdus from the q corresponds to back-off 3 This valus is in micro seconds.
15:0	EDCF_TXOP_2	TXOP that is used while transmitting mpdus from the q corresponds to back-off 2 This valus is in micro seconds.

0x0A082008 WCSS_A_TPE_EDCF_TXOP_4_5

Type: RW

Reset State: 0x06000600

edcf txop corresponds to back-offs 4 and 5

WCSS_A_TPE_EDCF_TXOP_4_5

Bits	Name	Description
31:16	EDCF_TXOP_5	TXOP that is used while transmitting mpdus from the q corresponds to back-off 5 This value is in micro seconds.
15:0	EDCF_TXOP_4	TXOP that is used while transmitting mpdus from the q corresponds to back-off 4 This value is in micro seconds.

0x0A08200C WCSS_A_TPE_EDCF_TXOP_6_7**Type:** RW**Reset State:** 0x06000600

edcf txop corresponds to back-offs 6 and 7

WCSS_A_TPE_EDCF_TXOP_6_7

Bits	Name	Description
31:16	EDCF_TXOP_7	TXOP that is used while transmitting mpdus from the q corresponds to back-off 7 This value is in micro seconds.
15:0	EDCF_TXOP_6	TXOP that is used while transmitting mpdus from the q corresponds to back-off 6 This value is in micro seconds.

0x0A082010 WCSS_A_TPE_SW_TEMPLATE_BASE_ADDR**Type:** RW**Reset State:** 0x00005000

This register contains the implicit beamform bkof qosnull template address.

WCSS_A_TPE_SW_TEMPLATE_BASE_ADDR

Bits	Name	Description
31:0	SW_BKOF_QOSNULL_TEMPLATE_ADDR	This address is used to specify the implicit beamform bkof qosnull template address.

0x0A082014 WCSS_A_TPE_SW_TPE_HW_CONTROL_REG**Type:** RW**Reset State:** 0x01840A01

This register contains all the h/w control config registers. s/w needs to set them as per h/w requirements. These may be either config for bug fixes or for future feature expansion or ...

WCSS_A_TPE_SW_TPE_HW_CONTROL_REG

Bits	Name	Description
31	IGNORE_TXP_ERROR_INT_ECO	Set '1' to ignore the txp_mim_internal_error_int_p, so tpe won't issue soft reset because of the assertion of the interrupt
30:25	RESERVED	Reserved spare register bit
24:16	SW_11G_DUPLICATE_CTRL_INDEX_OFFSET	This is same as sw_11g_ctrl_index_offset but is used only for (40Mhz) pkts If 11b stations are in, in 11g protection This sw_11g_duplicate_ctrl_index_offset + 11G Rate index of the ctrl pkt from rate table is used to derive the actual ctrl rate index -- used for RTS,CTS,BAR there is no separate valid bit for duplicate rate. sw_11g_ctrl_index_offset_valid is used
11	SW_DTIM_TERMINATE_VALID	when set, dtim will be terminated when p2p/bt/lte termination happened. When cleared, same behavior as in Volans.
10	SW_P2P_TX_BOUNDARY_TERMINATE_VALID	when set, TPE will terminate the current transmission when p2p tx boundary txop reaches 0.
9	SW_GEN6_3WIRE_VALID	when set, the gen6 bt functionality is enabled to generate wlan_Active
8	SW_11G_OFDM_VALID	If this bit is set, the compensation reg is added to duration Also the sifs value in duration calculation is made 10
7:4	SW_11G_OFDM_COMPENSATION	In the case of 11G OFDM, we add 6usec to duration. The value is given in Register for flexibility
1:0	SW_COMP_DIV_DELAY_REG	The div function delay is specified in this register. Actual MCP is = sw_comp_div_delay_reg+2. By default 1+2=3 cycles

0x0A082018 WCSS_A_TPE_SW_SOFTWARE_TX_CONTROL_REG1**Type:** RW**Reset State:** 0x00300000

This register contains the controls needed for s/w triggered transmission

WCSS_A_TPE_SW_SOFTWARE_TX_CONTROL_REG1

Bits	Name	Type	Description
29:24	SW_WAIT_COMMAND2	RW	This register contains the wait command2. This command is used by TXP while sending pkt in the case of TXOP burst, it is used only first time and later onwards follows the station parameters
21:16	SW_WAIT_COMMAND1	RW	This register contains the wait command1. The tpe main waits as per this wait command before the request is considered for arbitration. The definition is as per TXP wait command. Any value beyond 21Hex is treated as no wait. by default it is no wait
10	SW_TX_GAM_SELECT	RW	When set, TPE will read the sw template from FDAHB. This is only used to send the beamform report from CFG memory in 11n sw assist mode When clear, TPE will read the sw template from CAHB.
9:7	SW_TX_SESSION_CONTROL	RW	This register contains the type of transmission s/w wants 000 --> nothing 001 --> data and use back-off index provided by s/w 010 --> data and use the staid, Qid given by s/w 011 --> template transmission, addr given by template addr
6	SW_TX_RAW_PKT_VALID_NEED_11AC_DELIMITER	RW	if this bit is set the transmission is done in raw pkt mode, but TPE will add delimiter/ofdm paddings if the rate is 11ac
5	SW_TX_RAW_PKT_VALID	RW	if this bit is set the transmission is done in raw pkt mode
4	SW_TX_TERMINATE_VALID	RW	during s/w controlled tx, if this bit is set, the on going transmission will be terminated as if the txop is not available. The current transmission is ended gracefully. Do we send cf_end?? We won't
3:1	TPE_TX_TIMING_FEEDBACK	R	the feedback bits from h/w. They will be made zero on start_valid 000 --> Nothing is going on 001 --> waiting in command1 010 --> command1 is done and command2 is going on 011 --> tx done 111 --> ack to 100 --> aging

WCSS_A_TPE_SW_SOFTWARE_TX_CONTROL_REG1 (cont.)

Bits	Name	Type	Description
0	SW_TX_START_VALID	RW	by writing 1 to this bit s/w indicates to h/w that the s/w tx controls are valid and h/w should start working on the s/w request sw needs to toggle this by writing 0 and then 1

0x0A08201C WCSS_A_TPE_SW_SOFTWARE_TX_ADDRESS**Type:** RW**Reset State:** 0x00005000

This register contains the template address.

WCSS_A_TPE_SW_SOFTWARE_TX_ADDRESS

Bits	Name	Description
31:0	SW_SOFTWARE_TX_ADDRESS	S/W programs this register during the s/w initiated transmission in the case of template transmission, this is templated address session control 001 --> [3:0] = backoff index, other bits are not used [31:16] = txop for this transmission 010 --> [3:0] = QID of the stream [11:4] = STAID [31:16] = txop for this transmission 011 --> [31:0] = template memory address --> template transmission is always txop=0

0x0A082020 WCSS_A_TPE_SW_MAX_BYTES_AND_TX_TIME_IN_AMPDU**Type:** RW**Reset State:** 0x02000200

This register contains the max_tx (in micro sec) time that needs to be considered to terminate the AMPDU

WCSS_A_TPE_SW_MAX_BYTES_AND_TX_TIME_IN_AMPDU

Bits	Name	Description
28:16	SW_MAX_AMPDU_TX_TIME	This is the max tx_time that an AMPDU can take. This is another AMPDU termination condition
12:0	SW_MAX_AMPDU_TX_TIME_FOR_MIXED_MODE	During the mixed mode, we should not exceed this limit. This is considered in mixed mode only

0x0A082024 WCSS_A_TPE_SW_MAX_MPDUS_IN_AMPDU_AND_MISC**Type:** RW**Reset State:** 0x7F002010

This register contains the max no. of mpdus that can be packed in one AMPDU

WCSS_A_TPE_SW_MAX_MPDUS_IN_AMPDU_AND_MISC

Bits	Name	Description
31:16	SW_PROTECTION_THR	The threshold that needs to be used for protection... RTS/CTS to self etc
15	SW_TX_AMPDU_TERMINATE_AT_RATE_CHANGE	if this bit is set, Whenever there is a rate change, ampdu will be terminated
14	SW_TX_AMPDU_WINDOW_CHECK_VALID	the AMPDU window shcek is done in TX only when this bit is set Once the sata structure init is done in lab also, we can take out this bi
13	SW_AMPDU_TERMINATE_FROM_BD_VALID	when set, TPE will terminate the ampdu based on the bd bit from bmu.
9	SW_CONSIDER_80_MHZ	80MHZ rates are considered only when this bit is set
8	SW_GLOBAL_SB_MODE	indicates the side band mode. MAC simply copies this bit in the phy commands This bit is meaningfull only when the CB is valid.
7	SW_GLOBAL_CB_VALID	40MHZ rates are considered only when this bit is set
6:0	SW_MAX_MPDUS_IN_AMPDU	This field indicates the number of MPDUs that can be packed in one AMPDU

0x0A082028 WCSS_A_TPE_SW_STA_DESCR_ADDR**Type:** RW**Reset State:** 0x00005000

This register contains the sta descriptor start address

WCSS_A_TPE_SW_STA_DESCR_ADDR

Bits	Name	Description
31:0	SW_STA_DESCR_ADDR	the actual start address of descr is sw_sta_descr_addr + staid * (sw_global_no_of_qids * 16*4) Basically 64 bytes are reserved for each sta

0x0A082034 WCSS_A_TPE_SW_PM**Type:** RW**Reset State:** 0xF096280A

S/W-configurable PM bit

WCSS_A_TPE_SW_PM

Bits	Name	Description
31:24	SW_TX_SIFS_A_MODE_CYCLES	The lower bits of SIFS cycles that needs to be programmed in tXP commands for A and G (non B) mode pkts This number is multiplied by 8 and used internally. F0 corresponds to hex 780 corresponds 1920(decimal) which is 16usec. The upper bits are in sw_pm_2.sw_tx_sifs_a_mode_cycles
23:16	SW_TX_SIFS_B_MODE_CYCLES	The SIFS cycles that needs to be programmed in tXP commands for B mode pkts This number is multiplied by 8 and used internally. 96 corresponds to hex x4b0 corresponds 1200(decimal) which is 10usec.
15	SW_PROMOTE_BT_LOW_PRIORITY	if this bit is set, the lower priority BT is treated as Higher priority This should not be set in normal conditions. I don't think we ever set this bit Provided so that if we get in to any system issues, this can be turned on
14	SW_CONSIDER_TXP_ERROR_IN_TPE_ERROR	If this bit is set the tpe_mcu_error includes the TXP Error too
13	SW_CONSIDER_RESPONSE_WHILE_WAITING	if this bit is set, response pkt will be sent even tpe is busy
12	SW_IGNORE_DMA_INDEX	The dma index from rxp is ignored
11	SW_IGNORE_DMA_CONFIRM	The dma_confirm from RXP is ignored -- to eliminate any potential Hangs in the rxp-tpe interface
10	SW_LSIG_PROTECTION_TYPE	If this bit is set the entire TXOP is used for LSIG protection. Otherwise what ever duration is seen in pkt is used for lsig
9	SW_LSIG_PROTECTION_VALID	If this bit is set the lsig protection is considered. Entire TXOP or only the next_pkt is done based on lsig_protection_type
8	SW_CONSIDER_SECOND_PKT_READ	If this bit is set the next_pkt read and the duration computation for non zero TXOP and frags is done as per spec. Otherwise we don't include next pkt for the computation. This will be removed once the verification is done

WCSS_A_TPE_SW_PM (cont.)

Bits	Name	Description
7	SW_CONSIDER_TX_BOUNDARY_TXOP	if this bit is set, the tx_boundary_txop is considered in TPE
6	SW_BT_TERMINATE_VALID	if this bit is set, mproc will terminate if the btc_is_active (after validating it with configs) btc_active_final & sw_bt_terminate_valid = terminate mproc
5	SW_CONSIDER_BT_AVAIL_TIME_CNT	if this bit is set, the btc_tpe_avail_time_cnt is considered in tPE
4	SW_CONSIDER_BT_LOW_PRI	if this bit is set, the btc low priority request is considered
3	SW_CONSIDER_BT_HIGH_PRI	if this bit is set, the btc high priority request is considered
2	SW_CONSIDER_WARMUP_DELAY_FOR_SIFS_CMD	If this bit is set, all the sifs_ommand instructions will wait warm_upenable signal from mtu. This is to reduce the warmup pulse width for the cases in which PHY has less delay. Setting this bit to 0 is Taurus compatible
1	SW_BCN_TERMINATE_VALID	if this bit is set, the current transmission will be terminated if it is TBTT time
0	SW_PM	Reserved. The pm bit for data is in sta descriptor now.

0x0A08203C WCSS_A_TPE_SW_11G_CTRL_INDEX_OFFSET**Type:** RW**Reset State:** 0x0003FC00

offset for 11g protection rates

WCSS_A_TPE_SW_11G_CTRL_INDEX_OFFSET

Bits	Name	Description
31:24	SW_AMPDU_EXTRA_DURATION	This value is added to AMPDU duration if the current one is not last one in the TXOP. Since we don't know the exact duration of the next AMPDU, we just add a constant value. By default it is ZERO
18:10	SW_CF_END_TXOP_THR	CF-END Will be sent only if the remaining TXOP is more than this value Default is 255 usec
9	SW_11G_CTRL_INDEX_OFFSET_VALID	if this bit is set, sw_11g_ctrl_index_offset is used basically this is nothing but use_11b_protection_mode Do we need to validate with sta_mode??
8:0	SW_11G_CTRL_INDEX_OFFSET	If 11b stations are in, in 11g protection This sw_11g_index_offset + 11G Rate index of the ctrl pkt from rate table is used to derive the actual ctrl rate index -- used for RTS,CTS,BAR

0x0A082040 WCSS_A_TPE_RATE_TABLE_SRAM_CONTROL**Type:** RW**Reset State:** 0x80000000

controls sw operations on TPE rate table. To start a read transaction, check first if bit 31 is 1. If 1, then proceed, writing 0 to bit 31, address to [29:21], 0 to bit 1, and 1 to bit 0. When bit 31 turns 1, then read the data bits. To start a write operation, check first if bit 31 is 1. If 1, then proceed, write 0 to bit 31, address to [29:21], data to [20:4], 1 to bit 1, and 1 to bit 0. When bit 31 turns 1, then write is done.

WCSS_A_TPE_RATE_TABLE_SRAM_CONTROL

Bits	Name	Description
31	RATE_SRAM_XACT_DONE	1 indicates transaction complete - write to 0 at start of operation
29:21	RATE_SRAM_XACT_ADDR	address for SW rate table sram read/write
20:3	RATE_SRAM_XACT_DATA	rate table sram data [3] - ctrl resp lpe bit ([26] in rate table) [7:4] - ctrl rate index ([17:14] in rate table) [12:8] - cntrl rep tx power ([31:27] in rate table) [16:13] - resp rate index ([35:32] in rate table) [20:17] - 11g cntrl rate index minus 11b base offset ([61:58] in rate table)
1	RATE_SRAM_XACT_WRITE_READZ	1 indicates write operation, 0 indicates read operation
0	RATE_SRAM_XACT_START	Write only bit that initiates SW rate sram transaction

0x0A082044 WCSS_A_TPE_RATE_TABLE_SRAM_CONTROL2**Type:** RW**Reset State:** 0x00000000

controls sw operations on TPE rate table.

WCSS_A_TPE_RATE_TABLE_SRAM_CONTROL2

Bits	Name	Description
9:0	RATE_SRAM_XACT_DATA	rate table sram data [4:0] - upper bits of ctrl rate index ([22:18] in rate table) [9:5] - upper bits of resp rate index ([40:36] in rate table)

0x0A082050 WCSS_A_TPE_SW_BEACON_BASE_ADDR**Type:** RW**Reset State:** 0x00005000

This register contains the beacon base address. THIS REGISTER CAN BE REMOVED --
SIMPLY USE THE OFFSET FROM THE TEMPLATE

WCSS_A_TPE_SW_BEACON_BASE_ADDR

Bits	Name	Description
31:0	SW_BEACON_BASE_ADDR	S/w needs to program this register based on the chip configuration h/w uses this base address and depending on the sw_beacon_max_size, it derives the beacon addresses for all the bssids accordingly

0x0A082054 WCSS_A_TPE_SW_BEACON_MAX_SIZE_MISC**Type:** RW**Reset State:** 0x00000800

This register contains the max size of the beacon. Make sure the size is in bytes but always word boundary i.e. the lsb 2 bits are always expected to be Zeros

WCSS_A_TPE_SW_BEACON_MAX_SIZE_MISC

Bits	Name	Description
22	SW_BCN_UN_LOCK_BY_SW	s/w unlocks the beacon ownership by writing 1 to this register. Typically after updating the beacon, s/w writes to this register It is write only register
21:18	SW_UPDATE_BCN_INDEX	the beacon index that s/w wants to update
17	MAIN_SW_UPDATE_BCN_GNT_BY_HW	h/w grant to the s/w request to update beacon. Basically after requesting to update a beacon s/w will poll this register. Once this bit is set s/w can go ahead and update the beacon template. Once the s/w changes the beacon it needs to unlock by writing 1 to sw_bcn_un_lock_by_sw
16	SW_UPDATE_BCN_REQ	by writing this bit s/w requests h/w to grant to update beacon. when it is read, main_sw_bcn_update_pending_valid is reflected this bit will be set when s/w is written but reset by writing to sw_bcn_un_lock_by_sw
15:0	SW_BEACON_MAX_SIZE	This register is used to derive the start address of the beacons. This is used in multiple bssid base_address of beacon[index] = sw_beacon_base_addr + index * sw_beacon_max_size

0x0A082058 WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE**Type:** RW**Reset State:** 0x00000000**WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE**

Bits	Name	Description
30	FEC_MODE	

WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE (cont.)

Bits	Name	Description
29	LPE_BIT	
27:26	SW_CONSIDER_WLAN_RX_FOR_BT_ECO_VECTOR	basically this is config register to enable the ECO in Libra 2.0. While giving channel to BT Low priority request, the RX path (the packet det from PHY) is used. Two bits are provide for pkt_det and rxp filter pass Bit 0 of the vector i.e. bit 26 of this register enables consideration of rxp_tpeflt_pass in the logic, Bit 1 of the vector i.e. bit 27 of this register enables consideration of rxp_mtu_pktdet_n in the logic,
25	AMPDU_VALID	
24:20	TX_POWER	
18:16	TX_ANTENNA_EN	
15:14	STBC_VALID	
13	SGI_VALID	
12:11	NSS_11B_MODE	
8:3	STA_RATE	
2:0	STA_MODE	

0x0A082080 WCSS_A_TPE_TPE_BMU_INTERFACE_CNTS**Type:** R**Reset State:** 0x00000000

TPE<->BMU interface counters

WCSS_A_TPE_TPE_BMU_INTERFACE_CNTS

Bits	Name	Description
31:24	TPE_BMU_FEEDBACK_CNT	Increments when tpe_bmu_feedback_p is sent.
23:16	BMU_TPE_FEEDBACK_DONE_CNT	Increments when bmu_tpe_feedback_done_p is sent.
15:8	TPE_BMU_GET_INFO_CNT	Increments when tpe_bmu_get_info_p is sent.
7:0	BMU_TPE_GET_INFO_VALID_CNT	Increments when bmu_tpe_get_info_valid_p is sent.

0x0A082084 WCSS_A_TPE_RXP_TPE_INTERFACE_CNTS**Type:** R**Reset State:** 0x00000000

RXP<->TPE interface counters

WCSS_A_TPE_RXP_TPE_INTERFACE_CNTS

Bits	Name	Description
31:24	RXP_TPE_FRAME_INFO_CNT	Increments when rxp_tpe_frame_info_p is sent.
23:16	RXP_TPE_AMPDU_END_CNT	Increments when rxp_tpe_ampdu_end_p is sent.
15:8	RXP_TPE_DMA_CONFIRM_CNT	Increments when rxp_tpe_dma_confirm_p is sent.
7:0	RXP_TPE_BAR_INFO_CNT	Increments when rxp_tpe_bar_info_p is sent.

0x0A082088 WCSS_A_TPE_MTU_TPE_INTERFACE_CNTS

Type: R

Reset State: 0x00000000

MTU<->TPE interface counters

WCSS_A_TPE_MTU_TPE_INTERFACE_CNTS

Bits	Name	Description
23:16	MTU_TPE_BCN_REQ_VALID_CNT	Increments when mtu_tpe_bcn_req_valid_p is sent.
15:8	MTU_TPE_REQ_VALID_CNT	Increments when mtu_tpe_req_valid_p is sent.
7:0	TPE_MTU_FEEDBACK_VALID_ID_CNT	Increments when tpe_mtu_feedback_valid_p is sent.

0x0A08208C WCSS_A_TPE_RPE_TPE_INTERFACE_CNTS

Type: R

Reset State: 0x00000000

RPE<->TPE interface counters

WCSS_A_TPE_RPE_TPE_INTERFACE_CNTS

Bits	Name	Description
15:8	TPE_RPE_BITMAP_REQ_CNT	Increments when tpe_rpe_bitmap_req_p is sent.
7:0	RPE_TPE_BITMAP_VLD_CNT	Increments when rpe_tpe_bitmap_vld_p is sent.

0x0A082090 WCSS_A_TPE_ERROR_INT_CNTS**Type:** R**Reset State:** 0x00000000

Error counters

WCSS_A_TPE_ERROR_INT_CNTS

Bits	Name	Description
23:16	MPROC_ERROR2_CNT	
15:8	MPROC_ERROR1_CNT	
7:0	TXP_ERROR_INT_CNT	Increments when txp signals error interrupt

0x0A0820C0 WCSS_A_TPE_UNICAST_BYTES_LOWER**Type:** R**Reset State:** 0x00000000

lower unicast bytes

WCSS_A_TPE_UNICAST_BYTES_LOWER

Bits	Name	Description
31:0	TX_UNICAST_BYTES_LOWER	

0x0A0820C4 WCSS_A_TPE_UNICAST_BYTES_UPPER**Type:** R**Reset State:** 0x00000000

upper unicast bytes

WCSS_A_TPE_UNICAST_BYTES_UPPER

Bits	Name	Description
31:0	TX_UNICAST_BYTES_UPPER	

0x0A0820C8 WCSS_A_TPE_MULTICAST_BYTES_LOWER**Type:** R**Reset State:** 0x00000000

lower multicast bytes

WCSS_A_TPE_MULTICAST_BYTES_LOWER

Bits	Name	Description
31:0	TX_MULTICAST_BYTES_LOWER	

0x0A0820CC WCSS_A_TPE_MULTICAST_BYTES_UPPER**Type:** R**Reset State:** 0x00000000

upper multicast bytes

WCSS_A_TPE_MULTICAST_BYTES_UPPER

Bits	Name	Description
31:0	TX_MULTICAST_BYTES_UPPER	

0x0A0820D0 WCSS_A_TPE_BROADCAST_BYTES_LOWER**Type:** R**Reset State:** 0x00000000

lower broadcast bytes

WCSS_A_TPE_BROADCAST_BYTES_LOWER

Bits	Name	Description
31:0	TX_BROADCAST_BYTES_LOWER	

0x0A0820D4 WCSS_A_TPE_BROADCAST_BYTES_UPPER**Type:** R**Reset State:** 0x00000000

upper broadcast bytes

WCSS_A_TPE_BROADCAST_BYTES_UPPER

Bits	Name	Description
31:0	TX_BROADCAST_BYTES_UPPER	

0x0A082100 WCSS_A_TPE_STATISTIC_COUNTERS_CNTL

Type: RW

Reset State: 0x00000004

statistic counters control

WCSS_A_TPE_STATISTIC_COUNTERS_CNTL

Bits	Name	Description
2	COPY_VISTA_COUNTERS	copy 64 vista counters over into stats registers
1	CLEAR_VISTA_COUNTERS	clear vista counters
0	CLEAR_GLOBAL_COUNTERS	clear global counters

0x0A082104 WCSS_A_TPE_TPE_STATUS_REG_LOWER

Type: R

Reset State: 0x00000000

tpe status - should be all 0 when idle and da are all 0

WCSS_A_TPE_TPE_STATUS_REG_LOWER

Bits	Name	Description
31:0	TPE_STATUS	uspu_testbus[4:0], // 32:28 uspm_testbus[5:0], // 27:22 wpg_testbus[4:0], // 21:17 twr_testbus[5:0], // 16:11 tpe_mproc_test[5:0], // 10:5 tpe_main_test[22:18] // 4:0

0x0A082108 WCSS_A_TPE_TPE_STATUS_REG_UPPER

Type: R

Reset State: 0x00000000

tpe status upper - should be all 0 when idle and da are all 0

WCSS_A_TPE_TPE_STATUS_REG_UPPER

Bits	Name	Description
12:0	TPE_STATUS	mtu_tpe_response_to, // 44 bmu_tpe_bo_data_avail[5:0], // 43:38 usps_testbus[4:0], // 37:33

0x0A082110 WCSS_A_TPE_GOT_ACK_FOR_BACK_INFO_REG**Type:** R**Reset State:** 0x00000000

staidd, qid for got_ack_for_back_info interrupt

WCSS_A_TPE_GOT_ACK_FOR_BACK_INFO_REG

Bits	Name	Description
12:5	GOT_ACK_FOR_BACK_STAID	got ack for back staidd
4:0	GOT_ACK_FOR_BACK_QID	got ack for back qid

0x0A082118 WCSS_A_TPE_SW_DELAY_WAIT_CMD_CNT_REG**Type:** RW**Reset State:** 0xFF1E801E

This is used to delay the wait command (so that the warmup pulse can be sent ahead in time)

WCSS_A_TPE_SW_DELAY_WAIT_CMD_CNT_REG

Bits	Name	Description
31:24	SW_AGING_CNT_THRSHLD	(in terms of 16 us). The sw_template request if not sent after this there should time will be dropped
23:16	SW_WAIT_CYCLES_THRESHOLD	(in terms of 8 cycles). this value is num of clocks before we send warmup. we will be delaying the wait command, sending warmup, and then sending the wait command with sw_wait_cycles_threshold to the txp. the default value is 240 cycles, which is 2 us
15	SW_SEND_WARMUP_LATER_EN	send warmup later when we send wait_cycles (e.g. after cts-to-self) instead of right at the beginning of sifs. this "later" is determined by sw_wait_cycles_threshold
13:8	SW_DELAY_CYCLE_FOR_NO_WAIT_TX	For beacons, Template tx, the transmission will happen immediately This is a problem for Warm up. We can't use pifs because the trigger to TPE already after pifs_to.

WCSS_A_TPE_SW_DELAY_WAIT_CMD_CNT_REG (cont.)

Bits	Name	Description
5:0	SW_DELAY_WAIT_CMD_CNT	This is in terms of 8 clk cycles, so a value of 'd30 would mean 240 clk cycles, or 2us

0x0A08211C WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC0**Type:** RW**Reset State:** 0x00000000

This register contains the medium time used for AC0 This is internal to h/w. s/w can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register(update should be only in debug mode.) To make sure that there are no side effects, s/w needs to disable the h/w control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector

WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC0

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC0	Medium time used for AC0. Each count corresponds to 32usec

0x0A082120 WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC1**Type:** RW**Reset State:** 0x00000000

This register contains the medium time used for AC1 This is internal to h/w. s/w can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register(update should be only in debug mode.) To make sure that there are no side effects, s/w needs to disable the h/w control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector

WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC1

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC1	Medium time used for AC1. Each count corresponds to 32usec

0x0A082124 WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC2**Type:** RW**Reset State:** 0x00000000

This register contains the medium time used for AC2 This is internal to h/w. s/w can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register(update should be only in debug mode.) To make sure that there are no side effects, s/w needs to disable the h/w control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector

WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC2

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC2	Medium time used for AC2. Each count corresponds to 32usec

0x0A082128 WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC3

Type: RW

Reset State: 0x00000000

This register contains the medium time used for AC3 This is internal to h/w. s/w can write to these register at its risk. Basically the corresponding AC should not be enabled for Admission control while updating this register(update should be only in debug mode.) To make sure that there are no side effects, s/w needs to disable the h/w control over the backoffs by writing appropriate value to sw_mtu_bckof_disable_valid_vector

WCSS_A_TPE_SW_MEDIUM_TIME_USED_AC3

Bits	Name	Description
15:0	SW_MEDIUM_TIME_USED_AC3	Medium time used for AC3. Each count corresponds to 32usec

0x0A08212C WCSS_A_TPE_SW_MEDIUM_TIME_THR_AC0_AC1

Type: RW

Reset State: 0xEFFFFFFF

This register contains the medium time threshold used for AC0 and AC1 Though the register will be written immediately, the internal logic will take this value at next one second pulse or when a pkt has been transmitted from the corresponding AC

WCSS_A_TPE_SW_MEDIUM_TIME_THR_AC0_AC1

Bits	Name	Description
31:16	SW_MEDIUM_TIME_THR_AC1	Medium time threshold for AC1. Each count corresponds to 32usec
15:0	SW_MEDIUM_TIME_THR_AC0	Medium time threshold for AC0. Each count corresponds to 32usec

0x0A082130 WCSS_A_TPE_SW_MEDIUM_TIME_THR_AC2_AC3**Type:** RW**Reset State:** 0xEFFFFFFF

This register contains the medium time threshold used for AC2 and AC3. Though the register will be written immediately, the internal logic will take this value at next one second pulse or when a pkt has been transmitted from the corresponding AC

WCSS_A_TPE_SW_MEDIUM_TIME_THR_AC2_AC3

Bits	Name	Description
31:16	SW_MEDIUM_TIME_THR_AC3	Medium time threshold for AC3. Each count corresponds to 32usec
15:0	SW_MEDIUM_TIME_THR_AC2	Medium time threshold for AC2. Each count corresponds to 32usec

0x0A082134 WCSS_A_TPE_SW_ADMISSION_CONTROL_CONTROL_REG**Type:** RW**Reset State:** 0x0000E4E4

This register contains the control for Admission Control feature. Basically it contains the back-off to AC mapping and enables to Admission control

WCSS_A_TPE_SW_ADMISSION_CONTROL_CONTROL_REG

Bits	Name	Description
31:24	SW_MTU_BCKOF_DISABLE_VALID_VECTOR	Enable bits for backoff disable control. [24] --> bkof0, [25]-> bkof 1, [26] -> bkof 27 This is override to disable back-off. Bug protection + also used if s/w wants to update the sw_medium_time_used_acs.
23:16	SW_AC_VALID_FOR_BKOF_VECTOR	Enable bits for Admission control. [16] --> bkof0, [17]-> bkof 1, [23] -> bkof 7 Only the traffic that corresponds to the back-off for which the enable is set is considered for admission control
15:0	SW_AC_TO_BKOF_LOOKUP_VECTOR	The AC that needs to be used for back-off 0, 1, 2, ...7 [1:0] -> bkof0, [3:2] -> bkof1,..[15:14]-> bkof7

0x0A08213C WCSS_A_TPE_SW_LIFE_TIME_DROP_CNT**Type:** RW**Reset State:** 0x00000000

Counter that counts the dropped pkts due to life time enforcement

WCSS_A_TPE_SW_LIFE_TIME_DROP_CNT

Bits	Name	Description
31:0	SW_LIFE_TIME_DROP_CNT	Whenever a pkt is dropped due to life time enforcement, this count will be incremented. Writing to this register clears the counter. s/w is given higher priority over h/w

0x0A082140 WCSS_A_TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK**Type:** R**Reset State:** 0x00000000

Contains the feedback info for the bd based tx interrupt

WCSS_A_TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK

Bits	Name	Description
31:0	TPE_MCU_BD_BASED_TX_INT_FEEDBACK	[0] is ack_to_valid [3:1] feedback that is sent to bmu -- Definition is as follows. S/w Doesn't need this. Kept this for any debug purpose and if s/w comes up with new requirement in future, these can be used TPE_BMU_FB_RESET 3'b000 TPE_BMU_FB_DROP 3'b001 TPE_BMU_FB_DROP_AND_REARB 3'b010 TPE_BMU_FB_RESET_AND_REARB 3'b011 TPE_BMU_FB_RESET_AND_CHK_RETRY 3'b100 TPE_BMU_FB_RESET_CHK_RTRY_AND_REARB 3'b101 TPE_BMU_FB_RESET_AND_REARB_UPDATE_RETRY 3'b110 [8:4] QID [15:9] STAID [31:16] bd index

0x0A082144 WCSS_A_TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK_1**Type:** R**Reset State:** 0x00000000

Contains the feedback info for the bd based tx interrupt

WCSS_A_TPE_TPE_MCU_BD_BASED_TX_INT_FEEDBACK_1

Bits	Name	Description
31:0	TPE_MCU_BD_BASED_TX_INT_FEEDBACK_1	[0] is ack_to_valid [3:1] feedback that is sent to bmu -- Definition is as follows. S/w Doesn't need this. Kept this for any debug purpose and if s/w comes up with new requirement in future, these can be used TPE_BMU_FB_RESET 3'b000 TPE_BMU_FB_DROP 3'b001 TPE_BMU_FB_DROP_AND_REARB 3'b010 TPE_BMU_FB_RESET_AND_REARB 3'b011 TPE_BMU_FB_RESET_AND_CHK_RETRY 3'b100 TPE_BMU_FB_RESET_CHK_RTRY_AND_REARB 3'b101 TPE_BMU_FB_RESET_AND_REARB_UPDATE_RETRY 3'b110 [8:4] QID [15:9] STAID [31:16] bd index

0x0A082148 WCSS_A_TPE_WRONG_BA_SSN_TID_FEEDBACK**Type:** R**Reset State:** 0x00000000

Contains the feedback info for the wrong BA interrupt. For the BAR sent, it a BA is received with different SSN or TID, an interrupt is set This register contains the Staid and tid of the corresponding flow

WCSS_A_TPE_WRONG_BA_SSN_TID_FEEDBACK

Bits	Name	Description
11:8	WRONG_BA_TID_FEEDBACK	This contains the tid of the flow for which a wrong BA is received
7:0	WRONG_BA_STAID_FEEDBACK	This contains the station id of the flow for which a wrong BA is received

0x0A08214C WCSS_A_TPE_SW_CAPPED_POWER_CONTROL**Type:** RW**Reset State:** 0x00000000

This register contains the capped power controls -- bit vector and the capped power

WCSS_A_TPE_SW_CAPPED_POWER_CONTROL

Bits	Name	Description
26:24	SW_PKT_BASED_POWER_BITMAP	The capped power is used only if the corresponding bit is set Bit 0 is for All response pkts -- ack, ba, cts in response to RTS Bit 1 is for RTS,CTS to self Bit 2 is for the rest of types
20:16	SW_CAPPED_POWER_VALUE	The capped power. The power that needs to be used for data and ack. Note the minimum of this and the one specified in R2P is used
15:0	SW_CAPPED_POWER_BIT_MAP	Station bit vector for capped power. If the corresponding bit is set, only then the capped power is used for the data and ack

0x0A082150 WCSS_A_TPE_SW_ACK_TO_DUE_TO_BTC_COUNT**Type:** RW**Reset State:** 0x00000000

A counter which increments every time when there is ack_to due to BTC

WCSS_A_TPE_SW_ACK_TO_DUE_TO_BT_COUNT

Bits	Name	Description
15:0	SW_ACK_TO_DUE_TO_BT_C_COUNT	Whenever there is ack_to due to BTC, this counter is ++

0x0A082154 WCSS_A_TPE_SW_LOW_PRIORITY_BT_REJECTED_COUNT**Type:** RW**Reset State:** 0x00000000

A counter which ++ whenever the low priority BT is rejected due to the wlan is busy

WCSS_A_TPE_SW_LOW_PRIORITY_BT_REJECTED_COUNT

Bits	Name	Description
15:0	SW_LOW_PRIORITY_BT_REJECTED_COUNT	Whenever there is no grant to BT due to the wlan is busy (for low priority BT) this counter increments

0x0A082158 WCSS_A_TPE_SW_TERMINATE_CURRENT_TX_VALID**Type:** RW**Reset State:** 0x00000000

To support terminate at TBTT in STA mode

WCSS_A_TPE_SW_TERMINATE_CURRENT_TX_VALID

Bits	Name	Description
0	SW_TERMINATE_CURRENT_TX_VALID	If this bit is set, tpe will terminate the current transmission. Basically this needs to be used by s/w when the chip is in station mode. Though we lived with this in earlier chips, it is realized that we might occupy the channel such that the AP might delay the beacons which is not good for the power save of other stations. Basically s/w simply have tsf based timers to trigger TBTT and enable this bit. This is not a sticky bit. This bit is reset if the tpe is in idle

0x0A08215C WCSS_A_TPE_RTT_REGISTER**Type:** RW**Reset State:** 0x00000000

RTT registers for InNav Positioning

WCSS_A_TPE_RTT_REGISTER

Bits	Name	Type	Description
31	RTT_INFO_VALID	RW	When set to 1, this RTT register contains new valid information. The SW can clear this bit by writing '0'.
30:24	FIR0_RSSI	R	The measured RSSI value from FIR-0
23:16	SNR	R	The measured SBR value
15:11	TX_STAID	R	The TX STAID corresponding to this measurement
10:0	RTT	R	The measured RTT value in 80MHz clk cycles

0x0A082160 WCSS_A_TPE_BEAMFORM_CTRL**Type:** RW**Reset State:** 0x00000000

Contains the control signals for calibration and beamform

WCSS_A_TPE_BEAMFORM_CTRL

Bits	Name	Description
31:26	RESERVED	Move to ndp_beamform_ctrl.sounding_frame_response_rate_index due to bit-width increased because of new rate.
25	CLEAR_WAITING_FOR_SE NDING_QOSNULL	In SW controlled implicit beamform, SW has to write this bit so new qosnull request will be accepted SW can also use this to clear the waiting if anything goes wrong
24	ENABLE_MPI_CSI_EN	The mcfg_phyicsxi_xfercsi_nonndp will be always on (as a backup if anything goes wrong).
23	CLEAR_WAITING_FOR_SE NDING_CSI	In SW controlled calibration/explicit beamform, SW has to write this bit so new csi request will be accepted SW can also use this to clear the waiting if anything goes wrong
22	EXPLICIT_IMMEDIATE_CTS _RSP_EN	When set, the 'cts response' explicit beamform will be acked with immediate cts and later ack+csi feedback, regardless the setting in bit19. This is not currently implemented. When cleared, delayed feedback will be used if bit19 is set.
21	EXPLICIT_IMMEDIATE_ACK _RSP_EN	When set, the ack 'response' explicit beamform will be acked with immediate ack/ba+csi feedback, regardless the setting in bit19. When cleared, delayed feedback will be used if bit19 is set.
20	EXPLICIT_IMMEDIATE_NO_ RSP_EN	When set, the 'no response' explicit beamform will be acked with immediate csi feedback, regardless the setting in bit19. When cleared, delayed feedback will be used if bit19 is set.
19	HW_EXPLICIT_BEAMFORM _DELAY_FEEDBACK	Set to '1' to enable the hw control csi delayed feedback for explicit beamform (when the support is enabled, and not ruled by the immediate feedback bits).

WCSS_A_TPE_BEAMFORM_CTRL (cont.)

Bits	Name	Description
18	EXPLICIT_BEAMFORM_EN	Set to '1' to enable the CSI explicit beamform support.
17:14	SENDING_BKOF_QOSNULL_RETRY_THRSHLD	To setup the retry threshold when sending the bkof qosnull in hw-controlled implicit beamform mode.
13:10	SENDING_BKOF_CSI_RETRY_THRSHLD	To setup the retry threshold when sending the bkof csi in hw-controlled calibration and explicit beamform mode.
7	SW_NONCOMPRESSED_EXPLICIT_BEAMFORM_EN	When set, sw control noncompressed explicit beamform is enabled. Note no hw support for this mode.
6	SW_COMPRESSED_EXPLICIT_BEAMFORM_EN	When set, sw control compressed explicit beamform is enabled. Note no hw support for this mode.
5	HW_CONTROLLED_IMPLICIT_BEAMFORM_EN	When set, implicit is under hw control. If a qosnull is waiting to be sent and bakoff 6 expires. the qosnull will be sent.
4	HW_CONTROLLED_CALIBRATION_EN	When set, calibration is under hw control. If a csi is waiting to be sent and bakoff 7 expires. the csi will be sent.
3	IGNORE_CSI_FIELD_FOR_CAL_START_NDP	Set to '1' to ignore the csi field for ndp based calibration cal start frame
2	SW_SEND_NDP2_VALID	Set to '1' to force the HW to send the ndp frame to responded to the ndp frame in the ndp based calibration. The first response for this frame exchange will be a normal ack/cts. Clear to '0' so no ndp is sent. The first response for the ndp based calibration will be a sounding frame.
1	IMPLICIT_BEAMFORM_EN	Set to '1' to enable implicit beamform support
0	SW_CALIBRATION_FRAME_EXCHANGE_ENABLED	Set to '1' to enable calibration support

0x0A082164 WCSS_A_TPE_CFG_CSI_ADDR**Type:** RW**Reset State:** 0x00000000

Contains the address of the CSI template

WCSS_A_TPE_CFG_CSI_ADDR

Bits	Name	Description
31:0	CFG_CSI_ADDR	Contains the address of the CSI frame template

0x0A082168 WCSS_A_TPE_INTERRUPT_ENABLE**Type:** RW**Reset State:** 0x00000000

Contains the enable bits for which interrupt has to be generated

WCSS_A_TPE_INTERRUPT_ENABLE

Bits	Name	Description
12	RTT3_T2_CAPTURE_INT_EN	Set to '1' to enable the rtt3 interrupt when ack is send in respond to the received TMF so SW can stop the channel capture
11	RTT3_T4_CAPTURE_INT_EN	Set to '1' to enable the rtt3 interrupt when (t4-t1) and absolute t1 value is ready in the register
10	SW_TEMPLATE_WRONG_CMD_INT_EN	Set to '1' to enable the invalid sw command interrupt
9	EXPLICITBF_QOSNULL_INT_EN	Set to '1' to enable the explicit beamform qosnull+ndp interrupt when the ndp is received followed by the qosnull request frame.
8	SW_TEMPLATE_SENT_INT_EN	Set to '1' to enable interrupt after sw template is sent
7	GOT_ACK_FOR_BACK_INT_EN	Set to '1' to enable got_ack_for_back interrupt when expecting ba but received ack
6	ERROR_VALID_INT_EN	Set to '1' to enable error interrupt. It can be either the mproc enters error state (pkt length is '0' for non qosnull/datanull pkt), or when enabled by sw, the txp timeout or internal error interrupts
5	WRONG_SSN_OR_TID_ERROR_INT_EN	Set to '1' to enable wrong_ssn_or_tid interrupt when bar is sent and the tid/ssn of the received ba are not matched
4	NONCOMPRESSED_EXPLICIT_BEAMFORM_INT_EN	Set to '1' to enable noncompressed explicit beamform interrupt for sw-controlled non compressed explicit beamform transmission
3	COMPRESSED_EXPLICIT_BEAMFORM_INT_EN	Set to '1' to enable compressed explicit beamform interrupt for sw-controlled compressed explicit beamform transmission
2	CSI_EXPLICIT_BEAMFORM_INT_EN	Set to '1' to enable csi explicit beamform interrupt for sw controlled delayed csi explicit beamform transmission
1	IMPLICIT_BEAMFORM_INT_EN	Set to '1' to enable implicit beamform interrupt for sw controlled non-SIFS sounding frame transmission
0	CALIBRATION_INT_EN	Set to '1' to enable calibration interrupt for sw controlled calibration CSI frame transmission

0x0A08216C WCSS_A_TPE_INTERRUPT_STATUS**Type:** RW**Reset State:** 0x00000000

Contains the interrupt status, writing 1 to any bit will clear the corresponding interrupt

WCSS_A_TPE_INTERRUPT_STATUS

Bits	Name	Description
12	RTT3_T2_CAPTURE_INT_STATUS	When set, indicates that ack is send in responded to the received TMF so SW can stop the channel capture Write '1' to clear the interrupt.
11	RTT3_T4_CAPTURE_INT_STATUS	When set, indicates that (t4-t1) and absolute t1 value is ready in the register Write '1' to clear the interrupt.
10	SW_TEMPLATE_WRONG_CMD_INT_STATUS	When set, indicates that there's an invalid sw template command Write '1' to clear the interrupt.
9	EXPLICITBF_QOSNULL_INT_STATUS	When set, indicates that explicit bf qosdata+ndp frame exchange is received Write '1' to clear the interrupt.
8	SW_TEMPLATE_SENT_INT_STATUS	When set, indicates that sw template transmit is completed Write '1' to clear the interrupt.
7	GOT_ACK_FOR_BACK_INT_STATUS	When set, indicates that when expecting ba but received ack Write '1' to clear the interrupt.
6	ERROR_VALID_INT_STATUS	When set, indicates the mproc error state, or when enabled by sw, the txp timeout or internal error interrupts Write '1' to clear the interrupt.
5	WRONG_SSN_OR_TID_ERROR_INT_STATUS	When set, indicates that bar is sent and the tid/ssn of the received ba are not matched Write '1' to clear the interrupt.
4	NONCOMPRESSED_EXPLICIT_BEAMFORM_INT_STATUS	When set, indicates the noncompressed explicit beamform frame request is received. SW has to control the non compressed explicit beamform transmission Write '1' to clear the interrupt.
3	COMPRESSED_EXPLICIT_BEAMFORM_INT_STATUS	When set, indicate the compressed explicit beamform frame req is received. SW has to control the compressed explicit beamform transmission Write '1' to clear the interrupt.
2	CSI_EXPLICIT_BEAMFORM_INT_STATUS	When set, indicates the explicit beamform frame is received. SW has to control the delayed csi explicit beamform transmission Write '1' to clear the interrupt.
1	IMPLICIT_BEAMFORM_INT_STATUS	When set, indicates the implicit beamform frame is received. SW has to send the non-SIFS sounding frame transmission at bkof Write '1' to clear the interrupt.
0	CALIBRATION_INT_STATUS	When set, indicates the calibration frame exchnage step1 is done. SW has to control the CSI frame transmission Write '1' to clear the interrupt.

0x0A082170 WCSS_A_TPE_BEAMFORM_STATUS**Type:** R**Reset State:** 0x00000000

Contains the status for calibration and beamform.

WCSS_A_TPE_BEAMFORM_STATUS

Bits	Name	Description
25	WAITING_FOR_SEND_QOSNULL	A qosnull is waiting to be sent. HW won't accept any new qosnull request until the signal is cleared by 1. qosnull is sent. 2. dropped due to retry limit 3. sw write to the clear register bit
24	WAITING_FOR_SEND_CSI	A CSI is waiting to be sent. HW won't accept any new csi request until the signal is cleared by 1. csi is sent. 2. csi is dropped due to retry limit 3. sw write to the clear register bit
23:20	SENDING_QOSNULL_CSI_RETRY_CNT	Retry counter for the bkof qosnull
19:16	SENDING_BKOF_CSI_RETRY_CNT	Retry counter for the bkof csi
15:8	ADDR2_STAID	The addr2_staaid for SW to send the bkof qosnull in sw controlled implicit beamform
7:0	ADDR1_STAID	The addr1_staaid for SW to send the bkof qosnull in sw controlled implicit beamform

0x0A082174 WCSS_A_TPE_CALIBRATION_CNT**Type:** R**Reset State:** 0x00000000

Contains the debug counter for calibration

WCSS_A_TPE_CALIBRATION_CNT

Bits	Name	Description
23:16	CALIBRATION_SENT_CNT	Calibration sent count, increase when the bkof csi is sent or dropped.
15:8	CALIBRATION_ABORT_CNT	Calibration abort count, increase when calibration complete frame is not received
7:0	CALIBRATION_REQ_CNT	Calibration request count

0x0A082178 WCSS_A_TPE_BEAMFORM_CNT**Type:** R**Reset State:** 0x00000000

Contains the debug counter for implicit/explicit beamform`

WCSS_A_TPE_BEAMFORM_CNT

Bits	Name	Description
31:24	EXPLICIT_BEAMFORM_CSI_SENT_CNT	Explicit Beamform sent count, increase when the bkof csi is sent or dropped
23:16	EXPLICIT_BEAMFORM_REQ_CNT	Explicit beamform request count
15:8	IMPLICIT_BEAMFORM_QOSNULL_SENT_CNT	Implicit Beamform sent count, increase when the bkof qosnull is sent or dropped
7:0	IMPLICIT_BEAMFORM_REQ_CNT	Implicit Beamform request count

0x0A08217C WCSS_A_TPE_SW_PM_2**Type:** RW**Reset State:** 0x00000000

sw controlled pm bit

WCSS_A_TPE_SW_PM_2

Bits	Name	Description
31:28	SW_TX_SIFS_A_MODE_CYCLES	The upper bits of SIFS cycles that needs to be programmed in tXP commands for A and G (non B) mode pkts (The lower bits are in sw_pm.sw_tx_sifs_a_mode_cycles)
9:0	SW_PM	SW configurable PM bit for control/response frame which were sent by HW template before. bit0 - ACK. bit1 - RTS. bit2 - CTS. bit3 - BAR. bit4 - BA. bit5 - CF_END bit6 - ACK CTRL WRAPPER. bit7 - CTS CTRL WRAPPER. bit8 - Null feedback in 11ac bit9 - BA CTRL WRAPPER

0x0A082198 WCSS_A_TPE_SW_11AC_PADDING**Type:** RW**Reset State:** 0x0100794E

The SMDA version of A-MPDU delimiters to fill in the last ofdm symbol for 11ac

WCSS_A_TPE_SW_11AC_PADDING

Bits	Name	Description
31:0	SW_11AC_PADDING_CONTENTS	The SMDA version of A-MPDU delimiters to fill in the last ofdm symbol for 11ac

0x0A0821B0 WCSS_A_TPE_NDP_BEAMFORM_CTRL**Type:** RW**Reset State:** 0x00000000

Contains the control signals for beamform qosnull + ndp

WCSS_A_TPE_NDP_BEAMFORM_CTRL

Bits	Name	Description
24	SW_EXPLICITBF_NDP_NO_NCOMPRESSED_EN	When set, ndp based noncompressed explicit beamform is enabled.
23	SW_EXPLICITBF_NDP_COMPRESSED_EN	When set, ndp based compressed explicit beamform is enabled.
22	SW_EXPLICITBF_NDP_CSI_EN	When set, ndp based csi explicit beamform is enabled.
21:13	SOUNDING_FRAME_RESPONSE_RATE_INDEX_40MHZ	To be used in a sounding frame response at 40MHz when the response rate from the rate table is 11b or 11g rate.
12:4	SOUNDING_FRAME_RESPONSE_RATE_INDEX	To be used in a sounding frame response at 20MHz when the response rate from the rate table is 11b or 11g rate.
3	ENABLE_MPI_NDP_EN	The mcfg_phyicsxi_xfercsi_ndp will be always on (as a backup if anything goes wrong).
2	SW_EXPLICITBF_QOSNULL_HW_CTRL_EN	Set to '1' to enable the hw controlled delay feedback of beamform qosnull+ndp
1	SW_EXPLICITBF_QOSNULL_IMMEDIATE_EN	Set to '1' to enable the immediate feedback of beamform qosnull+ndp
0	SW_EXPLICITBF_QOSNULL_NDP_EN	Set to '1' to enable the explicit beamform qosnull + ndp

0x0A0821B4 WCSS_A_TPE_BEAMFORM_QOSNULL_NDP_CNT**Type:** R**Reset State:** 0x00000000

Contains the debug counter for beamform qosnull+ndp

WCSS_A_TPE_BEAMFORM_QOSNULL_NDP_CNT

Bits	Name	Description
23:16	EXPLICITBF_QOSNULL_SENT_CNT	explicit beamform feedback sent count
15:8	EXPLICITBF_QOSNULL_NDP_RECV_CNT	explicit beamform ndp receive count

WCSS_A_TPE_BEAMFORM_QOSNULL_NDP_CNT (cont.)

Bits	Name	Description
7:0	EXPLICITBF_QOSNULL_RE Q_CNT	explicit beamform qosnull request count

0x0A0821B8 WCSS_A_TPE_CXM_CTRL**Type:** RW**Reset State:** 0x00000080

Contains the control and status of cxm logic

WCSS_A_TPE_CXM_CTRL

Bits	Name	Type	Description
7	TPE_MTU_GEN6_3WIRE_WLAN_ACTIVE	R	tpe_mtu_gen6_3wire_wlan_active status
6	WMAC_RFIF_BT_TX_120	R	btc_active_final status
5	WMAC_RFIF_BT_MEDIUM_120	R	btc_active_final status
4	BTC_ACTIVE_FINAL	R	btc_active_final status
3	LTE_CXM_WLAN_TX_GRANT	R	lte_cxm_wlan_tx_grant status
2	WLAN_TX_GRANT	R	wlan_tx_grant status
1	SW_WLAN_TX_GRANT_SE L	RW	When enabled(bit[0]), 0: btc_active from pta controls tx, 1:lte_cxm_wlan_tx_grant from timer controls tx
0	SW_WLAN_TX_GRANT_CT RL_EN	RW	Set 1 to enable the wlan_tx_grant control logic. Clear 0 to always allow transmission

0x0A0821BC WCSS_A_TPE_SW_11AC_CTRL**Type:** RW**Reset State:** 0x00000200

Contains the control signals 11ac related

WCSS_A_TPE_SW_11AC_CTRL

Bits	Name	Description
28	SW_DONT_SEND_NULL_F EEDBACK	Set to 1 to disable sending null feedback. The FSM will go back to idle and do nothing if the VHTCB is not ready

WCSS_A_TPE_SW_11AC_CTRL (cont.)

Bits	Name	Description
27:16	SW_EXTRA_PADDING_FOR_11AC	The extra padding (in number of words) to be added to mimic mu packet generation. Debug purpose only.
15:0	SW_MAX_AMPDU_TX_TIME_11AC	The maximum ampdu tx time in 11ac mode

0x0A0821E4 WCSS_A_TPE_SW_NONHT_BW_CTRL**Type:** RW**Reset State:** 0x00000000

Contains the BW indication configuration

WCSS_A_TPE_SW_NONHT_BW_CTRL

Bits	Name	Description
6	SW_NAV_CHECK_FOR_RTS_EN	When set, always check if nav is zero before sending cts. Otherwise it will only be checked for BW signaling.
5:0	SW_RTS_BW_RETRY_THRESHOLD	In static mode, when rts retry counters is larger than the threshold, data will be sent out at 20Mhz rate.

0x0A0821E8 WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_40MHZ**Type:** RW**Reset State:** 0x00000000**WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_40MHZ**

Bits	Name	Description
30	FEC_MODE	
29	LPE_BIT	
25	AMPDU_VALID	
24:20	TX_POWER	
19	RESERVED	
18:16	TX_ANTENNA_EN	
15:14	STBC_VALID	
13	SGI_VALID	
12:11	NSS_11B_MODE	
8:3	STA_RATE	

WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_40MHZ (cont.)

Bits	Name	Description
2:0	STA_MODE	

0x0A0821EC WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_80MHZ**Type:** RW**Reset State:** 0x00000000**WCSS_A_TPE_SW_GLOBAL_CF_END_DATA_POWER_TEMPLATE_80MHZ**

Bits	Name	Description
30	FEC_MODE	
29	LPE_BIT	
25	AMPDU_VALID	
24:20	TX_POWER	
19	RESERVED	
18:16	TX_ANTENNA_EN	
15:14	STBC_VALID	
13	SGI_VALID	
12:11	NSS_11B_MODE	
8:3	STA_RATE	
2:0	STA_MODE	

0x0A0821F0 WCSS_A_TPE_SW_WARMUP_DELAY**Type:** RW**Reset State:** 0x00000000

This register contains the control signals for warmup

WCSS_A_TPE_SW_WARMUP_DELAY

Bits	Name	Description
23:20	SW_DELAY_WAIT_CMD_CNT_UPPER	The upper bits of sw_delay_wait_cmd_cnt_reg.sw_delay_wait_cmd_cnt
19:16	SW_WAIT_CYCLES_THRESHOLD_UPPER	(in terms of 8 cycles). The upper bits of sw_delay_wait_cmd_cnt_reg.sw_wait_cycles_threshold
15:12	SW_WARMUP_TIME_UPPER	The upper bits of wait time to be programmed in txp commands. The lower bits are [10:0]

WCSS_A_TPE_SW_WARMUP_DELAY (cont.)

Bits	Name	Description
11	SW_FIX_WARMUP_DELAY_EN	Set this bit to 1 to enable the fix warmup delay
10:0	SW_WARMUP_TIME	The wait time to be programmed in txp commands. This is the time between tpe asserts the warmup and the time when txp sends the first phy cmd.

0x0A0821F4 WCSS_A_TPE_MAIN_MPROC_REQ_CNT**Type:** R**Reset State:** 0x00000000

This register contains the main_mproc request counter per session

WCSS_A_TPE_MAIN_MPROC_REQ_CNT

Bits	Name	Description
27:24	SESSION_IS_BACKOFF_CSI_QOSNULL_CNT	
23:20	SESSION_IS_BACKOFF_CNT	
19:16	SESSION_IS_BEACON_CN	
15:12	SESSION_IS_SW_TEMPLATE_CNT	
11:8	SESSION_IS_SW_STA_QID_CNT	
7:4	SESSION_IS_SW_BACKOFF_INDEX_CNT	
3:0	SESSION_IS_RXP_CNT	

0x0A0821F8 WCSS_A_TPE_SW_11AC_BEAMFORM_CTRL**Type:** RW**Reset State:** 0x00000000

This register contains the control signals for 11ac beamform

WCSS_A_TPE_SW_11AC_BEAMFORM_CTRL

Bits	Name	Description
9	SW_11N_LINK_ADAPTATION_EN	Set to 1 to enable the 11n link adaptation feature

WCSS_A_TPE_SW_11AC_BEAMFORM_CTRL (cont.)

Bits	Name	Description
8	SW_11AC_LINK_ADAPTATION_EN	Set to 1 to enable the 11ac link adaptation feature
7:3	SW_CHECK_CFG_READY_TIME	The time (in micro second) when TPE should check the cfg_ready signal to see if the report is ready or not.
0	SW_11AC_BEAMFORM_EN	Set to 1 to enable the 11ac beamform feature

0x0A0821FC WCSS_A_TPE_SW_11AC_CNT1**Type:** R**Reset State:** 0x00000000

Contains the debug counters for 11ac beamform

WCSS_A_TPE_SW_11AC_CNT1

Bits	Name	Description
31:24	NULLFEEDBACK_SENT_COUNT	11ac null feedback sent count
23:16	VHTC_SENT_CNT	11ac vhtc sent count
15:8	NDP_RCVD_CNT	11ac ndp (following ndpa) receive count
7:0	NDPA_RCVD_CNT	11ac ndpa received count

0x0A0821AC WCSS_A_TPE_SW_11AC_CNT2**Type:** R**Reset State:** 0x00000000

Contains the debug counters for 11ac beamform / link adaptation

WCSS_A_TPE_SW_11AC_CNT2

Bits	Name	Description
23:16	NDPA_MRQ_REQ_CNT	11ac ndpa mrq request count
15:8	PPDU_MRQ_REQ_CNT	11ac ppdu mrq request receive count
7:0	BRPOLL_RCVD_CNT	11ac BR Poll received count

0x0A0821A8 WCSS_A_TPE_SW_11AC_VHTCB_RATE**Type:** RW**Reset State:** 0x00000000

Contains the rate for sending 11ac vhtcb/null feedback SW has to program this register dynamically following RA. The primary or secondary rate should be programmed.

WCSS_A_TPE_SW_11AC_VHTCB_RATE

Bits	Name	Description
26:18	VHTCB_RATE_80MHZ	the rate index to be used to send vhtcb/null feedback at 80Mhz
17:9	VHTCB_RATE_40MHZ	the rate index to be used to send vhtcb/null feedback at 40Mhz
8:0	VHTCB_RATE_20MHZ	the rate index to be used to send vhtcb/null feedback at 20Mhz

0x0A0821A0 WCSS_A_TPE_SW_VHTCB_ADDR2_0_LO**Type:** RW**Reset State:** 0x00000000

Contains the lower 32 bits of addr2 to send vhtcb/null feedback

WCSS_A_TPE_SW_VHTCB_ADDR2_0_LO

Bits	Name	Description
31:0	VHTCB_ADDR2_0_LO	the lower 32 bits of addr2 to send vhtcb/null feedback

0x0A0821A4 WCSS_A_TPE_SW_VHTCB_ADDR2_0_HI**Type:** RW**Reset State:** 0x00000000

Contains the upper 16 bits of addr2 to send vhtcb/null feedback

WCSS_A_TPE_SW_VHTCB_ADDR2_0_HI

Bits	Name	Description
15:0	VHTCB_ADDR2_0_HI	the upper 16 bits of addr2 to send vhtcb/null feedback

0x0A0821C0 WCSS_A_TPE_SW_VHTCB_ADDR2_1_LO**Type:** RW**Reset State:** 0x00000000

Contains the lower 32 bits of addr2 to send vhtcb/null feedback

WCSS_A_TPE_SW_VHTCB_ADDR2_1_LO

Bits	Name	Description
31:0	VHTCB_ADDR2_1_LO	the lower 32 bits of addr2 to send vhtcb/null feedback

0x0A0821C4 WCSS_A_TPE_SW_VHTCB_ADDR2_1_HI**Type:** RW**Reset State:** 0x00000000

Contains the upper 16 bits of addr2 to send vhtcb/null feedback

WCSS_A_TPE_SW_VHTCB_ADDR2_1_HI

Bits	Name	Description
15:0	VHTCB_ADDR2_1_HI	the upper 16 bits of addr2 to send vhtcb/null feedback

0x0A0821C8 WCSS_A_TPE_SW_VHTCB_ADDR2_LOOKUP**Type:** RW**Reset State:** 0x00000000

Contains the lookup table to select the sw_vhtcb_addr2 registers

WCSS_A_TPE_SW_VHTCB_ADDR2_LOOKUP

Bits	Name	Description
31:0	VHTCB_ADDR2_LOOKUP	2 bits for each staid to select which vhtcb_addr2 registers for sending vhtcb/nullfeedback in response to NPD 00: sw_vhtcb_addr2_0, 01: sw_vhtcb_addr2_1, 10, 11: reserved

0x0A0821CC WCSS_A_TPE_SW_RTT3_ABSOLUTE**Type:** R**Reset State:** 0x00000000

Contains the absolute value of t1 for rtt3

WCSS_A_TPE_SW_RTT3_ABSOLUTE

Bits	Name	Description
31:0	RTT_REF	The absolute value of r1

0x0A0821D0 WCSS_A_TPE_SW_RTT3_DELTA**Type:** R**Reset State:** 0x00010000

Contains the value of (t4-t1) for rtt3

WCSS_A_TPE_SW_RTT3_DELTA

Bits	Name	Description
16	RESP_TO_TMF_STATUS	The bit will be set when SW writes 1 to sw_rtt3_ctrl.rtt3_resp_to_tmf_en (bit4), and will be cleared after ack is sent in response to tmf.
15	DUPLICATE_PKT	1 indicates this is a duplicate/retried TMF that has been dropped by rxp
14	RTT_TYPE	Taken from pmi stats directly (through rxp). 1 indicates it's a valid t4-t1 value
13:0	RTT_DELTA	The (t4-t1) value

0x0A0821D4 WCSS_A_TPE_SW_RTT3_CTRL**Type:** RW**Reset State:** 0x00000000

Contains the rtt3 configuration

WCSS_A_TPE_SW_RTT3_CTRL

Bits	Name	Type	Description
31:16	RTT3_VALIDATE_TA_HI	RW	The upper bits of the TA of TMF to be validate
4	RTT3_RESP_TO_TMF_EN	W	When bit3 is set, SW has to write 1 to this bit field so HW will send ack for TMF. Once an ack is sent for a TMF, no more ack will be sent when tmf is received until this bit has been set to 1. Always read 0.

WCSS_A_TPE_SW_RTT3_CTRL (cont.)

Bits	Name	Type	Description
3	RTT3_ENABLE_NO_ACK_T O_TMF	RW	when clear to 0, the ack will always be sent for TMF regardless bit4 setting when set to 1, enable the feature of not sending ack to TMF. SW has to write 1 to bit4 so ack will be sent in response to TMF. No further ack will be sent to TMF afterwards and SW has to re-enable bit4 so the ack will be sent.
2	RTT3_NONHT_RESP_RAT E_EN	RW	Set to 1 to enable ht/vht response rate to TMF/TMRF
1	RTT3_RESPONDER_EN	RW	Set to 1 to enable rtt3 feature as responder
0	RTT3_INITIATOR_EN	RW	Set to 1 to enable rtt3 feature as initiator

0x0A0821D8 WCSS_A_TPE_SW_RTT3_CTRL2**Type:** RW**Reset State:** 0x00000000

Contains the rtt3 configuration

WCSS_A_TPE_SW_RTT3_CTRL2

Bits	Name	Description
31:0	RTT3_VALIDATE_TA_LO	The lower bits of the TA of TMF to be validate

0x0A0821DC WCSS_A_TPE_SW_11AF_CTRL**Type:** RW**Reset State:** 0x00000000

Contains the 11/11af configuration

WCSS_A_TPE_SW_11AF_CTRL

Bits	Name	Description
15:8	SW_11AF_SIFS	The SIFS time for duration calculation in 11j/11af mode (when bit5 is enabled)
5	SW_11AF_EN	To enable the scale factor for tx time and SIFS in 11j/11af
4:0	SW_11AF_SCALE_FACTOR	The scale factor for tx time in 11j/11af mode (when bit5 is enabled) Theses are the allowed numbers to be programmed: 2,4,5,8,10,16

0x0A0821E0 WCSS_A_TPE_SW_QBOOST_CTRL**Type:** RW**Reset State:** 0x00000000

Contains the 11/11af configuration

WCSS_A_TPE_SW_QBOOST_CTRL

Bits	Name	Type	Description
31:16	SW_QBOOST_TXOP	RW	To program the txop when sending data in qboost when bit2 is set to 1
3	MAIN_MPROC_QBOOST_VALID	R	main_mproc_qboost_valid status
2	SW_QBOOST_TXOP_SEL	RW	Set to 1 to select the max txop from the register value in bit[31:16] Clear to 0 then the existing logic will be used
1	SW_QBOOST_PROTECTION_SEL	RW	Set to 1 to disable sending protection frame before sending the data Clear to 0 then the existing logic will be used
0	SW_QBOOST_EN	RW	Set to 1 to enable the qboost feature

10.60 WCSS_A_TXCLKCTRL_TXCLKCTRL**0x0A013000 WCSS_A_TXCLKCTRL_ROOT_CLK_EN****Type:** RW**Reset State:** 0x0000**WCSS_A_TXCLKCTRL_ROOT_CLK_EN**

1	TXCTL	
0	MPI	

10.61 WCSS_A_TXCTL_TXCTL**0x0A012000 WCSS_A_TXCTL_FIR_MODE****Type:** RW**Reset State:** 0x00C4

This register is used to switch in a test waveform feed to the TX FIR instead of the normal packet data stream and to manually enable the DACs and RF chains during the test mode. !! NOTE : the user must also appropriately program the DAC_SHUTDOWN register to ensure that the DAC standby and shutdown registers are configured correctly

WCSS_A_TXCTL_FIR_MODE

Bits	Name	Description
9:8	RESERVED	reserved
7	DIS_11MBPS	When set disables secondary antennae (i.e. all antennae except ant0) for 11 Mbps mode. Should be 1 (antennae disabled) for normal operation. 0x0: ENABLE (secondary antennae enabled for 11 Mbps mode) 0x1: DISABLE (secondary antennae disabled for 11 Mbps mode)
6	DIS_5MBPS	When set disables secondary antennae (i.e. all antennae except ant0) for 5.5 Mbps mode. Should be 1 (antennae disabled) for normal operation. 0x0: ENABLE (secondary antennae enabled for 5.5 Mbps mode) 0x1: DISABLE (secondary antennae disabled for 5.5 Mbps mode)
2	ANT_EN	4'bxxx0 -> none (No DAC/RF chains enabled) 4'bxxx1 -> zero (DAC/RF chain 0 enabled) This field defines which TX CHAINS (DAC and RF) are enabled in the waveform (test) mode of operation and also for packets that request the default TX enable configuration. Default 1'b1, ie Chain 0 enabled.
1	RESERVED	reserved
0	SELECT_FIRMODE	This bit selects the input to the TX FIR, 0=Normal, 1=WFM generator. Default 0 0x0: NORMAL (Normal operation, packet data fed to TX FIR) 0x1: GENERATOR (Waveform operation, waveform generator output fed to TX FIR)

0x0A012004 WCSS_A_TXCTL_PA_GUARD

Type: RW

Reset State: 0x0000

Specifies guard interval duration before enabling PAs. Delay between assertion of T/R and assertion of PA enable to protect PAs from transients.

WCSS_A_TXCTL_PA_GUARD

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes between enabling T/R switch and enabling PAs. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 20, ie 0.125us in Gen5, 0.25uS in Libra 0x0: MIN (0 ns) 0x1: STEP (6.25 ns for Spica, 12.5 ns for Libra) 0x3FF: MAX (6.4 us for Spica, 12.8 us for Libra)

0x0A012008 WCSS_A_TXCTL_RAMP_UP_11A**Type:** RW**Reset State:** 0x004C

Specifies ramp up time for OFDM packets. Delay between RF enable and time that IQ waveform is presented on IQ outputs.

WCSS_A_TXCTL_RAMP_UP_11A

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes to ramp up before the base band data can be shifted into it. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 40, ie 0.25us in Gen5, 0.5uS in Libra 0x0: MIN (0 ns) 0x1: STEP (6.25 ns for Spica, 12.5 ns for Libra) 0x3FF: MAX (6.4 us for Spica, 12.8 us for Libra)

0x0A01200C WCSS_A_TXCTL_RAMP_UP_11B**Type:** RW**Reset State:** 0x0024

Specifies ramp up time for 802.11b packets. Delay between RF enable and time that IQ waveform is presented on IQ outputs.

WCSS_A_TXCTL_RAMP_UP_11B

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes to ramp up before the base band data can be shifted into it. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 40, ie 0.25us in Gen5, 0.5uS in Libra 0x0: MIN (0 ns) 0x1: STEP (6.25 ns for Spica, 12.5 ns for Libra) 0x3FF: MAX (6.4 us for Spica, 12.8 us for Libra)

0x0A012010 WCSS_A_TXCTL_RAMP_DOWN**Type:** RW**Reset State:** 0x00A0

Specifies ramp down time. Delay between end of IQ waveform and de-assertion of the RF enable to accomodate the delay through the DACs.

WCSS_A_TXCTL_RAMP_DOWN

Bits	Name	Description
9:0	TIMER	Specifies the time that the TX takes to ramp up before the base band data can be shifted into it. Measured in increments of 6.25 ns for Spica (12.5 ns for Libra) from 0 to 6.4 us (12.8us for Libra). Default 160, ie 1.0us in Gen5, 2.0uS in Libra 0x0: MIN (0 ns) 0x1: STEP (6.25 ns for Spica, 12.5 ns for Libra) 0x3FF: MAX (6.4 us for Spica, 12.8 us for Libra)

0x0A012014 RESERVED**0x0A012018 WCSS_A_TXCTL_DAC_CONTROL****Type:** RW**Reset State:** 0x0001

This register controls DAC and RF enable signals such as standby and TX enables. Also, can control the DAC STANDBY and RF TX enable signals

WCSS_A_TXCTL_DAC_CONTROL

Bits	Name	Description
9	TXEN_OVERRIDE_EN	0x0: NORMAL (RF TX enable signals in normal mode) 0x1: OVERRIDE (RF TX enable signals in override mode)

WCSS_A_TXCTL_DAC_CONTROL (cont.)

Bits	Name	Description
8	DAC_OVERRIDE_EN	0x0: NORMAL (DAC Standby signals in normal mode) 0x1: OVERRIDE (DAC Standby signals in override mode)
4	TXEN0_OVERRIDE_VAL	0x0: TXEN_OFF (Chain 0 RF off (txen de-asserted)) 0x1: TXEN_ON (Chain 0 RF on (txen asserted))
0	CH0STDBY_OVERRIDE_VAL	0x0: DAC_ON (Chain 0 DAC on (standby de-asserted)) 0x1: DAC_OFF (Chain 0 DAC off (standby asserted))

0x0A01201C WCSS_A_TXCTL_DAC_STDBY**Type:** RW**Reset State:** 0x0181

This register controls the timing of DAC STANDBY signals

WCSS_A_TXCTL_DAC_STDBY

Bits	Name	Description
8:0	TIMING	Each bit corresponds to one of the possible state of the TXCTL state machine. The states are as follows: Bit 0 = TXCTL_IDLE Bit 1 = TXCTL_RFWARM Bit 2 = TXCTL_START Bit 3 = reserved (unused) Bit 4 = TXCTL_RAMPUP Bit 5 = TXCTL_TX Bit 6 = TXCTL_SHUTOFF Bit 7 = TXCTL_TPC Bit 8 = TXCTL_OVERRIDE

0x0A012020 WCSS_A_TXCTL_PLCP_OVERRIDE**Type:** RW**Reset State:** 0x0000

This register contains an override mask and override values for HT-SIG fields.

WCSS_A_TXCTL_PLCP_OVERRIDE

Bits	Name	Description
8:7	NESS	Override value for Ness field
6	RSVR	Override value for Reserved field
5	SOUND	Override value for Not-sounding field
4	SMOOTH	Override value for Smoothing field
3:0	MASK	Override mask for {Ness, Reserved, Not_sounding, Smoothing} fields

0x0A012024 WCSS_A_TXCTL_FSHIFT**Type:** RW**Reset State:** 0x0017

When enabled, this register defines the value of the frequency shift applied to quarter and half-bandwidth packets. For instance, a 20MHz packet in an 80MHz channel is considered as a quarter-bandwidth packet and its frequency shift would be defined by the bw14 field. Similarly, the frequency shift for a 20MHz packet in a 40MHz channel or 40MHz packet in an 80MHz channel would be defined by the bw12 field

WCSS_A_TXCTL_FSHIFT

Bits	Name	Description
4:2	BW14	0x0: ZERO (No shift) 0x1: P10 (+10MHz shift) 0x2: P20 (+20MHz shift) 0x3: P30 (+30MHz shift) 0x4: RESERVED (No shift) 0x5: M30 (-30MHz shift) 0x6: M20 (-20MHz shift) 0x7: M10 (-10MHz shift)
1:0	BW12	0x0: ZERO (No shift) 0x1: P20 (+static_BW/4 shift) 0x2: RESERVED (No shift) 0x3: M20 (-static_BW/4 shift)

0x0A012028 WCSS_A_TXCTL_SOFTRESET**Type:** W**Reset State:** 0x0000

Resets the PHY transmitter

WCSS_A_TXCTL_SOFTRESET

Bits	Name	Description
0	RESET	When this register is written to with any value, a active high pulse is generated which will reset the whole of Phy Tx.

0x0A01202C WCSS_A_TXCTL_WATCHDOG_START**Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in START state

WCSS_A_TXCTL_WATCHDOG_START

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A012030 WCSS_A_TXCTL_WATCHDOG_RFWARM

Type: RW

Reset State: 0x0009

Allowed time for state machine to remain in RFWARM state

WCSS_A_TXCTL_WATCHDOG_RFWARM

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A012034 WCSS_A_TXCTL_WATCHDOG_PAGUARD

Type: RW

Reset State: 0x0000

Allowed time for state machine to remain in PAGUARD state

WCSS_A_TXCTL_WATCHDOG_PAGUARD

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A012038 WCSS_A_TXCTL_WATCHDOG_RAMPUP

Type: RW

Reset State: 0x0000

Allowed time for state machine to remain in RAMPUP state

WCSS_A_TXCTL_WATCHDOG_RAMPUP

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A01203C WCSS_A_TXCTL_WATCHDOG_TX**Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in TX state

WCSS_A_TXCTL_WATCHDOG_TX

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A012040 WCSS_A_TXCTL_WATCHDOG_SHUTOFF**Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in SHUTOFF state

WCSS_A_TXCTL_WATCHDOG_SHUTOFF

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A012044 WCSS_A_TXCTL_WATCHDOG_TPC**Type:** RW**Reset State:** 0x0000

Allowed time for state machine to remain in TPC state

WCSS_A_TXCTL_WATCHDOG_TPC

Bits	Name	Description
15:0	CYCLES	Allowed period of time in this state = (Register value * 128 * 12.5)ns. The state machine automatically adjusts for 20/40/80MHz bandwidth settings. Setting a value of 0 disables the watchdog.

0x0A012048 WCSS_A_TXCTL_MAX_TXBUSY**Type:** RW**Reset State:** 0x0000

Holds the max active duration of the txctl_mpi_txbusy signal (measured in 160MHz clock cycles)
Default value of 0 disables the timeout event

WCSS_A_TXCTL_MAX_TXBUSY

Bits	Name	Description
15:0	VALUE	

0x0A01204C WCSS_A_TXCTL_MAX_TXENB**Type:** RW**Reset State:** 0x0000

Holds the max active duration of the RF TX enables (measured in 160MHz clock cycles) Default value of 0 disables the timeout event

WCSS_A_TXCTL_MAX_TXENB

Bits	Name	Description
15:0	VALUE	

0x0A012050 WCSS_A_TXCTL_TXBUSY_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of TXBUSY timeout events

WCSS_A_TXCTL_TXBUSY_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A012054 WCSS_A_TXCTL_TXEN_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of TXEN timeout events

WCSS_A_TXCTL_TXEN_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A012058 WCSS_A_TXCTL_TXCTL_STATE**Type:** R**Reset State:** 0x00000000

Stores last four states of the TXCTL state machine.

WCSS_A_TXCTL_TXCTL_STATE

Bits	Name	Description
15:0	VALUE	Bits[15:12] = Previous (N-3) state Bits[11:8] = Previous (N-2) state Bits[7:4] = Previous (N-1) state Bits[3:0] = Current state

0x0A01205C WCSS_A_TXCTL_LAST_PKT_PARAMS1**Type:** R**Reset State:** 0x00000000

Stores the packet type, RATE field, Nss, BW mode and subband params for the last command word received.

WCSS_A_TXCTL_LAST_PKT_PARAMS1

Bits	Name	Description
12:6	RATE	MCS Rate parameter

WCSS_A_TXCTL_LAST_PKT_PARAMS1 (cont.)

Bits	Name	Description
5:4	BANDWIDTH	Bandwidth mode parameter 00 = 20MHz packet 01 = 40MHz packet 10 = 80MHz packet 11 = Reserved
3	DUPLICATE	Subband duplicate parameter
2:0	PKT_TYPE	Packet type parameter

0x0A012060 WCSS_A_TXCTL_LAST_PKT_PACKET_LENGTH**Type:** R**Reset State:** 0x00000000

Stores the PACKET length parameter for the last command word received.

WCSS_A_TXCTL_LAST_PKT_PACKET_LENGTH

Bits	Name	Description
15:0	VALUE	PACKET length parameter

0x0A012064 WCSS_A_TXCTL_LAST_PKT_LSIG_LENGTH**Type:** R**Reset State:** 0x00000000

Stores the LSIG length parameter for the last command word received.

WCSS_A_TXCTL_LAST_PKT_LSIG_LENGTH

Bits	Name	Description
11:0	VALUE	LSIG length parameter

0x0A012068 WCSS_A_TXCTL_LAST_TX_POWER**Type:** R**Reset State:** 0x00000000

Stores the TX power parameter for the last command word received.

WCSS_A_TXCTL_LAST_TX_POWER

Bits	Name	Description
4:0	VALUE	Packet TX power parameter

0x0A01206C WCSS_A_TXCTL_WATCHDOG_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of WATCHDOG_ALARM abort pulses generated by the TXCTL module.

WCSS_A_TXCTL_WATCHDOG_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A012070 WCSS_A_TXCTL_PKT_INVALID_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of PKT_INVALID_ALARM abort pulses generated by the TXCTL module.

WCSS_A_TXCTL_PKT_INVALID_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A012074 WCSS_A_TXCTL_TXA_ABORT_ALARM**Type:** W**Reset State:** 0x00000000

Counts number of abort pulses generated by the TXA module.

WCSS_A_TXCTL_TXA_ABORT_ALARM

Bits	Name	Description
15:0	COUNT	

0x0A012078 WCSS_A_TXCTL_LEGACY_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of IEEE 802.11a packets transmitted.

WCSS_A_TXCTL_LEGACY_PKTS

Bits	Name	Description
15:0	COUNT	Legacy packet counter.

0x0A01207C WCSS_A_TXCTL_GF_SIMO_20_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of GF SIMO 20MHz packets transmitted.

WCSS_A_TXCTL_GF_SIMO_20_PKTS

Bits	Name	Description
15:0	COUNT	GF SIMO 20MHz packet counter.

0x0A012080 WCSS_A_TXCTL_GF_SIMO_40_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of GF SIMO 40MHz packets transmitted.

WCSS_A_TXCTL_GF_SIMO_40_PKTS

Bits	Name	Description
15:0	COUNT	GF SIMO 40MHz packet counter.

0x0A012084 WCSS_A_TXCTL_MM_SIMO_20_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of mixed-mode SIMO 20MHz packets transmitted.

WCSS_A_TXCTL_MM_SIMO_20_PKTS

Bits	Name	Description
15:0	COUNT	mixed-mode SIMO 20MHz packet counter.

0x0A012088 WCSS_A_TXCTL_MM_SIMO_40_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of mixed-mode SIMO 40MHz packets transmitted.

WCSS_A_TXCTL_MM_SIMO_40_PKTS

Bits	Name	Description
15:0	COUNT	mixed-mode SIMO 40MHz packet counter.

0x0A01208C WCSS_A_TXCTL_AC_SIMO_20_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of 11ac SIMO 20MHz packets transmitted.

WCSS_A_TXCTL_AC_SIMO_20_PKTS

Bits	Name	Description
15:0	COUNT	11ac SIMO 20MHz packet counter.

0x0A012090 WCSS_A_TXCTL_AC_SIMO_40_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of 11ac SIMO 40MHz packets transmitted.

WCSS_A_TXCTL_AC_SIMO_40_PKTS

Bits	Name	Description
15:0	COUNT	11ac SIMO 40MHz packet counter.

0x0A012094 WCSS_A_TXCTL_AC_SIMO_80_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of 11ac SIMO 80MHz packets transmitted.

WCSS_A_TXCTL_AC_SIMO_80_PKTS

Bits	Name	Description
15:0	COUNT	11ac SIMO 80MHz packet counter.

0x0A012098 WCSS_A_TXCTL_TXB_SHORT_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of TXB packets with short preamble transmitted.

WCSS_A_TXCTL_TXB_SHORT_PKTS

Bits	Name	Description
15:0	COUNT	TXB short packet counter.

0x0A01209C WCSS_A_TXCTL_TXB_LONG_PKTS**Type:** W**Reset State:** 0x00000000

Counts number of TXB packets with long preamble transmitted.

WCSS_A_TXCTL_TXB_LONG_PKTS

Bits	Name	Description
15:0	COUNT	TXB long packet counter.

0x0A0120A0 WCSS_A_TXCTL_TXFIR_DONE**Type:** W**Reset State:** 0x00000000

Counts the number of packets completed at output of TXFIR.

WCSS_A_TXCTL_TXFIR_DONE

Bits	Name	Description
15:0	COUNT	TXFIR done event counter

0x0A0120A4 WCSS_A_TXCTL_MISSING_WARMUP**Type:** W**Reset State:** 0x00000000

Counts the number of packets that are initiated by TXP start pulse rather than the assertion of the TXP RF warmup flag.

WCSS_A_TXCTL_MISSING_WARMUP

Bits	Name	Description
15:0	COUNT	Missing RF warmup flag event counter

0x0A0120A8 WCSS_A_TXCTL_ALARMS**Type:** R**Reset State:** 0x0000

Monitor of all contributors to TXA abort

WCSS_A_TXCTL_ALARMS

Bits	Name	Description
6:0	VALUE	Bit[0] = TXCTL watchdog timed out Bit[1] = Incorrect bandwidth field in command word Bit[2] = Invalid 11b packet parameters error Bit[3] = TX enable not asserted during active transmission Bit[4] = RF_WARMUP signal not asserted for sufficient length of time Bit[5] = Abort received from TACTL Bit[6] = Abort received from MPI

0x0A0120AC WCSS_A_TXCTL_RESET_ALARMS**Type:** W**Reset State:** 0x0000

Resets the alarm flags

WCSS_A_TXCTL_RESET_ALARMS

Bits	Name	Description
0	RESET_ALARMS	When this register is written to with any value, a active high pulse is generated which will reset all alarm flags in the TACTL alarms register.

10.62 WCSS_A_TXFIR_TXFIR

0x0A018000 WCSS_A_TXFIR_CFG

Type: RW

Reset State: 0x003E

Sets the various modes for the Tx-FIR

WCSS_A_TXFIR_CFG

Bits	Name	Description
6	TVWS_EN	When this field is set, new filtering logic to support TV white space channels is enabled
5	PEAK_BYPASS_OVERRIDE_EN	When this field is set, dynamic bypass of the smart clipping logic will be disabled (low power) and the peak_bypass field will be used to either statically bypass or not bypass this logic
4	PEAK_BYPASS	When this field is set, the smart clipping logic is bypassed (as long as the peak_bypass_override_en field is also set)
3	DPD_BYPASS	When this field is set, the digital pre-distorter logic is bypassed
2	LOLEAKAGE_BYPASS	When this field is set, the LO leakage correction logic is bypassed
1	IQIMB_BYPASS	When this field is set, the IQ imbalance correction logic is bypassed
0	CHAIN0FIRBYPASS	When set bypasses the upsampling and filtering for chain 0 The output of the actual filter is 12-bits and hence drops the LSB of the inputs to present 9-bits at the output

0x0A018004 WCSS_A_TXFIR_LOLEAKAGE_SHIFT

Type: RW

Reset State: 0x0000

This register defines the number of left shifts applied to the LO leakage value derived from the gain-based look-up table in the TXFIR

WCSS_A_TXFIR_LOLEAKAGE_SHIFT

Bits	Name	Description
1:0	CH0	

0x0A01800C WCSS_A_TXFIR_COEFF_QUARTER_0**Type:** RW**Reset State:** 0x0099

2's complement 10-bit OFDM quarter-band FIR coefficient 0

WCSS_A_TXFIR_COEFF_QUARTER_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018010 WCSS_A_TXFIR_COEFF_QUARTER_1**Type:** RW**Reset State:** 0x006D

2's complement 10-bit OFDM quarter-band FIR coefficient 1

WCSS_A_TXFIR_COEFF_QUARTER_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018014 WCSS_A_TXFIR_COEFF_QUARTER_2**Type:** RW**Reset State:** 0x0099

2's complement 10-bit OFDM quarter-band FIR coefficient 2

WCSS_A_TXFIR_COEFF_QUARTER_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018018 WCSS_A_TXFIR_COEFF_QUARTER_3**Type:** RW**Reset State:** 0x03A9

2's complement 10-bit OFDM quarter-band FIR coefficient 3

WCSS_A_TXFIR_COEFF_QUARTER_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01801C WCSS_A_TXFIR_COEFF_QUARTER_4**Type:** RW**Reset State:** 0x0035

2's complement 10-bit OFDM quarter-band FIR coefficient 4

WCSS_A_TXFIR_COEFF_QUARTER_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018020 WCSS_A_TXFIR_COEFF_QUARTER_5**Type:** RW**Reset State:** 0x002C

2's complement 10-bit OFDM quarter-band FIR coefficient 5

WCSS_A_TXFIR_COEFF_QUARTER_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018024 WCSS_A_TXFIR_COEFF_QUARTER_6**Type:** RW**Reset State:** 0x007D

2's complement 10-bit OFDM quarter-band FIR coefficient 6

WCSS_A_TXFIR_COEFF_QUARTER_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018028 WCSS_A_TXFIR_COEFF_QUARTER_7**Type:** RW**Reset State:** 0x0050

2's complement 10-bit OFDM quarter-band FIR coefficient 7

WCSS_A_TXFIR_COEFF_QUARTER_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01802C WCSS_A_TXFIR_COEFF_QUARTER_8**Type:** RW**Reset State:** 0x0047

2's complement 10-bit OFDM quarter-band FIR coefficient 8

WCSS_A_TXFIR_COEFF_QUARTER_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018030 WCSS_A_TXFIR_COEFF_QUARTER_9**Type:** RW**Reset State:** 0x006F

2's complement 10-bit OFDM quarter-band FIR coefficient 9

WCSS_A_TXFIR_COEFF_QUARTER_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018034 WCSS_A_TXFIR_COEFF_QUARTER_10**Type:** RW**Reset State:** 0x0051

2's complement 10-bit OFDM quarter-band FIR coefficient 10

WCSS_A_TXFIR_COEFF_QUARTER_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018038 WCSS_A_TXFIR_COEFF_QUARTER_11**Type:** RW**Reset State:** 0x004C

2's complement 10-bit OFDM quarter-band FIR coefficient 11

WCSS_A_TXFIR_COEFF_QUARTER_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01803C WCSS_A_TXFIR_COEFF_QUARTER_12**Type:** RW**Reset State:** 0x0057

2's complement 10-bit OFDM quarter-band FIR coefficient 12

WCSS_A_TXFIR_COEFF_QUARTER_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018040 WCSS_A_TXFIR_COEFF_QUARTER_13**Type:** RW**Reset State:** 0x004A

2's complement 10-bit OFDM quarter-band FIR coefficient 13

WCSS_A_TXFIR_COEFF_QUARTER_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018044 WCSS_A_TXFIR_COEFF_QUARTER_14**Type:** RW**Reset State:** 0x0047

2's complement 10-bit OFDM quarter-band FIR coefficient 14

WCSS_A_TXFIR_COEFF_QUARTER_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018048 WCSS_A_TXFIR_COEFF_QUARTER_15**Type:** RW**Reset State:** 0x0041

2's complement 10-bit OFDM quarter-band FIR coefficient 15

WCSS_A_TXFIR_COEFF_QUARTER_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01804C WCSS_A_TXFIR_COEFF_QUARTER_16**Type:** RW**Reset State:** 0x003E

2's complement 10-bit OFDM quarter-band FIR coefficient 16

WCSS_A_TXFIR_COEFF_QUARTER_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018050 WCSS_A_TXFIR_COEFF_QUARTER_17**Type:** RW**Reset State:** 0x003C

2's complement 10-bit OFDM quarter-band FIR coefficient 17

WCSS_A_TXFIR_COEFF_QUARTER_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018054 WCSS_A_TXFIR_COEFF_QUARTER_18**Type:** RW**Reset State:** 0x002D

2's complement 10-bit OFDM quarter-band FIR coefficient 18

WCSS_A_TXFIR_COEFF_QUARTER_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018058 WCSS_A_TXFIR_COEFF_QUARTER_19**Type:** RW**Reset State:** 0x002D

2's complement 10-bit OFDM quarter-band FIR coefficient 19

WCSS_A_TXFIR_COEFF_QUARTER_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01805C WCSS_A_TXFIR_COEFF_QUARTER_20**Type:** RW**Reset State:** 0x0027

2's complement 10-bit OFDM quarter-band FIR coefficient 20

WCSS_A_TXFIR_COEFF_QUARTER_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018060 WCSS_A_TXFIR_COEFF_QUARTER_21**Type:** RW**Reset State:** 0x0017

2's complement 10-bit OFDM quarter-band FIR coefficient 21

WCSS_A_TXFIR_COEFF_QUARTER_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018064 WCSS_A_TXFIR_COEFF_QUARTER_22**Type:** RW**Reset State:** 0x0014

2's complement 10-bit OFDM quarter-band FIR coefficient 22

WCSS_A_TXFIR_COEFF_QUARTER_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018068 WCSS_A_TXFIR_COEFF_QUARTER_23**Type:** RW**Reset State:** 0x000C

2's complement 10-bit OFDM quarter-band FIR coefficient 23

WCSS_A_TXFIR_COEFF_QUARTER_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01806C WCSS_A_TXFIR_COEFF_QUARTER_24**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 24

WCSS_A_TXFIR_COEFF_QUARTER_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018070 WCSS_A_TXFIR_COEFF_QUARTER_25**Type:** RW**Reset State:** 0x03FC

2's complement 10-bit OFDM quarter-band FIR coefficient 25

WCSS_A_TXFIR_COEFF_QUARTER_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018074 WCSS_A_TXFIR_COEFF_QUARTER_26**Type:** RW**Reset State:** 0x03F9

2's complement 10-bit OFDM quarter-band FIR coefficient 26

WCSS_A_TXFIR_COEFF_QUARTER_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018078 WCSS_A_TXFIR_COEFF_QUARTER_27**Type:** RW**Reset State:** 0x03F8

2's complement 10-bit OFDM quarter-band FIR coefficient 27

WCSS_A_TXFIR_COEFF_QUARTER_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01807C WCSS_A_TXFIR_COEFF_QUARTER_28**Type:** RW**Reset State:** 0x03F7

2's complement 10-bit OFDM quarter-band FIR coefficient 28

WCSS_A_TXFIR_COEFF_QUARTER_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018080 WCSS_A_TXFIR_COEFF_QUARTER_29**Type:** RW**Reset State:** 0x03F8

2's complement 10-bit OFDM quarter-band FIR coefficient 29

WCSS_A_TXFIR_COEFF_QUARTER_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018084 WCSS_A_TXFIR_COEFF_QUARTER_30**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 30

WCSS_A_TXFIR_COEFF_QUARTER_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018088 WCSS_A_TXFIR_COEFF_QUARTER_31**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 31

WCSS_A_TXFIR_COEFF_QUARTER_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01808C WCSS_A_TXFIR_COEFF_QUARTER_32**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 32

WCSS_A_TXFIR_COEFF_QUARTER_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018090 WCSS_A_TXFIR_COEFF_QUARTER_33**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 33

WCSS_A_TXFIR_COEFF_QUARTER_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018094 WCSS_A_TXFIR_COEFF_QUARTER_34**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 34

WCSS_A_TXFIR_COEFF_QUARTER_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018098 WCSS_A_TXFIR_COEFF_QUARTER_35**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 35

WCSS_A_TXFIR_COEFF_QUARTER_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01809C WCSS_A_TXFIR_COEFF_QUARTER_36**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 36

WCSS_A_TXFIR_COEFF_QUARTER_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180A0 WCSS_A_TXFIR_COEFF_QUARTER_37**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 37

WCSS_A_TXFIR_COEFF_QUARTER_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180A4 WCSS_A_TXFIR_COEFF_QUARTER_38**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 38

WCSS_A_TXFIR_COEFF_QUARTER_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180A8 WCSS_A_TXFIR_COEFF_QUARTER_39**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 39

WCSS_A_TXFIR_COEFF_QUARTER_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180AC WCSS_A_TXFIR_COEFF_QUARTER_40**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 40

WCSS_A_TXFIR_COEFF_QUARTER_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180B0 WCSS_A_TXFIR_COEFF_QUARTER_41**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM quarter-band FIR coefficient 41

WCSS_A_TXFIR_COEFF_QUARTER_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180B4 WCSS_A_TXFIR_COEFF_HALF_0**Type:** RW**Reset State:** 0x003D

2's complement 10-bit OFDM half-band FIR coefficient 0

WCSS_A_TXFIR_COEFF_HALF_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180B8 WCSS_A_TXFIR_COEFF_HALF_1**Type:** RW**Reset State:** 0x0052

2's complement 10-bit OFDM half-band FIR coefficient 1

WCSS_A_TXFIR_COEFF_HALF_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180BC WCSS_A_TXFIR_COEFF_HALF_2**Type:** RW**Reset State:** 0x009B

2's complement 10-bit OFDM half-band FIR coefficient 2

WCSS_A_TXFIR_COEFF_HALF_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180C0 WCSS_A_TXFIR_COEFF_HALF_3**Type:** RW**Reset State:** 0x005A

2's complement 10-bit OFDM half-band FIR coefficient 3

WCSS_A_TXFIR_COEFF_HALF_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180C4 WCSS_A_TXFIR_COEFF_HALF_4**Type:** RW**Reset State:** 0x0095

2's complement 10-bit OFDM half-band FIR coefficient 4

WCSS_A_TXFIR_COEFF_HALF_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180C8 WCSS_A_TXFIR_COEFF_HALF_5**Type:** RW**Reset State:** 0x006B

2's complement 10-bit OFDM half-band FIR coefficient 5

WCSS_A_TXFIR_COEFF_HALF_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180CC WCSS_A_TXFIR_COEFF_HALF_6**Type:** RW**Reset State:** 0x00BF

2's complement 10-bit OFDM half-band FIR coefficient 6

WCSS_A_TXFIR_COEFF_HALF_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180D0 WCSS_A_TXFIR_COEFF_HALF_7**Type:** RW**Reset State:** 0x0094

2's complement 10-bit OFDM half-band FIR coefficient 7

WCSS_A_TXFIR_COEFF_HALF_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180D4 WCSS_A_TXFIR_COEFF_HALF_8**Type:** RW**Reset State:** 0x009B

2's complement 10-bit OFDM half-band FIR coefficient 8

WCSS_A_TXFIR_COEFF_HALF_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180D8 WCSS_A_TXFIR_COEFF_HALF_9**Type:** RW**Reset State:** 0x0085

2's complement 10-bit OFDM half-band FIR coefficient 9

WCSS_A_TXFIR_COEFF_HALF_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180DC WCSS_A_TXFIR_COEFF_HALF_10**Type:** RW**Reset State:** 0x007A

2's complement 10-bit OFDM half-band FIR coefficient 10

WCSS_A_TXFIR_COEFF_HALF_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180E0 WCSS_A_TXFIR_COEFF_HALF_11**Type:** RW**Reset State:** 0x0071

2's complement 10-bit OFDM half-band FIR coefficient 11

WCSS_A_TXFIR_COEFF_HALF_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180E4 WCSS_A_TXFIR_COEFF_HALF_12**Type:** RW**Reset State:** 0x0038

2's complement 10-bit OFDM half-band FIR coefficient 12

WCSS_A_TXFIR_COEFF_HALF_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180E8 WCSS_A_TXFIR_COEFF_HALF_13**Type:** RW**Reset State:** 0x0027

2's complement 10-bit OFDM half-band FIR coefficient 13

WCSS_A_TXFIR_COEFF_HALF_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180EC WCSS_A_TXFIR_COEFF_HALF_14**Type:** RW**Reset State:** 0x0025

2's complement 10-bit OFDM half-band FIR coefficient 14

WCSS_A_TXFIR_COEFF_HALF_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180F0 WCSS_A_TXFIR_COEFF_HALF_15**Type:** RW**Reset State:** 0x001F

2's complement 10-bit OFDM half-band FIR coefficient 15

WCSS_A_TXFIR_COEFF_HALF_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180F4 WCSS_A_TXFIR_COEFF_HALF_16**Type:** RW**Reset State:** 0x000B

2's complement 10-bit OFDM half-band FIR coefficient 16

WCSS_A_TXFIR_COEFF_HALF_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180F8 WCSS_A_TXFIR_COEFF_HALF_17**Type:** RW**Reset State:** 0x03C9

2's complement 10-bit OFDM half-band FIR coefficient 17

WCSS_A_TXFIR_COEFF_HALF_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0180FC WCSS_A_TXFIR_COEFF_HALF_18**Type:** RW**Reset State:** 0x03D0

2's complement 10-bit OFDM half-band FIR coefficient 18

WCSS_A_TXFIR_COEFF_HALF_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018100 WCSS_A_TXFIR_COEFF_HALF_19**Type:** RW**Reset State:** 0x03D8

2's complement 10-bit OFDM half-band FIR coefficient 19

WCSS_A_TXFIR_COEFF_HALF_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018104 WCSS_A_TXFIR_COEFF_HALF_20**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 20

WCSS_A_TXFIR_COEFF_HALF_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018108 WCSS_A_TXFIR_COEFF_HALF_21**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 21

WCSS_A_TXFIR_COEFF_HALF_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01810C WCSS_A_TXFIR_COEFF_HALF_22**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 22

WCSS_A_TXFIR_COEFF_HALF_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018110 WCSS_A_TXFIR_COEFF_HALF_23**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 23

WCSS_A_TXFIR_COEFF_HALF_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018114 WCSS_A_TXFIR_COEFF_HALF_24**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 24

WCSS_A_TXFIR_COEFF_HALF_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018118 WCSS_A_TXFIR_COEFF_HALF_25**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 25

WCSS_A_TXFIR_COEFF_HALF_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01811C WCSS_A_TXFIR_COEFF_HALF_26**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 26

WCSS_A_TXFIR_COEFF_HALF_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018120 WCSS_A_TXFIR_COEFF_HALF_27**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 27

WCSS_A_TXFIR_COEFF_HALF_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018124 WCSS_A_TXFIR_COEFF_HALF_28**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 28

WCSS_A_TXFIR_COEFF_HALF_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018128 WCSS_A_TXFIR_COEFF_HALF_29**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 29

WCSS_A_TXFIR_COEFF_HALF_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01812C WCSS_A_TXFIR_COEFF_HALF_30**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 30

WCSS_A_TXFIR_COEFF_HALF_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018130 WCSS_A_TXFIR_COEFF_HALF_31**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 31

WCSS_A_TXFIR_COEFF_HALF_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018134 WCSS_A_TXFIR_COEFF_HALF_32**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 32

WCSS_A_TXFIR_COEFF_HALF_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018138 WCSS_A_TXFIR_COEFF_HALF_33**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 33

WCSS_A_TXFIR_COEFF_HALF_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01813C WCSS_A_TXFIR_COEFF_HALF_34**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 34

WCSS_A_TXFIR_COEFF_HALF_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018140 WCSS_A_TXFIR_COEFF_HALF_35**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 35

WCSS_A_TXFIR_COEFF_HALF_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018144 WCSS_A_TXFIR_COEFF_HALF_36**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 36

WCSS_A_TXFIR_COEFF_HALF_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018148 WCSS_A_TXFIR_COEFF_HALF_37**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 37

WCSS_A_TXFIR_COEFF_HALF_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01814C WCSS_A_TXFIR_COEFF_HALF_38**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 38

WCSS_A_TXFIR_COEFF_HALF_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018150 WCSS_A_TXFIR_COEFF_HALF_39**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 39

WCSS_A_TXFIR_COEFF_HALF_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018154 WCSS_A_TXFIR_COEFF_HALF_40**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 40

WCSS_A_TXFIR_COEFF_HALF_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018158 WCSS_A_TXFIR_COEFF_HALF_41**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM half-band FIR coefficient 41

WCSS_A_TXFIR_COEFF_HALF_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01815C WCSS_A_TXFIR_COEFF_FULL_0**Type:** RW**Reset State:** 0x0030

2's complement 10-bit OFDM full-band FIR coefficient 0

WCSS_A_TXFIR_COEFF_FULL_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018160 WCSS_A_TXFIR_COEFF_FULL_1**Type:** RW**Reset State:** 0x0072

2's complement 10-bit OFDM full-band FIR coefficient 1

WCSS_A_TXFIR_COEFF_FULL_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018164 WCSS_A_TXFIR_COEFF_FULL_2**Type:** RW**Reset State:** 0x00E2

2's complement 10-bit OFDM full-band FIR coefficient 2

WCSS_A_TXFIR_COEFF_FULL_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018168 WCSS_A_TXFIR_COEFF_FULL_3**Type:** RW**Reset State:** 0x0104

2's complement 10-bit OFDM full-band FIR coefficient 3

WCSS_A_TXFIR_COEFF_FULL_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01816C WCSS_A_TXFIR_COEFF_FULL_4**Type:** RW**Reset State:** 0x0126

2's complement 10-bit OFDM full-band FIR coefficient 4

WCSS_A_TXFIR_COEFF_FULL_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018170 WCSS_A_TXFIR_COEFF_FULL_5**Type:** RW**Reset State:** 0x00EB

2's complement 10-bit OFDM full-band FIR coefficient 5

WCSS_A_TXFIR_COEFF_FULL_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018174 WCSS_A_TXFIR_COEFF_FULL_6**Type:** RW**Reset State:** 0x00F4

2's complement 10-bit OFDM full-band FIR coefficient 6

WCSS_A_TXFIR_COEFF_FULL_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018178 WCSS_A_TXFIR_COEFF_FULL_7**Type:** RW**Reset State:** 0x00A8

2's complement 10-bit OFDM full-band FIR coefficient 7

WCSS_A_TXFIR_COEFF_FULL_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01817C WCSS_A_TXFIR_COEFF_FULL_8**Type:** RW**Reset State:** 0x0086

2's complement 10-bit OFDM full-band FIR coefficient 8

WCSS_A_TXFIR_COEFF_FULL_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018180 WCSS_A_TXFIR_COEFF_FULL_9**Type:** RW**Reset State:** 0x0004

2's complement 10-bit OFDM full-band FIR coefficient 9

WCSS_A_TXFIR_COEFF_FULL_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018184 WCSS_A_TXFIR_COEFF_FULL_10**Type:** RW**Reset State:** 0x03D3

2's complement 10-bit OFDM full-band FIR coefficient 10

WCSS_A_TXFIR_COEFF_FULL_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018188 WCSS_A_TXFIR_COEFF_FULL_11**Type:** RW**Reset State:** 0x039A

2's complement 10-bit OFDM full-band FIR coefficient 11

WCSS_A_TXFIR_COEFF_FULL_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01818C WCSS_A_TXFIR_COEFF_FULL_12**Type:** RW**Reset State:** 0x03B8

2's complement 10-bit OFDM full-band FIR coefficient 12

WCSS_A_TXFIR_COEFF_FULL_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018190 WCSS_A_TXFIR_COEFF_FULL_13**Type:** RW**Reset State:** 0x03C0

2's complement 10-bit OFDM full-band FIR coefficient 13

WCSS_A_TXFIR_COEFF_FULL_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018194 WCSS_A_TXFIR_COEFF_FULL_14**Type:** RW**Reset State:** 0x03E6

2's complement 10-bit OFDM full-band FIR coefficient 14

WCSS_A_TXFIR_COEFF_FULL_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018198 WCSS_A_TXFIR_COEFF_FULL_15**Type:** RW**Reset State:** 0x0002

2's complement 10-bit OFDM full-band FIR coefficient 15

WCSS_A_TXFIR_COEFF_FULL_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01819C WCSS_A_TXFIR_COEFF_FULL_16**Type:** RW**Reset State:** 0x0020

2's complement 10-bit OFDM full-band FIR coefficient 16

WCSS_A_TXFIR_COEFF_FULL_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181A0 WCSS_A_TXFIR_COEFF_FULL_17**Type:** RW**Reset State:** 0x002B

2's complement 10-bit OFDM full-band FIR coefficient 17

WCSS_A_TXFIR_COEFF_FULL_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181A4 WCSS_A_TXFIR_COEFF_FULL_18**Type:** RW**Reset State:** 0x001C

2's complement 10-bit OFDM full-band FIR coefficient 18

WCSS_A_TXFIR_COEFF_FULL_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181A8 WCSS_A_TXFIR_COEFF_FULL_19**Type:** RW**Reset State:** 0x000B

2's complement 10-bit OFDM full-band FIR coefficient 19

WCSS_A_TXFIR_COEFF_FULL_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181AC WCSS_A_TXFIR_COEFF_FULL_20**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 20

WCSS_A_TXFIR_COEFF_FULL_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181B0 WCSS_A_TXFIR_COEFF_FULL_21**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 21

WCSS_A_TXFIR_COEFF_FULL_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181B4 WCSS_A_TXFIR_COEFF_FULL_22**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 22

WCSS_A_TXFIR_COEFF_FULL_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181B8 WCSS_A_TXFIR_COEFF_FULL_23**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 23

WCSS_A_TXFIR_COEFF_FULL_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181BC WCSS_A_TXFIR_COEFF_FULL_24**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 24

WCSS_A_TXFIR_COEFF_FULL_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181C0 WCSS_A_TXFIR_COEFF_FULL_25**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 25

WCSS_A_TXFIR_COEFF_FULL_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181C4 WCSS_A_TXFIR_COEFF_FULL_26**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 26

WCSS_A_TXFIR_COEFF_FULL_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181C8 WCSS_A_TXFIR_COEFF_FULL_27**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 27

WCSS_A_TXFIR_COEFF_FULL_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181CC WCSS_A_TXFIR_COEFF_FULL_28**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 28

WCSS_A_TXFIR_COEFF_FULL_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181D0 WCSS_A_TXFIR_COEFF_FULL_29**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 29

WCSS_A_TXFIR_COEFF_FULL_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181D4 WCSS_A_TXFIR_COEFF_FULL_30**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 30

WCSS_A_TXFIR_COEFF_FULL_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181D8 WCSS_A_TXFIR_COEFF_FULL_31**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 31

WCSS_A_TXFIR_COEFF_FULL_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181DC WCSS_A_TXFIR_COEFF_FULL_32**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 32

WCSS_A_TXFIR_COEFF_FULL_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181E0 WCSS_A_TXFIR_COEFF_FULL_33**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 33

WCSS_A_TXFIR_COEFF_FULL_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181E4 WCSS_A_TXFIR_COEFF_FULL_34**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 34

WCSS_A_TXFIR_COEFF_FULL_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181E8 WCSS_A_TXFIR_COEFF_FULL_35**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 35

WCSS_A_TXFIR_COEFF_FULL_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181EC WCSS_A_TXFIR_COEFF_FULL_36**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 36

WCSS_A_TXFIR_COEFF_FULL_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181F0 WCSS_A_TXFIR_COEFF_FULL_37**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 37

WCSS_A_TXFIR_COEFF_FULL_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181F4 WCSS_A_TXFIR_COEFF_FULL_38**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 38

WCSS_A_TXFIR_COEFF_FULL_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181F8 WCSS_A_TXFIR_COEFF_FULL_39**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 39

WCSS_A_TXFIR_COEFF_FULL_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0181FC WCSS_A_TXFIR_COEFF_FULL_40**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 40

WCSS_A_TXFIR_COEFF_FULL_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018200 WCSS_A_TXFIR_COEFF_FULL_41**Type:** RW**Reset State:** 0x0000

2's complement 10-bit OFDM full-band FIR coefficient 41

WCSS_A_TXFIR_COEFF_FULL_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018204 WCSS_A_TXFIR_COEFF_TXB_20_0**Type:** RW**Reset State:** 0x0014

2's complement 10-bit Tx-B FIR20 coefficient 0

WCSS_A_TXFIR_COEFF_TXB_20_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018208 WCSS_A_TXFIR_COEFF_TXB_20_1**Type:** RW**Reset State:** 0x003D

2's complement 10-bit Tx-B FIR20 coefficient 1

WCSS_A_TXFIR_COEFF_TXB_20_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01820C WCSS_A_TXFIR_COEFF_TXB_20_2**Type:** RW**Reset State:** 0x007A

2's complement 10-bit Tx-B FIR20 coefficient 2

WCSS_A_TXFIR_COEFF_TXB_20_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018210 WCSS_A_TXFIR_COEFF_TXB_20_3**Type:** RW**Reset State:** 0x00C2

2's complement 10-bit Tx-B FIR20 coefficient 3

WCSS_A_TXFIR_COEFF_TXB_20_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018214 WCSS_A_TXFIR_COEFF_TXB_20_4**Type:** RW**Reset State:** 0x00FD

2's complement 10-bit Tx-B FIR20 coefficient 4

WCSS_A_TXFIR_COEFF_TXB_20_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018218 WCSS_A_TXFIR_COEFF_TXB_20_5**Type:** RW**Reset State:** 0x0114

2's complement 10-bit Tx-B FIR20 coefficient 5

WCSS_A_TXFIR_COEFF_TXB_20_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01821C WCSS_A_TXFIR_COEFF_TXB_20_6**Type:** RW**Reset State:** 0x00FD

2's complement 10-bit Tx-B FIR20 coefficient 6

WCSS_A_TXFIR_COEFF_TXB_20_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018220 WCSS_A_TXFIR_COEFF_TXB_20_7**Type:** RW**Reset State:** 0x00BF

2's complement 10-bit Tx-B FIR20 coefficient 7

WCSS_A_TXFIR_COEFF_TXB_20_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018224 WCSS_A_TXFIR_COEFF_TXB_20_8**Type:** RW**Reset State:** 0x0072

2's complement 10-bit Tx-B FIR20 coefficient 8

WCSS_A_TXFIR_COEFF_TXB_20_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018228 WCSS_A_TXFIR_COEFF_TXB_20_9**Type:** RW**Reset State:** 0x0030

2's complement 10-bit Tx-B FIR20 coefficient 9

WCSS_A_TXFIR_COEFF_TXB_20_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01822C WCSS_A_TXFIR_COEFF_TXB_20_10**Type:** RW**Reset State:** 0x000A

2's complement 10-bit Tx-B FIR20 coefficient 10

WCSS_A_TXFIR_COEFF_TXB_20_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018230 WCSS_A_TXFIR_COEFF_TXB_20_11**Type:** RW**Reset State:** 0x03FA

2's complement 10-bit Tx-B FIR20 coefficient 11

WCSS_A_TXFIR_COEFF_TXB_20_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018234 WCSS_A_TXFIR_COEFF_TXB_20_12**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 12

WCSS_A_TXFIR_COEFF_TXB_20_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018238 WCSS_A_TXFIR_COEFF_TXB_20_13**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 13

WCSS_A_TXFIR_COEFF_TXB_20_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01823C WCSS_A_TXFIR_COEFF_TXB_20_14**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 14

WCSS_A_TXFIR_COEFF_TXB_20_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018240 WCSS_A_TXFIR_COEFF_TXB_20_15**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR20 coefficient 15

WCSS_A_TXFIR_COEFF_TXB_20_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018244 WCSS_A_TXFIR_COEFF_TXB_40_0**Type:** RW**Reset State:** 0x0008

2's complement 10-bit Tx-B FIR40 coefficient 0

WCSS_A_TXFIR_COEFF_TXB_40_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018248 WCSS_A_TXFIR_COEFF_TXB_40_1**Type:** RW**Reset State:** 0x000E

2's complement 10-bit Tx-B FIR40 coefficient 1

WCSS_A_TXFIR_COEFF_TXB_40_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01824C WCSS_A_TXFIR_COEFF_TXB_40_2**Type:** RW**Reset State:** 0x0018

2's complement 10-bit Tx-B FIR40 coefficient 2

WCSS_A_TXFIR_COEFF_TXB_40_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018250 WCSS_A_TXFIR_COEFF_TXB_40_3**Type:** RW**Reset State:** 0x0025

2's complement 10-bit Tx-B FIR40 coefficient 3

WCSS_A_TXFIR_COEFF_TXB_40_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018254 WCSS_A_TXFIR_COEFF_TXB_40_4**Type:** RW**Reset State:** 0x0035

2's complement 10-bit Tx-B FIR40 coefficient 4

WCSS_A_TXFIR_COEFF_TXB_40_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018258 WCSS_A_TXFIR_COEFF_TXB_40_5**Type:** RW**Reset State:** 0x0046

2's complement 10-bit Tx-B FIR40 coefficient 5

WCSS_A_TXFIR_COEFF_TXB_40_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01825C WCSS_A_TXFIR_COEFF_TXB_40_6**Type:** RW**Reset State:** 0x0058

2's complement 10-bit Tx-B FIR40 coefficient 6

WCSS_A_TXFIR_COEFF_TXB_40_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018260 WCSS_A_TXFIR_COEFF_TXB_40_7**Type:** RW**Reset State:** 0x0069

2's complement 10-bit Tx-B FIR40 coefficient 7

WCSS_A_TXFIR_COEFF_TXB_40_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018264 WCSS_A_TXFIR_COEFF_TXB_40_8**Type:** RW**Reset State:** 0x0078

2's complement 10-bit Tx-B FIR40 coefficient 8

WCSS_A_TXFIR_COEFF_TXB_40_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018268 WCSS_A_TXFIR_COEFF_TXB_40_9**Type:** RW**Reset State:** 0x0083

2's complement 10-bit Tx-B FIR40 coefficient 9

WCSS_A_TXFIR_COEFF_TXB_40_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01826C WCSS_A_TXFIR_COEFF_TXB_40_10**Type:** RW**Reset State:** 0x0089

2's complement 10-bit Tx-B FIR40 coefficient 10

WCSS_A_TXFIR_COEFF_TXB_40_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018270 WCSS_A_TXFIR_COEFF_TXB_40_11**Type:** RW**Reset State:** 0x0089

2's complement 10-bit Tx-B FIR40 coefficient 11

WCSS_A_TXFIR_COEFF_TXB_40_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018274 WCSS_A_TXFIR_COEFF_TXB_40_12**Type:** RW**Reset State:** 0x0083

2's complement 10-bit Tx-B FIR40 coefficient 12

WCSS_A_TXFIR_COEFF_TXB_40_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018278 WCSS_A_TXFIR_COEFF_TXB_40_13**Type:** RW**Reset State:** 0x0078

2's complement 10-bit Tx-B FIR40 coefficient 13

WCSS_A_TXFIR_COEFF_TXB_40_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01827C WCSS_A_TXFIR_COEFF_TXB_40_14**Type:** RW**Reset State:** 0x0069

2's complement 10-bit Tx-B FIR40 coefficient 14

WCSS_A_TXFIR_COEFF_TXB_40_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018280 WCSS_A_TXFIR_COEFF_TXB_40_15**Type:** RW**Reset State:** 0x0056

2's complement 10-bit Tx-B FIR40 coefficient 15

WCSS_A_TXFIR_COEFF_TXB_40_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018284 WCSS_A_TXFIR_COEFF_TXB_40_16**Type:** RW**Reset State:** 0x0043

2's complement 10-bit Tx-B FIR40 coefficient 16

WCSS_A_TXFIR_COEFF_TXB_40_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018288 WCSS_A_TXFIR_COEFF_TXB_40_17**Type:** RW**Reset State:** 0x0030

2's complement 10-bit Tx-B FIR40 coefficient 17

WCSS_A_TXFIR_COEFF_TXB_40_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01828C WCSS_A_TXFIR_COEFF_TXB_40_18**Type:** RW**Reset State:** 0x001F

2's complement 10-bit Tx-B FIR40 coefficient 18

WCSS_A_TXFIR_COEFF_TXB_40_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018290 WCSS_A_TXFIR_COEFF_TXB_40_19**Type:** RW**Reset State:** 0x0012

2's complement 10-bit Tx-B FIR40 coefficient 19

WCSS_A_TXFIR_COEFF_TXB_40_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018294 WCSS_A_TXFIR_COEFF_TXB_40_20**Type:** RW**Reset State:** 0x0008

2's complement 10-bit Tx-B FIR40 coefficient 20

WCSS_A_TXFIR_COEFF_TXB_40_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018298 WCSS_A_TXFIR_COEFF_TXB_40_21**Type:** RW**Reset State:** 0x0002

2's complement 10-bit Tx-B FIR40 coefficient 21

WCSS_A_TXFIR_COEFF_TXB_40_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01829C WCSS_A_TXFIR_COEFF_TXB_40_22**Type:** RW**Reset State:** 0x03FF

2's complement 10-bit Tx-B FIR40 coefficient 22

WCSS_A_TXFIR_COEFF_TXB_40_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182A0 WCSS_A_TXFIR_COEFF_TXB_40_23**Type:** RW**Reset State:** 0x03FB

2's complement 10-bit Tx-B FIR40 coefficient 23

WCSS_A_TXFIR_COEFF_TXB_40_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182A4 WCSS_A_TXFIR_COEFF_TXB_40_24**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 24

WCSS_A_TXFIR_COEFF_TXB_40_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182A8 WCSS_A_TXFIR_COEFF_TXB_40_25**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 25

WCSS_A_TXFIR_COEFF_TXB_40_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182AC WCSS_A_TXFIR_COEFF_TXB_40_26**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 26

WCSS_A_TXFIR_COEFF_TXB_40_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182B0 WCSS_A_TXFIR_COEFF_TXB_40_27**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 27

WCSS_A_TXFIR_COEFF_TXB_40_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182B4 WCSS_A_TXFIR_COEFF_TXB_40_28**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 28

WCSS_A_TXFIR_COEFF_TXB_40_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182B8 WCSS_A_TXFIR_COEFF_TXB_40_29**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 29

WCSS_A_TXFIR_COEFF_TXB_40_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182BC WCSS_A_TXFIR_COEFF_TXB_40_30**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 30

WCSS_A_TXFIR_COEFF_TXB_40_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182C0 WCSS_A_TXFIR_COEFF_TXB_40_31**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR40 coefficient 31

WCSS_A_TXFIR_COEFF_TXB_40_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182C4 WCSS_A_TXFIR_COEFF_TXB_80_0**Type:** RW**Reset State:** 0x0005

2's complement 10-bit Tx-B FIR80 coefficient 0

WCSS_A_TXFIR_COEFF_TXB_80_0

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182C8 WCSS_A_TXFIR_COEFF_TXB_80_1**Type:** RW**Reset State:** 0x0005

2's complement 10-bit Tx-B FIR80 coefficient 1

WCSS_A_TXFIR_COEFF_TXB_80_1

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182CC WCSS_A_TXFIR_COEFF_TXB_80_2**Type:** RW**Reset State:** 0x0006

2's complement 10-bit Tx-B FIR80 coefficient 2

WCSS_A_TXFIR_COEFF_TXB_80_2

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182D0 WCSS_A_TXFIR_COEFF_TXB_80_3**Type:** RW**Reset State:** 0x0009

2's complement 10-bit Tx-B FIR80 coefficient 3

WCSS_A_TXFIR_COEFF_TXB_80_3

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182D4 WCSS_A_TXFIR_COEFF_TXB_80_4**Type:** RW**Reset State:** 0x000B

2's complement 10-bit Tx-B FIR80 coefficient 4

WCSS_A_TXFIR_COEFF_TXB_80_4

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182D8 WCSS_A_TXFIR_COEFF_TXB_80_5**Type:** RW**Reset State:** 0x000E

2's complement 10-bit Tx-B FIR80 coefficient 5

WCSS_A_TXFIR_COEFF_TXB_80_5

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182DC WCSS_A_TXFIR_COEFF_TXB_80_6**Type:** RW**Reset State:** 0x0012

2's complement 10-bit Tx-B FIR80 coefficient 6

WCSS_A_TXFIR_COEFF_TXB_80_6

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182E0 WCSS_A_TXFIR_COEFF_TXB_80_7**Type:** RW**Reset State:** 0x0016

2's complement 10-bit Tx-B FIR80 coefficient 7

WCSS_A_TXFIR_COEFF_TXB_80_7

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182E4 WCSS_A_TXFIR_COEFF_TXB_80_8**Type:** RW**Reset State:** 0x0019

2's complement 10-bit Tx-B FIR80 coefficient 8

WCSS_A_TXFIR_COEFF_TXB_80_8

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182E8 WCSS_A_TXFIR_COEFF_TXB_80_9**Type:** RW**Reset State:** 0x001E

2's complement 10-bit Tx-B FIR80 coefficient 9

WCSS_A_TXFIR_COEFF_TXB_80_9

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182EC WCSS_A_TXFIR_COEFF_TXB_80_10**Type:** RW**Reset State:** 0x0022

2's complement 10-bit Tx-B FIR80 coefficient 10

WCSS_A_TXFIR_COEFF_TXB_80_10

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182F0 WCSS_A_TXFIR_COEFF_TXB_80_11**Type:** RW**Reset State:** 0x0027

2's complement 10-bit Tx-B FIR80 coefficient 11

WCSS_A_TXFIR_COEFF_TXB_80_11

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182F4 WCSS_A_TXFIR_COEFF_TXB_80_12**Type:** RW**Reset State:** 0x002B

2's complement 10-bit Tx-B FIR80 coefficient 12

WCSS_A_TXFIR_COEFF_TXB_80_12

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182F8 WCSS_A_TXFIR_COEFF_TXB_80_13**Type:** RW**Reset State:** 0x002F

2's complement 10-bit Tx-B FIR80 coefficient 13

WCSS_A_TXFIR_COEFF_TXB_80_13

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0182FC WCSS_A_TXFIR_COEFF_TXB_80_14**Type:** RW**Reset State:** 0x0034

2's complement 10-bit Tx-B FIR80 coefficient 14

WCSS_A_TXFIR_COEFF_TXB_80_14

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018300 WCSS_A_TXFIR_COEFF_TXB_80_15**Type:** RW**Reset State:** 0x0038

2's complement 10-bit Tx-B FIR80 coefficient 15

WCSS_A_TXFIR_COEFF_TXB_80_15

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018304 WCSS_A_TXFIR_COEFF_TXB_80_16**Type:** RW**Reset State:** 0x003B

2's complement 10-bit Tx-B FIR80 coefficient 16

WCSS_A_TXFIR_COEFF_TXB_80_16

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018308 WCSS_A_TXFIR_COEFF_TXB_80_17**Type:** RW**Reset State:** 0x003E

2's complement 10-bit Tx-B FIR80 coefficient 17

WCSS_A_TXFIR_COEFF_TXB_80_17

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01830C WCSS_A_TXFIR_COEFF_TXB_80_18**Type:** RW**Reset State:** 0x0041

2's complement 10-bit Tx-B FIR80 coefficient 18

WCSS_A_TXFIR_COEFF_TXB_80_18

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018310 WCSS_A_TXFIR_COEFF_TXB_80_19**Type:** RW**Reset State:** 0x0043

2's complement 10-bit Tx-B FIR80 coefficient 19

WCSS_A_TXFIR_COEFF_TXB_80_19

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018314 WCSS_A_TXFIR_COEFF_TXB_80_20**Type:** RW**Reset State:** 0x0044

2's complement 10-bit Tx-B FIR80 coefficient 20

WCSS_A_TXFIR_COEFF_TXB_80_20

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018318 WCSS_A_TXFIR_COEFF_TXB_80_21**Type:** RW**Reset State:** 0x0045

2's complement 10-bit Tx-B FIR80 coefficient 21

WCSS_A_TXFIR_COEFF_TXB_80_21

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01831C WCSS_A_TXFIR_COEFF_TXB_80_22**Type:** RW**Reset State:** 0x0045

2's complement 10-bit Tx-B FIR80 coefficient 22

WCSS_A_TXFIR_COEFF_TXB_80_22

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018320 WCSS_A_TXFIR_COEFF_TXB_80_23**Type:** RW**Reset State:** 0x0044

2's complement 10-bit Tx-B FIR80 coefficient 23

WCSS_A_TXFIR_COEFF_TXB_80_23

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018324 WCSS_A_TXFIR_COEFF_TXB_80_24**Type:** RW**Reset State:** 0x0042

2's complement 10-bit Tx-B FIR80 coefficient 24

WCSS_A_TXFIR_COEFF_TXB_80_24

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018328 WCSS_A_TXFIR_COEFF_TXB_80_25**Type:** RW**Reset State:** 0x0040

2's complement 10-bit Tx-B FIR80 coefficient 25

WCSS_A_TXFIR_COEFF_TXB_80_25

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01832C WCSS_A_TXFIR_COEFF_TXB_80_26**Type:** RW**Reset State:** 0x003D

2's complement 10-bit Tx-B FIR80 coefficient 26

WCSS_A_TXFIR_COEFF_TXB_80_26

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018330 WCSS_A_TXFIR_COEFF_TXB_80_27**Type:** RW**Reset State:** 0x0039

2's complement 10-bit Tx-B FIR80 coefficient 27

WCSS_A_TXFIR_COEFF_TXB_80_27

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018334 WCSS_A_TXFIR_COEFF_TXB_80_28**Type:** RW**Reset State:** 0x0035

2's complement 10-bit Tx-B FIR80 coefficient 28

WCSS_A_TXFIR_COEFF_TXB_80_28

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018338 WCSS_A_TXFIR_COEFF_TXB_80_29**Type:** RW**Reset State:** 0x0031

2's complement 10-bit Tx-B FIR80 coefficient 29

WCSS_A_TXFIR_COEFF_TXB_80_29

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01833C WCSS_A_TXFIR_COEFF_TXB_80_30**Type:** RW**Reset State:** 0x002C

2's complement 10-bit Tx-B FIR80 coefficient 30

WCSS_A_TXFIR_COEFF_TXB_80_30

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018340 WCSS_A_TXFIR_COEFF_TXB_80_31**Type:** RW**Reset State:** 0x0027

2's complement 10-bit Tx-B FIR80 coefficient 31

WCSS_A_TXFIR_COEFF_TXB_80_31

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018344 WCSS_A_TXFIR_COEFF_TXB_80_32**Type:** RW**Reset State:** 0x0023

2's complement 10-bit Tx-B FIR80 coefficient 32

WCSS_A_TXFIR_COEFF_TXB_80_32

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018348 WCSS_A_TXFIR_COEFF_TXB_80_33**Type:** RW**Reset State:** 0x001E

2's complement 10-bit Tx-B FIR80 coefficient 33

WCSS_A_TXFIR_COEFF_TXB_80_33

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01834C WCSS_A_TXFIR_COEFF_TXB_80_34**Type:** RW**Reset State:** 0x0019

2's complement 10-bit Tx-B FIR80 coefficient 34

WCSS_A_TXFIR_COEFF_TXB_80_34

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018350 WCSS_A_TXFIR_COEFF_TXB_80_35**Type:** RW**Reset State:** 0x0015

2's complement 10-bit Tx-B FIR80 coefficient 35

WCSS_A_TXFIR_COEFF_TXB_80_35

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018354 WCSS_A_TXFIR_COEFF_TXB_80_36**Type:** RW**Reset State:** 0x0011

2's complement 10-bit Tx-B FIR80 coefficient 36

WCSS_A_TXFIR_COEFF_TXB_80_36

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018358 WCSS_A_TXFIR_COEFF_TXB_80_37**Type:** RW**Reset State:** 0x000D

2's complement 10-bit Tx-B FIR80 coefficient 37

WCSS_A_TXFIR_COEFF_TXB_80_37

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01835C WCSS_A_TXFIR_COEFF_TXB_80_38**Type:** RW**Reset State:** 0x000A

2's complement 10-bit Tx-B FIR80 coefficient 38

WCSS_A_TXFIR_COEFF_TXB_80_38

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018360 WCSS_A_TXFIR_COEFF_TXB_80_39**Type:** RW**Reset State:** 0x0007

2's complement 10-bit Tx-B FIR80 coefficient 39

WCSS_A_TXFIR_COEFF_TXB_80_39

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018364 WCSS_A_TXFIR_COEFF_TXB_80_40**Type:** RW**Reset State:** 0x0005

2's complement 10-bit Tx-B FIR80 coefficient 40

WCSS_A_TXFIR_COEFF_TXB_80_40

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018368 WCSS_A_TXFIR_COEFF_TXB_80_41**Type:** RW**Reset State:** 0x0003

2's complement 10-bit Tx-B FIR80 coefficient 41

WCSS_A_TXFIR_COEFF_TXB_80_41

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01836C WCSS_A_TXFIR_COEFF_TXB_80_42**Type:** RW**Reset State:** 0x0001

2's complement 10-bit Tx-B FIR80 coefficient 42

WCSS_A_TXFIR_COEFF_TXB_80_42

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018370 WCSS_A_TXFIR_COEFF_TXB_80_43**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 43

WCSS_A_TXFIR_COEFF_TXB_80_43

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018374 WCSS_A_TXFIR_COEFF_TXB_80_44**Type:** RW**Reset State:** 0x03FF

2's complement 10-bit Tx-B FIR80 coefficient 44

WCSS_A_TXFIR_COEFF_TXB_80_44

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018378 WCSS_A_TXFIR_COEFF_TXB_80_45**Type:** RW**Reset State:** 0x03FF

2's complement 10-bit Tx-B FIR80 coefficient 45

WCSS_A_TXFIR_COEFF_TXB_80_45

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01837C WCSS_A_TXFIR_COEFF_TXB_80_46**Type:** RW**Reset State:** 0x03FF

2's complement 10-bit Tx-B FIR80 coefficient 46

WCSS_A_TXFIR_COEFF_TXB_80_46

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018380 WCSS_A_TXFIR_COEFF_TXB_80_47**Type:** RW**Reset State:** 0x03FC

2's complement 10-bit Tx-B FIR80 coefficient 47

WCSS_A_TXFIR_COEFF_TXB_80_47

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018384 WCSS_A_TXFIR_COEFF_TXB_80_48**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 48

WCSS_A_TXFIR_COEFF_TXB_80_48

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018388 WCSS_A_TXFIR_COEFF_TXB_80_49**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 49

WCSS_A_TXFIR_COEFF_TXB_80_49

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01838C WCSS_A_TXFIR_COEFF_TXB_80_50**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 50

WCSS_A_TXFIR_COEFF_TXB_80_50

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018390 WCSS_A_TXFIR_COEFF_TXB_80_51**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 51

WCSS_A_TXFIR_COEFF_TXB_80_51

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018394 WCSS_A_TXFIR_COEFF_TXB_80_52**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 52

WCSS_A_TXFIR_COEFF_TXB_80_52

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A018398 WCSS_A_TXFIR_COEFF_TXB_80_53**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 53

WCSS_A_TXFIR_COEFF_TXB_80_53

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A01839C WCSS_A_TXFIR_COEFF_TXB_80_54**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 54

WCSS_A_TXFIR_COEFF_TXB_80_54

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183A0 WCSS_A_TXFIR_COEFF_TXB_80_55**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 55

WCSS_A_TXFIR_COEFF_TXB_80_55

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183A4 WCSS_A_TXFIR_COEFF_TXB_80_56**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 56

WCSS_A_TXFIR_COEFF_TXB_80_56

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183A8 WCSS_A_TXFIR_COEFF_TXB_80_57**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 57

WCSS_A_TXFIR_COEFF_TXB_80_57

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183AC WCSS_A_TXFIR_COEFF_TXB_80_58**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 58

WCSS_A_TXFIR_COEFF_TXB_80_58

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183B0 WCSS_A_TXFIR_COEFF_TXB_80_59**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 59

WCSS_A_TXFIR_COEFF_TXB_80_59

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183B4 WCSS_A_TXFIR_COEFF_TXB_80_60**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 60

WCSS_A_TXFIR_COEFF_TXB_80_60

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183B8 WCSS_A_TXFIR_COEFF_TXB_80_61**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 61

WCSS_A_TXFIR_COEFF_TXB_80_61

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183BC WCSS_A_TXFIR_COEFF_TXB_80_62**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 62

WCSS_A_TXFIR_COEFF_TXB_80_62

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183C0 WCSS_A_TXFIR_COEFF_TXB_80_63**Type:** RW**Reset State:** 0x0000

2's complement 10-bit Tx-B FIR80 coefficient 63

WCSS_A_TXFIR_COEFF_TXB_80_63

Bits	Name	Description
9:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183C4 WCSS_A_TXFIR_COEFF_PEAKW_0**Type:** RW**Reset State:** 0x01FE

2's complement 9-bit peak windowing FIR coefficient 0

WCSS_A_TXFIR_COEFF_PEAKW_0

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183C8 WCSS_A_TXFIR_COEFF_PEAKW_1**Type:** RW**Reset State:** 0x01FF

2's complement 9-bit peak windowing FIR coefficient 1

WCSS_A_TXFIR_COEFF_PEAKW_1

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183CC WCSS_A_TXFIR_COEFF_PEAKW_2**Type:** RW**Reset State:** 0x0000

2's complement 9-bit peak windowing FIR coefficient 2

WCSS_A_TXFIR_COEFF_PEAKW_2

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183D0 WCSS_A_TXFIR_COEFF_PEAKW_3**Type:** RW**Reset State:** 0x0003

2's complement 9-bit peak windowing FIR coefficient 3

WCSS_A_TXFIR_COEFF_PEAKW_3

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183D4 WCSS_A_TXFIR_COEFF_PEAKW_4**Type:** RW**Reset State:** 0x0006

2's complement 9-bit peak windowing FIR coefficient 4

WCSS_A_TXFIR_COEFF_PEAKW_4

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183D8 WCSS_A_TXFIR_COEFF_PEAKW_5**Type:** RW**Reset State:** 0x000B

2's complement 9-bit peak windowing FIR coefficient 5

WCSS_A_TXFIR_COEFF_PEAKW_5

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183DC WCSS_A_TXFIR_COEFF_PEAKW_6**Type:** RW**Reset State:** 0x0010

2's complement 9-bit peak windowing FIR coefficient 6

WCSS_A_TXFIR_COEFF_PEAKW_6

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183E0 WCSS_A_TXFIR_COEFF_PEAKW_7**Type:** RW**Reset State:** 0x0016

2's complement 9-bit peak windowing FIR coefficient 7

WCSS_A_TXFIR_COEFF_PEAKW_7

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183E4 WCSS_A_TXFIR_COEFF_PEAKW_8**Type:** RW**Reset State:** 0x001A

2's complement 9-bit peak windowing FIR coefficient 8

WCSS_A_TXFIR_COEFF_PEAKW_8

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183E8 WCSS_A_TXFIR_COEFF_PEAKW_9**Type:** RW**Reset State:** 0x001D

2's complement 9-bit peak windowing FIR coefficient 9

WCSS_A_TXFIR_COEFF_PEAKW_9

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183EC WCSS_A_TXFIR_COEFF_PEAKW_10**Type:** RW**Reset State:** 0x001E

2's complement 9-bit peak windowing FIR coefficient 10

WCSS_A_TXFIR_COEFF_PEAKW_10

Bits	Name	Description
8:0	COEFFVAL	2's complement scaled, quantized coefficient

0x0A0183F0 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_0**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 0

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_0

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 0

0x0A0183F4 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_1**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 1

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_1

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 1

0x0A0183F8 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_2**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 2

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_2

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 2

0x0A0183FC WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_3**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 3

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_3

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 3

0x0A018400 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_4**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 4

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_4

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 4

0x0A018404 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_5**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 5

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_5

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 5

0x0A018408 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_6**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 6

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_6

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 6

0x0A01840C WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_7**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 7

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_7

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 7

0x0A018410 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_8**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 8

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_8

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 8

0x0A018414 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_9**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 9

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_9

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 9

0x0A018418 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_10**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 10

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_10

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 10

0x0A01841C WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_11**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 11

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_11

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 11

0x0A018420 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_12**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 12

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_12

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 12

0x0A018424 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_13**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 13

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_13

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 13

0x0A018428 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_14**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 14

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_14

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 14

0x0A01842C WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_15**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 15

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_15

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 15

0x0A018430 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_16**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 16

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_16

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 16

0x0A018434 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_17**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 17

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_17

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 17

0x0A018438 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_18**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 18

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_18

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 18

0x0A01843C WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_19**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 19

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_19

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 19

0x0A018440 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_20**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 20

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_20

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 20

0x0A018444 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_21**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 21

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_21

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 21

0x0A018448 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_22**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 22

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_22

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 22

0x0A01844C WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_23**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 23

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_23

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 23

0x0A018450 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_24**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 24

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_24

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 24

0x0A018454 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_25**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 25

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_25

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 25

0x0A018458 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_26**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 26

WCSS_A_TXFIR_PEAkW_CLIP_THRESHOLD_26

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 26

0x0A01845C WCSS_A_TXFIR_PEAkW_CLIP_THRESHOLD_27**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 27

WCSS_A_TXFIR_PEAkW_CLIP_THRESHOLD_27

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 27

0x0A018460 WCSS_A_TXFIR_PEAkW_CLIP_THRESHOLD_28**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 28

WCSS_A_TXFIR_PEAkW_CLIP_THRESHOLD_28

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 28

0x0A018464 WCSS_A_TXFIR_PEAkW_CLIP_THRESHOLD_29**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 29

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_29

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 29

0x0A018468 WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_30**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 30

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_30

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 30

0x0A01846C WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_31**Type:** RW**Reset State:** 0x0032

8-bit peak windowing clip threshold for power index 31

WCSS_A_TXFIR_PEAKW_CLIP_THRESHOLD_31

Bits	Name	Description
7:0	COEFFVAL	Clip threshold for MPI power index 31

0x0A018470 WCSS_A_TXFIR_Q_INVERT**Type:** RW**Reset State:** 0x0000

Register to enable sign inversion of the Q component of each chain

WCSS_A_TXFIR_Q_INVERT

Bits	Name	Description
0	ENABLE	Per-chain enable for Q-component sign inversion of each chain

0x0A018474 WCSS_A_TXFIR_INTERP_X2**Type:** RW**Reset State:** 0x0000

Register to enable interpolation by 2 instead of 1.5. This is used for P2P emulation

WCSS_A_TXFIR_INTERP_X2

Bits	Name	Description
0	ENABLE	Interpolation-by-2 enable

0x0A018478 WCSS_A_TXFIR_IQCORR_CENTRE_TAP**Type:** RW**Reset State:** 0x0002

This register defines the centre tap value in the IQ corrector complex filter

WCSS_A_TXFIR_IQCORR_CENTRE_TAP

Bits	Name	Description
2:0	VALUE	IQ corrector centre tap location

0x0A01847C WCSS_A_TXFIR_GAIN_OFFSET_OFDM**Type:** RW**Reset State:** 0x0000

This register stores the gain offset (dB) applied to the demanded power for OFDM packets. The adjusted value is used to adjust the scaling profile applied in the DPD module.

WCSS_A_TXFIR_GAIN_OFFSET_OFDM

Bits	Name	Description
5:0	VALUE	

0x0A018480 WCSS_A_TXFIR_FINEGAIN_OFFSET**Type:** RW**Reset State:** 0x0000

This register stores the gain offset applied to the fine gain value provided by the TPC module.
Valid range = 0 to 24, i.e. +0dB to +6dB inclusive

WCSS_A_TXFIR_FINEGAIN_OFFSET

Bits	Name	Description
5:0	VALUE	

0x0A018484 WCSS_A_TXFIR_GAIN_OFFSET_11B**Type:** RW**Reset State:** 0x0000

This register stores the gain offset (dB) applied to the demanded power for 11b packets. The adjusted value is used to adjust the scaling profile applied in the DPD module.

WCSS_A_TXFIR_GAIN_OFFSET_11B

Bits	Name	Description
5:0	VALUE	

0x0A018488 WCSS_A_TXFIR_TXFIR_FIFO_RESET**Type:** W**Reset State:** 0x0000

Writing any value to this register will generate an active-high reset pulse for the TXFIR output FIFO.

WCSS_A_TXFIR_TXFIR_FIFO_RESET

Bits	Name	Description
0	TXFIR_FIFO_RESET	

**0x0A018800+ WCSS_A_TXFIR_TXCAL_MEM0n_0, n=[0..23]
0x20*n**
Type: RW**Reset State:** 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_0

Bits	Name	Description
15:9	IQPHASEIMB_COEFF_Q0_0	2's complement IQ phase imbalance correction value, coefficient q0 for chain 0
8:0	IQPHASEIMB_COEFF_I0	2's complement IQ phase imbalance correction value, coefficient i0 for chain 0

**0x0A018804+ WCSS_A_TXFIR_TXCAL_MEM0n_1, n=[0..23]
0x20*n**
Type: RW**Reset State:** 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_1

Bits	Name	Description
15:11	IQPHASEIMB_COEFF_Q1_0	2's complement IQ phase imbalance correction value, coefficient q1 for chain 0
10:2	IQPHASEIMB_COEFF_I1	2's complement IQ phase imbalance correction value, coefficient i1 for chain 0
1:0	IQPHASEIMB_COEFF_Q0_1	2's complement IQ phase imbalance correction value, coefficient q0 for chain 0

**0x0A018808+ WCSS_A_TXFIR_TXCAL_MEM0n_2, n=[0..23]
0x20*n**
Type: RW**Reset State:** 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_2

Bits	Name	Description
15:13	IQPHASEIMB_COEFF_Q2_0	2's complement IQ phase imbalance correction value, coefficient q2 for chain 0
12:4	IQPHASEIMB_COEFF_I2	2's complement IQ phase imbalance correction value, coefficient i2 for chain 0
3:0	IQPHASEIMB_COEFF_Q1_1	2's complement IQ phase imbalance correction value, coefficient q1 for chain 0

0x0A01880C+WCSS_A_TXFIR_TXCAL_MEM0n_3, n=[0..23]
0x20*n

Type: RW

Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_3

Bits	Name	Description
15	IQPHASEIMB_COEFF_Q3_0	2's complement IQ phase imbalance correction value, coefficient q3 for chain 0
14:6	IQPHASEIMB_COEFF_I3	2's complement IQ phase imbalance correction value, coefficient i3 for chain 0
5:0	IQPHASEIMB_COEFF_Q2_1	2's complement IQ phase imbalance correction value, coefficient q2 for chain 0

0x0A018810+ WCSS_A_TXFIR_TXCAL_MEM0n_4, n=[0..23]
0x20*n

Type: RW

Reset State: 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_4

Bits	Name	Description
15:8	IQPHASEIMB_COEFF_I4_0	2's complement IQ phase imbalance correction value, coefficient i4 for chain 0
7:0	IQPHASEIMB_COEFF_Q3_1	2's complement IQ phase imbalance correction value, coefficient q3 for chain 0

0x0A018814+ WCSS_A_TXFIR_TXCAL_MEM0n_5, n=[0..23]
0x20*n
Type: RW**Reset State:** 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_5

Bits	Name	Description
15:10	IQ_AMPIMB_COEFF_0	2's complement IQ amplitude imbalance correction factor.
9:1	IQPHASEIMB_COEFF_Q4	2's complement IQ phase imbalance correction value, coefficient q4 for chain 0
0	IQPHASEIMB_COEFF_I4_1	2's complement IQ phase imbalance correction value, coefficient i4 for chain 0

0x0A018818+ WCSS_A_TXFIR_TXCAL_MEM0n_6, n=[0..23]
0x20*n
Type: RW**Reset State:** 0x0000

Contains TX IQ imbalance correction and TX carrier suppression values for each RF gain setting

WCSS_A_TXFIR_TXCAL_MEM0n_6

Bits	Name	Description
14:9	TXLOLEAKAGE_Q	2's complement Transmit chain local oscillator leakage for chain 0, Q rail

WCSS_A_TXFIR_TXCAL_MEM0n_6 (cont.)

Bits	Name	Description
8:3	TXLOLEAKAGE_I	2's complement Transmit chain local oscillator leakage for chain 0, I rail
2:0	IQ_AMPIMB_COEFF_1	2's complement IQ amplitude imbalance correction factor.

0x0A019000+ WCSS_A_TXFIR_DPD_MEM0n_0, n=[0..127]
0x10*n
Type: RW**Reset State:** 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

WCSS_A_TXFIR_DPD_MEM0n_0

Bits	Name	Description
15:12	DPD_AOFFSET_0	DPD amplitude gain offset for each section on chain 0
11:0	DPD_THRESHOLD	DPD amplitude threshold for each section on chain 0

0x0A019004+ WCSS_A_TXFIR_DPD_MEM0n_1, n=[0..127]
0x10*n
Type: RW**Reset State:** 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

WCSS_A_TXFIR_DPD_MEM0n_1

Bits	Name	Description
15:8	DPD_AGAIN_0	DPD amplitude gain change for each section on chain 0
7:0	DPD_AOFFSET_1	DPD amplitude gain offset for each section on chain 0

0x0A019008+ WCSS_A_TXFIR_DPD_MEM0n_2, n=[0..127]
0x10*n
Type: RW**Reset State:** 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

WCSS_A_TXFIR_DPD_MEM0n_2

Bits	Name	Description
15:4	DPD_POFFSET	DPD phase gain offset for each section on chain 0
3:0	DPD_AGAIN_1	DPD amplitude gain change for each section on chain 0

0x0A01900C+WCSS_A_TXFIR_DPD_MEM0n_3, n=[0..127] 0x10*n

Type: RW

Reset State: 0x0000

Contains TX pre-distorter parameter values for each RF gain setting

WCSS_A_TXFIR_DPD_MEM0n_3

Bits	Name	Description
11:0	DPD_PGAIN	DPD phase gain change for each section on chain 0

10.63 WCSS_A_TXP_TXP

0x0A080400 WCSS_A_TXP_TXP_CMDF_DIN

Type: W

Reset State: 0x00000000

Command write port of TXP FIFO.

WCSS_A_TXP_TXP_CMDF_DIN

Bits	Name	Description
31:0	TXP_CMDF_WDATA	Write-only, 32-bit bitfield for commands from the software to the TXP.

0x0A080404 WCSS_A_TXP_TXP_CMDF_CONTROL**Type:** RW**Reset State:** 0x00010024

TXP command FIFO control register.

WCSS_A_TXP_TXP_CMDF_CONTROL

Bits	Name	Type	Description
16	TPE_CAHBZ	RW	This bit controls where the TXP commands will come from. 1 for TPE, 0 for CAHB (i.e. from SW).
7:0	FREE_ENTRIES	R	Read-only field that shows free entries remaining in TXP command FIFO

0x0A080408 WCSS_A_TXP_TXP_TIMEOUT_TIMER**Type:** RW**Reset State:** 0x00000000

TXP Timeout Timer - will interrupt cpu if TXP state machines do not return to idle within prespecified time.

WCSS_A_TXP_TXP_TIMEOUT_TIMER

Bits	Name	Description
31	TIMER_EN	Timeout timer enable bit.
23:0	TIMEOUT_TIMER_VAL	Timeout timer value - in microseconds

0x0A08040C WCSS_A_TXP_TXP_STATUS**Type:** R**Reset State:** 0x00000000

Shows status of TXP.

WCSS_A_TXP_TXP_STATUS

Bits	Name	Description
18:17	GAS_STATUS	Status of GAS in TXP.
16	GAM_BUSY	Shows whether GAM in TXP is busy.
15:8	ERROR_CODE	Read-only field that shows TXP error code (0 if no error). Command FIFO - Over flow: 8'b0001_0000; GAM control - AHB error returned from GAM: 8'b0010_0000; Invalid BD header: 8'b0010_0001; tx_size with 0 bytes: 8'b0010_0010; MPDU Header longer than 1st pdu: 8'b0010_0011; Data starts outside 1st pdu: 8'b0010_0100; MPDU header longer than MPDU: 8'b0010_0101; MPDU data_offset < MPDU_hdr_off: 8'b0010_0110; PINF - PHY sends abort/BTC Active: 8'b0011_0000; - FIFO underrun: 8'b0011_0001; - New transmission with no PHY clkstart: 8'b0011_0010; - New transmission, but PHY not idle: 8'b0011_0011; - PHY goes idle prematurely: 8'b0011_0100; FCS - Two consecutive FCS Starts received (last was FCS32): 8'b0100_0001; - FCS8 Start followed by FCS8 Start: 8'b0100_0010; - Two consecutive FCS Stops received (last was FCS8): 8'b0100_0011; - FCS32 Start followed by FCS8 Start: 8'b0100_0100; - FCS32 Start followed by FCS8 Stop: 8'b0100_0101; - FCS8 Start followed by FCS32 Start: 8'b0100_0110; - FCS8 Start followed by FCS32 Stop: 8'b0100_0111; Main FSM - Invalid command type: 8'b0101_0000; - PHY command with 0 bytes: 8'b0101_0001; - tx_sw with 0 bytes: 8'b0101_0010;
7:0	LAST_CMD_NR	Read-only field that shows last command number successfully completed by TXP. TXP extracts the last 8 bits of the command and blindly copies it to this register This is the CMD index nr field supplied by s/w.

0x0A080410 WCSS_A_TXP_TXP_BTC_ACTIVE_ABORT_ENABLE**Type:** RW**Reset State:** 0x00000000

Controls if BTC active will cause TXP to be abort. SW would then have to soft reset the TXP.

WCSS_A_TXP_TXP_BTC_ACTIVE_ABORT_ENABLE

Bits	Name	Description
0	BTC_ACTIVE	Allows BTC active to cause TXP abort.

0x0A080418 WCSS_A_TXP_TXP_WARMUP_CNTL**Type:** RW**Reset State:** 0x00000530

TXP warmup control register - added for Virgo

WCSS_A_TXP_TXP_WARMUP_CNTL

Bits	Name	Description
13:8	DELAY_PHY_START_COUNT	Number of clock cycles to delay the phy start
5	TPE_TXP_RF_WARMUP_END_P_EN	allow tpe_txp_rf_warmup_end_p to affect txp_mpi_warmup
4	TPE_TXP_RF_WARMUP_P_EN	allow tpe_txp_rf_warmup_p to affect txp_mpi_warmup

0x0A080484 WCSS_A_TXP_TXP_NR_FRAMES_XMIT**Type:** RW**Reset State:** 0x00000000

Number of frames (PPDU) transmitted

WCSS_A_TXP_TXP_NR_FRAMES_XMIT

Bits	Name	Description
15:0	NR_FRAMES_XMIT	Number of frames transmitted; stuck at 0xffff

0x0A080488 WCSS_A_TXP_TXP_PHY_ABORTS**Type:** RW**Reset State:** 0x00000000

Number of times that txp_mpi_abort or mpi_txp_abort is asserted (counter is located before the loopback mux). The counters increment once for every low to high transition in the signal.

WCSS_A_TXP_TXP_PHY_ABORTS

Bits	Name	Description
31:16	NR_PHY_ABORT_RCVD	Number of times mpi_txp_abort (or fphy_txp_abort) is asserted.

WCSS_A_TXP_TXP_PHY_ABORTS (cont.)

Bits	Name	Description
15:0	NR_PHY_ABORT_GEN	Number of times txp_mpi_abort (or txp_fphy_abort) is asserted

0x0A08048C WCSS_A_TXP_TXP_NR_END_INTERRUPTS**Type:** RW**Reset State:** 0x00000000

Number of end interrupts sent by TXP.

WCSS_A_TXP_TXP_NR_END_INTERRUPTS

Bits	Name	Description
15:0	TXP_NR_END_INTERRUPT S	Number of end interrupts sent to s/w. Once it is reached max(0xFFFF), hw stops updating SW needs to reset to restart this counter again

0x0A080490 WCSS_A_TXP_TXP_NR_CMDS**Type:** RW**Reset State:** 0x00000000

Number of TXP commands processed.

WCSS_A_TXP_TXP_NR_CMDS

Bits	Name	Description
15:0	TXP_NR_CMDS	Number of commands processed

0x0A080494 WCSS_A_TXP_TXP_FSM_STATUS**Type:** R**Reset State:** 0x00000000

TXP internal FSM status

WCSS_A_TXP_TXP_FSM_STATUS

Bits	Name	Description
23:0	TXP_FSM_STATUS	txp_mcu_status, // [23] 1 is busy enc_txp_pinf_phy_cs_s[3:0], // [22:19] phy domain, own't be accurate when it's active enc_txp_fcs_cs_s[3:0], // [18:15] enc_txp_gamc_cs_s[4:0], // [14:10] enc_txp_main_cs_s[4:0], // [9:5] enc_txp_pinf_mac_cs_s[1:0], // [4:3] enc_txp_wait_cs_s[2:0]

0x0A08049C WCSS_A_TXP_TXP_NR_MPI**Type:** R**Reset State:** 0x00000000

Number of MPI request and data valid Note this register is only used for debug purpose. The counters are in phy clock domain, and is not sync to the mac domain. It's only valid when we are debugging txp is hang

WCSS_A_TXP_TXP_NR_MPI

Bits	Name	Description
31:16	TXP_NR_MPI_DATA_VALID	Number of mpi_data_valid (before loopback mux)
15:0	TXP_NR_MPI_REQ	Number of mpi request (after loopback mux)

11 PMIC Arbiter

11.1 SPMI_CFG_TOP

11.1.1 SPMI_GENI_CFG

0x0200A000 SPMI_GENI_CLK_CTRL

Type: RW
Clock: AHB_CLK
Reset State: 0x00000000

GENI clock control register.

SPMI_GENI_CLK_CTRL

Bits	Name	Description
0	SER_CLK_SEL	Serial clock select. When clear(0), GENI PROGRAM RAM, and other serial clock domain logic is connected to AHB clock, this is required for the configuration phase. When set(1), GENI PROGRAM RAM, and other serial clock domain logic is connected to Serial clock, this is required for the command execution phase.

0x0200A008 SPMI_GENI_FW_REVISION

Type: RW
Clock: AHB_CLK
Reset State: 0x0000FFFF

GENI FW revision register.

In the full-duplex mode, the TX and RX protocols might be not the same.

For example, the same Geni instance might support RC-5 protocol for TX and RC-6 for RX. Therefore there are 2 FW Revision registers, one for TX and one for RX (if needed).

For half-duplex protocols (SPMI, RFFE, SSBI2, ...) both FW revision registers will contains the same value.

SPMI_GENI_FW_REVISION

Bits	Name	Description
15:6	PROTOCOL	TX protocol implemented.
5:0	VERSION	TX FW version.

0x0200A00C SPMI_GENI_S_FW_REVISION

Type: RW

Clock: AHB_CLK

Reset State: 0x0000FFFF

GENI secondary FW revision register.

In the full-duplex mode, the TX and RX protocols might be not the same.

For example, the same Geni instance might support RC-5 protocol for TX and

RC-6 for RX. Therefore there are 2 FW Revision registers, one for TX and one for RX (if needed).

For half-duplex protocols (SPMI, RFFE, SSBI2, ...) both FW revision registers will contains the same value.

SPMI_GENI_S_FW_REVISION

Bits	Name	Description
15:6	PROTOCOL	RX protocol implemented.
5:0	VERSION	RX FW version.

0x0200A010 SPMI_GENI_FORCE_DEFAULT_REG

Type: W

Clock: AHB_CLK

Reset State: 0x00000000

GENI force default register. Writing '1' to this register forces default values on GENI's outputs to pads. The default values are part of the GENI image (i.e. GENI_CFG_REG)

SPMI_GENI_FORCE_DEFAULT_REG

Bits	Name	Description
0	FORCE_DEFAULT	force default bit.

0x0200A014 SPMI_GENI_OUTPUT_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

GENI output control register.

SPMI_GENI_OUTPUT_CTRL

Bits	Name	Description
2	SOE2_EN	forces geni_soe02 to be 0 when set, i.e. geni_sout2 is high-Z.
1	SOE1_EN	forces geni_soe1 to be 0 when set, i.e. geni_sout1 is high-Z.
0	SOE0_EN	forces geni_soe0 to be 0 when set, i.e. geni_sout0 is high-Z.

0x0200A018 SPMI_GENI_CGC_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000078

GENI clock gating control register.

SPMI_GENI_CGC_CTRL

Bits	Name	Description
9	PROG_RAM_SCLK_OFF	When set, SCLK to program RAM is turned off. Should be used only when SCLK_CGC_ON bit is set, otherwise the clock is turned off automatically by HW when not required.
8	PROG_RAM_HCLK_OFF	When set, HCLK to program RAM is turned off
6	EXT_CLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is always enabled.
5	RX_CLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is enabled taking into consideration clock division
4	TX_CLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is enabled taking into consideration clock division

SPMI_GENI_CGC_CTRL (cont.)

Bits	Name	Description
3	SCLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is always enabled. This bit might be cleared only in half-duplex mode and when the SCLK isn't divided internally; use RX_CLK_ON and TX_CLK_ON to control CGCs in that cases.
2	DATA_AHB_CLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is always enabled.
1	CFG_AHB_WR_CLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is always enabled.
0	CFG_AHB_CLK_CGC_ON	When set, HW controls the CGC. When cleared, the CGC is always enabled.

0x0200A028 SPMI_GENI_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni control register.

Command which is in progress during GENI disabling will complete its process and the next command will pend.

SPMI_GENI_CTRL

Bits	Name	Description
1	S_GENI_DISABLE	when 1, secondary sequencer is disabled, when 0 it is enabled
0	M_GENI_DISABLE	when 1, main sequencer is disabled, when 0 it is enabled

0x0200A02C SPMI_GENI_STATUS**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni status register

SPMI_GENI_STATUS

Bits	Name	Description
20:16	S_GENI_CMD_FSM_STATE	secondary command interface state

SPMI_GENI_STATUS (cont.)

Bits	Name	Description
12	S_GENI_CMD_ACTIVE	when 0, secondary sequencer is idle, when 1, secondary sequencer is executing a command
8:4	M_GENI_CMD_FSM_STATE	main command interface state
0	M_GENI_CMD_ACTIVE	when 0, main sequencer is idle, when 1, main sequencer is executing a command

0x0200A034 SPMI_GENI_SER_CLK_CFG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00004002

Geni serial clock configuration register

SPMI_GENI_SER_CLK_CFG

Bits	Name	Description
25:14	TX_CLK_DIV_VALUE	Main sequencer (TX) clock division value. The TX clock's frequency is $SER_CLK / (TX_CLK_DIV_VALUE * 2^{RX_SER_CLK_EN})$
13:2	RX_CLK_DIV_VALUE	Secondary sequencer (RX) clock division value. The RX clock's frequency is $SER_CLK / (RX_CLK_DIV_VALUE * 2^{TX_SER_CLK_EN})$
1	TX_SER_CLK_EN	Main sequencer (TX) clock enable
0	RX_SER_CLK_EN	Secondary sequencer (RX) clock enable

0x0200A038 SPMI_GENI_TX_WATERMARK_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni TX FIFO Watermark register

SPMI_GENI_TX_WATERMARK_REG

Bits	Name	Description
3:0	TX_WATERMARK	Sets the condition for assertion of TX_WATERMARK interrupt bit. When 0 - watermark = 1, when 1 - watermark = 2, when 2 - watermark = 3, else - reserved

0x0200A03C SPMI_GENI_RX_WATERMARK_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni RX FIFO Watermark register

SPMI_GENI_RX_WATERMARK_REG

Bits	Name	Description
3:0	RX_WATERMARK	Sets the condition for assertion of RX_WATERMARK interrupt bit. When 0 - watermark = 1, when 1 - watermark = 2, when 2 - watermark = 3, else - reserved

0x0200A040 SPMI_GENI_STOP_REG**Type:** W**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni stop register

SPMI_GENI_STOP_REG

Bits	Name	Description
1	S_GENI_STOP	Writing one forces immediate termination of the secondary sequencer
0	M_GENI_STOP	Writing one forces immediate termination of the main sequencer

0x0200A044 SPMI_GENI_SW_COMP_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni SW comparator input register

SPMI_GENI_SW_COMP_REG

Bits	Name	Description
2:0	SW_COMP	SW input to Geni's comparator unit

0x0200A048 SPMI_GENI_PROG_ROM_CTRL_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000001

Geni Program ROM control register

SPMI_GENI_PROG_ROM_CTRL_REG

Bits	Name	Description
0	PROG_ROM_EN	Program ROM may be generated in parallel to Program RAM (depends on a generic). HW accesses the Program ROM if this register is set to high.

0x0200A100 SPMI_GENI_CFG_REG0**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x0202187F

Geni Configuration Register 0.

SPMI_GENI_CFG_REG0

Bits	Name	Description
29	GENI_TX_MODE	
28:21	COND_COMP_IN_0_SEL_RST_VAL	
20:13	COND_COMP_IN_VEC	

SPMI_GENI_CFG_REG0 (cont.)

Bits	Name	Description
12	M_DATA_CNT_INIT_VALUE_INCR	
11	DATA_CNT_MODE	
8:3	M_DATA_CNT_EN_BITS	
2	EXT_SECURITY_EN	
1	EXT_ARB_EN	
0	M_PROG_RAM_SEC_WORD_EN	

0x0200A104 SPMI_GENI_CFG_REG1**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00027F7B

Geni Configuration Register 1.

SPMI_GENI_CFG_REG1

Bits	Name	Description
17:9	TX_PARAM_TABLE_VEC_1	
8:0	TX_PARAM_TABLE_VEC_0	

0x0200A108 SPMI_GENI_CFG_REG2**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x000076BF

Geni Configuration Register 2.

SPMI_GENI_CFG_REG2

Bits	Name	Description
17:9	TX_PARAM_TABLE_VEC_3	
8:0	TX_PARAM_TABLE_VEC_2	

0x0200A10C SPMI_GENI_CFG_REG3**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x0007F8FE

Geni Configuration Register 3.

SPMI_GENI_CFG_REG3

Bits	Name	Description
19:10	TX_DATA_TABLE_VEC_1	
9:0	TX_DATA_TABLE_VEC_0	

0x0200A110 SPMI_GENI_CFG_REG4**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x000FFEFE

Geni Configuration Register 4.

SPMI_GENI_CFG_REG4

Bits	Name	Description
19:10	TX_DATA_TABLE_VEC_3	
9:0	TX_DATA_TABLE_VEC_2	

0x0200A114 SPMI_GENI_CFG_REG5**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x208802AB

Geni Configuration Register 5.

SPMI_GENI_CFG_REG5

Bits	Name	Description
29	DRIVE_DEFAULT_ON_STA RT_EN	
28	TX_BP_MODE	
27	TX_SOE_EDGE_SEL	

SPMI_GENI_CFG_REG5 (cont.)

Bits	Name	Description
26	TX_SOUT_EDGE_SEL	
25	TX_DEFAULT_PRIM_SOE_VALUE	
24	TX_DEFAULT_PRIM_SOUT_VALUE	
23	TX_DEFAULT_SOE_VALUE	
22	TX_DEFAULT_SOUT_VALU E	
20:18	TX_CONST1_EFF_SIZE	
9:2	TX_CONST1_REG	
1	TX_PAR_MODE	
0	TX_PAR_CALC_EN	

0x0200A118 SPMI_GENI_CFG_REG6**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00005512

Geni Configuration Register 6.

SPMI_GENI_CFG_REG6

Bits	Name	Description
31:30	M_TIME_CNT_FR_DIV	
29	M_TIME_CNT_EN_FR_SEL	
25:21	M_GP_CNT_INIT_VAL	
20	M_GP_CNT_DIRECTION	
19	TX_SOUT_MODUL_START_ VAL

0x0200A178 SPMI_GENI_CFG_REG30**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

Geni Configuration Register 30.

SPMI_GENI_CFG_REG30

Bits	Name	Description
23	PRIM_23_RX_TIME_COUNTER_EN	
22	PRIM_22_RX_TIME_COUNTER_EN	
21	PRIM_21_RX_TIME_COUNTER_EN	
20	PRIM_20_RX_TIME_COUNTER_EN	
19	PRIM_19_RX_TIME_COUNTER_EN	
18	PRIM_18_RX_TIME_COUNTER_EN	
17	PRIM_17_RX_TIME_COUNTER_EN	
16	PRIM_16_RX_TIME_COUNTER_EN	
15	PRIM_15_RX_TIME_COUNTER_EN	
14	PRIM_14_RX_TIME_COUNTER_EN	
13	PRIM_13_RX_TIME_COUNTER_EN	
12	PRIM_12_RX_TIME_COUNTER_EN	
11	PRIM_11_RX_TIME_COUNTER_EN	

SPMI_GENI_CFG_REG30 (cont.)

Bits	Name	Description
10	PRIM_10_RX_TIME_COUNTER_EN	
9	PRIM_9_RX_TIME_COUNTER_EN	
8	PRIM_8_RX_TIME_COUNTER_EN	
7	PRIM_7_RX_TIME_COUNTER_EN	
6	PRIM_6_RX_TIME_COUNTER_EN	
5	PRIM_5_RX_TIME_COUNTER_EN	
4	PRIM_4_RX_TIME_COUNTER_EN	
3	PRIM_3_RX_TIME_COUNTER_EN	
2	PRIM_2_RX_TIME_COUNTER_EN	
1	PRIM_1_RX_TIME_COUNTER_EN	
0	PRIM_0_RX_TIME_COUNTER_EN	

**0x0200A200+ SPMI_GENI_CFG_RAMn, n=[0..255]
0x4*n**

Type: RW

Clock: AHB_CLK

Reset State: 0x00000000

GENI Program RAM set of registers.

SPMI_GENI_CFG_RAMn

Bits	Name	Description
20:0	TBD	

11.1.2 SPMI_CFG

SPMI Configuration

11.1.2.1 SPMI_CFG

SPMI Configuration

**0x0200A700+ SPMI_PERIPHm_2OWNER_TABLE_REG, m=[0..255]
0x4*m**

Type: RW

Clock: AHB_CLK

Reset State: 0x00000000

Peripheral 2 owner Table; Each Peripheral has 4 bits indicating its associated owner. The APID2PPID is used verify that each mapping table request is given the correct APID

SPMI_PERIPHm_2OWNER_TABLE_REG

Bits	Name	Type	Description
27:16	APID2PPID	R	APID to PPID mapping
2:0	PERIPH2OWNER	RW	Owner index for peripheral m.

**0x0200AB00+ SPMI_MAPPING_TABLE_REGk, k=[0..254]
0x4*k**

Type: RW

Clock: AHB_CLK

Reset State: 0x00000000

Mapping table register; this table is used for conversion of the 12-bit physical peripheral ID (4-bit SID + 8 high address bits, PPID) to the 8-bit application peripheral ID (APID).

SPMI_MAPPING_TABLE_REGk

Bits	Name	Description
21:18	BIT_INDEX	Mapping logic table contents.
17	BRANCH_RESULT_0_FLAG	Mapping logic table contents.
16:9	BRANCH_RESULT_0	Mapping logic table contents.
8	BRANCH_RESULT_1_FLAG	Mapping logic table contents.
7:0	BRANCH_RESULT_1	Mapping logic table contents.

0x0200AF00 SPMI_MID_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register defines the MID (master ID) of the SPMI master on the bus.

SPMI_MID_REG

Bits	Name	Description
1:0	MID	This register contains the SPMI master MID.

0x0200AF04 SPMI_CFG_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000020

This register holds different configuration of the SPMI-controller.

SPMI_CFG_REG

Bits	Name	Description
16:12	ARBITER_CTRL	Reserved bits for arbiter control need.
11	ASYNC_SSC_DET_INT_DIS	when '0'(default) mean the spmi_m async_ssc_detect use the internal indication for SSC,this can be used also for multi master (unlike ssc_detect).
10	SSC_Q1_DELAY_DIS	when set,disable the delay that placed between Q1 to Q2 regs in the SSC_DETECT
9	ARB_UNKNOWN_EN	when '0'(default) mean that if ssc_window_en='1',ssc will be detect only when master_win slave_win (suitable for single master) if it set to '1'ssc will be detected when master_win slave_win arb_unknown(suitable for multi master).if ssc_window_en='0' arb_unknown_en is dont_care.
8	SSC_WINDOW_EN	when set ,SSC is detected only in specific window when it is expected in order to reduce glitch risk
7	SSC_DET_INT_DIS	when '0'(default) mean the spmi_m use the internal indication for SSC (suitable for single master ,when set use the external bus for ssc detection suitable for multi master).
6	FORCE_MPM_CLK_REQ_MM	When set request clock for cofiguration, to enable transferring the values to the ser_clock domain
5	FORCE_ARB_AFTER_MASTER_TO	When set, BOM starts an arbitration after false master arbitration (i.e. SSC hasn't been asserted within 64 us after an arbitration win.

SPMI_CFG_REG (cont.)

Bits	Name	Description
4	BUS_IDLE_CONN_MODE	When asserted, sdata is deasserted on a rising edge when connecting on bus idle. When deasserted, sdata is deasserted on the falling edge.
3	FORCE_MASTER_WRITE_ON_ERROR	When set, the arbiter will treat a slave command as master write in case of a parity error in a command frame.
2	FORCE_MPM_CLK_REQ	When set, the mpm_clk_req is high.
1	ARBITER_BYPASS	Set to enable bypass of SPMI bus arbitration. Used in case where SPMI-controller is a single master and there are no RCS slaves on the bus. Clear to disable the bypass.
0	ARBITER_ENABLE	Set to enable arbitration process (MID must be valid at time of assertion). All other bits in SPMI_CFG_REG are allowed to change value only while ARBITER_ENABLE bit remains low. Deassertion of this bit must be followed by arst to avoid errors

0x0200AF08 SPMI_SEC_DISABLE_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register disables the use of all **security** features. Used for boot initialization.

SPMI_SEC_DISABLE_REG

Bits	Name	Description
0	DISABLE_ SECURITY	Set to '1' to disable and bypass all security features. Set to '0' to enable them.

0x0200AF10 SPMI_CGC_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI clock gating control register.

SPMI_CGC_CTRL

Bits	Name	Description
6	MAP_LOGIC_CLK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open
5	RPU_CLK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open
4	MWB_CLK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open
3	PIC_CLK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open
2	PAC_CLK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open
1	CFG_AHB_BRIDGE_WRC_LK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open
0	CFG_AHB_BRIDGE_CLK_CGC_ON	When set, HW CGC control enabled. When clear, the CGC is always open

0x0200AF14 SPMI_MWB_ENABLE_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

This register enables master write buffer. It is used in order to prevent receiving an PMIC interrupt until the PIC database is initialized..

SPMI_MWB_ENABLE_REG

Bits	Name	Description
0	MWB_ENABLE	Set to '1' to enable master write buffer (i.e. allow PMIC interrupts to enter the PIC. Set to '0' to disable.

0x0200AF54 SPMI_CMPR_EN_REG**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000**SPMI_CMPR_EN_REG**

Bits	Name	Description
0	CMPR_ENABLE	

0x0200B000 SPMI_PROTOCOL_IRQ_STATUS**Type:** R**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI-protocol interrupt status register. The bits in this register are sticky. In order to clear some bit in this register, corresponding bit should be set in the SPMI_PROTOCOL_IRQ_CLEAR register.

SPMI_PROTOCOL_IRQ_STATUS

Bits	Name	Description
11	ARBITER_DISCONNECTED	Disconnection was detected.
10	ARBITER_CONNECTED	Connection was detected.
9	PERIH_IRQ_LOST	A Peripheral interrupt was lost.
8	UNEXPECTED_SSC	Unexpected SSC was detected.
7	NO_RESPONSE_DATA_FRAME_DETECTED	No response data-frame was detected.
6	NO_RESPONSE_CMD_FRAME_DETECTED	No response frame was detected.
5	FALSE_MASTER_ARBITRATION_WIN	Master has won the arbitration but didn't initiate any command sequence within TBT.
4	FALSE_BUS_REQUEST	Bus arbitration request was asserted but no master/slave won.
3	UNSUPPORTED_COMMAND	Unsupported SPMI command was detected.
2	DATA_ADDR_FRAME_PARITY_ERROR	A parity error was detected in a data or address frame driven by an external master/slave.
1	SLAVE_CMD_FRAME_PARITY_ERROR	A parity error was detected in a command-frame driven by a slave.
0	MASTER_CMD_FRAME_PARITY_ERROR	A parity error was detected in a command-frame driven by an external master.

0x0200B004 SPMI_PROTOCOL_IRQ_ENABLE**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI protocol interrupt enable register. This register is used to enable the corresponding functions in the SPMI_PROTOCOL_IRQ_STATUS register. Setting (1) a bit in the SPMI_PROTOCOL_IRQ_ENABLE register causes an interrupt to be generated, if the corresponding bit in the SPMI_PROTOCOL_IRQ_STATUS register is set. Clearing (0) a bit in

the SPMI_PROTOCOL_IRQ_ENABLE register causes the setting of the corresponding bit in the SPMI_PROTOCOL_IRQ_STATUS register to have no effect on the interrupt.

SPMI_PROTOCOL_IRQ_ENABLE

Bits	Name	Description
11	ARBITER_DISCONNECTED	Enable bit of ARBITER_DISCONNECTED interrupt.
10	ARBITER_CONNECTED	Enable bit of ARBITER_CONNECTED interrupt.
9	PERIH_IRQ_LOST	Enable bit of PERIH_IRQ_LOST interrupt.
8	UNEXPECTED_SSC	
7	NO_RESPONSE_DATA_FRAME_DETECTED	Enable bit of NO_RESPONSE_DATA_FRAME_DETECTED interrupt.
6	NO_RESPONSE_CMD_FRAME_DETECTED	Enable bit of NO_RESPONSE_CMD_FRAME_DETECTED interrupt.
5	FALSE_MASTER_ARBITRATION_WIN	Enable bit of FALSE_MASTER_ARBITRATION_WIN interrupt.
4	FALSE_BUS_REQUEST	Enable bit of FALSE_BUS_REQUEST interrupt.
3	UNSUPPORTED_COMMAND	Enable bit of UNSUPPORTED_COMMAND interrupt.
2	DATA_ADDR_FRAME_PARITY_ERROR	Enable bit of DATA_ADDR_FRAME_PARITY_ERROR interrupt.
1	SLAVE_CMD_FRAME_PARITY_ERROR	Enable bit of SLAVE_CMD_FRAME_PARITY_ERROR interrupt.
0	MASTER_CMD_FRAME_PARITY_ERROR	Enable bit of MASTER_CMD_FRAME_PARITY_ERROR interrupt.

0x0200B008 SPMI_PROTOCOL_IRQ_CLEAR

Type: W

Clock: AHB_CLK

Reset State: 0x00000000

SPMI protocol interrupt clear register. Setting one of this register bits generates a pulse which clears corresponding bit in SPMI_PROTOCOL_IRQ_STATUS register.

SPMI_PROTOCOL_IRQ_CLEAR

Bits	Name	Description
11	ARBITER_DISCONNECTED	Clear bit of ARBITER_DISCONNECTED interrupt.
10	ARBITER_CONNECTED	Clear bit of ARBITER_CONNECTED interrupt.
9	PERIH_IRQ_LOST	Clear bit of PERIH_IRQ_LOST interrupt.
8	UNEXPECTED_SSC	Clear bit of UNEXPECTED_SSC interrupt.

SPMI_PROTOCOL_IRQ_CLEAR (cont.)

Bits	Name	Description
7	NO_RESPONSE_DATA_FRAME_DETECTED	Clear bit of NO_RESPONSE_DATA_FRAME_DETECTED interrupt.
6	NO_RESPONSE_CMD_FRAME_DETECTED	Clear bit of NO_RESPONSE_CMD_FRAME_DETECTED interrupt.
5	FALSE_MASTER_ARBITRATION_WIN	Clear bit of FALSE_MASTER_ARBITRATION_WIN interrupt.
4	FALSE_BUS_REQUEST	Clear bit of FALSE_BUS_REQUEST interrupt.
3	UNSUPPORTED_COMMAND	Clear bit of UNSUPPORTED_COMMAND interrupt.
2	DATA_ADDR_FRAME_PARITY_ERROR	Clear bit of DATA_ADDR_FRAME_PARITY_ERROR interrupt.
1	SLAVE_CMD_FRAME_PARITY_ERROR	Clear bit of SLAVE_CMD_FRAME_PARITY_ERROR interrupt.
0	MASTER_CMD_FRAME_PARITY_ERROR	Clear bit of MASTER_CMD_FRAME_PARITY_ERROR interrupt.

0x0200B00C SPMI_PROTOCOL_IRQ_EN_SET**Type:** W**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI protocol interrupt enable set register. This register is used to set the corresponding bits in the SPMI_PROTOCOL_IRQ_ENABLE register. Setting one of this register bits generates a pulse which sets corresponding bit in SPMI_PROTOCOL_IRQ_ENABLE register.

SPMI_PROTOCOL_IRQ_EN_SET

Bits	Name	Description
11	ARBITER_DISCONNECTED	Set-Enable bit of ARBITER_DISCONNECTED interrupt.
10	ARBITER_CONNECTED	Set-Enable bit of ARBITER_CONNECTED interrupt.
9	PERIH_IRQ_LOST	Set-Enable bit of PERIH_IRQ_LOST interrupt.
8	UNEXPECTED_SSC	Set-Enable bit of UNEXPECTED_SSC interrupt.
7	NO_RESPONSE_DATA_FRAME_DETECTED	Set-Enable bit of NO_RESPONSE_DATA_FRAME_DETECTED interrupt.
6	NO_RESPONSE_CMD_FRAME_DETECTED	Set-Enable bit of NO_RESPONSE_CMD_FRAME_DETECTED interrupt.
5	FALSE_MASTER_ARBITRATION_WIN	Set-Enable bit of FALSE_MASTER_ARBITRATION_WIN interrupt.
4	FALSE_BUS_REQUEST	Set-Enable bit of FALSE_BUS_REQUEST interrupt.

SPMI_PROTOCOL_IRQ_EN_SET (cont.)

Bits	Name	Description
3	UNSUPPORTED_COMMAND	Set-Enable bit of UNSUPPORTED_COMMAND interrupt.
2	DATA_ADDR_FRAME_PARITY_ERROR	Set-Enable bit of DATA_ADDR_FRAME_PARITY_ERROR interrupt.
1	SLAVE_CMD_FRAME_PARITY_ERROR	Set-Enable bit of SLAVE_CMD_FRAME_PARITY_ERROR interrupt.
0	MASTER_CMD_FRAME_PARITY_ERROR	Set-Enable bit of MASTER_CMD_FRAME_PARITY_ERROR interrupt.

0x0200B010 SPMI_PROTOCOL_IRQ_EN_CLEAR**Type:** W**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI protocol interrupt enable clear register. This register is used to clear the corresponding bits in the SPMI_PROTOCOL_IRQ_ENABLE register. Setting one of this register bits generates a pulse which clears corresponding bit in SPMI_PROTOCOL_IRQ_ENABLE register.

SPMI_PROTOCOL_IRQ_EN_CLEAR

Bits	Name	Description
11	ARBITER_DISCONNECTED	Clear-Enable bit of ARBITER_DISCONNECTED interrupt.
10	ARBITER_CONNECTED	Clear-Enable bit of ARBITER_CONNECTED interrupt.
9	PERIH_IRQ_LOST	Clear-Enable bit of PERIH_IRQ_LOST interrupt.
8	UNEXPECTED_SSC	Clear-Enable bit of UNEXPECTED_SSC interrupt.
7	NO_RESPONSE_DATA_FRAME_DETECTED	Clear-Enable bit of NO_RESPONSE_DATA_FRAME_DETECTED interrupt.
6	NO_RESPONSE_CMD_FRAME_DETECTED	Clear-Enable bit of NO_RESPONSE_CMD_FRAME_DETECTED interrupt.
5	FALSE_MASTER_ARBITRATION_WIN	Clear-Enable bit of FALSE_MASTER_ARBITRATION_WIN interrupt.
4	FALSE_BUS_REQUEST	Clear-Enable bit of FALSE_BUS_REQUEST interrupt.
3	UNSUPPORTED_COMMAND	Clear-Enable bit of UNSUPPORTED_COMMAND interrupt.
2	DATA_ADDR_FRAME_PARITY_ERROR	Clear-Enable bit of DATA_ADDR_FRAME_PARITY_ERROR interrupt.
1	SLAVE_CMD_FRAME_PARITY_ERROR	Clear-Enable bit of SLAVE_CMD_FRAME_PARITY_ERROR interrupt.

SPMI_PROTOCOL_IRQ_EN_CLEAR (cont.)

Bits	Name	Description
0	MASTER_CMD_FRAME_PARITY_ERROR	Clear-Enable bit of MASTER_CMD_FRAME_PARITY_ERROR interrupt.

0x0200C004 SPMI_HW_SW_EVENTS_CTRL**Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI HW/SW Events selector

SPMI_HW_SW_EVENTS_CTRL

Bits	Name	Description
2:0	HW_SW_EVENTS_SEL	when 3'd1 spmi_hw_sw_events is spmi hw events, when 3'd2 spmi_hw_sw_events is spmi sw events, when 3'd3 spmi_hw_sw_events is geni hw events, when 3'd4 spmi_hw_sw_events is geni sw events, else, spmi_hw_sw_events is 32'd0

**0x0200C008+ SPMI_HW_SW_EVENTS_BITWISE_REGj, j=[0..7]
0x4*j****Type:** RW**Clock:** AHB_CLK**Reset State:** 0x00000000

SPMI HW/SW Bitwise Events selector - to be used instead of SPMI_HW_SW_EVENTS_CTRL.
for each bit in spmi_hw_sw_events there are 2 control bits, a selector and an enable.

SPMI_HW_SW_EVENTS_BITWISE_REGj

Bits	Name	Description
31	HW_EVENTS_EN_D	when 0, bit is disabled, when 1, bit is enabled
24	HW_EVENTS_SEL_D	when 0, selects SPMI_HW_EVENTS, when 1,selects GENI_HW_EVENTS
23	HW_EVENTS_EN_C	when 0, bit is disabled, when 1, bit is enabled
16	HW_EVENTS_SEL_C	when 0, selects SPMI_HW_EVENTS, when 1,selects GENI_HW_EVENTS
15	HW_EVENTS_EN_B	when 0, bit is disabled, when 1, bit is enabled

SPMI_HW_SW_EVENTS_BITWISE_REGj (cont.)

Bits	Name	Description
8	HW_EVENTS_SEL_B	when 0, selects SPMI_HW_EVENTS, when 1,selects GENI_HW_EVENTS
7	HW_EVENTS_EN_A	when 0, bit is disabled, when 1, bit is enabled
0	HW_EVENTS_SEL_A	when 0, selects SPMI_HW_EVENTS, when 1,selects GENI_HW_EVENTS

11.2 SPMI_PIC

**0x03900000+ SPMI_PIC_OWNERm_ACC_STATUSn, m=[0..5], n=[0..3]
4096*m+4*n**

Type: R

Clock: AHB_CLK

Reset State: 0x00000000

Accumulated status register.

SPMI_PIC_OWNERm_ACC_STATUSn

Bits	Name	Description
31:0	INT_ACC_STATUS	256 accumulated interrupt bits; one bit per peripheral. The n-th register contains accumulated interrupts of peripherals $[32*(n+1)-1:32*n]$. m defines the owner

**0x03800000+ SPMI_PIC_ACC_ENABLEn, n=[0..127]
4096*n**

Type: RW

Clock: AHB_CLK

Reset State: 0x00000000

Accumulated interrupt enable register.

SPMI_PIC_ACC_ENABLEn

Bits	Name	Description
0	INT_ACC_ENABLE	256 interrupt enable bits. Each bit enables a peripheral's accumulated interrupt.

**0x03800004+ SPMI_PIC_IRQ_STATUSn, n=[0..127]
4096*n**

Type: R
Clock: AHB_CLK
Reset State: 0x00000000

Peripheral interrupt status register.

SPMI_PIC_IRQ_STATUSn

Bits	Name	Description
7:0	INT_STATUS	256 bytes of interrupts. Byte per peripheral to indicate individual interrupts.

**0x03800008+ SPMI_PIC_IRQ_CLEARn, n=[0..127]
4096*n**

Type: W
Clock: AHB_CLK
Reset State: 0x00000000

Interrupt clear register.

SPMI_PIC_IRQ_CLEARn

Bits	Name	Description
7:0	INT_CLEAR	256 bytes of interrupt clear commands. Byte per peripheral to clear individual interrupts.

11.3 PMIC_ARB_CORE

The PMIC arbiter core are used to configure the PMIC arbiter itself and for software environments to issue commands over the SPMI bus.

11.3.1 PMIC_ARB_CORE_SW

The PMIC arbiter core are used to configure the PMIC arbiter itself and for software environments to issue commands over the SPMI bus.

0x0200F004 PMIC_ARB_MISC_CONFIG

Type: RW
Clock: HCLK
Reset State: 0x00000002

This register provides a master switch to globally enable/disable transaction done interrupts.

PMIC_ARB_MISC_CONFIG

Bits	Name	Description
1	CLK_GATE_EN	Enable/disable dynamic hardware clock gating for the PMIC arbiter. 1: Enable 0: Disable
0	DONE_IRQ_EN	Globally enable/disable all transaction done interrupts. 1: Enable 0: Disable

0x0200F008 PMIC_ARB_PVC_INTF_CTL

Type: RW

Clock: HCLK

Reset State: 0x00000000

This register is used to configure aspects of the PMIC arbiter's PVC interfaces. Global and per-port enable/disable control over PVC ports is provided.

PMIC_ARB_PVC_INTF_CTL

Bits	Name	Description
0	PVC_INTF_EN	Global enable/disable for all PVC ports.

0x0200F00C PMIC_ARB_PVC_INTF_STATUS

Type: R

Clock: HCLK

Reset State: 0x00000000

This register is used to provide status of the PMIC arbiter's PVC interface as a whole. Provides status as to whether any PVC port has a request that has been received and is not yet complete.

PMIC_ARB_PVC_INTF_STATUS

Bits	Name	Description
0	PVC_INTF_BUSY	Status bit indicating whether or not there is a currently outstanding PMIC command on a PVC interface.

**0x0200F100+ PMIC_ARB_PRIORITIESn, n=[0..5]
0x4*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register specifies which arbiter port has priority n. Priority 0 is the highest priority, priority 1 is the next highest, and so on.

Arbiter ports are numbered as follows: software is port 0, PVC ports are numbered from 1 to the total number of PVC ports.

PMIC_ARB_PRIORITIESn

Bits	Name	Description
2:0	PORT	Number of the port with priority n.

**0x0200F200+ PMIC_ARB_PVC_PORTn_CTL, n=[0..4]
0x4*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

This register controls the settings for individual PVC ports. The SPMI priority of commands from this port and whether or not the port is enabled are controlled by this register.

PMIC_ARB_PVC_PORTn_CTL

Bits	Name	Description
1	SPMI_PRIORITY	The priority the SPMI master should use when executing SPMI commands that are requested by this port. Note that this is not priority for the PMIC arbiter, but priority on the SPMI bus in the event that other (off-chip) devices are also trying to use the SPMI bus. 1: High priority 0: Low priority
0	PVC_PORT_EN	Enables/disables this particular PVC port. 1: Enable 0: Disable

**0x0200F280+ PMIC_ARB_PVC_PORTn_STATUS, n=[0..4]
0x4*n****Type:** R**Clock:** HCLK**Reset State:** 0x00000000

This register provides per-port status on the PMIC arbiter's PVC interface.

PMIC_ARB_PVC_PORTn_STATUS

Bits	Name	Description
1	PVC_PORT_FAILURE	Status bit indicating whether or not a PMIC command has failed due to an SPMI protocol error. This bit is cleared on a read of this register.
0	PVC_PORT_BUSY	Status bit indicating a PMIC command is in progress.

0x0200F400+ PMIC_ARB_PVCn_ADDRm, n=[0..4], m=[0..3]
0x20*n+0x4*
m

Type: RW

Clock: HCLK

Reset State: 0x00000000

PVC table entry for PVC port n, address index m.

PMIC_ARB_PVCn_ADDRm

Bits	Name	Description
19:16	SID	SPMI slave ID
15:0	ADDRESS	PMIC register address

0x0200F800+ PMIC_ARB_REG_CHNLn, n=[0..127]
0x4*n

Type: RW

Clock: HCLK

Reset State: 0x00000000

SW register address translation table.

PMIC_ARB_REG_CHNLn

Bits	Name	Description
19:16	SID	SPMI slave ID
15:8	ADDRESS	8 MSB bits of the registers present in the PMIC

11.4 PMIC_ARB_CORE_REGISTERS

The PMIC arbiter are for software environments to issue commands over the SPMI bus.

11.4.1 PMIC_ARB_CORE_SW_DEC_CHANNELS

The PMIC arbiter are for software environments to issue commands over the SPMI bus.

0x02400000+ PMIC_ARBq_CHNLn_CMD, q=[0..5], n=[0..127]
0x01000*q+0
x08000*n

Type: RW

Clock: HCLK

Reset State: 0x00000000

A write to this register triggers an SPMI command. This register is responsible for specifying all of the information needed to define the command to be performed (except for write data). The SPMI opcode, slave ID, address, and byte count are all written to this register and need to be set with a single write.

NOTE: A write to this register will queue up and SPMI command and until that command finished, further writes to this register will be ignored.

NOTE: The command register is write-only for PMIC arbiter 1.0.0 (will always read as zero).

PMIC_ARBq_CHNLn_CMD

Bits	Name	Type	Description
31:27	OPCODE	RW	SPMI opcode, as defined by the SPMI master. See the SPMI master documents for further details. 0x0: EXTENDED_REG_WRITE_LONG 0x1: EXTENDED_REG_READ_LONG 0x2: EXTENDED_REG_WRITE 0x3: RESET 0x4: SLEEP 0x5: SHUTDOWN 0x6: WAKEUP 0x7: AUTHENTICATE 0x8: MASTER_READ 0x9: MASTER_WRITE 0xA: TRANSFER_BUS_OWNERSHIP 0xB: DEVICE_DESC_BLOCK_MASTER 0xC: DEVICE_DESC_BLOCK_SLAVE 0xD: EXTENDED_REGISTER_READ 0xE: REGISTER_WRITE 0xF: REGISTER_READ 0x10: REGISTER_0_WRITE
26	PRIORITY	W	Controls whether the SPMI command should be sent with high or low priority. 1: High priority 0: Low priority

PMIC_ARBq_CHNLn_CMD (cont.)

Bits	Name	Type	Description
11:4	ADDRESS	W	8 LSB bits of address for the register the SPMI command is to access.
2:0	BYTE_CNT	W	Indicates the number of bytes to read or write for operations that span multiple bytes. For single-byte operations, as well as operations other than read/write operations, this should be set to zero. 111: Eight bytes 110: Seven bytes 101: Six bytes 100: Five bytes 011: Four bytes 010: Three bytes 001: Two bytes 000: One byte

0x02400004+ PMIC_ARBq_CHNLn_CONFIG, q=[0..5], n=[0..127]**0x01000*q+0****x08000*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

Configuration register for software channels: provides the ability to enable/disable interrupts indicating transactions are done on a per-channel basis.

PMIC_ARBq_CHNLn_CONFIG

Bits	Name	Description
0	IRQ_EN	Enable/disable transaction done interrupt for channel n. 1: Enable 0: Disable

0x02400008+ PMIC_ARBq_CHNLn_STATUS, q=[0..5], n=[0..127]**0x01000*q+0****x08000*n****Type:** R**Clock:** HCLK**Reset State:** 0x00000001

Provides status of the most recent SPMI command issued to channel n.

PMIC_ARBq_CHNLn_STATUS

Bits	Name	Description
3	DROPPED	Resets to 0 upon the issue of the new command. 1: Indicates that a write to this channel illegally occurred during handling of the last command and was subsequently dropped. 0: Indicates that no writes to the channel occurred while the most recent command was being handled.
2	DENIED	Resets to 0 upon the issue of a new command. This bit should only be considered when DONE=1. 1: Indicates that the most recent command was denied by the SPMI master. 0: Indicates that the most recent command was not denied.
1	FAILURE	Resets to 0 upon the issue of a new command. This bit should only be considered when DONE=1. 1: Indicates that the most recent command has failed. 0: Indicates that the most recent command has completed successfully.
0	DONE	Resets to 0 upon the issue of a new command. This bit indicates completion, but not necessarily success, and should be observed in conjunction with DENIED and FAILED to determine the status of an operation. 1: Indicates that the most recent command is finished. 0: Indicates that the most recent command is still pending.

0x02400010+ PMIC_ARBq_CHNLn_WDATA0, q=[0..5], n=[0..127]
0x01000*q+0
x08000*n

Type: RW

Clock: HCLK

Reset State: 0x00000000

Stores the lower 32-bits of data for an SPMI write. Starting with least significant bytes first, PMIC arbiter will grab only the bytes it needs for the write operation as specified in the BYTE_CNT of the command register.

PMIC_ARBq_CHNLn_WDATA0

Bits	Name	Description
31:0	DATA	Data to write to PMIC.

0x02400014+ PMIC_ARBq_CHNLn_WDATA1, q=[0..5], n=[0..127]
0x01000*q+0
x08000*n

Type: RW

Clock: HCLK

Reset State: 0x00000000

Stores the upper 32-bits of data for an SPMI write. Starting with least significant bytes first, PMIC arbiter will grab only the bytes it needs for the write operation as specified in the BYTE_CNT of the command register. Thus, this register is only needed for write operations larger than four bytes.

PMIC_ARBq_CHNLn_WDATA1

Bits	Name	Description
31:0	DATA	Data to write to PMIC.

0x02400018+ PMIC_ARBq_CHNLn_RDATA0, q=[0..5], n=[0..127]

**0x01000*q+0
x08000*n**

Type: R

Clock: HCLK

Reset State: 0x00000000

Stores the lower 32-bits of data from an SPMI read. Starting with the least significant bytes first, PMIC arbiter will fill only the bytes it needs for the read operation, as specified in the BYTE_CNT of the command register.

PMIC_ARBq_CHNLn_RDATA0

Bits	Name	Description
31:0	DATA	Data read from PMIC.

0x0240001C+ PMIC_ARBq_CHNLn_RDATA1, q=[0..5], n=[0..127]

**0x01000*q+0
x08000*n**

Type: R

Clock: HCLK

Reset State: 0x00000000

Stores the upper 32-bits of data from an SPMI read. Starting with the least significant bytes first, PMIC arbiter will fill only the bytes it needs for the read operation, as specified in the BYTE_CNT of the command register. Thus, this register is only needed for read operations larger than four bytes.

PMIC_ARBq_CHNLn_RDATA1

Bits	Name	Description
31:0	DATA	Data read from PMIC.

0x02400020+ PMIC_ARBq_CHNLn_RDATA2, q=[0..5], n=[0..127]**0x1000*q+0x08000*n****Type:** R**Clock:** HCLK**Reset State:** 0x00000000

Stores the additional two bytes needed for a device descriptor read command, which returns ten bytes of data.

PMIC_ARBq_CHNLn_RDATA2

Bits	Name	Description
15:0	DATA	Data read from PMIC.

11.5 PMIC_ARB_CORE_REGISTERS_OBS

The PMIC arbiter observer are for software environments to issue read only commands over the SPMI bus.

11.5.1 PMIC_ARB_CORE_SW_DEC_CHANNELS_OBS

The PMIC arbiter observer are for software environments to issue read only commands over the SPMI bus.

0x02C00000+ PMIC_ARB_OBSq_CHNLn_CMD, q=[0..5], n=[0..127]**0x01000*q+0x08000*n****Type:** RW**Clock:** HCLK**Reset State:** 0x00000000

A write to this register triggers an SPMI command. This register is responsible for specifying all of the information needed to define the command to be performed (except for write data). The SPMI opcode, slave ID, address, and byte count are all written to this register and need to be set with a single write.

NOTE: A write to this register will queue up an SPMI command and until that command finished, further writes to this register will be ignored.

NOTE: The command register is write-only for PMIC arbiter 1.0.0 (will always read as zero).

PMIC_ARB_OBSq_CHNLn_CMD

Bits	Name	Type	Description
31:27	OPCODE	RW	SPMI opcode, as defined by the SPMI master. See the SPMI master documents for further details. 0x1: EXTENDED_REG_READ_LONG

PMIC_ARB_OBSq_CHNLn_CMD (cont.)

Bits	Name	Type	Description
26	PRIORITY	W	Controls whether the SPMI command should be sent with high or low priority. 1: High priority 0: Low priority
11:4	ADDRESS	W	Contains 8 LSB bits of address for the register the SPMI command is to access.
2:0	BYTE_CNT	W	Indicates the number of bytes to read or write for operations that span multiple bytes. For single-byte operations, as well as operations other than read/write operations, this should be set to zero. 111: Eight bytes 110: Seven bytes 101: Six bytes 100: Five bytes 011: Four bytes 010: Three bytes 001: Two bytes 000: One byte

0x02C00004+ PMIC_ARB_OBSq_CHNLn_CONFIG, q=[0..5], n=[0..127]

0x01000*q+0
x08000*n

Type: RW**Clock:** HCLK**Reset State:** 0x00000000

Configuration register for software channels: provides the ability to enable/disable interrupts indicating transactions are done on a per-channel basis.

PMIC_ARB_OBSq_CHNLn_CONFIG

Bits	Name	Description
0	IRQ_EN	Enable/disable transaction done interrupt for channel n. 1: Enable 0: Disable

0x02C00008+ PMIC_ARB_OBSq_CHNLn_STATUS, q=[0..5], n=[0..127]

0x01000*q+0
x08000*n

Type: R**Clock:** HCLK**Reset State:** 0x00000001

Provides status of the most recent SPMI command issued to channel n.

PMIC_ARB_OBSq_CHNLn_STATUS

Bits	Name	Description
3	DROPPED	Resets to 0 upon the issue of the new command. 1: Indicates that a write to this channel illegally occurred during handling of the last command and was subsequently dropped. 0: Indicates that no writes to the channel occurred while the most recent command was being handled.
2	DENIED	Resets to 0 upon the issue of a new command. This bit should only be considered when DONE=1. 1: Indicates that the most recent command was denied by the SPMI master. 0: Indicates that the most recent command was not denied.
1	FAILURE	Resets to 0 upon the issue of a new command. This bit should only be considered when DONE=1. 1: Indicates that the most recent command has failed. 0: Indicates that the most recent command has completed successfully.
0	DONE	Resets to 0 upon the issue of a new command. This bit indicates completion, but not necessarily success, and should be observed in conjunction with DENIED and FAILED to determine the status of an operation. 1: Indicates that the most recent command is finished. 0: Indicates that the most recent command is still pending.

0x02C00018+ PMIC_ARB_OBSq_CHNLn_RDATA0, q=[0..5], n=[0..127]

0x01000*q+0
x08000*n

Type: R**Clock:** HCLK**Reset State:** 0x00000000

Stores the lower 32-bits of data from an SPMI read. Starting with the least significant bytes first, PMIC arbiter will fill only the bytes it needs for the read operation, as specified in the BYTE_CNT of the command register.

PMIC_ARB_OBSq_CHNLn_RDATA0

Bits	Name	Description
31:0	DATA	Data read from PMIC.

0x02C0001C+ PMIC_ARB_OBSq_CHNLn_RDATA1, q=[0..5], n=[0..127]

0x01000*q+0
x08000*n

Type: R**Clock:** HCLK**Reset State:** 0x00000000

Stores the upper 32-bits of data from an SPMI read. Starting with the least significant bytes first, PMIC arbiter will fill only the bytes it needs for the read operation, as specified in the BYTE_CNT of the command register. Thus, this register is only needed for read operations larger than four bytes.

PMIC_ARB_OBSq_CHNLn_RDATA1

Bits	Name	Description
31:0	DATA	Data read from PMIC.

STM Burst Translator Control Register

QDSS_CS_QDSSCSR_STMTRANSCTRL

Bits	Name	Type	Description
31:4	RFU	R	Reserved for Future Use.
3	STMTRANENAB3	RW	Enables STM Burst Translator on STMAWID3[7:0]. A one means STM Burst Translator on STMAWID3[7:0] is enabled.
2	STMTRANENAB2	RW	Enables STM Burst Translator on STMAWID2[7:0]. A one means STM Burst Translator on STMAWID2[7:0] is enabled.
1	STMTRANENAB1	RW	Enables STM Burst Translator on STMAWID1[7:0]. A one means STM Burst Translator on STMAWID1[7:0] is enabled.
0	STMTRANENAB0	RW	Enables STM Burst Translator on STMAWID0[7:0]. A one means STM Burst Translator on STMAWID0[7:0] is enabled.

0x00801014 QDSS_CS_QDSSCSR_STMAWIDCTRL**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

STM Burst Translator AWID Match Control Register

QDSS_CS_QDSSCSR_STMAWIDCTRL

Bits	Name	Description
31:24	STMAWID3	Burst Translator 3 AXI AWID filter. If STMTRANENAB3 is set and an incoming AXI transaction AWID matches this field, then burst translation is performed on that transaction.
23:16	STMAWID2	Burst Translator 2 AXI AWID filter. If STMTRANENAB2 is set and an incoming AXI transaction AWID matches this field, then burst translation is performed on that transaction.
15:8	STMAWID1	Burst Translator 1 AXI AWID filter. If STMTRANENAB1 is set and an incoming AXI transaction AWID matches this field, then burst translation is performed on that transaction.
7:0	STMAWID0	Burst Translator 0 AXI AWID filter. If STMTRANENAB0 is set and an incoming AXI transaction AWID matches this field, then burst translation is performed on that transaction.

0x00801018 QDSS_CS_QDSSCSR_STMCHNOFST0**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

STM Burst Translator Channel Offset Register 0

QDSS_CS_QDSSCSR_STMCHNOFST0

Bits	Name	Type	Description
31:27	RFU	R	Reserved for Future Use.
26:18	STMCHNOFST2	RW	STPv2 channel offset for Burst Translator 2. If STMTRANENAB2 is set and an incoming AXI transaction AWID matches the AWID filter, then burst translation uses this STPv2 channel offset.
17:9	STMCHNOFST1	RW	STPv2 channel offset for Burst Translator 1. If STMTRANENAB1 is set and an incoming AXI transaction AWID matches the AWID filter, then burst translation uses this STPv2 channel offset.

QDSS_CS_QDSSCSR_STMCHNOFST0 (cont.)

Bits	Name	Type	Description
8:0	STMCHNOFST0	RW	STPv2 channel offset for Burst Translator 0. If STMTRANENAB0 is set and an incoming AXI transaction AWID matches the AWID filter, then burst translation uses this STPv2 channel offset.

0x0080101C QDSS_CS_QDSSCSR_STMCHNOFST1**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

STM Burst Translator Channel Offset Register 1

QDSS_CS_QDSSCSR_STMCHNOFST1

Bits	Name	Type	Description
31:9	RFU	R	Reserved for Future Use.
8:0	STMCHNOFST3	RW	STPv2 channel offset for Burst Translator 3. If STMTRANENAB3 is set and an incoming AXI transaction AWID matches the AWID filter, then burst translation uses this STPv2 channel offset.

0x00801020 QDSS_CS_QDSSCSR_STMEXTHWCTRL0**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

STM Extended Hardware Event Interface Control Register 0

QDSS_CS_QDSSCSR_STMEXTHWCTRL0

Bits	Name	Description
31:28	HEBS7	For bit 7 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
27:24	HEBS6	For bit 6 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
23:20	HEBS5	For bit 5 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

QDSS_CS_QDSSCSR_STMEXTHWCTRL0 (cont.)

Bits	Name	Description
19:16	HEBS4	For bit 4 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
15:12	HEBS3	For bit 3 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
11:8	HEBS2	For bit 2 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
7:4	HEBS1	For bit 1 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
3:0	HEBS0	For bit 0 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

0x00801024 QDSS_CS_QDSSCSR_STMEXTHWCTRL1**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

STM Extended Hardware Event Interface Control Register 1

QDSS_CS_QDSSCSR_STMEXTHWCTRL1

Bits	Name	Description
31:28	HEBS15	For bit 15 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
27:24	HEBS14	For bit 14 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
23:20	HEBS13	For bit 13 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
19:16	HEBS12	For bit 12 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
15:12	HEBS11	For bit 11 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

QDSS_CS_QDSSCSR_STMEXTHWCTRL1 (cont.)

Bits	Name	Description
11:8	HEBS10	For bit 10 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
7:4	HEBS9	For bit 9 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
3:0	HEBS8	For bit 8 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

STM Extended Hardware Event Interface Control Register 2

QDSS_CS_QDSSCSR_STMEXTHWCTRL2

Bits	Name	Description
31:28	HEBS23	For bit 23 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
27:24	HEBS22	For bit 22 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
23:20	HEBS21	For bit 21 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
19:16	HEBS20	For bit 20 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
15:12	HEBS19	For bit 19 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
11:8	HEBS18	For bit 18 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
7:4	HEBS17	For bit 17 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

QDSS_CS_QDSSCSR_STMEXTHWCTRL2 (cont.)

Bits	Name	Description
3:0	HEBS16	For bit 16 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

0x0080102C QDSS_CS_QDSSCSR_STMEXTHWCTRL3**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

STM Extended Hardware Event Interface Control Register 3

QDSS_CS_QDSSCSR_STMEXTHWCTRL3

Bits	Name	Description
31:28	HEBS31	For bit 31 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
27:24	HEBS30	For bit 30 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
23:20	HEBS29	For bit 29 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
19:16	HEBS28	For bit 28 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
15:12	HEBS27	For bit 27 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
11:8	HEBS26	For bit 26 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
7:4	HEBS25	For bit 25 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.
3:0	HEBS24	For bit 24 of the STM hardware event interface, this bit determines which bit of the incoming 512 bit hardware event bus is provided as the input.

0x00801030 QDSS_CS_QDSSCSR_USBBAMCTRL**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

USB NDP BAM Control Register

QDSS_CS_QDSSCSR_USBBAMCTRL

Bits	Name	Type	Description
31:3	RFU	R	Reserved for Future Use.
2	USBENAB	RW	USB trace sink enable. BLKSIZE and USBENAB must be configured before ETR and NDP BAM are configured. A one means USB trace sinking enabled once ETR and NDP BAM blocks have been configured.
1:0	BLKSIZE	RW	Configures the number of bytes that will be allowed to be written by the ETR between successive EOB indications. This is an average value over time so the EOB descriptors could deviate from this size by plus or minus 15*8 bytes. 0x3: ENUM_3 (2048 bytes) 0x2: ENUM_2 (1024 bytes) 0x1: ENUM_1 (512 bytes) 0x0: ENUM_0 (256 bytes)

0x00801034 QDSS_CS_QDSSCSR_USBFLSHCTRL**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

USB Trace Sink Flush Control Register

QDSS_CS_QDSSCSR_USBFLSHCTRL

Bits	Name	Type	Description
31:20	RFU	R	Reserved for Future Use.
19	TRIGEOT	RW	NDP BAM EOT control upon ECT trigger reception by the NDP BAM interface. A one means EOT descriptor creation upon ECT trigger reception enabled.
18	PERFLSHEOT	RW	NDP BAM EOT control upon periodic flush request by the NDP BAM interface. A one means EOT descriptor creation upon periodic flush creation enabled.
17:2	PERFLSHTHRS	RW	NDP BAM interface periodic flush periodicity in NDP BAM clock cycles control. When PERFLSH is set, determines flush periodicity in NDP BAM clock cycles.

QDSS_CS_QDSSCSR_USBFLSHCTRL (cont.)

Bits	Name	Type	Description
1	PERFLSH	RW	NDP BAM periodic flush control. A one means periodic flushing enabled and occurs every PERFLSHTHRS NDP BAM clock cycles.
0	EOT	RW	Manual NDP BAM EOT descriptor creation control. A LOW to HIGH transition causes manual creation of an EOT descriptor.

0x00801038 QDSS_CS_QDSSCSR_TIMESTAMPCTRL**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

Timestamp Control Register

QDSS_CS_QDSSCSR_TIMESTAMPCTRL

Bits	Name	Type	Description
31:2	RFU	R	Reserved for Future Use.
1	TIMESTAMPDISABLE	RW	Enable for the master timestamp generator. This register should be set high (generator disabled) prior to writing CAPTURE. A one means master timestamp generator disabled.
0	CAPTURE	RW	Capture enable for AOTIMEVAL0,1 and QDSSTIMEVAL0,1. A LOW to HIGH transition triggers capturing of values into AOTIMEVAL0,1 and QDSSTIMEVAL0,1.

0x0080103C QDSS_CS_QDSSCSR_AOTIMEVAL0**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

MPM AO Counter Capture Register 0

QDSS_CS_QDSSCSR_AOTIMEVAL0

Bits	Name	Description
31:0	TIMEVAL	This register contains the captured value of the lower 32 bits of the 56 bit MPM AO system counter reference. Capture occurs on cc_qdss_pclkdbg_clk so when the timestamp clock is disabled in the system clock controller, cc_qdss_pclkdbg_clk must be active for this value to be captured.

0x00801040 QDSS_CS_QDSSCSR_AOTIMEVAL1**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

MPM AO Counter Capture Register 1

QDSS_CS_QDSSCSR_AOTIMEVAL1

Bits	Name	Description
31:24	RFU	Reserved for Future Use.
23:0	TIMEVAL	This register contains the captured value of the upper 24 bits of the 56 bit MPM AO system counter reference. Capture occurs on cc_qdss_pclkdbg_clk so when the timestamp clock is disabled in the system clock controller, cc_qdss_pclkdbg_clk must be active for this value to be captured.

0x00801044 QDSS_CS_QDSSCSR_QDSSTIMEVAL0**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS Timestamp Counter Capture Value Register 0

QDSS_CS_QDSSCSR_QDSSTIMEVAL0

Bits	Name	Description
31:0	TIMEVAL	This register contains the captured value of the lower 32 bits of the 64 bit QDSS timestamp counter. Capture occurs on cc_qdss_pclkdbg_clk so when the timestamp clock is disabled in the system clock controller, cc_qdss_pclkdbg_clk must be active for this value to be captured.

0x00801048 QDSS_CS_QDSSCSR_QDSSTIMEVAL1

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Timestamp Counter Capture Value Register 1

QDSS_CS_QDSSCSR_QDSSTIMEVAL1

Bits	Name	Description
31:0	TIMEVAL	This register contains the captured value of the upper 32 bits of the 64 bit QDSS timestamp counter. Capture occurs on cc_qdss_pclkdbg_clk so when the timestamp clock is disabled in the system clock controller, cc_qdss_pclkdbg_clk must be active for this value to be captured.

0x0080104C QDSS_CS_QDSSCSR_QDSSTIMELOAD0

Type: RW
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Timestamp Counter Load Value Register 0

QDSS_CS_QDSSCSR_QDSSTIMELOAD0

Bits	Name	Description
31:0	TIMELOAD	Lower 32 bits of the value to be loaded into the QDSS timestamp reference by the RPM post VDDCX minimization. Loading occurs once both QDSSTIMELOAD0 and 1 have been written irrespective of the order in which they are written. It should be ensured that the timestamp counter clock is inactive whilst writing the TIMELOAD values.

0x00801050 QDSS_CS_QDSSCSR_QDSSTIMELOAD1

Type: RW
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Timestamp Counter Load Value Register 1

QDSS_CS_QDSSCSR_QDSSTIMELOAD1

Bits	Name	Description
31:0	TIMELOAD	Upper 32 bits of the value to be loaded into the QDSS timestamp reference by the RPM post VDDCX minimization. Loading occurs once both QDSSTIMELOAD0 and 1 have been written irrespective of the order in which they are written. It should be ensured that the timestamp counter clock is inactive whilst writing the TIMELOAD values.

0x00801054 QDSS_CS_QDSSCSR_DAPMSAVAL**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS DAP AHB-AP MSA Value Register

QDSS_CS_QDSSCSR_DAPMSAVAL

Bits	Name	Type	Description
31:1	RFU	R	Reserved for Future Use.
0	MSAVAL	RW	Sets the value of the Modem Self Authentication (MSA) bit for outgoing DAP AHB-AP transactions. Setting this bit HIGH is masked by the QDSS modem_IDEN fuse.

0x0080105C QDSS_CS_QDSSCSR_QDSSCLKIPI**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS Clock Frequency Vote IPI Register

QDSS_CS_QDSSCSR_QDSSCLKIPI

Bits	Name	Type	Description
31:1	RFU	R	Reserved for Future Use.
0	CLKIPI	RW	Sets the value of the QDSS clock vote IPI to RPM. A one activates IRQ to RPM CPU.

0x00801060 QDSS_CS_QDSSCSR_QDSSPWRREQIGNORE**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS CDBGPWRUPREQ Ignore Register

QDSS_CS_QDSSCSR_QDSSPWRREQIGNORE

Bits	Name	Description
31:0	PWRREQIGNORE	Enables up to 32 receivers of QDSS CDBGPWRUPREQ to ignore all internal hardware implications of CDBGPWRUPREQ. For example, the RPM Cortex M3 will use this to undo CDBGPWRUPREQ to their local HCLK sleep FSM. When RPM's ignore bit is removed, the GCC must be polled to determine when the RPM's HCLK has been re-activated.

0x00801064 QDSS_CS_QDSSCSR_QDSSSPARE**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS Spare Register

QDSS_CS_QDSSCSR_QDSSSPARE

Bits	Name	Description
31:0	SPARE	32 spare RW bits.

0x00801068 QDSS_CS_QDSSCSR_IPCAT**Type:** R**Clock:** PDBGCLK**Reset State:** 0x30000000

QDSS IPCAT Register

QDSS_CS_QDSSCSR_IPCAT

Bits	Name	Description
31:28	MAJ	Indicates different interface version. Major version changes are not backwards compatible.
27:16	MIN	Indicates expanded functionality. Minor version adds functionality while being backward compatible for existing features.

QDSS_CS_QDSSCSR_IPCAT (cont.)

Bits	Name	Description
15:0	STEP	Indicates a change in the hardware which is not intended to impact software compatibility.

0x0080106C QDSS_CS_QDSSCSR_ETRIRQCTRL**Type:** RW**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS ETR Byte Counter Interrupt Control Register

QDSS_CS_QDSSCSR_ETRIRQCTRL

Bits	Name	Description
31:0	IRQBYTECNTVAL	This 32 bit value defines the number of bytes that, when moved by the ETR AXI interface, causes an interrupt that may be used by an EE to know how much data is present in memory requiring copy to some other location. A zero setting disables the interrupt. A one setting means 8 bytes, two 16 bytes, etc. In other words, the value in this register is the interrupt threshold times 8 bytes.

0x00801070 QDSS_CS_QDSSCSR_PRESERVEETF**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS ETB/ETF WDOG RESET Preservation Register

QDSS_CS_QDSSCSR_PRESERVEETF

Bits	Name	Description
31:23	RFU	Reserved for Future Use.
22	STS_MEMERR	Used to determine if an error on the AXI master interface caused the TMCReady to be set instead of a clean transition due to flush and stop on a crash reset
21	AFVALIDS	Used to determine if the flush got stuck for some reason as part of the flush and stop that occurs on a crash reset
20	STS_EMPTY	Used to determine valid trace being present in the trace memory on a crash reset
19	ACQCOMP	Similar usage as TMCReady bit on a crash reset

QDSS_CS_QDSSCSR_PRESERVEETF (cont.)

Bits	Name	Description
18	STS_TMCREADY	Used to determine we properly transitioned into the stopped state with flush on stop on a crash reset
17	STS_TRIGGERED	Indicates a trigger event being detected while trace capture was enabled when the crash reset occurred
16	FULL	Full bit to help determine if the buffer wrapped or got full at least one. This is used to decide whether the data should be dumped from location 0 or from the value of write pointer
15:0	RWP_PRESERVE	Write pointer value to keep track of where to start dumping trace from i.e. figuring the oldest and newest data in the circular buffer

0x00801074 QDSS_CS_QDSSCSR_PRESERVEETR0**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS ETR WDOG RESET Preservation Register0

QDSS_CS_QDSSCSR_PRESERVEETR0

Bits	Name	Description
31:0	RWP_PRESERVE	Write pointer value to keep track of where to start dumping trace from i.e. figuring the oldest and newest data in the circular buffer

0x00801078 QDSS_CS_QDSSCSR_PRESERVEETR1**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS ETR WDOG RESET Preservation Register1

QDSS_CS_QDSSCSR_PRESERVEETR1

Bits	Name	Description
31:23	RFU	Reserved for Future Use.
22	STS_MEMERR	Used to determine if an error on the AXI master interface caused the TMCReady to be set instead of a clean transition due to flush and stop on a crash reset
21	AFVALIDS	Used to determine if the flush got stuck for some reason as part of the flush and stop that occurs on a crash reset

QDSS_CS_QDSSCSR_PRESERVEETR1 (cont.)

Bits	Name	Description
20	STS_EMPTY	Used to determine valid trace being present in the trace memory on a crash reset
19	ACQCOMP	Similar usage as TMCReady bit on a crash reset
18	STS_TMCREADY	Used to determine we properly transitioned into the stopped state with flush on stop on a crash reset
17	STS_TRIGGERED	Indicates a trigger event being detected while trace capture was enabled when the crash reset occurred
16	FULL	Full bit to help determine if the buffer wrapped or got full at least one. This is used to decide whether the data should be dumped from location 0 or from the value of write pointer
15:8	RFU15_8	Reserved for Future Use.
7:0	RWP_PRESERVE	Write pointer value to keep track of where to start dumping trace from i.e. figuring the oldest and newest data in the circular buffer

0x00801F00 QDSS_CS_QDSSCSR_ITCTL**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS Integration Control (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_ITCTL

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x00801FA0 QDSS_CS_QDSSCSR_CLAIMSET**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS Claim Tag Set (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_CLAIMSET

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x00801FA4 QDSS_CS_QDSSCSR_CLAIMCLR

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Claim Tag Clear (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_CLAIMCLR

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x00801FB0 QDSS_CS_QDSSCSR_LOCKACCESS

Type: W
Clock: PDBGCLK
Reset State: Undefined

QDSS Lock Access (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_LOCKACCESS

Bits	Name	Description
31:0	LOCKACCESS	Write access code. A write of 0xC5ACCE55 enables further writes to the QDSS Coresight CSR Slave from software.

0x00801FB4 QDSS_CS_QDSSCSR_LOCKSTATUS

Type: R
Clock: PDBGCLK
Reset State: 0x00000003

QDSS Lock Status (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_LOCKSTATUS

Bits	Name	Description
31:3	RFU	Reserved for Future Use.
2	FIELD_8_BIT_LOCK	Reads as zero since this component does not implement an 8 bit lock access register.

QDSS_CS_QDSSCSR_LOCKSTATUS (cont.)

Bits	Name	Description
1	ACCESS	Access permission. This bit reflects the inversion of the current state of the UNLOCK bit within this component. 0x1: HIGH (Write access blocked. Reads permitted.) 0x0: LOW (Access permitted.)
0	LOCK_CONTROL	Reads as one since lock exists for this component.

0x00801FB8 QDSS_CS_QDSSCSR_AUTHSTATUS

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Authentication Status (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_AUTHSTATUS

Bits	Name	Description
31:0	RFU	Reads as zero since no integration functionality is implemented.

0x00801FC8 QDSS_CS_QDSSCSR_DEVICEID

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Device Identification (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_DEVICEID

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	DEVID	This register is implementation defined for each Part Number and Designer. Unused for this component so reads as zeros.

0x00801FCC QDSS_CS_QDSSCSR_DEVICETYPE

Type: R
Clock: PDBGCLK
Reset State: 0x00000004

QDSS Device Type (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_DEVICETYPE

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	SUBTYPE	Reads as zeros meaning Other sub type.
3:0	MAJTYPE	Reads as 0x4 meaning Debug Control major type.

0x00801FD0 QDSS_CS_QDSSCSR_PERIPHID4**Type:** R**Clock:** PDBGCLK**Reset State:** 0x0000000X

QDSS Peripheral ID4 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID4

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	FIELD_4KB_COUNT	Number of 4kB blocks. Reads as zero or 4kB block size.
3:0	JEP106_CONTINUATION	JEP106 continuation code. Reads as TARGETID[11:8] from MSM JTAG ID fuses [11:8]. This field should be set to bits [10:7] of Qualcomm's JEDEC assigned JEP106 code.

0x00801FD4 QDSS_CS_QDSSCSR_PERIPHID5**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000000

QDSS Peripheral ID5 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID5

Bits	Name	Description
31:0	RFU	Reads as zero per Coresight Architecture.

0x00801FD8 QDSS_CS_QDSSCSR_PERIPHID6

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Peripheral ID6 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID6

Bits	Name	Description
31:0	RFU	Reads as zero per Coresight Architecture.

0x00801FDC QDSS_CS_QDSSCSR_PERIPHID7

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Peripheral ID7 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID7

Bits	Name	Description
31:0	RFU	Reads as zero per Coresight Architecture.

0x00801FE0 QDSS_CS_QDSSCSR_PERIPHID0

Type: R
Clock: PDBGCLK
Reset State: 0x00000040

QDSS Peripheral ID0 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID0

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PARTNUM	PartNumber[7:0]. [7:6] is Subsystem/core family ID (e.g. denote QDSS family or generation). [5:4] is Subsystem/core configuration options (e.g. denote cache options, etc.). [3:2] is Subsystem/core fuse options (e.g. indicate modem fuse options, etc.). [1:0] is Subsystem/core future use field. Reads as 0x40.

0x00801FE4 QDSS_CS_QDSSCSR_PERIPHID1

Type: R
Clock: PDBGCLK
Reset State: 0x000000X4

QDSS Peripheral ID1 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID1

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	JEP106_IDENTITY_3_0	JEF106 Identity Code[3:0]. Reads as TARGETID[4:1] from MSM JTAG ID fuses [4:1] which will always be 0x0 for Qualcomm.
3:0	PARTNUM	PartNumber[11:8]. [11:8] is 0x4 meaning Qualcomm designed Coresight component in QDSS. Reads as 0x4.

0x00801FE8 QDSS_CS_QDSSCSR_PERIPHID2

Type: R
Clock: PDBGCLK
Reset State: 0b0000000000000000000000000000000011XXX

QDSS Peripheral ID2 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID2

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	MAJREV	Major revision number of this peripheral. Reads as 0x0 for this version of QDSS.
3	JEDEC	Reads as one which indicates that a JEDEC assigned value is used.
2:0	JEP106_IDENTITY_6_4	JEF106 Identity Code[6:4]. Reads as TARGETID[7:5] from MSM JTAG ID fuses [7:5] which will always be 3'b111 for Qualcomm.

0x00801FEC QDSS_CS_QDSSCSR_PERIPHID3

Type: R
Clock: PDBGCLK
Reset State: 0x00000000

QDSS Peripheral ID3 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_PERIPHID3

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	REV_AND	This field indicates minor errata fixes specific to this design. Reads as zeros for this version of QDSS.
3:0	CUSTOMER_MODIFIED	Implementation defined. Always reads as zeros for QDSS.

0x00801FF0 QDSS_CS_QDSSCSR_COMPID0**Type:** R**Clock:** PDBGCLK**Reset State:** 0x0000000D

QDSS Component ID0 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_COMPID0

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PREAMBLE_7_0	Coresight mandates this read as 0x0D.

0x00801FF4 QDSS_CS_QDSSCSR_COMPID1**Type:** R**Clock:** PDBGCLK**Reset State:** 0x00000090

QDSS Component ID1 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_COMPID1

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:4	PREAMBLE_15_12	Coresight mandates this read as 0x9 or Coresight class component.
3:0	PREAMBLE_11_8	Coresight mandates this read as 0x0.

0x00801FF8 QDSS_CS_QDSSCSR_COMPID2

Type: R
Clock: PDBGCLK
Reset State: 0x00000005

QDSS Component ID2 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_COMPID2

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PREAMBLE_23_16	Coresight mandates this read as 0x05.

0x00801FFC QDSS_CS_QDSSCSR_COMPID3

Type: R
Clock: PDBGCLK
Reset State: 0x000000B1

QDSS Component ID3 (Coresight Programmer's Model) Register

QDSS_CS_QDSSCSR_COMPID3

Bits	Name	Description
31:8	RFU	Reserved for Future Use.
7:0	PREAMBLE_31_24	Coresight mandates this read as 0xB1.

12.1.3 CXSTM_2_32_32_TRUE

The CoreSight CXSTM is instrumentation trace macrocell with software and hardware stimulus ports that generates trace according to MIPI STPv2 protocol.

12.1.3.1 QDSS_CXSTM_2_32_32_TRUE

The CoreSight CXSTM is instrumentation trace macrocell with software and hardware stimulus ports that generates trace according to MIPI STPv2 protocol.

0x00802C04 QDSS_STMDMASTARTR

Type: W
Reset State: Undefined

QDSS_STMDMASTARTR

Bits	Name	Description
0	START	Start a DMA transfer 0x1: START (Start a DMA transfer)

0x00802C08 QDSS_STMDMASTOPR**Type:** W**Reset State:** Undefined**QDSS_STMDMASTOPR**

Bits	Name	Description
0	STOP	Stop an active DMA transfer 0x1: STOP (Stop an active DMA transfer)

0x00802C0C QDSS_STMDMASTATR**Type:** R**Reset State:** 0x00000000**QDSS_STMDMASTATR**

Bits	Name	Description
0	STATUS	Stop an active DMA transfer 0x0: IDLE (interface is idle) 0x1: ACTIVE (interface is active)

0x00802C10 QDSS_STMDMACTLR**Type:** RW**Reset State:** 0x00000000**QDSS_STMDMACTLR**

Bits	Name	Description
3:2	SENS	Determines the sensitivity of the DMA request to the current buffer level in the STM: 0x0: EMPTY (FIFO is less than 25% full) 0x1: ENUM_25 (FIFO is less than 50% full) 0x2: ENUM_50 (FIFO is less than 75% full) 0x3: ENUM_75 (FIFO is less than 100% full)

0x00802CFC QDSS_STMDMAIDR**Type:** R**Reset State:** 0x00000002**QDSS_STMDMAIDR**

Bits	Name	Description
11:8	VENDSPEC	The VENDSPEC field identifies any vendor specific modifications or mappings. 0x0: VENDSPEC (Vendor specific information.)
7:4	CLASSREV	The CLASSREV field identifies the revision of the programmer's model. 0x0: REVISION_CONTROL (Revision.)
3:0	CLASS	The CLASS field identifies the programmer's model. 0x2: CONTROL (DMA Control.)

0x00802D00 QDSS_STMHEER**Type:** RW**Reset State:** Undefined**QDSS_STMHEER**

Bits	Name	Description
31:0	HEE	

0x00802D20 QDSS_STMHETER**Type:** RW**Reset State:** Undefined**QDSS_STMHETER**

Bits	Name	Description
31:0	HETE	

0x00802D64 QDSS_STMHEMCR**Type:** RW**Reset State:** 0b000000000000000000000000XX00XX0

QDSS_STMHEMCR

Bits	Name	Type	Description
7	RESERVED	RW	Reserved
6	TRIGCLEAR	W	0x0: NO_EFFECT (No effect) 0x1: CLEAR (Clears TRIGSTATUS if TRIGSTATUS is b1)
5	TRIGSTATUS	R	0x0: NOT_OCCURRED (Trigger has not occurred) 0x1: OCCURRED (Trigger has occurred)
4	TRIGCTL	RW	0x0: MULTI_SHOT (Triggers are multi-shot) 0x1: SINGLE_SHOT (Triggers are single-shot)
2	ERRDETECT	R	Enable error detection on the hardware event tracing 0x0: DISABLE (Error detection disabled) 0x1: ENABLE (Error detection enabled.)
1	COMPEN	RW	Enable leading zero suppression of hardware event data values in the trace stream 0x0: DISABLE (Compression disabled) 0x1: ENABLE (Compression enabled.)
0	EN	RW	Enable Hardware Event tracing 0x0: DISABLE (Disabled) 0x1: ENABLE (Enabled)

0x00802DF4 QDSS_STMHEMASTR**Type:** R**Reset State:** 0x00000080**QDSS_STMHEMASTR**

Bits	Name	Description
15:0	MASTER	The STPv2 master number for hardware event trace: 0x80: MASTER_1 (Hardware events are associated with master 0x80.)

0x00802DF8 QDSS_STMHEFEAT1R**Type:** R**Reset State:** 0x00100035**QDSS_STMHEFEAT1R**

Bits	Name	Description
23:15	NUMHE	The number of hardware events supported by the STM: 0x20: EVENTS (32 hardware events.)

QDSS_STMHEFEAT1R (cont.)

Bits	Name	Description
5:4	HECOMP	0x3: RO (Data compression support is programmable. STMHEMCR.COMPEN is implemented)
3	HEMASTR	0x0: RO (STMHEMASTR is read-only.)
2	HEERR	0x1: IMPLEMENTED (Hardware event error detection implemented. STMHEMCR.ERRDETECT is implemented.)
0	HETER	0x1: IMPLEMENTED (STMHETER implemented.)

0x00802DFC QDSS_STMHEIDR**Type:** R**Reset State:** 0x00000001**QDSS_STMHEIDR**

Bits	Name	Description
11:8	VENDSPEC	The VENDSPEC field identifies any vendor specific modifications or mappings: 0x0: VENDSPEC (Vendor specific information.)
7:4	CLASSREV	The CLASSREV field identifies the revision of the programmers model: 0x0: REVISION_CONTROL (Revision.)
3:0	CLASS	The CLASS field identifies the programmers model: 0x1: CONTROL (Hardware Event Control.)

0x00802E00 QDSS_STMSPER**Type:** RW**Reset State:** 0x00000000**QDSS_STMSPER**

Bits	Name	Description
31:0	SPE	

0x00802E20 QDSS_STMSPTER**Type:** RW**Reset State:** 0x00000000

QDSS_STMSPTER

Bits	Name	Description
31:0	SPTTE	

0x00802E60 QDSS_STMSPSCR**Type:** RW**Reset State:** 0xXXX00000**QDSS_STMSPSCR**

Bits	Name	Description
31:20	PORTSEL	This field defines which stimulus ports the STMSPTER and/or STMSPER apply to
1:0	PORTCTL	0x0: NOT_USED (Port selection not used) 0x1: STMSPTER_ONLY (Port selection applies only to the STMSPTER) 0x2: RESERVED (Reserved) 0x3: STMSPER_AND_STMSPTER (Port selection applies to both the STMSPER and STMSPTER)

0x00802E68 QDSS_STMSPOVERRIDER**Type:** RW**Reset State:** 0bXXXXXXXXXXXXXXXXX0000000000000000**QDSS_STMSPOVERRIDER**

Bits	Name	Description
31:15	PORTSEL	
2	OVERTS	0x0: DISABLED (Override not enabled) 0x1: ENABLED (Override enabled)
1:0	OVERCTL	0x0: DISABLED (Override controls disabled) 0x1: GUARANTEED (Ports selected by PORTSEL always behave as Guaranteed transactions) 0x2: INVARIANT_TIMING (Ports selected by PORTSEL always behave as Invariant Timing transactions) 0x3: RESERVED (Reserved)

0x00802E6C QDSS_STMSPMOVERRIDER**Type:** RW**Reset State:** 0b000000000XXXXXXXXX0000000000000000**QDSS_STMSPMOVERRIDER**

Bits	Name	Description
22:15	MASTSEL	
0	MASTCTL	0x0: DISABLED (Override controls disabled. STMSPMOVERRIDER applies equally to all masters) 0x1: ENABLED (Master selection enabled. STMSPMOVERRIDER applies to the masters selected by MASTSEL)

0x00802E70 QDSS_STMSPTRIGCSR**Type:** RW**Reset State:** 0b000000000000000000000000000000XX0**QDSS_STMSPTRIGCSR**

Bits	Name	Type	Description
4	RESERVED	RW	Reserved
3	RESERVED	RW	Reserved
2	TRIGCLEAR	W	0x0: NO_EFFECT (No effect) 0x1: CLEAR (Clears TRIGSTATUS if TRIGSTATUS is b1)
1	TRIGSTATUS	R	0x0: NOT_OCCURRED (Trigger has not occurred) 0x1: OCCURRED (Trigger has occurred)
0	TRIGCTL	RW	0x0: MULTI_SHOT (Triggers are multi-shot) 0x1: SINGLE_SHOT (Triggers are single-shot)

0x00802E80 QDSS_STMTCSR**Type:** RW**Reset State:** 0b000000000XXXXXXXXX0000000000000100**QDSS_STMTCSR**

Bits	Name	Type	Description
23	BUSY	R	STM is busy, for example the STM trace FIFO is not empty: 0x0: IDLE (STM is not busy.) 0x1: BUSY (STM is busy.)
22:16	RESERVED	RW	Reserved

QDSS_STMTCSR (cont.)

Bits	Name	Type	Description
5	COMPEN	RW	0x0: DISABLED (Compression disabled, data transfers are transmitted at the size of the transaction.) 0x1: ENABLED (Compression enabled, data transfers are compressed to save bandwidth.)
2	SYNCEN	R	STMSYNCR is implemented so this value is RAO. 0x1: RAO (STMSYNCR implemented.)
1	TSEN	RW	This bit controls if timestamp requests are ignored or not: 0x0: DISABLE (Timestamping disabled. Requests for timestamp generation are ignored, and stimulus port writes selecting timestamping are treated as if it were not selected.) 0x1: ENABLE (Timestamping enabled. If stimulus writes select timestamping, a timestamp is output according to STPv2.)
0	EN	RW	Global STM enable: 0x0: DISABLE (STM disabled) 0x1: ENABLE (STM enabled)

0x00802E84 QDSS_STMTSSTIMR**Type:** W**Reset State:** Undefined**QDSS_STMTSSTIMR**

Bits	Name	Description
0	FORCETS	0x1: FORCETS (Force Timestamp Stimulus)

0x00802E8C QDSS_STMTSFREQR**Type:** RW**Reset State:** 0x00000000**QDSS_STMTSFREQR**

Bits	Name	Description
31:0	FREQ	The timestamp frequency in Hz

0x00802E90 QDSS_STMSYNCR**Type:** RW**Reset State:** 0x00000000**QDSS_STMSYNCR**

Bits	Name	Description
12	MODE	0x0: N_BYTES (COUNT[11:0] defines a value N. Synchronization period is N bytes) 0x1: ENUM_2_N_BYTES (COUNT[11:7] defines a value N. Synchronization period is 2^N bytes. N must be in the range of 12 to 27 inclusive and other values are Unpredictable)
11:2	COUNT	Counter value for the number of bytes between synchronization packets. Reads return the value of this register.

0x00802E94 QDSS_STMAUXCR**Type:** RW**Reset State:** 0x00000000**QDSS_STMAUXCR**

Bits	Name	Description
4	AFREADYHIGH	0x0: NO_OVERRIDE (No override, AFREADY is controlled by the state of the STM.) 0x1: OVERRIDE (Override, AFREADY is driven HIGH.)
3	CLKON	0x0: NO_OVERRIDE (No override, clock gate is controlled by the state of STM.) 0x1: OVERRIDE (Override, clock is enabled.)
2	PRIORINVDIS	0x0: INVERSION_ENABLED (Priority inversion, when AXI flush is finished, HW gets priority until HW flush is done) 0x1: INVERSION_DISABLED (Priority inversion disabled, AXI always has priority over HW.)
1	ASYNCPPE	0x0: DISABLE (ASYNCP priority is always lower than trace.) 0x1: ENABLE (ASYNCP priority escalates on second synchronization request.)
0	FIFOAF	0x0: DISABLED (Auto-flush disabled.) 0x1: ENABLED (Auto-flush enabled.)

0x00802EA0 QDSS_STMSPFEAT1R**Type:** R**Reset State:** 0x006587D1

QDSS_STMSPFEAT1R

Bits	Name	Description
23:22	SWOEN	0x1: NOT_IMPLEMENTED (STMTCSR.SWOEN not implemented.)
21:20	SYNCEN	0x2: RAO (STMTCSR.SYNCEN implemented but always reads as b1.)
19:18	HWTEN	0x1: NOT_IMPLEMENTED (STMTCSR.HWTEN not implemented.)
17:16	TSPRESCALE	0x1: NOT_IMPLEMENTED (Timestamp prescale not implemented.)
15:14	TRIGCTL	0x2: MULTI_SHOT_AND_SINGLE_SHOT (Multi-shot and single-shot triggers supported. STMTRIGCSR implemented.)
13:10	RESERVED	Reserved
9:8	SYNC	0x3: MODE (STMSYNCR implemented with MODE control.)
7	FORCETS	0x1: IMPLEMENTED (STMTSSTIMR bit [0] implemented.)
6	TSFREQ	0x1: RW (STMTSFREQR is read-write.)
5:4	TS	0x1: ABSOLUT (Absolute timestamps implemented.)
3:0	PROT	0x1: STPV2 (STPV2 protocol.)

0x00802EA4 QDSS_STMSPFEAT2R**Type:** R**Reset State:** 0x000104F2**QDSS_STMSPFEAT2R**

Bits	Name	Description
17:16	SPTYPE	0x1: EXTENDED_ONLY (Only Extended Stimulus Ports implemented.)
15:12	DSIZE	0x0: ENUM_32_BIT (32-bit data.)
10:9	SPTRTYPE	0x2: INVARIANT_TIMING_AND_GUARANTEED (Both invariant timing and guaranteed transactions are supported)
8:7	PRIVMASK	0x1: NOT_IMPLEMENTED (STMPRIVMASKR not implemented.)
6	SPOVERRIDE	0x1: IMPLEMENTED (STMSPOVERRIDER and STMSPMOVERRIDER implemented.)
5:4	SPCOMP	0x3: PROGRAMMABLE (Data compression support is programmable. STMTCSR.COMPEN is implemented.)
2	SPER	0x0: IMPLEMENTED (STMSPER is implemented.)
1:0	SPTER	0x2: IMPLEMENTED (STMSPTER is implemented.)

0x00802EA8 QDSS_STMSPFEAT3R**Type:** R**Reset State:** 0x0000007F

Indicates the features of the STM.

QDSS_STMSPFEAT3R

Bits	Name	Description
6:0	NUMMAST	0x7F: NUMMAST (128 masters are implemented.)

0x00802EE8 QDSS_STMITTRIGGER**Type:** W**Reset State:** Undefined

Integration Test for Cross-Trigger Outputs Register

QDSS_STMITTRIGGER

Bits	Name	Description
3	ASYNCOOUT_W	Sets the value of the ASYNCOOUT output in integration mode: 0x1: HIGH (Drive logic 1 on ASYNCOOUT output.) 0x0: LOW (Drive logic 0 on ASYNCOOUT output.)
2	TRIGOUTHETE_W	Sets the value of the TRIGOUTHETE output in integration mode: 0x1: HIGH (Drive logic 1 on TRIGOUTHETE output.) 0x0: LOW (Drive logic 0 on TRIGOUTHETE output.)
1	TRIGOUTSW_W	Sets the value of the TRIGOUTSW output in integration mode: 0x1: HIGH (Drive logic 1 on TRIGOUTSW output.) 0x0: LOW (Drive logic 0 on TRIGOUTSW output.)
0	TRIGOUTSPTE_W	Sets the value of the TRIGOUTSPTE output in integration mode: 0x1: HIGH (Drive logic 1 on TRIGOUTSPTE output.) 0x0: LOW (Drive logic 0 on TRIGOUTSPTE output.)

0x00802EEC QDSS_STMITATBDATA0**Type:** W**Reset State:** Undefined

Controls the value of the ATDATAM output in integration mode:

QDSS_STMITATBDATA0

Bits	Name	Description
4	ATDATAM31_W	Set the value of the ATDATAM[31] output: 0x1: HIGH (Drive logic 1 on ATDATAM[31] output.) 0x0: LOW (Drive logic 0 on ATDATAM[31] output.)
3	ATDATAM23_W	Set the value of the ATDATAM[23] output: 0x1: HIGH (Drive logic 1 on ATDATAM[23] output.) 0x0: LOW (Drive logic 0 on ATDATAM[23] output.)
2	ATDATAM15_W	Set the value of the ATDATAM[15] output: 0x1: HIGH (Drive logic 1 on ATDATAM[15] output.) 0x0: LOW (Drive logic 0 on ATDATAM[15] output.)
1	ATDATAM7_W	Set the value of the ATDATAM[7] output: 0x1: HIGH (Drive logic 1 on ATDATAM[7] output.) 0x0: LOW (Drive logic 0 on ATDATAM[7] output.)
0	ATDATAM0_W	Set the value of the ATDATAM[0] output: 0x1: HIGH (Drive logic 1 on ATDATAM[0] output.) 0x0: LOW (Drive logic 0 on ATDATAM[0] output.)

0x00802EF0 QDSS_STMITATBCTR2**Type:** R**Reset State:** Undefined

Returns the value of the ATREADYM and AFVALIDM inputs in integration mode.

QDSS_STMITATBCTR2

Bits	Name	Description
1	AFVALIDM_R	Reads the value of the AFVALIDM input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)
0	ATREADYM_R	Reads the value of the ATREADYM input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)

0x00802EF4 QDSS_STMITATBID**Type:** W**Reset State:** Undefined

Controls the value of the ATIDM output in integration mode.

QDSS_STMITATBID

Bits	Name	Description
6:0	ATIDM_W	Sets the value of the ATIDM output.

0x00802EF8 QDSS_STMITATBCTR0**Type:** W**Reset State:** Undefined

Controls the value of the ATVALIDM, AFREADYM, and ATBYTESM outputs in integration mode.

QDSS_STMITATBCTR0

Bits	Name	Description
9:8	ATBYTESM_W	Sets the value of the ATBYTESM output: 0x3: ENUM_11 (Drive logic 2'b11 on the ATBYTESM output.) 0x2: ENUM_10 (Drive logic 2'b10 on the ATBYTESM output.) 0x1: ENUM_01 (Drive logic 2'b01 on the ATBYTESM output.) 0x0: ENUM_00 (Drive logic 2'b00 on the ATBYTESM output.)
1	AFREADYM_W	Sets the value of the AFREADYM output: 0x1: HIGH (Drive logic 1 on the AFREADYM output.) 0x0: LOW (Drive logic 0 on the AFREADYM output.)
0	ATVALIDM_W	Sets the value of the ATVALIDM output: 0x1: HIGH (Drive logic 1 on the ATVALIDM output.) 0x0: LOW (Drive logic 0 on the ATVALIDM output.)

0x00802F00 QDSS_STMITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_STMITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Enables the component to switch from functional mode to integration mode and back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode.) 0x0: FUNCTIONAL_MODE (Disable integration mode.)

0x00802FA0 QDSS_STMCLAIMSET**Type:** RW**Reset State:** 0x0000000F**QDSS_STMCLAIMSET**

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00802FA4 QDSS_STMCLAIMCLR**Type:** RW**Reset State:** 0x00000000**QDSS_STMCLAIMCLR**

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00802FB0 QDSS_STMLAR**Type:** W**Reset State:** Undefined**QDSS_STMLAR**

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write has the affect of removing write access. 0xC5ACCE55: UNLOCK (unlock the protection register to enable write access)

0x00802FB4 QDSS_STMLSR**Type:** R**Reset State:** 0x00000003

QDSS_STMLSR

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register, 0xFB0, is implemented as 8-bit or 32-bit. 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register.)
1	LOCKGRANT	Returns the current status of the Lock. 0x0: ACCESS_PERMITTED (Write access is allowed to this device.) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted.)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access Register, 0xFB0, are ignored.) 0x1: LOCK_PRESENT (Lock control mechanism is present.)

0x00802FC8 QDSS_STMDEVID**Type:** R**Reset State:** 0x00010000**QDSS_STMDEVID**

Bits	Name	Description
16:0	NUMSP	This value indicates the number of stimulus ports implemented. 0x10000: NUMBER_OF_PORTS (65536 stimulus ports implemented.)

0x00802FCC QDSS_STMDEVTYPE**Type:** R**Reset State:** 0x00000063**QDSS_STMDEVTYPE**

Bits	Name	Description
7:4	SUB_TYPE	Sub-classification within the major category: 0x6: CORESIGHT_STM (This component generates trace based on software and hardware stimulus.)
3:0	RESERVED	Reserved

0x00802FE0 QDSS_STMPIDR0**Type:** R**Reset State:** 0x00000062**QDSS_STMPIDR0**

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component part number. This is selected by the designer of the component. 0x62: CORESIGHT_STM_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number, 0x962.)

0x00802FE4 QDSS_STMPIDR1**Type:** R**Reset State:** 0x000000B9**QDSS_STMPIDR1**

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits [3:0] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code.)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component part number. This is selected by the designer of the component. 0x9: CORESIGHT_STM_PART_NUMBER_11_8 (Upper 4 bits of the Part Number, 0x907.)

0x00802FE8 QDSS_STMPIDR2**Type:** R**Reset State:** 0x0000001B**QDSS_STMPIDR2**

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is used as a look-up to establish the exact major and minor revision. 0x1: R0P1 (This device is at r0p1.)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used. 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org).)

QDSS_STMPIDR2 (cont.)

Bits	Name	Description
2:0	JEP106_BITS6TO4	Bits [6:4] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code.)

0x00802FEC QDSS_STMPIDR3**Type:** R**Reset State:** 0x00000000**QDSS_STMPIDR3**

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component.)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made.)

0x00802FD0 QDSS_STMPIDR4**Type:** R**Reset State:** 0x00000004**QDSS_STMPIDR4**

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB, this must read as 0x0, 4KB only. For 8KB set to 0x1, for 16KB set to 0x2, for 32KB set to 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4KB of memory.)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component, together with the identity code. 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank.)

0x00802FD4 QDSS_STMPIDR5**Type:** RW**Reset State:** Undefined**QDSS_STMPIDR5**

Bits	Name	Description
31:0	STMPIDR5	

0x00802FD8 QDSS_STMPIDR6**Type:** RW**Reset State:** Undefined**QDSS_STMPIDR6**

Bits	Name	Description
31:0	STMPIDR6	

0x00802FDC QDSS_STMPIDR7**Type:** RW**Reset State:** Undefined**QDSS_STMPIDR7**

Bits	Name	Description
31:0	STMPIDR7	

0x00802FF0 QDSS_STMCIDR0**Type:** R**Reset State:** 0x0000000D**QDSS_STMCIDR0**

Bits	Name	Description
7:0	PREAMBLE	Contains bits [24:31] of the component identification. 0xD: ENUM_0D (Identification value.)

0x00802FF4 QDSS_STMCIDR1**Type:** R**Reset State:** 0x00000090**QDSS_STMCIDR1**

Bits	Name	Description
7:4	CLASS	Class of the component, for example, ROM table or CoreSight component. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component.)
3:0	PREAMBLE	Contains bits [19:16] of the component identification. 0x0: ENUM_0 (Identification value.)

0x00802FF8 QDSS_STMCIDR2**Type:** R**Reset State:** 0x00000005**QDSS_STMCIDR2**

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification. 0x5: ENUM_05 (Identification value.)

0x00802FFC QDSS_STMCIDR3**Type:** R**Reset State:** 0x000000B1**QDSS_STMCIDR3**

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification. 0xB1: B1 (Identification value.)

12.1.4 CTIO_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.4.1 QDSS_CTIO_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00810000 QDSS_CTIO_CTICONTROL

Type: RW

Reset State: 0x00000000

QDSS_CTIO_CTICONTROL

Bits	Name	Description
0	GLBEN	0x1: ENABLED (When this bit is 1, cross triggering mapping logic functionality is enabled.) 0x0: DISABLED (When this bit is 0, all cross triggering mapping logic functionality is disabled.)

0x00810010 QDSS_CTIO_CTIINTACK

Type: W

Reset State: 0x00000000

QDSS_CTIO_CTIINTACK

Bits	Name	Description
7:0	INTACK	

0x00810014 QDSS_CTIO_CTIAPPSET

Type: W

Reset State: 0x00000000

QDSS_CTIO_CTIAPPSET

Bits	Name	Description
3:0	APPSET	

0x00810018 QDSS_CTIO_CTIAPPCLEAR**Type:** W**Reset State:** 0x00000000**QDSS_CTIO_CTIAPPCLEAR**

Bits	Name	Description
3:0	APPCLEAR	

0x0081001C QDSS_CTIO_CTIAPPPULSE**Type:** W**Reset State:** 0x00000000**QDSS_CTIO_CTIAPPPULSE**

Bits	Name	Description
3:0	APPULSE	

0x00810020 QDSS_CTIO_CTIINEN0**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN0**

Bits	Name	Description
3:0	TRIGINEN	

0x00810024 QDSS_CTIO_CTIINEN1**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN1**

Bits	Name	Description
3:0	TRIGINEN	

0x00810028 QDSS_CTIO_CTIINEN2**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN2**

Bits	Name	Description
3:0	TRIGINEN	

0x0081002C QDSS_CTIO_CTIINEN3**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN3**

Bits	Name	Description
3:0	TRIGINEN	

0x00810030 QDSS_CTIO_CTIINEN4**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN4**

Bits	Name	Description
3:0	TRIGINEN	

0x00810034 QDSS_CTIO_CTIINEN5**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN5**

Bits	Name	Description
3:0	TRIGINEN	

0x00810038 QDSS_CTIO_CTIINEN6**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN6**

Bits	Name	Description
3:0	TRIGINEN	

0x0081003C QDSS_CTIO_CTIINEN7**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIINEN7**

Bits	Name	Description
3:0	TRIGINEN	

0x008100A0 QDSS_CTIO_CTIOUTEN0**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN0**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100A4 QDSS_CTIO_CTIOUTEN1**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN1**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100A8 QDSS_CTIO_CTIOUTEN2**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN2**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100AC QDSS_CTIO_CTIOUTEN3**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN3**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100B0 QDSS_CTIO_CTIOUTEN4**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN4**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100B4 QDSS_CTIO_CTIOUTEN5**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN5**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100B8 QDSS_CTIO_CTIOUTEN6**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN6**

Bits	Name	Description
3:0	TRIGOUTEN	

0x008100BC QDSS_CTIO_CTIOUTEN7**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_CTIOUTEN7**

Bits	Name	Description
3:0	TRIGOUTEN	

0x00810130 QDSS_CTIO_CTITRIGINSTATUS**Type:** R**Reset State:** Undefined**QDSS_CTIO_CTITRIGINSTATUS**

Bits	Name	Description
7:0	TRIGINSTATUS	

0x00810134 QDSS_CTIO_CTITRIGOUTSTATUS**Type:** R**Reset State:** 0x00000000**QDSS_CTIO_CTITRIGOUTSTATUS**

Bits	Name	Description
7:0	TRIGOUTSTATUS	

0x00810138 QDSS_CTIO_CTICHINSTATUS**Type:** R**Reset State:** Undefined**QDSS_CTIO_CTICHINSTATUS**

Bits	Name	Description
3:0	CTICHINSTATUS	

0x0081013C QDSS_CTIO_CTICHOUTSTATUS**Type:** R**Reset State:** 0x00000000**QDSS_CTIO_CTICHOUTSTATUS**

Bits	Name	Description
3:0	CTICHOUTSTATUS	

0x00810140 QDSS_CTIO_CTIGATE**Type:** RW**Reset State:** 0x0000000F**QDSS_CTIO_CTIGATE**

Bits	Name	Description
3	CTIGATEEN3	
2	CTIGATEEN2	
1	CTIGATEEN1	
0	CTIGATEEN0	

0x00810144 QDSS_CTIO_ASICCTL**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_ASICCTL**

Bits	Name	Description
7:0	ASICCTL	

0x00810EDC QDSS_CTIO_ITCHINACK**Type:** W**Reset State:** 0x00000000**QDSS_CTIO_ITCHINACK**

Bits	Name	Description
3:0	CTCHINACK	

0x00810EE0 QDSS_CTIO_ITTRIGINACK**Type:** W**Reset State:** 0x00000000**QDSS_CTIO_ITTRIGINACK**

Bits	Name	Description
7:0	CTTRIGINACK	

0x00810EE4 QDSS_CTIO_ITCHOUT**Type:** W**Reset State:** 0x00000000**QDSS_CTIO_ITCHOUT**

Bits	Name	Description
3:0	CTCHOUT	

0x00810EE8 QDSS_CTIO_ITTRIGOUT**Type:** W**Reset State:** 0x00000000**QDSS_CTIO_ITTRIGOUT**

Bits	Name	Description
7:0	CTTRIGOUT	

0x00810EEC QDSS_CTIO_ITCHOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CTIO_ITCHOUTACK**

Bits	Name	Description
3:0	CTCHOUTACK	

0x00810EF0 QDSS_CTIO_ITTRIGOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CTIO_ITTRIGOUTACK**

Bits	Name	Description
7:0	CTTRIGOUTACK	

0x00810EF4 QDSS_CTIO_ITCHIN**Type:** R**Reset State:** 0x00000000**QDSS_CTIO_ITCHIN**

Bits	Name	Description
3:0	CTCHIN	

0x00810EF8 QDSS_CTIO_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CTIO_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00810F00 QDSS_CTIO_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CTIO_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00810FA0 QDSS_CTIO_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CTIO_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00810FA4 QDSS_CTIO_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CTIO_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.

QDSS_CTIO_CLAIMCLR (cont.)

Bits	Name	Type	Description
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00810FB0 QDSS_CTIO_LAR**Type:** W**Reset State:** Undefined**QDSS_CTIO_LAR**

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00810FB4 QDSS_CTIO_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTIO_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00810FB8 QDSS_CTIO_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTIO_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00810FC8 QDSS_CTIO_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTIO_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00810FE0 QDSS_CTIO_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTIO_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00810FE4 QDSS_CTIO_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTIO_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00810FE8 QDSS_CTIO_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTIO_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00810FEC QDSS_CTIO_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CTIO_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00810FD0 QDSS_CTIO_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTIO_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00810FF0 QDSS_CTIO_COMPID0**Type:** R**Reset State:** 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CTIO_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00810FF4 QDSS_CTIO_COMPID1**Type:** R**Reset State:** 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CTIO_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00810FF8 QDSS_CTIO_COMPID2**Type:** R**Reset State:** 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTIO_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00810FFC QDSS_CTIO_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTIO_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.5 CTI1_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.5.1 QDSS_CTII_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00811F00 QDSS_CTI1_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CTI1_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00811FA0 QDSS_CTI1_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CTI1_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00811FA4 QDSS_CTI1_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CTI1_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00811FB0 QDSS_CTI1_LAR**Type:** W**Reset State:** Undefined

QDSS_CTI1_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00811FB4 QDSS_CTI1_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTI1_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00811FB8 QDSS_CTI1_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTL1_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00811FC8 QDSS_CTL1_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTL1_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00811FE0 QDSS_CTL1_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTI1_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00811FE4 QDSS_CTI1_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTI1_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00811FE8 QDSS_CTI1_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTI1_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CTI1_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00811FEC QDSS_CTI1_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CTI1_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00811FD0 QDSS_CTI1_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI1_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00811FF8 QDSS_CTI1_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTI1_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00811FFC QDSS_CTI1_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTI1_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.6 CTI2_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.6.1 QDSS_CTI2_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

3:0	CTICHINSTSTATUS	

0x0081213C QDSS_CT12_CTICHOUTSTATUS**Type:** R**Reset State:** 0x00000000

QDSS_CT12_CTICHOUTSTATUS

Bits	Name	Description
3:0	CTICHOUTSTATUS	

0x00812140 QDSS_CT12_CTIGATE**Type:** RW**Reset State:** 0x0000000F**QDSS_CT12_CTIGATE**

Bits	Name	Description
3	CTIGATEEN3	
2	CTIGATEEN2	
1	CTIGATEEN1	
0	CTIGATEEN0	

0x00812144 QDSS_CT12_ASICCTL**Type:** RW**Reset State:** 0x00000000**QDSS_CT12_ASICCTL**

Bits	Name	Description
7:0	ASICCTL	

0x00812EDC QDSS_CT12_ITCHINACK**Type:** W**Reset State:** 0x00000000**QDSS_CT12_ITCHINACK**

Bits	Name	Description
3:0	CTCHINACK	

0x00812EE0 QDSS_CT12_ITTRIGINACK**Type:** W**Reset State:** 0x00000000**QDSS_CT12_ITTRIGINACK**

Bits	Name	Description
7:0	CTTRIGINACK	

0x00812EE4 QDSS_CT12_ITCHOUT**Type:** W**Reset State:** 0x00000000**QDSS_CT12_ITCHOUT**

Bits	Name	Description
3:0	CTCHOUT	

0x00812EE8 QDSS_CT12_ITTRIGOUT**Type:** W**Reset State:** 0x00000000**QDSS_CT12_ITTRIGOUT**

Bits	Name	Description
7:0	CTTRIGOUT	

0x00812EEC QDSS_CT12_ITCHOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CT12_ITCHOUTACK**

Bits	Name	Description
3:0	CTCHOUTACK	

0x00812EF0 QDSS_CT12_ITTRIGOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CT12_ITTRIGOUTACK**

Bits	Name	Description
7:0	CTTRIGOUTACK	

0x00812EF4 QDSS_CT12_ITCHIN**Type:** R**Reset State:** 0x00000000**QDSS_CT12_ITCHIN**

Bits	Name	Description
3:0	CTCHIN	

0x00812EF8 QDSS_CT12_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CT12_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00812F00 QDSS_CT12_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CT12_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00812FA0 QDSS_CT12_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CT12_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00812FA4 QDSS_CT12_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CT12_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00812FB0 QDSS_CT12_LAR**Type:** W**Reset State:** Undefined

QDSS_CTI2_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00812FB4 QDSS_CTI2_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTI2_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00812FB8 QDSS_CTI2_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTL2_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00812FC8 QDSS_CTL2_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTL2_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00812FE0 QDSS_CTL2_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTID2_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00812FE4 QDSS_CTID2_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTID2_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00812FE8 QDSS_CTID2_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTID2_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CTID2_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00812FEC QDSS_CTID2_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CTID2_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00812FD0 QDSS_CTID2_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI2_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00812FD4 QDSS_CTI2_PERIPHID5**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI2_PERIPHID5

Bits	Name	Description
31:0	PERIPHID5	

0x00812FD8 QDSS_CTI2_PERIPHID6**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI2_PERIPHID6

Bits	Name	Description
31:0	PERIPHID6	

0x00812FDC QDSS_CTI2_PERIPHID7**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTID2_PERIPHID7

Bits	Name	Description
31:0	PERIPHID7	

0x00812FF0 QDSS_CTID2_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CTID2_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00812FF4 QDSS_CTID2_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CTID2_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00812FF8 QDSS_CTID2_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTID2_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00812FFC QDSS_CTID2_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTID2_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.7 CTI3_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.7.1 QDSS_CTID3_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00813000 QDSS_CTID3_CTICONTROL**Type:** RW**Reset State:** 0x00000000

QDSS_CT13_CTICONTROL

Bits	Name	Description
0	GLBEN	0x1: ENABLED (When this bit is 1, cross triggering mapping logic functionality is enabled.) 0x0: DISABLED (When this bit is 0, all cross triggering mapping logic functionality is disabled.)

0x00813010 QDSS_CT13_CTIINTACK**Type:** W**Reset State:** 0x00000000**QDSS_CT13_CTIINTACK**

Bits	Name	Description
7:0	CTTRIGINACK	

0x00813EE4 QDSS_CT13_ITCHOUT**Type:** W**Reset State:** 0x00000000**QDSS_CT13_ITCHOUT**

Bits	Name	Description
3:0	CTCHOUT	

0x00813EE8 QDSS_CT13_ITTRIGOUT**Type:** W**Reset State:** 0x00000000**QDSS_CT13_ITTRIGOUT**

Bits	Name	Description
7:0	CTTRIGOUT	

0x00813EEC QDSS_CT13_ITCHOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CT13_ITCHOUTACK**

Bits	Name	Description
3:0	CTCHOUTACK	

0x00813EF0 QDSS_CT13_ITTRIGOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CT13_ITTRIGOUTACK**

Bits	Name	Description
7:0	CTTRIGOUTACK	

0x00813EF4 QDSS_CT13_ITCHIN**Type:** R**Reset State:** 0x00000000**QDSS_CT13_ITCHIN**

Bits	Name	Description
3:0	CTCHIN	

0x00813EF8 QDSS_CT13_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CT13_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00813F00 QDSS_CT13_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CT13_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00813FA0 QDSS_CT13_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CT13_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00813FA4 QDSS_CT13_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CT13_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00813FB0 QDSS_CT13_LAR**Type:** W**Reset State:** Undefined

QDSS_CT13_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00813FB4 QDSS_CT13_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CT13_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00813FB8 QDSS_CT13_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTI3_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00813FC8 QDSS_CTI3_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTI3_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00813FE0 QDSS_CTI3_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CT13_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00813FE4 QDSS_CT13_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CT13_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00813FE8 QDSS_CT13_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CT13_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CT13_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00813FEC QDSS_CT13_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CT13_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00813FD0 QDSS_CT13_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI3_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00813FD4 QDSS_CTI3_PERIPHID5**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI3_PERIPHID5

Bits	Name	Description
31:0	PERIPHID5	

0x00813FD8 QDSS_CTI3_PERIPHID6**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI3_PERIPHID6

Bits	Name	Description
31:0	PERIPHID6	

0x00813FDC QDSS_CTI3_PERIPHID7**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CT13_PERIPID7

Bits	Name	Description
31:0	PERIPID7	

0x00813FF0 QDSS_CT13_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CT13_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00813FF4 QDSS_CT13_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CT13_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00813FF8 QDSS_CT13_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CT13_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00813FFC QDSS_CT13_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CT13_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.8 CTI4_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.8.1 QDSS_CT14_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00814000 QDSS_CT14_CTICONTROL**Type:** RW**Reset State:** 0x00000000

QDSS_CT14_CTICONTROL

Bits	Name	Description
0	GLBEN	0x1: ENABLED (When this bit is 1, cross triggering mapping logic functionality is enabled.) 0x0: DISABLED (When this bit is 0, all cross triggering mapping logic functionality is disabled.)

0x00814010 QDSS_CT14_CTIINTACK**Type:** W**Reset State:** 0x00000000**QDSS_CT14_CTIINTACK**

Bits	Name	Description
7:0	INTACK	

0x00814014 QDSS_CT14_CTIAPPSET**Type:** W**Reset State:** 0x00000000**QDSS_CT14_CTIAPPSET**

Bits	Name	Description
3:0	APPSET	

0x00814018 QDSS_CT14_CTIAPPCLEAR**Type:** W**Reset State:** 0x00000000**QDSS_CT14_CTIAPPCLEAR**

Bits	Name	Description
3:0	APPCLEAR	

0x0081401C QDSS_CT14_CTIAPPPULSE**Type:** W**Reset State:** 0x00000000

QDSS_CTIA_CTIAPPPULSE

Bits	Name	Description
3:0	APPULSE	

0x00814020 QDSS_CTIA_CTIINEN0**Type:** RW**Reset State:** 0x00000000**QDSS_CTIA_CTIINEN0**

3:0	CTCHOUTACK	

0x00814EF0 QDSS_CT14_ITTRIGOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CT14_ITTRIGOUTACK**

Bits	Name	Description
7:0	CTTRIGOUTACK	

0x00814EF4 QDSS_CT14_ITCHIN**Type:** R**Reset State:** 0x00000000**QDSS_CT14_ITCHIN**

Bits	Name	Description
3:0	CTCHIN	

0x00814EF8 QDSS_CT14_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CT14_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00814F00 QDSS_CT14_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CT14_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00814FA0 QDSS_CT14_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CT14_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00814FA4 QDSS_CT14_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CT14_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00814FB0 QDSS_CT14_LAR**Type:** W**Reset State:** Undefined

QDSS_CTl4_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00814FB4 QDSS_CTl4_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTl4_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00814FB8 QDSS_CTl4_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTL4_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00814FC8 QDSS_CTL4_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTL4_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00814FE0 QDSS_CTL4_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTI4_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00814FE4 QDSS_CTI4_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTI4_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00814FE8 QDSS_CTI4_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTI4_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CT14_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00814FEC QDSS_CT14_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CT14_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00814FD0 QDSS_CT14_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CT14_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

Bits	Name	Description
31:0	PERIPHID7	

0x00814FF0 QDSS_CTIA_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CTIA_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00814FF4 QDSS_CTIA_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CTIA_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00814FF8 QDSS_CTIA_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTID_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00814FFC QDSS_CTID_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTID_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.9 CTI5_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.9.1 QDSS_CTID_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00815000 QDSS_CTID_CTICONTROL**Type:** RW**Reset State:** 0x00000000

QDSS_CT15_CTICONTROL

Bits	Name	Description
0	GLBEN	0x1: ENABLED (When this bit is 1, cross triggering mapping logic functionality is enabled.) 0x0: DISABLED (When this bit is 0, all cross triggering mapping logic functionality is disabled.)

0x00815EF8 QDSS_CT15_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CT15_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00815F00 QDSS_CT15_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CT15_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00815FA0 QDSS_CT15_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CT15_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00815FA4 QDSS_CT15_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CT15_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00815FB0 QDSS_CT15_LAR**Type:** W**Reset State:** Undefined

QDSS_CTI5_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00815FB4 QDSS_CTI5_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTI5_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00815FB8 QDSS_CTI5_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTL5_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00815FC8 QDSS_CTL5_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTL5_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00815FE0 QDSS_CTL5_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CT15_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00815FE4 QDSS_CT15_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CT15_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00815FE8 QDSS_CT15_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CT15_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CT15_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00815FEC QDSS_CT15_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CT15_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00815FD0 QDSS_CT15_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI5_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00815FF0 QDSS_CT15_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CT15_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00815FF4 QDSS_CT15_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CT15_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00815FF8 QDSS_CT15_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTI5_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00815FFC QDSS_CTI5_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTI5_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.10 CTI6_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.10.1 QDSS_CTI6_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00816EF8 QDSS_CT16_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CT16_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00816F00 QDSS_CT16_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CT16_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00816FA0 QDSS_CTI6_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CTI6_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00816FA4 QDSS_CTI6_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CTI6_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00816FB0 QDSS_CTI6_LAR**Type:** W**Reset State:** Undefined

QDSS_CTI6_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00816FB4 QDSS_CTI6_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTI6_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00816FB8 QDSS_CTI6_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTI6_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00816FC8 QDSS_CTI6_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTI6_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00816FE0 QDSS_CTI6_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTI6_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00816FE4 QDSS_CTI6_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTI6_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00816FE8 QDSS_CTI6_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTI6_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CTL6_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00816FEC QDSS_CTL6_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CTL6_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00816FD0 QDSS_CTL6_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI6_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00816FD4 QDSS_CTI6_PERIPHID5**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI6_PERIPHID5

0x00816FDC QDSS_CTI6_PERIPHID7**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI6_PERIPHID7

Bits	Name	Description
31:0	PERIPHID7	

0x00816FF0 QDSS_CTI6_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CTI6_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00816FF4 QDSS_CTI6_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CTI6_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00816FF8 QDSS_CTI6_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTI6_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00816FFC QDSS_CTI6_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTI6_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.11 CTI7_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.11.1 QDSS_CTI7_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

7:0	ASICCTL	

0x00817EDC QDSS_CTI7_ITCHINACK**Type:** W**Reset State:** 0x00000000**QDSS_CTI7_ITCHINACK**

Bits	Name	Description
3:0	CTCHINACK	

0x00817EE0 QDSS_CTI7_ITTRIGINACK**Type:** W**Reset State:** 0x00000000**QDSS_CTI7_ITTRIGINACK**

Bits	Name	Description
7:0	CTTRIGINACK	

0x00817EE4 QDSS_CTI7_ITCHOUT**Type:** W**Reset State:** 0x00000000**QDSS_CTI7_ITCHOUT**

Bits	Name	Description
3:0	CTCHOUT	

0x00817EE8 QDSS_CTI7_ITTRIGOUT**Type:** W**Reset State:** 0x00000000**QDSS_CTI7_ITTRIGOUT**

Bits	Name	Description
7:0	CTTRIGOUT	

0x00817EEC QDSS_CTI7_ITCHOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CTI7_ITCHOUTACK**

Bits	Name	Description
3:0	CTCHOUTACK	

0x00817EF0 QDSS_CTI7_ITTRIGOUTACK**Type:** R**Reset State:** 0x00000000**QDSS_CTI7_ITTRIGOUTACK**

Bits	Name	Description
7:0	CTTRIGOUTACK	

0x00817EF4 QDSS_CTI7_ITCHIN**Type:** R**Reset State:** 0x00000000**QDSS_CTI7_ITCHIN**

Bits	Name	Description
3:0	CTCHIN	

0x00817EF8 QDSS_CTI7_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CTI7_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00817F00 QDSS_CTI7_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CTI7_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00817FA0 QDSS_CTI7_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CTI7_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00817FA4 QDSS_CTI7_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CTI7_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00817FB0 QDSS_CTI7_LAR**Type:** W**Reset State:** Undefined

QDSS_CTI7_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00817FB4 QDSS_CTI7_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTI7_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00817FB8 QDSS_CTI7_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CTI7_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00817FC8 QDSS_CTI7_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CTI7_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00817FE0 QDSS_CTI7_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CTI7_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00817FE4 QDSS_CTI7_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CTI7_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00817FE8 QDSS_CTI7_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CTI7_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CTI7_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00817FEC QDSS_CTI7_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CTI7_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00817FD0 QDSS_CTI7_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CTI7_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00817FD4 QDSS_CTI7_PERIPHID5**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI7_PERIPHID5

Bits	Name	Description
31:0	PERIPHID5	

0x00817FD8 QDSS_CTI7_PERIPHID6**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI7_PERIPHID6

Bits	Name	Description

0x00817FDC QDSS_CTI7_PERIPHID7**Type:** RW**Reset State:** Undefined

Reserved

QDSS_CTI7_PERIPHID7

Bits	Name	Description
31:0	PERIPHID7	

0x00817FF0 QDSS_CTI7_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CTI7_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00817FF4 QDSS_CTI7_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CTI7_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00817FF8 QDSS_CTI7_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CTI7_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00817FFC QDSS_CTI7_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CTI7_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.12 CTI8_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

12.1.12.1 QDSS_CTI8_CSCTI

The CTI allows mapping a trigger on the Trigger interface to a signal on the Channel interface and vice versa. The mapping is user-programmable. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

0x00818000 QDSS_CTI8_CTICONTROL**Type:** RW**Reset State:** 0x00000000

QDSS_CT18_CTICONTROL

Bits	Name	Description
0	GLBEN	0x1: ENABLED (When this bit is 1, cross triggering mapping logic functionality is enabled.) 0x0: DISABLED (When this bit is 0, all cross triggering mapping logic functionality is disabled.)

0x00818010 QDSS_CT18_CTIINTACK**Type:** W**Reset State:** 0x00000000**QDSS_CT18_CTIINTACK**

7:0	CTTRIGOUTACK	

0x00818EF4 QDSS_CT18_ITCHIN**Type:** R**Reset State:** 0x00000000**QDSS_CT18_ITCHIN**

Bits	Name	Description
3:0	CTCHIN	

0x00818EF8 QDSS_CT18_ITTRIGIN**Type:** R**Reset State:** 0x00000000**QDSS_CT18_ITTRIGIN**

Bits	Name	Description
7:0	CTTRIGIN	

0x00818F00 QDSS_CT18_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_CT18_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00818FA0 QDSS_CT18_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CT18_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00818FA4 QDSS_CT18_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CT18_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00818FB0 QDSS_CT18_LAR**Type:** W**Reset State:** Undefined

QDSS_CTl8_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00818FB4 QDSS_CTl8_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CTl8_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00818FB8 QDSS_CTl8_AUTHSTATUS**Type:** R**Reset State:** 0xFFFFFFFF0X

Reports what functionality is currently permitted by the authentication interface.

QDSS_CT18_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented.)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x2: ENUM_2_B10 (Non-secure Non-Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Non-Invasive debug functionality currently enabled.)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x2: ENUM_2_B10 (Non-secure Invasive debug functionality currently disabled.) 0x3: ENUM_2_B11 (Non-secure Invasive debug functionality currently enabled.)

0x00818FC8 QDSS_CT18_DEVID**Type:** R**Reset State:** 0x00040800

This register indicates the capabilities of the CTI.

QDSS_CT18_DEVID

Bits	Name	Description
19:16	NUMCH	Number of ECT channels available.
15:8	NUMTRIG	Number of ECT triggers available.
4:0	EXTMUXNUM	Indicates the number of multiplexing available on Trigger Inputs and Trigger Outputs using ASICCTL. Default value of 5'b00000 indicating no multiplexing present. Reflects the value of the Verilog `define EXTMUXNUM that the user must alter accordingly.

0x00818FE0 QDSS_CT18_PERIPHID0**Type:** R**Reset State:** 0x00000006

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CT18_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x6: CTI_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x906))

0x00818FE4 QDSS_CT18_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CT18_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CTI_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00818FE8 QDSS_CT18_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CT18_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)

QDSS_CT18_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00818FEC QDSS_CT18_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CT18_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00818FD0 QDSS_CT18_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CT18_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

QDSS_CT18_PERIPHID7

Bits	Name	Description
31:0	PERIPHID7	

0x00818FF0 QDSS_CT18_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CT18_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00818FF4 QDSS_CT18_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CT18_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00818FF8 QDSS_CT18_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CT18_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00818FFC QDSS_CT18_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CT18_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.13 CSTPIU_CSTPIU

The TPIU acts as a bridge between the on-chip trace data, with separate IDs, to a data stream, encapsulating IDs where required, that is then captured by a Trace Port Analyzer (TPA). The internal formatter inserts source ID signals into the data packet stream so that trace data can be re-associated with its trace source. It contains an Asynchronous FIFO that enables trace data to be driven out at a speed that is not dependent on the on-chip bus clock. The internal trace-out block serializes formatted data before it goes off-chip. The TPIU includes a pattern generator unit that provides a simple set of defined bit sequences or patterns that can be output over the Trace Port and be detected by the TPA or other associated Trace Capture Device (TCD). The TCD can use these patterns to indicate if it is possible to increase or to decrease the trace port clock speed.

12.1.13.1 QDSS_CSTPIU_CSTPIU**0x00820000 QDSS_CSTPIU_SUPPORTED_PORT_SIZES****Type:** R**Reset State:** 0bXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX1**QDSS_CSTPIU_SUPPORTED_PORT_SIZES**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00820FA0 QDSS_CSTPIU_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_CSTPIU_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00820FA4 QDSS_CSTPIU_CLAIMCLR

Type: RW

Reset State: 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_CSTPIU_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00820FB0 QDSS_CSTPIU_LAR

Type: W

Reset State: Undefined

QDSS_CSTPIU_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00820FB4 QDSS_CSTPIU_LSR**Type:** R**Reset State:** 0x00000003**QDSS_CSTPIU_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00820FC8 QDSS_CSTPIU_DEVID**Type:** R**Reset State:** 0x000000A0

This register indicates the capabilities of the TPIU.

QDSS_CSTPIU_DEVID

Bits	Name	Description
11	SWOUARTNRZ	Indicates whether Serial Wire Output (UART/NRZ) is supported. 0x0: ENUM_0 (Serial Wire Output (UART/NRZ) not supported.)
10	SWOMAN	Indicates whether Serial Wire Output (Manchester) is supported. 0x0: ENUM_0 (Serial Wire Output (Manchester) not supported.)
9	TCLKDATA	Indicates whether trace clock + data is supported. 0x0: ENUM_0 (Trace clock + data is supported.)
8:6	FIFOSIZE	FIFO size in powers of 2. 0x2: ENUM_2 (FIFO size of 4 entries (16 bytes).)

QDSS_CSTPIU_DEVID (cont.)

Bits	Name	Description
5	CLKRELAT	Indicates the relationship between ATCLK and TRACECLKIN. 0x1: ASYNC (ATCLK and TRACECLKIN are asynchronous.)
4:0	MUXNUM	

0x00820FE0 QDSS_CSTPIU_PERIPHID0**Type:** R**Reset State:** 0x00000012

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_CSTPIU_PERIPHID0

Bits	Name	Description
7:0	PART_0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x12: TPIU_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x912))

0x00820FE4 QDSS_CSTPIU_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_CSTPIU_PERIPHID1

Bits	Name	Description
7:4	DES_0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_3_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_1	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: TPIU_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x912))

0x00820FE8 QDSS_CSTPIU_PERIPHID2**Type:** R**Reset State:** 0x0000004B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_CSTPIU_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x4: R0P4 (This device is at r0p4)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	DES_1	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00820FEC QDSS_CSTPIU_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_CSTPIU_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODIFICATION (Indicates that there have been no metal fixes to this component)
3:0	CMOD	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODIFICATION (Indicates that there have been no modifications made)

0x00820FD0 QDSS_CSTPIU_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_CSTPIU_PERIPHID4

Bits	Name	Description
7:4	SIZE	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	DES_2	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00820FF0 QDSS_CSTPIU_COMPID0**Type:** R**Reset State:** 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_CSTPIU_COMPID0

Bits	Name	Description
7:0	PRMBL_0	Contains bits [7:0] of the component identification 0xD: ENUM_0D (Identification value)

0x00820FF4 QDSS_CSTPIU_COMPID1**Type:** R**Reset State:** 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_CSTPIU_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PRMBL_1	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00820FF8 QDSS_CSTPIU_COMPID2**Type:** R**Reset State:** 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_CSTPIU_COMPID2

Bits	Name	Description
7:0	PRMBL_2	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00820FFC QDSS_CSTPIU_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_CSTPIU_COMPID3

Bits	Name	Description
7:0	PRMBL_3	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.14 IN_FUN0_CXATBFUNNEL_128W8SP

The Funnel is used when there is more than one trace source.

12.1.14.1 QDSS_IN_FUN0_CXATBFUNNEL_128W8SP

The Funnel is used when there is more than one trace source.

0x00821000 QDSS_IN_FUN0_CTRL_REG**Type:** RW**Reset State:** 0x00000300

The Funnel Control Register enables the slave ports and defines the hold time of the slave ports. Hold time refers to the number of transactions that are output on the funnel master port from the same slave while that slave port atvalidsx is HIGH. Hold time does not refer to clock cycles in this context

QDSS_IN_FUN0_CTRL_REG

Bits	Name	Description
11:8	HT	The formatting scheme can easily become inefficient if fast switching occurs, so, where possible, this must be minimized. If a source has nothing to transmit, then another source is selected irrespective of the minimum number of transactions. The maximum value that can be entered is 0xE and this equates to 15 cycles. 0xF is reserved. 0x0: HOLD_TIME_1 (1 transactions hold time) 0x1: HOLD_TIME_2 (2 transactions hold time) 0x2: HOLD_TIME_3 (3 transactions hold time) 0x3: HOLD_TIME_4 (4 transactions hold time) 0x4: HOLD_TIME_5 (5 transactions hold time) 0x5: HOLD_TIME_6 (6 transactions hold time) 0x6: HOLD_TIME_7 (7 transactions hold time) 0x7: HOLD_TIME_8 (8 transactions hold time) 0x8: HOLD_TIME_9 (9 transactions hold time) 0x9: HOLD_TIME_10 (10 transactions hold time) 0xA: HOLD_TIME_11 (11 transactions hold time) 0xB: HOLD_TIME_12 (12 transactions hold time) 0xC: HOLD_TIME_13 (13 transactions hold time) 0xD: HOLD_TIME_14 (14 transactions hold time) 0xE: HOLD_TIME_15 (15 transactions hold time)
7	ENS7	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
6	ENS6	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
5	ENS5	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
4	ENS4	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)

QDSS_IN_FUN0_CTRL_REG (cont.)

Bits	Name	Description
3	ENS3	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
2	ENS2	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
1	ENS1	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)
0	ENS0	Setting this bit enables this input, or slave, port. If the bit is not set then this has the effect of excluding the port from the priority selection scheme. The reset value is all clear, that is, all ports disabled. 0x1: ENABLE (Slave port enabled) 0x0: DISABLE (Slave port disabled)

0x00821004 QDSS_IN_FUN0_PRIORITY_CTRL_REG**Type:** RW**Reset State:** 0x00000000

The Priority Control Register defines the order in which inputs are selected. Each 3-bit field represents a priority for each particular slave interface. Location 0 has the priority value for the first slave port. Location 1 is the priority value for the second slave port, Location 2 is the third, down to location 7, which has the priority value of the eighth slave port. Values represent the priority value for each port number. If you want to give highest priority to a particular slave port, the corresponding port must be programmed with the lowest value. Typically this is likely to be a port that has more important data or that has a small FIFO and is therefore likely to overflow.

If you want to give lowest priority to a particular slave port, the corresponding slave port must be programmed with the highest value. Typically this is likely to be a device that has a large FIFO that is less likely to overflow or a source that has information that is of lower importance.

QDSS_IN_FUN0_PRIORITY_CTRL_REG

Bits	Name	Description
23:21	PRIPORT7	Priority value of the eighth port. The value written into this location is the value that you want to assign the eighth slave port. If a priority value has been entered for multiple different slave ports then the arbitration logic selects the lowest port number of them. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
20:18	PRIPORT6	Priority value of the 7th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
17:15	PRIPORT5	Priority value of the 6th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

QDSS_IN_FUN0_PRIORITY_CTRL_REG (cont.)

Bits	Name	Description
14:12	PRIPORT4	Priority value of the 5th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
11:9	PRIPORT3	Priority value of the 4th port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
8:6	PRIPORT2	Priority value of the 3rd port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)
5:3	PRIPORT1	Priority value of the 2nd port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

QDSS_IN_FUN0_PRIORITY_CTRL_REG (cont.)

Bits	Name	Description
2:0	PRIPORT0	Priority value of the first slave port. The value written into this location is the value that you want to assign the first slave port. 0x0: PRORITY_LEVEL_0 (This value represents the highest priority.) 0x1: PRORITY_LEVEL_1 (2nd highest priority) 0x2: PRORITY_LEVEL_2 (3rd highest priority) 0x3: PRORITY_LEVEL_3 (4th highest priority) 0x4: PRORITY_LEVEL_4 (5th highest priority) 0x5: PRORITY_LEVEL_5 (6th highest priority) 0x6: PRORITY_LEVEL_6 (7th highest priority) 0x7: PRORITY_LEVEL_7 (This value represents the lowest priority.)

0x00821F00 QDSS_IN_FUN0_ITCTRL**Type:** RW**Reset State:** 0x00000000

This register is used to enable topology detection. This register enables the component to switch from a functional mode, the default behavior, to integration mode where the inputs and outputs of the component can be directly controlled for the purpose of integration testing and topology solving

Note

When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, you must reset the system to ensure correct behavior of CoreSight and other connected system components that are affected by the integration or topology detection.

QDSS_IN_FUN0_ITCTRL

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00821FA0 QDSS_IN_FUN0_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_IN_FUN0_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00821FA4 QDSS_IN_FUN0_CLAIMCLR

Type: RW

Reset State: 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_IN_FUN0_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00821FB0 QDSS_IN_FUN0_LOCKACCESS

Type: W

Reset State: Undefined

This is used to enable write access to device registers.

QDSS_IN_FUN0_LOCKACCESS

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access) 0xDEADBEEF: LOCK (invalid write value to enable the protection register and block write access)

0x00821FC8 QDSS_IN_FUN0_DEVID**Type:** R**Reset State:** 0x00000038

This indicates the capabilities of the CoreSight Funnel.

QDSS_IN_FUN0_DEVID

Bits	Name	Description
7:4	SCHEME	This value indicates the priority scheme implemented within the Funnel 0x3: STATIC_PRIORITY (Slave ports may be programmed to have higher or lower priority with respect to each other)
3:0	RESERVED	Reserved

0x00821FE0 QDSS_IN_FUN0_PERIPHID0**Type:** R**Reset State:** 0x00000008

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_IN_FUN0_PERIPHID0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x8: CORESIGHT_FUNNEL_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x100))

0x00821FE4 QDSS_IN_FUN0_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_IN_FUN0_PERIPHID1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CORESIGHT_FUNNEL_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x100))

0x00821FE8 QDSS_IN_FUN0_PERIPHID2**Type:** R**Reset State:** 0x0000002B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_IN_FUN0_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x2: R2P0 (This device is at r2p0)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	JEP106_BITS6TO4	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00821FEC QDSS_IN_FUN0_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_IN_FUN0_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made)

0x00821FD0 QDSS_IN_FUN0_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_IN_FUN0_PERIPHID4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

QDSS_IN_FUN0_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PREAMBLE	Contains bits [19:16] of the component identification 0x0: ENUM_0 (Identification value)

0x00821FF8 QDSS_IN_FUN0_COMPID2**Type:** R**Reset State:** 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_IN_FUN0_COMPID2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification 0x5: ENUM_05 (Identification value)

0x00821FFC QDSS_IN_FUN0_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_IN_FUN0_COMPID3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification 0xB1: B1 (Identification value)

12.1.15 REPL64_CXATBREPLICATOR_64WP

Replicator component forks ATB data stream into multiple streams

12.1.15.1 QDSS_REPL64_CXATBREPLICATOR_64WP

Replicator component forks ATB data stream into multiple streams

0x00824000 QDSS_REPL64_IDFILTER0

Type: RW

Reset State: 0x00000000

Allows the setting of ID filter for Master 0.

QDSS_REPL64_IDFILTER0

Bits	Name	Description
7	ID0_70_7F	Enable or disable ID filtering for id's 0x70 to 0x7F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
6	ID0_60_6F	Enable or disable ID filtering for id's 0x60 to 0x6F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
5	ID0_50_5F	Enable or disable ID filtering for id's 0x50 to 0x5F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
4	ID0_40_4F	Enable or disable ID filtering for id's 0x40 to 0x4F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
3	ID0_30_3F	Enable or disable ID filtering for id's 0x30 to 0x3F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
2	ID0_20_2F	Enable or disable ID filtering for id's 0x20 to 0x2F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)

QDSS_REPL64_IDFILTER0 (cont.)

Bits	Name	Description
1	ID0_10_1F	Enable or disable ID filtering for id's 0x10 to 0x1F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
0	ID0_0_F	Enable or disable ID filtering for id's 0x0 to 0xF 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)

0x00824004 QDSS_REPL64_IDFILTER1**Type:** RW**Reset State:** 0x00000000

Allows the setting of ID filter for Master 1.

QDSS_REPL64_IDFILTER1

Bits	Name	Description
7	ID1_70_7F	Enable or disable ID filtering for id's 0x70 to 0x7F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
6	ID1_60_6F	Enable or disable ID filtering for id's 0x60 to 0x6F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
5	ID1_50_5F	Enable or disable ID filtering for id's 0x50 to 0x5F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
4	ID1_40_4F	Enable or disable ID filtering for id's 0x40 to 0x4F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
3	ID1_30_3F	Enable or disable ID filtering for id's 0x30 to 0x3F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
2	ID1_20_2F	Enable or disable ID filtering for id's 0x20 to 0x2F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
1	ID1_10_1F	Enable or disable ID filtering for id's 0x10 to 0x1F 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)
0	ID1_0_F	Enable or disable ID filtering for id's 0x0 to 0xF 0x1: HIGH (Enable filtering.) 0x0: LOW (Disable filtering.)

0x00824EFC QDSS_REPL64_ITATBCTR0**Type:** W**Reset State:** Undefined

Controls the value of the ATVALIDM0, ATVALIDM1 and ATREADYDYS outputs in integration mode.

QDSS_REPL64_ITATBCTR0

Bits	Name	Description
4	ATREADYDYS_W	Sets the value of the ATREADYDYS output: 0x1: HIGH (Drive logic 1 on the ATREADYDYS output.) 0x0: LOW (Drive logic 0 on the ATREADYDYS output.)
2	ATVALIDM1_W	Sets the value of the ATVALIDM1 output: 0x1: HIGH (Drive logic 1 on the ATVALIDM1 output.) 0x0: LOW (Drive logic 0 on the ATVALIDM1 output.)
0	ATVALIDM0_W	Sets the value of the ATVALIDM0 output: 0x1: HIGH (Drive logic 1 on the ATVALIDM0 output.) 0x0: LOW (Drive logic 0 on the ATVALIDM0 output.)

0x00824EF8 QDSS_REPL64_ITATBCTR1**Type:** R**Reset State:** Undefined

Returns the value of the ATREADYM0, ATREADYM1 and ATVALIDDS inputs in integration mode.

QDSS_REPL64_ITATBCTR1

Bits	Name	Description
3	ATVALIDDS_R	Reads the value of the ATVALIDDS input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)
1	ATREADYM1_R	Reads the value of the ATREADYM1 input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)
0	ATREADYM0_R	Reads the value of the ATREADYM0 input: 0x1: HIGH (Pin is at logic 1.) 0x0: LOW (Pin is at logic 0.)

0x00824F00 QDSS_REPL64_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_REPL64_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Enables the component to switch from functional mode to integration mode and back. If no integration functionality is implemented, this register must read as zero. 0x1: INTEGRATION_MODE (Enable integration mode.) 0x0: FUNCTIONAL_MODE (Disable integration mode.)

0x00824FA0 QDSS_REPL64_CLAIMSET**Type:** RW**Reset State:** 0x0000000F**QDSS_REPL64_CLAIMSET**

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00824FA4 QDSS_REPL64_CLAIMCLR**Type:** RW**Reset State:** 0x00000000**QDSS_REPL64_CLAIMCLR**

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00824FB0 QDSS_REPL64_LAR**Type:** W**Reset State:** Undefined**QDSS_REPL64_LAR**

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. An invalid write has the affect of removing write access. 0xC5ACCE55: UNLOCK (unlock the protection register to enable write access)

0x00824FB4 QDSS_REPL64_LSR**Type:** R**Reset State:** 0x00000003**QDSS_REPL64_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register, 0xFB0, is implemented as 8-bit or 32-bit. 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register.)
1	LOCKGRANT	Returns the current status of the Lock. 0x0: ACCESS_PERMITTED (Write access is allowed to this device.) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted.)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access Register, 0xFB0, are ignored.) 0x1: LOCK_PRESENT (Lock control mechanism is present.)

0x00824FB8 QDSS_REPL64_AUTHSTATUS**Type:** R**Reset State:** 0x00000000

Reports the required **security** level and current status of those enables. Where functionality changes on a given **security** level then this change in status must be reported in this register

QDSS_REPL64_AUTHSTATUS

Bits	Name	Description
7:6	SNID	Indicates the security level for secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
5:4	SID	Indicates the security level for secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
3:2	NSNID	Indicates the security level for non-secure non-invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)
1:0	NSID	Indicates the security level for non-secure invasive debug 0x0: ENUM_2_B00 (Functionality not implemented or controlled elsewhere)

0x00824FC8 QDSS_REPL64_DEVID**Type:** R**Reset State:** 0x00000002**QDSS_REPL64_DEVID**

Bits	Name	Description
3:0	PORTNUM	This value indicates the number of master ports implemented. 0x2: NUMBER_OF_PORTS (2 master ports implemented.)

0x00824FCC QDSS_REPL64_DEVTYPE**Type:** R**Reset State:** 0x00000022**QDSS_REPL64_DEVTYPE**

Bits	Name	Description
7:4	SUB_TYPE	Sub-classification within the major category: 0x2: CORESIGHT_REPLICATOR (This component replicates traces from single source to multiple targets.)
3:0	RESERVED	Reserved

0x00824FE0 QDSS_REPL64_PIDR0**Type:** R**Reset State:** 0x00000009**QDSS_REPL64_PIDR0**

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component part number. This is selected by the designer of the component. 0x9: CORESIGHT_REPLICATOR_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number, 0x909.)

0x00824FE4 QDSS_REPL64_PIDR1**Type:** R**Reset State:** 0x000000B9**QDSS_REPL64_PIDR1**

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits [3:0] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code.)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component part number. This is selected by the designer of the component. 0x9: CORESIGHT_REPLICATOR_PART_NUMBER_11_8 (Upper 4 bits of the Part Number, 0x907.)

0x00824FE8 QDSS_REPL64_PIDR2**Type:** R**Reset State:** 0x0000001B**QDSS_REPL64_PIDR2**

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is used as a look-up to establish the exact major and minor revision. 0x1: R1P0 (This device is at r1p0.)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used. 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org).)

QDSS_REPL64_PIDR2 (cont.)

Bits	Name	Description
2:0	JEP106_BITS6TO4	Bits [6:4] of the JEDEC identity code indicating the designer of the component, together with the continuation code. 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code.)

0x00824FEC QDSS_REPL64_PIDR3**Type:** R**Reset State:** 0x00000000**QDSS_REPL64_PIDR3**

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component.)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made.)

0x00824FD0 QDSS_REPL64_PIDR4**Type:** R**Reset State:** 0x00000004**QDSS_REPL64_PIDR4**

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB, this must read as 0x0, 4KB only. For 8KB set to 0x1, for 16KB set to 0x2, for 32KB set to 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4KB of memory.)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component, together with the identity code. 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank.)

0x00824FD4 QDSS_REPL64_PIDR5**Type:** RW**Reset State:** Undefined**QDSS_REPL64_PIDR5**

Bits	Name	Description
31:0	PIDR5	

0x00824FD8 QDSS_REPL64_PIDR6**Type:** RW**Reset State:** Undefined**QDSS_REPL64_PIDR6**

Bits	Name	Description
31:0	PIDR6	

0x00824FDC QDSS_REPL64_PIDR7**Type:** RW**Reset State:** Undefined**QDSS_REPL64_PIDR7**

Bits	Name	Description
31:0	PIDR7	

0x00824FF0 QDSS_REPL64_CIDR0**Type:** R**Reset State:** 0x0000000D**QDSS_REPL64_CIDR0**

Bits	Name	Description
7:0	PREAMBLE	Contains bits [24:31] of the component identification. 0xD: ENUM_0D (Identification value.)

0x00824FF4 QDSS_REPL64_CIDR1**Type:** R**Reset State:** 0x00000090**QDSS_REPL64_CIDR1**

Bits	Name	Description
7:4	CLASS	Class of the component, for example, ROM table or CoreSight component. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component.)
3:0	PREAMBLE	Contains bits [19:16] of the component identification. 0x0: ENUM_0 (Identification value.)

0x00824FF8 QDSS_REPL64_CIDR2**Type:** R**Reset State:** 0x00000005**QDSS_REPL64_CIDR2**

Bits	Name	Description
7:0	PREAMBLE	Contains bits [15:8] of the component identification. 0x5: ENUM_05 (Identification value.)

0x00824FFC QDSS_REPL64_CIDR3**Type:** R**Reset State:** 0x000000B1**QDSS_REPL64_CIDR3**

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification. 0xB1: B1 (Identification value.)

12.1.16 ETFETB_CXTMC_F128W8K

The CoreSight TMC enables use of local memory as a trace buffer.

12.1.16.1 QDSS ETFETB_CXTMC_F128W8K

The CoreSight TMC enables use of local memory as a trace buffer.

0x00825004 QDSS ETFETB_RSZ**Type:** R**Reset State:** 0x00000800**QDSS ETFETB_RSZ**

Bits	Name	Description
30:0	RSZ	

0x0082500C QDSS ETFETB_STS**Type:** R**Reset State:** 0x0000000C

TMC Status register

QDSS ETFETB_STS

Bits	Name	Description
4	EMPTY	0x1: HIGH (Trace buffer is empty) 0x0: LOW (Trace buffer is not empty)
3	FEMPTY	0x1: HIGH (Trace capture has been completed and all captured trace data has been written to the trace memory) 0x0: LOW (Trace capture has not yet completed)
2	TMCREADY	0x1: HIGH (Trace capture has been completed and all captured trace data has been written to the trace memory) 0x0: LOW (Trace capture has not yet completed)
1	TRIGGERED	0x1: HIGH (Trigger event has occurred) 0x0: LOW (Trigger event has not occurred)
0	FULL	0x1: HIGH 0x0: LOW

0x00825010 QDSS ETFETB_RRD**Type:** R**Reset State:** Undefined**QDSS ETFETB_RRD**

Bits	Name	Description
31:0	RRD	Reads return data from Trace RAM

0x00825014 QDSS ETFETB_RRP**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_RRP**

Bits	Name	Description
12:0	RRP	

0x00825018 QDSS ETFETB_RWP**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_RWP**

Bits	Name	Description
12:0	RWP	

0x0082501C QDSS ETFETB_TRG**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_TRG**

Bits	Name	Description
10:0	TRG	

0x00825020 QDSS ETFETB_CTL**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_CTL**

Bits	Name	Description
0	TRACECAPTEN	0x0: LOW (Trace capture is disabled.) 0x1: HIGH (Trace capture is enabled.)

0x00825024 QDSS ETFETB_RWD**Type:** W**Reset State:** Undefined**QDSS ETFETB_RWD**

Bits	Name	Description
31:0	RWD	

0x00825028 QDSS ETFETB_MODE**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_MODE**

Bits	Name	Description
1:0	MODE	Selects the operating mode. 0x3: RESERVED 0x2: HW_FIFO 0x1: SW_FIFO 0x0: CIRCULAR_BUFFER

0x0082502C QDSS ETFETB_LBUFLEVEL**Type:** R**Reset State:** 0x00000000**QDSS ETFETB_LBUFLEVEL**

Bits	Name	Description
11:0	LBUFLEVEL	Indicates the maximum fill level of the trace memory in 32-bit words since this register was last read.

0x00825030 QDSS ETFETB_CBUFLEVEL**Type:** R**Reset State:** 0x00000000**QDSS ETFETB_CBUFLEVEL**

Bits	Name	Description
11:0	CBUFLEVEL	Indicates the current fill level of the trace memory in 32-bit words.

0x00825034 QDSS ETFETB_BUFWM**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_BUFWM**

Bits	Name	Description
10:0	BUFWM	Indicates the desired threshold vacancy level in 32-bit words in the trace memory.

0x00825300 QDSS ETFETB_FFSR**Type:** R**Reset State:** 0x00000002

This register indicates the status of the Formatter and the status of Flush request.

QDSS ETFETB_FFSR

Bits	Name	Description
1	FTSTOPPED	0x0: LOW (Trace capture has not yet completed.) 0x1: HIGH (Trace capture has been completed and all captured trace data has been written to the trace memory.)
0	RESERVED	Reserved

0x00825304 QDSS ETFETB_FFCR**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_FFCR**

Bits	Name	Type	Description
14	RESERVED	W	Reserved
13	STOPONTRIG EVT	RW	0x0: LOW (Formatting is not stopped when trigger event is observed.) 0x1: HIGH (Formatting is stopped when trigger event is observed.)
12	STOPONFL	RW	0x0: LOW (Formatting is not stopped when FLUSH is completed.) 0x1: HIGH (Formatting is stopped when FLUSH is completed. Any part-completed packets are drained off into the trace memory with a post-amble.)

QDSS_ETFETB_FFCR (cont.)

Bits	Name	Type	Description
10	TRIGONFL	RW	0x0: LOW (A trigger is not indicated on the trace stream when AFREADY is returned HIGH.) 0x1: HIGH (A trigger is indicated on the trace stream when AFREADY is returned HIGH.)
9	TRIGONTRIGEV	RW	0x0: LOW (A trigger is not indicated on the trace stream when a Trigger Event occurs.) 0x1: HIGH (A trigger is indicated on the trace stream when a Trigger event occurs.)
8	TRIGONTRIGIN	RW	0x0: LOW (A trigger is not indicated on the trace stream when a rising edge is detected on the TRIGIN input.) 0x1: HIGH (A trigger is indicated on the trace stream when a rising edge is detected on the TRIGIN input.)
6	FLUSHMAN_R	R	Manually generate a flush of the system. Setting this bit causes a flush to be generated. If TraceCaptEn bit in CTL register is 0, then writes to this bit are ignored. In Circular buffer mode and Hardware-FIFO mode, this bit is cleared automatically when AFREADY is sampled HIGH. In Software-FIFO mode, this bit is cleared when the flush data is written to trace memory. This bit is clear on reset. 0x0: LOW (Manual Flush is not initiated) 0x1: HIGH (Manual Flush is initiated)
6	FLUSHMAN_W	W	Manually generate a flush of the system. Setting this bit causes a flush to be generated. If TraceCaptEn bit in CTL register is 0, then writes to this bit are ignored. In Circular buffer mode and Hardware-FIFO mode, this bit is cleared automatically when AFREADY is sampled HIGH. In Software-FIFO mode, this bit is cleared when the flush data is written to trace memory. This bit is clear on reset. 0x0: LOW (Manual Flush is not initiated) 0x1: HIGH (Manual Flush is initiated)
5	FONTRIGEV	RW	0x0: LOW (Flush-on-trigger-event disabled) 0x1: HIGH (Flush-on-trigger-event enabled)
4	FONFLIN	RW	Setting this bit enables the detection of transitions on the FLUSHIN input by the TMC. If this bit is set and the Formatter has not already stopped, a rising edge on FLUSHIN initiates a flush request. This bit is clear on reset. 0x0: LOW (Flush-on-FLUSHIN feature is disabled) 0x1: HIGH (Flush-on-FLUSHIN feature is enabled)

QDSS ETFETB_FFCR (cont.)

Bits	Name	Type	Description
1	ENTI	RW	Setting this bit enables the insertion of triggers in the formatted trace stream. A trigger is indicated by inserting one byte of data 8'h00 with ATID 7'h7D in the trace stream. Trigger indication on the trace stream is additionally controlled by the register bits TrigOnFI, TrigOnTrigEvt and TrigOnTrigIn in the FFCR register, 0x304. This bit can only be changed when TMCReady=1 and TraceCaptEn=0. This bit takes effect only when the EnFt register bit in this register is set. If EnTI bit is set to 1 when EnFt is 0, it results in formatting being enabled. This bit is clear on reset. 0x1: TRIGGER_INSERTION_ENABLED (Embed triggers into formatted trace stream) 0x0: TRIGGER_INSERTION_DISABLED (Triggers are not embedded into the formatted strace stream)
0	ENFT	RW	0x1: HIGH (Formatting enabled) 0x0: LOW (Formatting disabled.)

0x00825308 QDSS ETFETB_PSCR**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_PSCR**

Bits	Name	Description
4:0	PSCOUNT	

0x00825ED0 QDSS ETFETB_ITATBMDATA0**Type:** W**Reset State:** 0x00000000**QDSS ETFETB_ITATBMDATA0**

Bits	Name	Description
16	ATDATAMBIT127	Control the value of ATDATAM[127] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)
15	ATDATAMBIT119	Control the value of ATDATAM[119] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)

QDSS ETFETB_ITATBMDATA0 (cont.)

Bits	Name	Description

4	ATDATAMBIT31	Control the value of ATDATAM[31] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)
3	ATDATAMBIT23	Control the value of ATDATAM[23] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)
2	ATDATAMBIT15	Control the value of ATDATAM[15] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)

QDSS ETFETB_ITATBMDATA0 (cont.)

Bits	Name	Description
1	ATDATAMBIT7	Control the value of ATDATAM[7] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)
0	ATDATAMBIT0	Control the value of ATDATAM[0] output of TMC 0x1: HIGH (Drive logic 1 on this output) 0x0: LOW (Drive logic 0 on this output)

0x00825ED8 QDSS ETFETB_ITATBMCTR1**Type:** W**Reset State:** 0x00000000**QDSS ETFETB_ITATBMCTR1**

Bits	Name	Description
6:0	ATIDM	Control the value of ATIDM output from TMC. The value written to this field is driven on the ATIDM output of the TMC.

0x00825EDC QDSS ETFETB_ITATBMCTR0**Type:** W**Reset State:** 0x00000000**QDSS ETFETB_ITATBMCTR0**

Bits	Name	Description
11:8	ATBYTESM	Control the value of ATBYTESM output from TMC. The value written to this field is driven on the ATBYTESM output of the TMC.
1	AFREADYM	Set the value of AFREADYM output 0x1: HIGH (Drive logic 1 on AFREADYM output) 0x0: LOW (Drive logic 0 on AFREADYM output)
0	ATVALIDM	Set the value of ATVALIDM output 0x1: HIGH (Drive logic 1 on ATVALIDM output) 0x0: LOW (Drive logic 0 on ATVALIDM output)

0x00825EE0 QDSS ETFETB_ITMISCOP0**Type:** W**Reset State:** 0x00000000

QDSS ETFETB_ITMISCOP0

Bits	Name	Description
1	FULL	Set the value of the FULL output. 0x1: HIGH (Drive logic 1 on FULL output) 0x0: LOW (Drive logic 0 on FULL output)
0	ACQCOMP	Set the value of the ACQCOMP output. 0x1: HIGH (Drive logic 1 on ACQCOMP output) 0x0: LOW (Drive logic 0 on ACQCOMP output)

0x00825EE8 QDSS ETFETB_ITTRFLIN**Type:** R**Reset State:** 0x00000000**QDSS ETFETB_ITTRFLIN**

Bits	Name	Description
1	FLUSHIN	Read the value of the FLUSHIN input. 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
0	TRIGIN	Read the value of the TRIGIN input. 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)

0x00825EEC QDSS ETFETB_ITATBDATA0**Type:** R**Reset State:** 0x00000000**QDSS ETFETB_ITATBDATA0**

Bits	Name	Description
16	ATDATASBIT127	Read the value of ATDATAS[127] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
15	ATDATASBIT119	Read the value of ATDATAS[119] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
14	ATDATASBIT111	Read the value of ATDATAS[111] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)

QDSS ETFETB_ITATBDATA0 (cont.)

Bits	Name	Description
13	ATDATASBIT103	Read the value of ATDATAS[103] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
12	ATDATASBIT95	Read the value of ATDATAS[95] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
11	ATDATASBIT87	Read the value of ATDATAS[87] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
10	ATDATASBIT79	Read the value of ATDATAS[79] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
9	ATDATASBIT71	Read the value of ATDATAS[71] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
8	ATDATASBIT63	Read the value of ATDATAS[63] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
7	ATDATASBIT55	Read the value of ATDATAS[55] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
6	ATDATASBIT47	Read the value of ATDATAS[47] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
5	ATDATASBIT39	Read the value of ATDATAS[39] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
4	ATDATASBIT31	Read the value of ATDATAS[31] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
3	ATDATASBIT23	Read the value of ATDATAS[23] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
2	ATDATASBIT15	Read the value of ATDATAS[15] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)
1	ATDATASBIT7	Read the value of ATDATAS[7] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)

QDSS ETFETB_ITATBDATA0 (cont.)

Bits	Name	Description
0	ATDATASBIT0	Read the value of ATDATAS[0] input to TMC 0x1: HIGH (Pin is at logic 1) 0x0: LOW (Pin is at logic 0)

0x00825EF0 QDSS ETFETB_ITATBCTR2**Type:** W**Reset State:** 0x00000000**QDSS ETFETB_ITATBCTR2**

Bits	Name	Description
2	SYNCREQS	Set the value of SYNCREQS output 0x1: HIGH (Drive logic 1 on SYNCREQS output) 0x0: LOW (Drive logic 0 on SYNCREQS output)
1	AFVALIDS	Set the value of AFVALIDS output 0x1: HIGH (Drive logic 1 on AFVALIDS output) 0x0: LOW (Drive logic 0 on AFVALIDS output)
0	ATREADYDYS	Set the value of ATREADYDYS output 0x1: HIGH (Drive logic 1 on ATREADYDYS output) 0x0: LOW (Drive logic 0 on ATREADYDYS output)

0x00825F00 QDSS ETFETB_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS ETFETB_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00825FA0 QDSS ETFETB_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS ETFETB CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00825FA4 QDSS ETFETB CLAIMCLR

Type: RW

Reset State: 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS ETFETB CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00825FB0 QDSS ETFETB_LAR

Type: W

Reset State: Undefined

QDSS ETFETB_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00825FB4 QDSS ETFETB_LSR**Type:** R**Reset State:** 0x00000003**QDSS ETFETB_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00825FC8 QDSS ETFETB_DEVID**Type:** R**Reset State:** 0x00000580

This register indicates the capabilities of the CoreSight TMC.

QDSS ETFETB_DEVID

Bits	Name	Description
10:8	MEMWIDTH	0x2: ENUM_32_BITS (Memory interface databus is 32-bits wide.) 0x3: ENUM_64_BITS (Memory interface databus is 64-bits wide.) 0x4: ENUM_128_BITS (Memory interface databus is 128-bits wide.) 0x5: ENUM_256_BITS (Memory interface databus is 256-bits wide.)

QDSS ETFETB_DEVID (cont.)

Bits	Name	Description
7:6	CONFIGTYPE	This value indicates TMC configuration type - ETB, ETF or ETR configuration. 0x0: TMC_CONFIGURED_AS_ETB_EMBEDDED_TRACE_BUFFER (When configured as an ETB, trace data is stored in local SRAM through the memory interface. Trace data can only be retrieved through APB register reads.) 0x1: TMC_CONFIGURED_AS_ETR_EMBEDDED_TRACE_ROUTER (When configured as an ETR, the TMC stores trace data in the system memory through the AXI interface. Trace data can only be retrieved through APB register reads.) 0x2: Reserved
5	CLKSCHEME	This value indicates the TMC RAM clocking scheme used i.e.. whether the TMC RAM operates synchronously or asynchronously to CLK. 0x0: TMC_RAM_SYNCHRONOUS_TO_CLK (The TMC RAM operates synchronously to CLK.)
4:0	RESERVED	Reserved

0x00825FE0 QDSS ETFETB_PERIPHID0**Type:** R**Reset State:** 0x00000061

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS ETFETB_PERIPHID0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x61: CORESIGHT_TMC_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x961))

0x00825FE4 QDSS ETFETB_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS ETFETB_PERIPHID1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CORESIGHT_TMC_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00825FE8 QDSS ETFETB_PERIPHID2**Type:** R**Reset State:** 0x0000001B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS ETFETB_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x1: R0P1 (This device is at r0p1)
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	JEP106_BITS6TO4	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00825FEC QDSS ETFETB_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS ETFETB_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made)

0x00825FD0 QDSS ETFETB_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS ETFETB_PERIPHID4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00825FD4 QDSS ETFETB_PERIPHID5**Type:** RW**Reset State:** Undefined

31:0	PERIPHID7	

0x00825FF0 QDSS ETFETB_COMPID0**Type:** R**Reset State:** 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS ETFETB_COMPID0

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification 0xD: ENUM_OD (Identification value)

0x00825FF4 QDSS ETFETB_COMPID1**Type:** R**Reset State:** 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS ETFETB_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PREAMBLE	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00825FF8 QDSS ETFETB_COMPID2**Type:** R**Reset State:** 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS ETFETB_COMPID2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00825FFC QDSS ETFETB_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS ETFETB_COMPID3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.1.17 ETR_CXTMC_R64W32D

The CoreSight TMC enables use of local memory as a trace buffer.

12.1.17.1 QDSS_ETR_CXTMC_R64W32D

The CoreSight TMC enables use of local memory as a trace buffer.

0x00826004 QDSS_ETR_RSZ

Bits	Name	Description
7:0	RWPHI	

0x00826110 QDSS_ETR_AXICTL**Type:** RW**Reset State:** 0x00000000**QDSS_ETR_AXICTL**

Bits	Name	Description
11:8	WRBURSTLEN	
7	SCATTERGATHERMODE	This bit indicates whether trace memory is accessed as a single buffer in system memory or as a linked-list based scatter-gather memory. This is ignored when the TMC is in Disabled state (TraceCaptEn=0 and TMCReady=1). 0x0: SINGLE_BUFFER (Trace memory is a single contiguous block of system memory) 0x1: SCATTER_GATHER (Trace memory is spread over multiple blocks of system memory based on a linked-list mechanism.)
5	CACHECTRLBIT3	This bit controls the value driven on the ARCCACHEM[3]/AWCCACHEM[3] signal on the AXI interface when performing AXI transfers. If CacheCtrlBit1 is 0, then this bit must also be 0 to comply with AXI protocol. Setting this bit to 1 when the CacheCtrlBit1 is 0 will result in Unpredictable behavior. 0x0: DO_NOT_CACHE_ALLOCATE_ON_WRITES (Do not cache allocate on writes) 0x1: CACHE_ALLOCATE_ON_WRITES (If the transfer is a write and it misses in the cache then it should be allocated.)
4	CACHECTRLBIT2	This bit controls the value driven on the ARCCACHEM[2]/AWCCACHEM[2] signal on the AXI interface when performing AXI transfers. If CacheCtrlBit1 is 0, then this bit must also be 0 to comply with AXI protocol. Setting this bit to 1 when the CacheCtrlBit1 is 0 will result in Unpredictable behavior. 0x0: DO_NOT_CACHE_ALLOCATE_ON_READS (Do not cache allocate on reads) 0x1: CACHE_ALLOCATE_ON_READS (If the transfer is a read and it misses in the cache then it should be allocated.)

QDSS_ETR_AXICTL (cont.)

Bits	Name	Description
3	CACHECTRLBIT1	This bit controls the value driven on the ARCACHEM[1]/AWCACHEM[1] signal on the AXI interface when performing AXI transfers. 0x0: NON_CACHEABLE (Non-cacheable) 0x1: CACHEABLE (Cacheable. The transaction at the final destination does not have to match the characteristics of the original transaction. For reads this means that a location can be pre-fetched or can be fetched just once for multiple read transactions. For writes this means that a number of different writes can be merged together. To determine if a transaction should be cached this bit should be used in conjunction with the Read Allocate (RA) and Write Allocate (WA) bits.)
2	CACHECTRLBIT0	This bit controls the value driven on the ARCACHEM[0]/AWCACHEM[0] signal on the AXI interface when performing AXI transfers. 0x0: NON_BUFFERABLE (Non-bufferable) 0x1: BUFFERABLE (Bufferable)
1	PROTCTRLBIT1	0x0: SECURE_ACCESS (Secure access) 0x1: NON_SECURE_ACCESS (Non-secure access)
0	PROTCTRLBIT0	0x0: NORMAL_ACCESS (Normal access) 0x1: PRIVILEGED_ACCESS (Privileged access. A privileged processing mode might have a greater level of access within a system.)

0x00826118 QDSS_ETR_DBALO**Type:** RW**Reset State:** 0x00000000**QDSS_ETR_DBALO**

Bits	Name	Description
31:0	BUFADDRLO	Holds the lower 32 bits of the 40-bit address used to locate the trace buffer in system memory

0x0082611C QDSS_ETR_DBAHI**Type:** RW**Reset State:** 0x00000000

QDSS_ETR_DBAHI

Bits	Name	Description
7:0	BUFADDRHI	Holds the upper 8 bits of the 40-bit address used to locate the trace buffer in system memory

0x00826300 QDSS_ETR_FFSR**Type:** R**Reset State:** 0x00000002

This register indicates the status of the Formatter and the status of Flush request.

QDSS_ETR_FFSR

Bits	Name	Description
1	FTSTOPPED	0x0: LOW (Trace capture has not yet completed.) 0x1: HIGH (Trace capture has been completed and all captured trace data has been written to the trace memory.)
0	RESERVED	Reserved

0x00826304 QDSS_ETR_FFCR**Type:** RW**Reset State:** 0x00000000**QDSS_ETR_FFCR**

Bits	Name	Type	Description
13	STOPONTRIG EVT	RW	0x0: LOW (Formatting is not stopped when trigger event is observed.) 0x1: HIGH (Formatting is stopped when trigger event is observed.)
12	STOPONFL	RW	0x0: LOW (Formatting is not stopped when FLUSH is completed.) 0x1: HIGH (Formatting is stopped when FLUSH is completed. Any part-completed packets are drained off into the trace memory with a post-amble.)
10	TRIGONFL	RW	0x0: LOW (A trigger is not indicated on the trace stream when AFREADY is returned HIGH.) 0x1: HIGH (A trigger is indicated on the trace stream when AFREADY is returned HIGH.)

QDSS_ETR_FFCR (cont.)

Bits	Name	Type	Description
9	TRIGONTRIGEV	RW	0x0: LOW (A trigger is not indicated on the trace stream when a Trigger Event occurs.) 0x1: HIGH (A trigger is indicated on the trace stream when a Trigger event occurs.)
8	TRIGONTRIGIN	RW	0x0: LOW (A trigger is not indicated on the trace stream when a rising edge is detected on the TRIGIN input.) 0x1: HIGH (A trigger is indicated on the trace stream when a rising edge is detected on the TRIGIN input.)
6	FLUSHMAN_R	R	Manually generate a flush of the system. Setting this bit causes a flush to be generated. If TraceCaptEn bit in CTL register is 0, then writes to this bit are ignored. In Circular buffer mode and Hardware-FIFO mode, this bit is cleared automatically when AFREADY is sampled HIGH. In Software-FIFO mode, this bit is cleared when the flush data is written to trace memory. This bit is clear on reset. 0x0: LOW (Manual Flush is not initiated) 0x1: HIGH (Manual Flush is initiated)
6	FLUSHMAN_W	W	Manually generate a flush of the system. Setting this bit causes a flush to be generated. If TraceCaptEn bit in CTL register is 0, then writes to this bit are ignored. In Circular buffer mode and Hardware-FIFO mode, this bit is cleared automatically when AFREADY is sampled HIGH. In Software-FIFO mode, this bit is cleared when the flush data is written to trace memory. This bit is clear on reset. 0x0: LOW (Manual Flush is not initiated) 0x1: HIGH (Manual Flush is initiated)
5	FONTRIGEV	RW	0x0: LOW (Flush-on-trigger-event disabled) 0x1: HIGH (Flush-on-trigger-event enabled)
4	FONFLIN	RW	Setting this bit enables the detection of transitions on the FLUSHIN input by the TMC. If this bit is set and the Formatter has not already stopped, a rising edge on FLUSHIN initiates a flush request. This bit is clear on reset. 0x0: LOW (Flush-on-FLUSHIN feature is disabled) 0x1: HIGH (Flush-on-FLUSHIN feature is enabled)

QDSS_ETR_FFCR (cont.)

Bits	Name	Type	Description
1	ENTI	RW	Setting this bit enables the insertion of triggers in the formatted trace stream. A trigger is indicated by inserting one byte of data 8'h00 with ATID 7'h7D in the trace stream. Trigger indication on the trace stream is additionally controlled by the register bits TrigOnFI, TrigOnTrigEvt and TrigOnTrigIn in the FFCR register, 0x304. This bit can only be changed when TMCReady=1 and TraceCaptEn=0. This bit takes effect only when the EnFt register bit in this register is set. If EnTI bit is set to 1 when EnFt is 0, it results in formatting being enabled. This bit is clear on reset. 0x1: TRIGGER_INSERTION_ENABLED (Embed triggers into formatted trace stream) 0x0: TRIGGER_INSERTION_DISABLED (Triggers are not embedded into the formatted strace stream)
0	ENFT	RW	0x1: HIGH (Formatting enabled) 0x0: LOW (Formatting disabled.)

1	AFVALIDS	Set the value of AFVALIDS output 0x1: HIGH (Drive logic 1 on AFVALIDS output) 0x0: LOW (Drive logic 0 on AFVALIDS output)
0	ATREADYDYS	Set the value of ATREADYDYS output 0x1: HIGH (Drive logic 1 on ATREADYDYS output) 0x0: LOW (Drive logic 0 on ATREADYDYS output)

0x00826F00 QDSS_ETR_ITCTRL**Type:** RW**Reset State:** 0x00000000**QDSS_ETR_ITCTRL**

Bits	Name	Description
0	INTEGRATION_MODE	Allows the component to switch from functional mode to integration mode or back. 0x1: INTEGRATION_MODE (Enable integration mode) 0x0: FUNCTIONAL_MODE (Disable integration mode)

0x00826FA0 QDSS_ETR_CLAIMSET**Type:** RW**Reset State:** 0x0000000F

This is used in conjunction with Claim Tag Clear Register, CLAIMCLR. This register forms one half of the Claim Tag value. This location allows individual bits to be set, write, and returns the number of bits that can be set, read.

QDSS_ETR_CLAIMSET

Bits	Name	Type	Description
3:0	CLAIMSET_W	W	Each bit is considered separately: 0 = no effect, 1 = set this bit in the claim tag.
3:0	CLAIMSET_R	R	This claim tag bit is implemented 0xF: CLAIM_TAG_IMPLEMENTED_BITS (These bits are present within the claim tag field)

0x00826FA4 QDSS_ETR_CLAIMCLR**Type:** RW**Reset State:** 0x00000000

This register is used in conjunction with Claim Tag Set Register, CLAIMSET. This register forms one half of the Claim Tag value. This location enables individual bits to be cleared, write, and returns the current Claim Tag value, read.

QDSS_ETR_CLAIMCLR

Bits	Name	Type	Description
3:0	CLAIMCLR_W	W	Each bit is considered separately: 0 = no effect, 1 = clear this bit in the claim tag.
3:0	CLAIMCLR_R	R	The value present reflects the current setting of the Claim Tag.

0x00826FB0 QDSS_ETR_LAR**Type:** W**Reset State:** Undefined

QDSS_ETR_LAR

Bits	Name	Description
31:0	ACCESS_W	A write of 0xC5ACCE55 enables further write access to this device. A write of any value other than 0xC5ACCE55 will have the affect of removing write access. 0xC5ACCE55: UNLOCK (Unlock the protection register to enable write access)

0x00826FB4 QDSS_ETR_LSR**Type:** R**Reset State:** 0x00000003**QDSS_ETR_LSR**

Bits	Name	Description
2	LOCKTYPE	Indicates if the Lock Access Register (0xFB0) is implemented as 8-bit or 32-bit 0x0: ENUM_32_BIT (This component implements a 32-bit Lock Access Register)
1	LOCKGRANT	Returns the current status of the Lock. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: ACCESS_PERMITTED (Write access is permitted to this device) 0x1: DEVICE_LOCKED (Write access to the component is blocked. All writes to control registers are ignored. Reads are permitted)
0	LOCKEXIST	Indicates that a lock control mechanism exists for this device. This bit reads as 0 when read from an external debugger (PADDRDBG31 = 1) since external debugger accesses are not subject to Lock Registers. 0x0: LOCK_NOT_PRESENT (No lock control mechanism exists, writes to the Lock Access register (0xFB0) will be ignored) 0x1: LOCK_PRESENT (Lock control mechanism is present)

0x00826FC8 QDSS_ETR_DEVID**Type:** R**Reset State:** 0x00002B40

This register indicates the capabilities of the CoreSight TMC.

QDSS_ETR_DEVID

Bits	Name	Description
13:11	WBUF_DEPTH	0x2: ENUM_4_ENTRIES (Depth of the Write buffer is 4 entries.) 0x3: ENUM_8_ENTRIES (Depth of the Write buffer is 8 entries.) 0x4: ENUM_16_ENTRIES (Depth of the Write buffer is 16 entries.) 0x5: ENUM_32_ENTRIES (Depth of the Write buffer is 32 entries.)
10:8	MEMWIDTH	0x2: ENUM_32_BITS (Memory interface databus is 32-bits wide.) 0x3: ENUM_64_BITS (Memory interface databus is 64-bits wide.) 0x4: ENUM_128_BITS (Memory interface databus is 128-bits wide.) 0x5: ENUM_256_BITS (Memory interface databus is 256-bits wide.)
7:6	CONFIGTYPE	This value indicates TMC configuration type - ETB, ETF or ETR configuration. 0x0: TMC_CONFIGURED_AS_ETB_EMBEDDED_TRACE_BUFFER (When configured as an ETB, trace data is stored in local SRAM through the memory interface. Trace data can only be retrieved through APB register reads.) 0x1: TMC_CONFIGURED_AS_ETR_EMBEDDED_TRACE_ROUTER (When configured as an ETR, the TMC stores trace data in the system memory through the AXI interface. Trace data can only be retrieved through APB register reads.) 0x2: Reserved
5	CLKSCHEME	This value indicates the TMC RAM clocking scheme used i.e., whether the TMC RAM operates synchronously or asynchronously to CLK. 0x0: TMC_RAM_SYNCHRONOUS_TO_CLK (The TMC RAM operates synchronously to CLK.)
4:0	RESERVED	Reserved

0x00826FE0 QDSS_ETR_PERIPHID0**Type:** R**Reset State:** 0x00000061

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number.

QDSS_ETR_PERIPHID0

Bits	Name	Description
7:0	PART_NUMBER_BITS7TO0	Bits [7:0] of the component's part number. This is selected by the designer of the component. 0x61: CORESIGHT_TMC_PART_NUMBER_7_0 (Lowest 8 bits of the Part Number (0x961))

0x00826FE4 QDSS_ETR_PERIPHID1**Type:** R**Reset State:** 0x000000B9

Part of the set of Peripheral Identification registers. Contains part of the designer specific part number and part of the designer identity.

QDSS_ETR_PERIPHID1

Bits	Name	Description
7:4	JEP106_BITS3TO0	Bits 3:0 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0xB: ARM_JEP106_IDENTITY_CODE_7_0 (Lowest 4 bits of the JEP106 Identity Code)
3:0	PART_NUMBER_BITS11TO8	Bits [11:8] of the component's part number. This is selected by the designer of the component. 0x9: CORESIGHT_TMC_PART_NUMBER_11_8 (Upper 4 bits of the Part Number (0x961))

0x00826FE8 QDSS_ETR_PERIPHID2**Type:** R**Reset State:** 0x0000001B

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the product revision.

QDSS_ETR_PERIPHID2

Bits	Name	Description
7:4	REVISION	The Revision field is an incremental value starting at 0x0 for the first design of this component. This only increases by 1 for both major and minor revisions and is simply used as a look-up to establish the exact major/minor revision. 0x1: R0P1 (This device is at r0p1)

QDSS_ETR_PERIPHID2 (cont.)

Bits	Name	Description
3	JEDEC	Always set. Indicates that a JEDEC assigned value is used 0x1: JEDEC_IDENTITY (The designer ID is specified by JEDEC (http://www.jedec.org))
2:0	JEP106_BITS6TO4	Bits 6:4 of the JEDEC identity code indicating the designer of the component (along with the continuation code) 0x3: ARM_JEP106_IDENTITY_CODE_6_4 (Upper 3 bits of the JEP106 Identity Code)

0x00826FEC QDSS_ETR_PERIPHID3**Type:** R**Reset State:** 0x00000000

Part of the set of Peripheral Identification registers. Contains the RevAnd and Customer Modified fields.

QDSS_ETR_PERIPHID3

Bits	Name	Description
7:4	REVAND	This field indicates minor errata fixes specific to this design, for example metal fixes after implementation. In most cases this field is zero. It is recommended that component designers ensure this field can be changed by a metal fix if required, for example by driving it from registers that reset to zero. 0x0: NO_MODS (Indicates that there have been no metal fixes to this component)
3:0	CUSTOMER_MODIFIED	Where the component is reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is zero. 0x0: NO_MODS (Indicates that there have been no modifications made)

0x00826FD0 QDSS_ETR_PERIPHID4**Type:** R**Reset State:** 0x00000004

Part of the set of Peripheral Identification registers. Contains part of the designer identity and the memory footprint indicator.

QDSS_ETR_PERIPHID4

Bits	Name	Description
7:4	FOURKB_COUNT	This is a 4-bit value that indicates the total contiguous size of the memory window used by this component in powers of 2 from the standard 4KB. If a component only requires the standard 4KB then this should read as 0x0, 4KB only, for 8KB set to 0x1, 16KB == 0x2, 32KB == 0x3, and so on. 0x0: ENUM_4KB (Indicates that the device only occupies 4kB of memory)
3:0	JEP106_CONT	JEDEC continuation code indicating the designer of the component (along with the identity code) 0x4: ARM_JEP106_CONTINUATION_CODE (Indicates that ARM's JEDEC identity code is on the 5th bank)

0x00826FF0 QDSS_ETR_COMPID0

Type: R

Reset State: 0x0000000D

A component identification register, that indicates that the identification registers are present.

QDSS_ETR_COMPID0

Bits	Name	Description
7:0	PREAMBLE	Contains bits [7:0] of the component identification 0xD: ENUM_OD (Identification value)

0x00826FF4 QDSS_ETR_COMPID1

Type: R

Reset State: 0x00000090

A component identification register, that indicates that the identification registers are present. This register also indicates the component class.

QDSS_ETR_COMPID1

Bits	Name	Description
7:4	CLASS	Class of the component. E.g. ROM table, CoreSight component etc. Constitutes bits [15:12] of the component identification. 0x9: CORESIGHT_COMPONENT (Indicates the component is a CoreSight component)
3:0	PREAMBLE	Contains bits [11:8] of the component identification 0x0: ENUM_0 (Identification value)

0x00826FF8 QDSS_ETR_COMPID2

Type: R

Reset State: 0x00000005

A component identification register, that indicates that the identification registers are present.

QDSS_ETR_COMPID2

Bits	Name	Description
7:0	PREAMBLE	Contains bits [23:16] of the component identification 0x5: ENUM_05 (Identification value)

0x00826FFC QDSS_ETR_COMPID3**Type:** R**Reset State:** 0x000000B1

A component identification register, that indicates that the identification registers are present.

QDSS_ETR_COMPID3

Bits	Name	Description
7:0	PREAMBLE	Contains bits [31:24] of the component identification 0xB1: B1 (Identification value)

12.2 QDSS_AHB**12.2.1 NDPBAM_BAM_TOP****12.2.1.1 QDSS_NDPBAM_BAM_BAM****0x00885100 QDSS_NDPBAM_BAM_BAM_AHB_MASTER_ERR_ADDR_LSB****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

Relevant only on 36 bit address BAM.

QDSS_NDPBAM_BAM_BAM_AHB_MASTER_ERR_ADDR_LSB

Bits	Name	Description
31:0	BAM_ERR_ADDR	32 LSB of HADDR

0x00885104 QDSS_NDPBAM_BAM_BAM_AHB_MASTER_ERR_ADDR_MSB**Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the information about the data error in the AHB Buffer during bus Access.

The value stored is the value of the first error occurred.

Clear the BAM_HRESP_ERR_IRQ interrupt to clear the recorded error.

Available in BAM only

Relevant only on 36 bit address BAM.

QDSS_NDPBAM_BAM_BAM_AHB_MASTER_ERR_ADDR_MSB

Bits	Name	Description
3:0	BAM_ERR_ADDR	4 MSB of Address (bits 35 to 32) of HADDR

**0x00886020+ QDSS_NDPBAM_BAM_BAM_P_TRUST_REGn, n=[0..30]
0x4*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This Register holds the BAM Trusted configurations.

This register cannot be reset by any SW reset. Only HW reset applies.

QDSS_NDPBAM_BAM_BAM_P_TRUST_REGn

Bits	Name	Description
12:8	RESERVED	Reserved
7:3	BAM_P_SUP_GROUP	Super-Group is the upper division of the pipes compared to the pipe-group division. When any pipe locks or unlocks the BAM, all the pipes which are in a different super-group will NOT be affected. Only the pipes within the same super-group of the locker are affected. Usually pipes which belongs to different peripherals which share the same BAM, would be in a different super-groups

QDSS_NDPBAM_BAM_BAM_P_TRUST_REGn (cont.)

Bits	Name	Description
2:0	BAM_P_EE	This Field Indicates the EE # (0-7) to which the Pipe Interrupt belongs to. The BAM interrupt will fire to the EE # set at BAM_P_TRUST_REGn registers. The number of supported EEs is reflect in the NUM_EES field in the BAM_REVISION register. 3'b000 - EE0 3'b001 - EE1 3'b010 - EE2 3'b011 - EE3 3'b100 - EE4 3'b101 - EE5 3'b110 - EE6 3'b111 - EE7

**0x00887000+ QDSS_NDPBAM_BAM_BAM_IRQ_SRCS_EEn, n=[0..7]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Interrupt Status Register provides a single interrupt bit per each pipe in the BAM and a single bit for the BAM (not pipe related) interrupt. This register is read only and provides fast indication for the software to decide which pipe triggered the interrupt. After checking this register, SW reads the BAM_P_IRQ_STTSn register for the pipe interrupt reason and BAM_IRQ_STTS for the BAM interrupt reason.

This register has an alias - BAM_IRQ_SRCS register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

QDSS_NDPBAM_BAM_BAM_IRQ_SRCS_EEn

Bits	Name	Description
31	BAM_IRQ	BAM Global interrupt
30:0	P_IRQ	An interrupt bit per each pipe in the BAM.

**0x00887004+ QDSS_NDPBAM_BAM_BAM_IRQ_SRCS_MSK_EEn, n=[0..7]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Interrupt Sources Mask register allows to mask the interrupts by their source, whether BAM or a specific pipe.

This register has an alias - BAM_IRQ_SRCS_MSK register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

QDSS_NDPBAM_BAM_BAM_IRQ_SRCS_MSK_EEn

Bits	Name	Description
31	BAM_IRQ_MSK	BAM Global Interrupt Mask 0x1: ENABLE_BAM_INTERRUPT (Enable BAM interrupt) 0x0: DISABLE_BAM_INTERRUPT (Disable BAM interrupt)
30:0	P_IRQ_MSK	An Interrupt Mask bit per each pipe in the BAM. 0x1: ENABLE_PIPE_INTERRUPT (Enable Pipe interrupt) 0x0: DISABLE_PIPE_INTERRUPT (Disable Pipe interrupt)

0x00887008+ QDSS_NDPBAM_BAM_BAM_IRQ_SRCS_UNMASKED_EEn, n=[0..7] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

The register shows the interrupts sources like (BAM_IRQ_SRCS) although the interrupts from the BAM and the pipes are not masked on the lower level.

This register has an alias - BAM_IRQ_SRCS_UNMASKED register.

Registers with n=[1..7] exist only when the BAM supports multiple EEs (NUM_EES field in the BAM_REVISION register).

QDSS_NDPBAM_BAM_BAM_IRQ_SRCS_UNMASKED_EEn

Bits	Name	Description
31	BAM_IRQ_UNMASKED	BAM Global Interrupt after Mask
30:0	P_IRQ_UNMASKED	An Interrupt bit per each pipe in the BAM, after Mask

0x0088700C+ QDSS_NDPBAM_BAM_BAM_PIPE_ATTR_EEn, n=[0..7] 4096*n

Type: R

Clock: bam_clk

Reset State: 0x00000000

The register shows the pipes attributed to a specific EE, and an indication if BAM is enabled.

The reset value written above is true only if EE>0. For BAM_PIPE_ATTR_EE0 the default value is: Bits [MAX_PIPES-1:0] = 1, Bits [31: MAX_PIPES] = 0.

QDSS_NDPBAM_BAM_BAM_PIPE_ATTR_EEn

Bits	Name	Description
31	BAM_ENABLED	1'b1 - BAM is Enabled. 1'b0 - BAM Disabled.
30:0	P_ATTR	If bit 'i' == 1'b1 - Pipe 'i' is attributed to this EE.

0x00897000+ QDSS_NDPBAM_BAM_BAM_P_CTRLn, n=[0..30] 4096*n

Type: RW

Clock: bam_clk

Reset State: 0x00000000

Pipe Control register provides various controls for the pipe.

QDSS_NDPBAM_BAM_BAM_P_CTRLn

Bits	Name	Description
20:16	P_LOCK_GROUP	Pipe's lock group. Upon a lock request on this pipe, all pipes related to different pipe group and different EE (see PIPE_TRUST_REG) will be locked.
11	P_WRITE_NWD	BAM-Lite feature. Applicable to BAM2BAM producer pipes only. When this bit is set for producer B2B pipe, NWD bit (bit number 28 in the second word of descriptor) will be written with EOT into the generated descriptor for the consumer usage. This bit is not applicable in pipes belong to a Peripheral which uses messaging_only (e.g. USB2).
10:9	P_PREFETCH_LIMIT	Bam Lite feature Selects the number of bytes to be prefetched by the Bam Lite, once a peripheral requests to read data from a pipe. This feature is relevant for Consumer modes only. 2'b00 - 32 bytes at most (INCR8) 2'b01 - 16 bytes at most (INCR4) 2'b10 - 4 bytes at most (SINGLE) Available in BAM-Lite only

QDSS_NDPBAM_BAM_BAM_P_CTRLn (cont.)

Bits	Name	Description
8:7	P_AUTO_EOB_SEL	Bam Lite feature. Selects the number of bytes to be processed before creating End Of Block indication internally by the BAM. See P_AUTO_EOB. Descriptors generated by this feature (bam to bam producer mode) will always be of the chosen size, unless an End Of Transfer, causes a smaller descriptor to be created. 2'b00 - 512 Bytes 2'b01 - 256 Bytes 2'b10 - 128 Bytes 2'b11 - 64 Bytes Available in BAM-Lite only
6	P_AUTO_EOB	BAM Lite feature. When Enabled, the BAM Lite will ignore any incoming End Of Block indications from the peripheral (if any). Instead, the BAM Lite will generate it's own End Of Block indications internally, every P_AUTO_EOB_SEL bytes. This feature is relevant for Producer Bam 2 Bam modes only. It is a must for peripherals which are not able to produce End Of Block indications. 1'b1 - Enable 1'b0 - Disable Available in BAM-Lite only
5	P_SYS_MODE	This bit sets the pipe to work in System Mode, where the Software is the second side of the pipe. 1'b1 - System mode. 1'b0 - BAM to BAM mode.
4	P_SYS_STRM	Streaming Enable. Relevant to System Producer BAM mode only. When enabled, BAM will not close descriptors with End Of Transfer notifications received from peripheral, but continue writing the data to the same descriptor. 1'b1 - Enable Streaming Mode 1'b0 - None-Streaming Mode. This field is NOT supported in BAM-NDP (i.e. no streaming mode in NDP).
3	P_DIRECTION	This bit denotes pipe direction. 1'b1 - The pipe can be written (producer mode) 1'b0 - The pipe can be read (consumer mode)
1	P_EN	1'b1 - Enable Pipe 1'b0 - Disable Pipe

**0x00897004+ QDSS_NDPBAM_BAM_BAM_P_RSTn, n=[0..30]
4096*n****Type:** W**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Reset register provides Pipe Reset ability. Software needs to write 1 to this register to make the Pipe Reset. Writing 0 to this register will finish the Pipe Reset. Writing zero is needed prior to Peripheral reconfiguration for the same pipe.

Note: Software can invoke pipe reset only after it make sure that the pipe is 'quiet'.

('quiet' - No data transaction or command-descriptor is active at the time.

BAM_P_RSTn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_RSTn

Bits	Name	Description
0	P_SW_RST	This resets the pipe and it's registers, (Both Flip-Flops and RAM). Software can invoke pipe reset only after it make sure that the pipe is 'quiet'. 1'b1 - Reset 1'b0 - Do Nothing

**0x00897008+ QDSS_NDPBAM_BAM_BAM_P_HALTn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Halt register Enables/Disables the Halt Sequence. Refer to the Software Procedures chapter for the Halt Sequence Procedure.

This is a self-modifying register.

QDSS_NDPBAM_BAM_BAM_P_HALTn

Bits	Name	Description
1	P_PROD_HALTED	This bit is used to inform the Consumer about the Producer being in Halt mode now. This is a part of the Halt procedure. See the Software Procedures chapter. 1'b1 - Sets this bit to 1 1'b0 - Does Nothing This bit will be cleared by the HW.

QDSS_NDPBAM_BAM_BAM_P_HALTn (cont.)

Bits	Name	Description
0	P_HALT	When Enabled, the Pipe will enter Halt Mode. 1'b1 - Enable Halt 1'b0 - Disable Halt For B2B Producer pipes, this bit is self modifying. It doesn't need the SW to clear it. See the Software Procedure chapter for the detailed flow.

**0x00897010+ QDSS_NDPBAM_BAM_BAM_P_IRQ_STTSn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

Pipe Interrupt status register describing the reason for the ongoing interrupt. This is an informative only register and therefore read only. It also has informative bits which are not interrupts.

Clearing the interrupt bits is done by writing to P_IRQ_CLR register.

QDSS_NDPBAM_BAM_BAM_P_IRQ_STTSn

Bits	Name	Description
7	P_HRESP_ERR_IRQ	This interrupt Indicates that an Erroneous HResponse has been received by the AHB Master. Additional Information about the error may be read at BAM_AHB_MASTER_ERR_* Registers. Clearing this interrupt also clears the BAM_AHB_MASTER_ERR_* Registers. Available in BAM only
6	P_PIPE_RST_ERROR_IRQ	Unsuccessful Pipe Reset operation. Pipe reset timer expired.
5	P_TRNSFR_END_IRQ	For producer this interrupt happens whenever the last AHB burst of a transfer happens For Consumer when ack_on_success closes a transfer
4	P_ERR_IRQ	Pipe Error interrupt indicates that an error has happened. TBD: Error reason is not yet defined. Interrupt not in use.
3	P_OUT_OF_DESC_IRQ	Out of descriptors interrupt has several meanings depending on the operation mode: Producer - no free space in the descriptors fifo for adding a descriptor Consumer - no descriptors in the descriptors fifo for processing IO Vectors Producer - No descriptors to read (and therefore no space for data to write to the pipe) IO Vectors Consumer - No descriptors to read (and therefore no data to read from pipe)

QDSS_NDPBAM_BAM_BAM_P_IRQ_STTSn (cont.)

Bits	Name	Description
2	P_WAKE_IRQ	Wake peripheral interrupt signals the driver to wake up the peripheral (USB for example) for transmission via the current pipe. This interrupt is issued whenever an Event comes to the specific pipe.
1	P_TIMER_IRQ	Inactivity timer has reached its threshold value Interrupt
0	P_PRCSD_DESC_IRQ	This Interrupt rises when BAM finishes processing an IO Vector which has INT bit selected

**0x00897014+ QDSS_NDPBAM_BAM_BAM_P_IRQ_CLRn, n=[0..30]
4096*n****Type:** W**Clock:** bam_clk**Reset State:** 0x00000000

Writing to this register causes the interrupt to clear.

BAM_P_IRQ_CLRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_IRQ_CLRn

Bits	Name	Description
7	P_HRESP_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged
6	P_PIPE_RST_ERROR_CLR	1'b1 - Clear 1'b0 - Unchanged
5	P_TRNSFR_END_CLR	1'b1 - Clear 1'b0 - Unchanged
4	P_ERR_CLR	1'b1 - Clear 1'b0 - Unchanged
3	P_OUT_OF_DESC_CLR	1'b1 - Clear 1'b0 - Unchanged
2	P_WAKE_CLR	Clear Wake peripheral interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
1	P_TIMER_CLR	Clear Inactivity timer interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged
0	P_PRCSD_DESC_CLR	Clear Descriptor Processed interrupt by writing this bit 1'b1 - Clear 1'b0 - Unchanged

**0x00897018+ QDSS_NDPBAM_BAM_BAM_P_IRQ_ENn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

Enable bits for the Interrupts in the Pipe Interrupt Status register.

QDSS_NDPBAM_BAM_BAM_P_IRQ_ENn

Bits	Name	Description
7	P_HRESP_ERR_EN	1'b1 - Enable 1'b0 - Disable
6	P_PIPE_RST_ERROR_EN	1'b1 - Enable 1'b0 - Disable
5	P_TRNSFR_END_EN	1'b1 - Enable 1'b0 - Disable
4	P_ERR_EN	1'b1 - Enable 1'b0 - Disable
3	P_OUT_OF_DESC_EN	1'b1 - Enable 1'b0 - Disable
2	P_WAKE_EN	Enable Wake peripheral interrupt 1'b1 - Enable 1'b0 - Disable
1	P_TIMER_EN	Enable Inactivity timer Interrupt 1'b1 - Enable 1'b0 - Disable
0	P_PRCSD_DESC_EN	Enable Descriptor Processed Interrupt 1'b1 - Enable 1'b0 - Disable

**0x0089701C+ QDSS_NDPBAM_BAM_BAM_P_TIMERn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This register counts the idle time of the pipe.

BAM_P_TIMERn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_TIMERn

Bits	Name	Description
15:0	P_TIMER	Inactivity timer counter. 16 bits = 64k*0.1ms ~ 6 seconds

**0x00897020+ QDSS_NDPBAM_BAM_BAM_P_TIMER_CTRLn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register sets various controls and the threshold of the inactivity for interrupt triggering after long idle time.

The resolution of the pipe inactivity timers are in units set by a common counter. This common counter is controlled by a PARAMETER value of the BAM, and uses a separate clock, the inactivity_timers_clk. This clock can be slower than the bam_clk. The intent of the design is to use the sleep_clk, which is an always on 32kHz clock. This allows the bam_clk to be turned-off, while the base counter keeps counting. The width of this counter, as well of the rollover value are set using BAM PARAMETER. These values, taking the inactivity_timers_clk frequency define the pulse frequency that the base counter gives, and the threshold value can be calculated and set to interrupt after a specific time, regardless of the bam_clk frequency, and independent of clock power save features of the bam_clk. The timers continue counting even if the clock is turned off due to BAM dynamic hardware clock request voting.

The timer configuration is based on the inactivity_timers_clk period and the INACTIVITY_TIMER_WIDTH parameter constant. These parameters should be taken into account when setting this register. For example: for inactivity_timer_clk period of 1us and parameter is 3 and P_TIMER_THRSHLD is 10 will indicate the $2^3 * 1\mu s * 10$ which is 80us of inactivity in a pipe before sending an interrupt.

The general formula is: $2^{\text{INACTIVITY_TIMER_WIDTH}} * \text{clock_period} * \text{P_TIMER_TRSHLD}$.

QDSS_NDPBAM_BAM_BAM_P_TIMER_CTRLn

Bits	Name	Description
31	P_TIMER_RST	To begin using the inactivity timer the SW should write the threshold and write 1 to this bit. writing the value 0 will hold the timer reset until value 1 is written again. Then the timer will start down counting from the P_TIMER_THRESHOLD value 1'b1 - Active 1'b0 - Reset
30	P_TIMER_RUN	Will be used along with P_TIMER_MODE Not implemented at this time. Set to zero(0)
29	P_TIMER_MODE	Not implemented at this time. Set to zero(0)

QDSS_NDPBAM_BAM_BAM_P_TIMER_CTRLn (cont.)

Bits	Name	Description
15:0	P_TIMER_TRSHLD	Inactivity timer threshold for interrupt generation.

**0x00897024+ QDSS_NDPBAM_BAM_BAM_P_PRDCR_SDBNDn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register reflects the current status of the Producer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

QDSS_NDPBAM_BAM_BAM_P_PRDCR_SDBNDn

Bits	Name	Description
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_producer. relevant for system mode only. The sideband-Inform block which responsible for reading descriptor has updated the SB block (which responsible for publishing to peripheral) with all of its read descriptors.
20	BAM_P_TOGGLE	Pipe Bytes Free Toggle value. The toggle polarity of the publishment (each publishment changes its polarity).
19:16	BAM_P_CTRL	Pipe Bytes Free Ctrl value. The possible values are only: 0000 or 0001 (means desc-fifo-full).
15:0	BAM_P_BYTES_FREE	Pipe Bytes Free value. The accumulated bytes_free which are available for peripheral to use

**0x00897028+ QDSS_NDPBAM_BAM_BAM_P_CNSMR_SDBNDn, n=[0..30]
4096*n****Type:** R**Clock:** bam_clk**Reset State:** 0x00000000

This Register reflects the current status of the Consumer Sideband interface as the peripheral sees it and some additional internal bits related to its management.

QDSS_NDPBAM_BAM_BAM_P_CNSMR_SDBNDn

Bits	Name	Description
24	BAM_P_SB_UPDATED	sideband_inform_bytes_avail_updated_consumer. The sideband-Inform block which responsible for reading descriptor has updated the SB block (which responsible for publishing to peripheral) with all of its read descriptors.

QDSS_NDPBAM_BAM_BAM_P_CNSTR_SDBNDn (cont.)

Bits	Name	Description
23	BAM_P_WAIT_4_ACK	waiting_for_ack_bytes_avail_r. BAM is waiting for Peripheral to acknowledge the former publish.
22	BAM_P_ACK_TOGGLE	ack_bytes_avail_toggle. The Peripheral's acknowledgement for the publish. This is a toggling signal (each ack will be inverted to its former).
21	BAM_P_ACK_TOGGLE_R	ack_bytes_avail_toggle_r. The Peripheral's sampled acknowledgement for the publish. This is a toggling signal (each ack will be inverted to its former).
20	BAM_P_TOGGLE	Pipe Bytes Avail Toggle value. The toggle polarity of the publishment (each publishment changes its polarity).
19:16	BAM_P_CTRL	Pipe Bytes Avail Ctrl value. The possible values of BAM_P_CTRL field are: 0100 - Means immediate command (could be only in bam-ndp). 0001 - Means End-Of-Transaction (EOT). 0011 - means End-Of-Transaction with Notify-When-Done (NWD). 0000 - Neither Immediate-command nor EOT nor NWD.
15:0	BAM_P_BYTES_AVAIL	Pipe Bytes AVAIL value. The size of the current publish.

**0x00897800+ QDSS_NDPBAM_BAM_BAM_P_SW_OFSTSn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register denotes the pointer Offset of the first Not Acknowledged Descriptor. Meaning all Descriptors prior to this one have been processed by the BAM. This register is only used by the Software. After receiving an interrupt, software reads this register in order to know what descriptors has been processed.

When the BAM works as Producer, Software will usually read this value after Descriptor Processed Interrupt or after the End of Transfer Interrupt.

When the BAM works as Consumer, Software will usually read this value after Descriptor Processed Interrupt.

NOTE This is non relevant in BAM to BAM modes.

NOTE Although being Writable, Software should never write to this register.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_SW_OFSTSn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_SW_OFSTSn

Bits	Name	Description
31:16	SW_OFST_IN_DESC	Offset inside the Descriptor. This value is used by the Software only when a BAM is working as System Producer. Then the SW can read this value to know how many Bytes were written to the current descriptor if it was not closed down. This is useful for Streaming mode. This Field is NOT available in BAM-NDP
15:0	SW_DESC_OFST	Descriptor FIFO offset.

**0x00897818+ QDSS_NDPBAM_BAM_BAM_P_EVNT_REGn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This Register is where Read/Write events are sent to. If current BAM works as Producer, it will receive Read events into this register from the Consumer. If the Consumer is another BAM, it will write read events to this register. If the Consumer is the Software, it will prepare descriptors in the descriptor FIFO and update the DESC_FIFO_PEER_OFST value in this register.

If current BAM works as Consumer, opposite behavior is assumed.

BAM_P_EVNT_REGn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_EVNT_REGn

Bits	Name	Description
31:16	P_BYTES_CONSUMED	This field is used only in the B2B mode. It indicates the number of bits consumed by the Consumer. Consumer sends this value to the Producer as a part of a read event, for the Producer to know how many bytes were consumed. When working in System mode, this value should be set to zero. BAM to BAM Producer writes zero in this value.
15:0	P_DESC_FIFO_PEER_OFST	This field indicates the Descriptor Fifo Offset Pointer of the Peer BAM (The BAM or the Software which creates descriptors). For example when current BAM works as consumer for the current pipe, Producer BAM (or the software) updates this value to let the current pipe know about the new descriptors added in the Descriptor Fifo.

**0x0089781C+ QDSS_NDPBAM_BAM_BAM_P_DESC_FIFO_ADDRn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the Address of the Descriptor Fifo beginning.

NOTE This register is used by all modes.

BAM_P_DESC_FIFO_ADDRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_DESC_FIFO_ADDRn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	Address of the Descriptors Fifo. This address must be 8 bytes aligned.

**0x00897820+ QDSS_NDPBAM_BAM_BAM_P_FIFO_SIZESn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

The least significant field is the Descriptor Fifo Size.

The most significant field is the Data Fifo Size.

NOTE This Descriptor Fifo Size is used by all modes. The Data Fifo Size is non relevant in System Modes.

BAM_P_FIFO_SIZESn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_FIFO_SIZESn

Bits	Name	Description
31:16	P_DATA_FIFO_SIZE	Size of the Data Address Space. ALWAYS write 16'b0 to this field of P_DATA_FIFO_SIZE unless you work in BAM2BAM producer mode (also known as peer mode). NOTE: Data fifo size should not be bigger than 32KB.
15:0	P_DESC_FIFO_SIZE	Size of the Descriptors Fifo. Must be 8 byte aligned. Each descriptor is 8 bytes. Size of the descriptor fifo must contain an integer number of Descriptors. Size of descriptor fifo must be 16 bytes and above.

**0x00897824+ QDSS_NDPBAM_BAM_BAM_P_DATA_FIFO_ADDRn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the Beginning of the Data Address space.

This register is non relevant in System Modes.

BAM_P_DATA_FIFO_ADDRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_DATA_FIFO_ADDRn

Bits	Name	Description
31:0	P_DATA_FIFO_ADDR	Data Address Space beginning.

**0x00897828+ QDSS_NDPBAM_BAM_BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register configures the threshold value for Read/Write event generation by the BAM towards another BAM. When aBAM pushes/pops this number of bytes to/from the pipe an event to the other BAM will be generated. A counter summing up the bytes pushed/popped is reset when event is issued, thus restarting count for the threshold.

Events are also issued after End Of Transfer received from the peripheral (Producer case), non regarding whether the pushed bytes count has reached the threshold or not.

This register is non relevant in System Modes.

BAM_P_EVNT_GEN_TRSHLDn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_EVNT_GEN_TRSHLDn

Bits	Name	Description
15:0	P_TRSHLD	Threshold value. The maximum allowed value is 32kByte.

**0x0089782C+ QDSS_NDPBAM_BAM_BAM_P_EVNT_DEST_ADDRn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

BAM_P_EVNT_DEST_ADDRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_EVNT_DEST_ADDRn

Bits	Name	Description
31:0	P_EVNT_DEST_ADDR	Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe.

0x00897900+ 4096*n QDSS_NDPBAM_BAM_BAM_P_PSM_CNTXT_3_LSBn, n=[0..30]

Type: RW

Clock: bam_clk

Reset State: 0x00000000

Internal Context of Pipe & Writeback state machines.

Relevant only on 36 bit address BAM.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_PSM_CNTXT_3_n, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_PSM_CNTXT_3_LSBn

Bits	Name	Description
31:0	PSM_DESC_ADDR	32 LSB of The Data Address provided in the current descriptor from the Writeback state machine.

0x00897904+ 4096*n QDSS_NDPBAM_BAM_BAM_P_PSM_CNTXT_3_MSBn, n=[0..30]

Type: RW

Clock: bam_clk

Reset State: 0x00000000

Internal Context of Pipe & Writeback state machines.

Relevant only on 36 bit address BAM.

NOTE When using 2 pipes BAM, REVISION 0x03, this registers is Read Only.

BAM_P_PSM_CNTXT_3_n, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_PSM_CNTXT_3_MSBn

Bits	Name	Description
3:0	PSM_DESC_ADDR	4 MSB of address (bits 35 to 32) of the Data Address provided in the current descriptor from the Writeback state machine.

0x00897910+ 4096*n QDSS_NDPBAM_BAM_BAM_P_DESC_FIFO_ADDR_LSBn, n=[0..30]

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the LSB of Address of the Descriptor Fifo beginning.

Relevant only on 36 bit address BAM.

NOTE This register is used by all modes.

BAM_P_DESC_FIFO_ADDRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_DESC_FIFO_ADDR_LSBn

Bits	Name	Description
31:0	P_DESC_FIFO_ADDR	32 LSB of address of the Descriptors Fifo. This address must be 8 bytes aligned.

0x00897914+ 4096*n QDSS_NDPBAM_BAM_BAM_P_DESC_FIFO_ADDR_MSBn, n=[0..30]

Type: RW

Clock: bam_clk

Reset State: 0x00000000

This register stores the MSB of Address of the Descriptor Fifo beginning.

Relevant only on 36 bit address BAM.

NOTE This register is used by all modes.

BAM_P_DESC_FIFO_ADDRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_DESC_FIFO_ADDR_MSBn

Bits	Name	Description
3:0	P_DESC_FIFO_ADDR	4 MSB of address (bits 35 to 32) of Address of the Descriptors Fifo. This address must be 8 bytes aligned.

**0x00897920+ QDSS_NDPBAM_BAM_BAM_P_DATA_FIFO_ADDR_LSBn, n=[0..30]

31:0	P_EVNT_DEST_ADDR	32 LSB of Address of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe. Relevant only on 36 bit address BAM.

**0x00897934+ QDSS_NDPBAM_BAM_BAM_P_EVNT_DEST_ADDR_MSBn, n=[0..30]
4096*n****Type:** RW**Clock:** bam_clk**Reset State:** 0x00000000

This register stores the Event Destination Address which is the address of BAM_P_EVNT_REG in the BAM on the other side of the Pipe.

Producer BAM will send Write Events to this address.

Consumer BAM will send Read Events to this address.

This is relevant only for BAM to BAM modes. In System modes, BAM doesn't issue Write/Read events.

Relevant only on 36 bit address BAM.

BAM_P_EVNT_DEST_ADDRn, n=[0..30]

QDSS_NDPBAM_BAM_BAM_P_EVNT_DEST_ADDR_MSBn

Bits	Name	Description
3:0	P_EVNT_DEST_ADDR	4 MSB of Address (bits 35 to 32) of the Event Register in the peer BAM (second end of the pipe). Driver will configure this when initializing the pipe. Relevant only on 36 bit address BAM.

13 SPDM Wrapper

13.1 SPDM_SPDM_OLEM

0x00041020+ SPDM_OLEM_CYCLE_Cn_OUT, n=[0..15]
0x4*n

Type: R
Clock: HCLK
Reset State: 0x00000000

The OLEM_CYCLE_Cn_OUT register configures the following:

SPDM_OLEM_CYCLE_Cn_OUT

Bits	Name	Description
31:0	RESULT	This value is the number of clock cycles that were detected during the interval period.

0x000410A0+ SPDM_OLEM_EVENT_Cn_OUT, n=[0..31]
0x4*n

Type: R
Clock: HCLK
Reset State: 0x00000000

The OLEM_EVENT_Cn_OUT register configures the following:

SPDM_OLEM_EVENT_Cn_OUT

Bits	Name	Description
31:0	RESULT	This value is the number of event cycles that were detected during the interval period.

0x00041120+ SPDM_OLEM_MULTIBIT_Cn_OUT, n=[0..7]
0x4*n

Type: R
Clock: HCLK
Reset State: 0x00000000

The OLEM_MULTIBIT_Cn_OUT register configures the following:

SPDM_OLEM_MULTIBIT_Cn_OUT

Bits	Name	Description
31:0	RESULT	This value is the accumulation of the multi-bit values coming from the realtime monitors during the interval period.

14 System NoC

Bits	Name	Description
15:0	ERRLOG5	Header: User lsb value

0x00581024 SNOC_MSS_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000**SNOC_MSS_TFILT_USERBASE**

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00581028 SNOC_MSS_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_MSS_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x005810A4 SNOC_MSS_NAV_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000

SNOC_MSS_NAV_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x005810A8 SNOC_MSS_NAV_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_MSS_NAV_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581100 SNOC_VENUS0_TFILT_ID_COREID**Type:** R**Reset State:** 0x785A6C09**SNOC_VENUS0_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581104 SNOC_VENUS0_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_VENUS0_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581108 SNOC_VENUS0_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058110C SNOC_VENUS0_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581110 SNOC_VENUS0_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581114 SNOC_VENUS0_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581118 SNOC_VENUS0_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058111C SNOC_VENUS0_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_SRCIDMASK**

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x00581120 SNOC_VENUS0_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x00581124 SNOC_VENUS0_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000

SNOC_VENUS0_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00581128 SNOC_VENUS0_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_VENUS0_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581180 SNOC_VFE_TFILT_ID_COREID**Type:** R**Reset State:** 0x80ED5E09**SNOC_VFE_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581184 SNOC_VFE_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_VFE_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581188 SNOC_VFE_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058118C SNOC_VFE_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581190 SNOC_VFE_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581194 SNOC_VFE_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581198 SNOC_VFE_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058119C SNOC_VFE_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_SRCIDMASK**

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x005811A0 SNOC_VFE_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x005811A4 SNOC_VFE_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000

SNOC_VFE_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x005811A8 SNOC_VFE_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_VFE_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581224 SNOC_QDSS_BAM_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000**SNOC_QDSS_BAM_TFILT_USERBASE**

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00581228 SNOC_QDSS_BAM_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_QDSS_BAM_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581280 SNOC_PCNOC_TFILT_ID_COREID**Type:** R**Reset State:** 0x5E04A609

SNOC_PCNOC_TFILT_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581284 SNOC_PCNOC_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_PCNOC_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581288 SNOC_PCNOC_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058128C SNOC_PCNOC_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581290 SNOC_PCNOC_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581294 SNOC_PCNOC_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581298 SNOC_PCNOC_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058129C SNOC_PCNOC_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000

SNOC_PCNOC_TFILT_SRCIDMASK

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x005812A0 SNOC_PCNOC_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x005812A4 SNOC_PCNOC_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_USERBASE**

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x005812A8 SNOC_PCNOC_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581300 SNOC_BIMC_TFILT_ID_COREID**Type:** R**Reset State:** 0xE7F8D409**SNOC_BIMC_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581304 SNOC_BIMC_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_BIMC_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581308 SNOC_BIMC_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058130C SNOC_BIMC_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581310 SNOC_BIMC_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581314 SNOC_BIMC_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581318 SNOC_BIMC_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058131C SNOC_BIMC_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000

SNOC_BIMC_TFILT_SRCIDMASK

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x00581320 SNOC_BIMC_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x00581324 SNOC_BIMC_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_USERBASE**

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00581328 SNOC_BIMC_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_BIMC_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581380 SNOC_WCSS_TFILT_ID_COREID**Type:** R**Reset State:** 0x30706C09**SNOC_WCSS_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581384 SNOC_WCSS_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_WCSS_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581388 SNOC_WCSS_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058138C SNOC_WCSS_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581390 SNOC_WCSS_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581394 SNOC_WCSS_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581398 SNOC_WCSS_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058139C SNOC_WCSS_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000

SNOC_WCSS_TFILT_SRCIDMASK

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x005813A0 SNOC_WCSS_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x005813A4 SNOC_WCSS_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_USERBASE**

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x005813A8 SNOC_WCSS_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581424 SNOC_QDSS_ETR_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000**SNOC_QDSS_ETR_TFILT_USERBASE**

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00581428 SNOC_QDSS_ETR_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_QDSS_ETR_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581480 SNOC_JPEG_TFILT_ID_COREID**Type:** R**Reset State:** 0x441A1609**SNOC_JPEG_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581484 SNOC_JPEG_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_JPEG_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581488 SNOC_JPEG_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058148C SNOC_JPEG_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581490 SNOC_JPEG_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581494 SNOC_JPEG_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581498 SNOC_JPEG_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058149C SNOC_JPEG_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_SRCIDMASK**

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x005814A0 SNOC_JPEG_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x005814A4 SNOC_JPEG_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000

SNOC_JPEG_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x005814A8 SNOC_JPEG_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00581500 SNOC_MDP0_TFILT_ID_COREID**Type:** R**Reset State:** 0xF70C5D09**SNOC_MDP0_TFILT_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x00581504 SNOC_MDP0_TFILT_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_MDP0_TFILT_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x00581508 SNOC_MDP0_TFILT_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_MODE**

Bits	Name	Description
0	MODE	Register Mode is a 1-bit register that sets the filtering mode as follows: handshake Mode = 0 or latency Mode = 1.

0x0058150C SNOC_MDP0_TFILT_ADDRBASE_LOW**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_ADDRBASE_LOW**

Bits	Name	Description
31:0	ADDRBASE_LOW	Address base LSB register.

0x00581510 SNOC_MDP0_TFILT_ADDRBASE_HIGH**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_ADDRBASE_HIGH**

Bits	Name	Description
0	ADDRBASE_HIGH	Address base MSB register.

0x00581514 SNOC_MDP0_TFILT_ADDRWINDOWSIZE**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_ADDRWINDOWSIZE**

Bits	Name	Description
5:0	ADDRWINDOWSIZE	Register AddrWindowSize contains the encoded address mask used to filter packets: the effective Mask value is equal to $\sim(2^{**}\text{AddrWindowSize} - 1)$. A packet is a candidate when $\text{ReqInfo.Addr} \& \text{AddrMask} = \text{AddrBase} \& \text{AddrMask}$.

0x00581518 SNOC_MDP0_TFILT_SRCIDBASE**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_SRCIDBASE**

Bits	Name	Description
14:0	SRCIDBASE	Reserved, null-width register. Register SrcIdBase is only available for specific designs, and contains the source ID base used to filter packets. The number of bits is set with parameter wSrcId.

0x0058151C SNOC_MDP0_TFILT_SRCIDMASK**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_SRCIDMASK**

Bits	Name	Description
14:0	SRCIDMASK	Reserved, null-width register. Register SrcIdMask is only available for specific designs, and contains the source ID mask used to filter packets. The number of bits is set with parameter wSrcId. A packet is a candidate when $\text{ReqInfo.SrcId} + \text{SrcIdMask} = \text{SrcIdBase} + \text{SrcIdMask}$.

0x00581520 SNOC_MDP0_TFILT_OPCODE**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_OPCODE**

Bits	Name	Description
1	WREN	When set to 1, selects WR requests.
0	RDEN	When set to 1, selects RD requests.

0x00581524 SNOC_MDP0_TFILT_USERBASE**Type:** RW**Reset State:** 0x00000000

SNOC_MDP0_TFILT_USERBASE

Bits	Name	Description
15:0	USERBASE	This register contains the User base used to filter requests.

0x00581528 SNOC_MDP0_TFILT_USERMASK**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_TFILT_USERMASK**

Bits	Name	Description
15:0	USERMASK	This register contains the User mask used to filter requests.

0x00582188 SNOC_TPRB3_TPROF_EN**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_EN**

Bits	Name	Description
0	EN	Register En is a 1-bit register that enables the transaction probe counter unit.

0x0058218C SNOC_TPRB3_TPROF_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_MODE**

Bits	Name	Description
1:0	MODE	Register Mode sets the counting mode per observed port. Each bit per observation port defines the incrementing mode. (Mode = 0 for Delay, Mode = 1 for Pending)

0x00582190 SNOC_TPRB3_TPROF_OBSERVEDSEL_0**Type:** RW**Reset State:** 0x00000000

SNOC_TPRB3_TPROF_OBSERVEDSEL_0

Bits	Name	Description
1:0	OBSERVEDSEL_0	Register ObservedSel_i selects the port to be observed: 0.

0x00582194 SNOC_TPRB3_TPROF_OBSERVEDSEL_1**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_OBSERVEDSEL_1**

Bits	Name	Description
1:0	OBSERVEDSEL_1	Register ObservedSel_i selects the port to be observed: 1.

0x005821A0 SNOC_TPRB3_TPROF_NTENURELINES_0**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_NTENURELINES_0**

Bits	Name	Description
3:0	NTENURELINES_0	Register nTenureLine_i indicates the number of transaction probe lines allocated to each observed port: 0.

0x005821AC SNOC_TPRB3_TPROF_THRESHOLDS_0_0**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_THRESHOLDS_0_0**

Bits	Name	Description
3:0	THRESHOLDS_0_0	Register Threshold_i_j contains the threshold index '0' that allows computation of threshold values.

0x005821B0 SNOC_TPRB3_TPROF_THRESHOLDS_0_1**Type:** RW**Reset State:** 0x00000000

SNOC_TPRB3_TPROF_THRESHOLDS_0_1

Bits	Name	Description
3:0	THRESHOLDS_0_1	Register Threshold_i_j contains the threshold index '1' that allows computation of threshold values.

0x005821B4 SNOC_TPRB3_TPROF_THRESHOLDS_0_2**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_THRESHOLDS_0_2**

Bits	Name	Description
3:0	THRESHOLDS_0_2	Register Threshold_i_j contains the threshold index '2' that allows computation of threshold values.

0x005821BC SNOC_TPRB3_TPROF_THRESHOLDS_1_0**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_THRESHOLDS_1_0**

Bits	Name	Description
3:0	THRESHOLDS_1_0	Register Threshold_i_j contains the threshold index '0' that allows computation of threshold values.

0x005821C0 SNOC_TPRB3_TPROF_THRESHOLDS_1_1**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_THRESHOLDS_1_1**

Bits	Name	Description
3:0	THRESHOLDS_1_1	Register Threshold_i_j contains the threshold index '1' that allows computation of threshold values.

0x005821C4 SNOC_TPRB3_TPROF_THRESHOLDS_1_2**Type:** RW**Reset State:** 0x00000000

SNOC_TPRB3_TPROF_THRESHOLDS_1_2

Bits	Name	Description
3:0	THRESHOLDS_1_2	Register Threshold_i_j contains the threshold index '2' that allows computation of threshold values.

0x005821EC SNOC_TPRB3_TPROF_OVERFLOWSTATUS**Type:** R**Reset State:** Undefined**SNOC_TPRB3_TPROF_OVERFLOWSTATUS**

Bits	Name	Description
1:0	OVERFLOWSTATUS	Register OverflowStatus is a status register that handles the overflow status on each observed port. OverflowStatus = nObservable. Bit 0 gives the status of observed port 0.

0x005821F0 SNOC_TPRB3_TPROF_OVERFLOWRESET**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_OVERFLOWRESET**

Bits	Name	Description
1:0	OVERFLOWRESET	Register OverflowReset is a pulse register that clears overflow status bits per observed port on each write access. OverflowReset = nObservable. Writing 0x2 clears the overflow status of observed port 1.

0x005821F4 SNOC_TPRB3_TPROF_PENDINGEVENTMODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_PENDINGEVENTMODE**

Bits	Name	Description
0	PENDINGEVENTMODE	Register pendingEventMode is a 1-bit register that configures the pending event mode. When set to 0 (CYCLE), and when register mode is set to PENDING, the pending event is generated on each cycle when the counter is greater than zero. When set to 1 (STOP) the pending event is generated on each stop event.

0x005821F8 SNOC_TPRB3_TPROF_PRESCALER**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_TPROF_PRESCALER**

Bits	Name	Description
7:0	PRESCALER	8Register Prescaler is an-bit pre-scaling register that accepts any pre-scaling value between 1 (default) and 256. If set to 0, pre-scaling is disabled. If set to any other supported value 'n', the threshold counter value is divided by (n + 1).

0x00584C08 SNOC_TPRB3_SPROF_MAINCTL**Type:** RW**Reset State:** 0x00000000

Register MainCtl contains probe global control bits. The register has seven bit fields:

SNOC_TPRB3_SPROF_MAINCTL

Bits	Name	Type	Description
7	FILTBYTEALWAYSCHAINABLEEN	RW	When set to 0, Filter Byte / ByteEn Cnt will be connected to all statistics counters where odd Stat count are not chainable. When set to 1, Filter Byte / ByteEn Cnt will be connected only to chainable stat counter (even stat counter).
6	INTRUSIVEMODE	R	When set to 1, register field IntrusiveMode enables trace operation in Intrusive flow-control mode. When set to 0, the register enables trace operation in Overflow flow-control mode
5	STATCONDDUMP	RW	When set, register field StatCondDump enables the dump of a statistics frame to the range of counter values set for registers StatAlarmMin, StatAlarmMax, and AlarmMode. This field also renders register StatAlarmStatus inoperative. When parameter statisticsCounterAlarm is set to False, the StatCondDump register bit is reserved.
4	ALARMEN	RW	When set, register field AlarmEn enables the probe to collect alarm-related information. When the register field bit is null, both TraceAlarm and StatAlarm outputs are driven to 0.
3	STATEN	RW	When set to 1, register field StatEn enables statistics profiling. The probe sendS statistics results to the output for signal ObsTx. All statistics counters are cleared when the StatEn bit goes from 0 to 1. When set to 0, counters are disabled.

SNOC_TPRB3_SPROF_MAINCTL (cont.)

Bits	Name	Type	Description
2	PAYLOADEN	RW	Register field PayloadEn, when set to 1, enables traces to contain headers and payload. When set to 0, only headers are reported.
1	TRACEEN	RW	Register field TraceEn enables the probe to send filtered packets (Trace) on the ObsTx observation output.
0	ERREN	RW	Register field ErrEn enables the probe to send on the ObsTx output any packet with Error status, independently of filtering mechanisms, thus constituting a simple supplementary global filter.

0x00584C0C SNOC_TPRB3_SPROF_CFGCTL**Type:** RW**Reset State:** 0b0000000000000000000000000000X0**SNOC_TPRB3_SPROF_CFGCTL**

Bits	Name	Type	Description
1	ACTIVE	R	
0	GLOBALEN	RW	

0x00584C24 SNOC_TPRB3_SPROF_STATPERIOD**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_STATPERIOD**

Bits	Name	Description
4:0	STATPERIOD	Register StatPeriod is a 5-bit register that sets a period, within a range of 2-8 megacycles, during which statistics are collected before being dumped automatically. Setting the register effectively enables automatic mode operation for statistics collection. Note: The configured period is also used for statistics alarm generation. The period is calculated with the formula: $N_Cycle = 2^{min(23, StatPeriod)}$ When register StatPeriod is set to its default value 0, automatic dump mode is disabled, and register StatGo is activated for manual mode operation. Note: When parameter nStatisticsCounter is set to 0, statistics collection is disabled, with the consequence that all statistics collection registers, including StatPeriod, are reserved.

0x00584C28 SNOC_TPRB3_SPROF_STATGO**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_STATGO**

Bits	Name	Description
0	STATGO	Writing to 1-bit pulse register StatGo generates a statistics dump. The register is active when statistics collection operates in its manual mode, that is, when register StatPeriod is set to 0.

0x00584C2C SNOC_TPRB3_SPROF_STATALARMMIN**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_STATALARMMIN**

Bits	Name	Description
31:0	STATALARMMIN	Register StatAlarmMin contains the minimum count value used in statistics alarm comparisons. The number of bits is equal to twice the value set for parameter wStatisticsCounter. When parameter statisticsCounterAlarm is set to False, StatAlarmMin is reserved.

0x00584C30 SNOC_TPRB3_SPROF_STATALARMMAX**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_STATALARMMAX**

Bits	Name	Description
31:0	STATALARMMAX	Register StatAlarmMax contains the maximum count value used in statistics alarm comparisons. The number of bits is equal to twice the value set for parameter wStatisticsCounter. When parameter statisticsCounterAlarm is set to False, StatAlarmMax is reserved.

0x00584C34 SNOC_TPRB3_SPROF_STATALARMSSTATUS**Type:** R**Reset State:** Undefined

SNOC_TPRB3_SPROF_STATALARMSSTATUS

Bits	Name	Description
0	STATALARMSSTATUS	Register StatAlarmStatus is a read-only 1-bit register indicating that at least one statistics counter has exceeded the programmed values for registers StatAlarmMin or StatAlarmMax. Output signal StatAlarm is equal to the values stored in register MainCtl fields StatAlarmStatus and AlarmEn. When parameter statisticsCounterAlarm is set to False, StatAlarmStatus is reserved.

0x00584C38 SNOC_TPRB3_SPROF_STATALARMCCLR**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_STATALARMCCLR**

Bits	Name	Description
0	STATALARMCCLR	Register StatAlarmClr is a 1-bit write-only register. A write operation to this register clears the register StatAlarmStatus bit. When parameter statisticsCounterAlarm is set to False, StatAlarmClr is reserved.

0x00584D38 SNOC_TPRB3_SPROF_COUNTERS_0_SRC**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_0_SRC**

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00584D3C SNOC_TPRB3_SPROF_COUNTERS_0_ALARMMODE**Type:** RW**Reset State:** 0x00000000

SNOC_TPRB3_SPROF_COUNTERS_0_ALARMMODE

Bits	Name	Description
1:0	COUNTERS_0_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00584D40 SNOC_TPRB3_SPROF_COUNTERS_0_VAL**Type:** R**Reset State:** Undefined**SNOC_TPRB3_SPROF_COUNTERS_0_VAL**

Bits	Name	Description
15:0	COUNTERS_0_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00584D4C SNOC_TPRB3_SPROF_COUNTERS_1_SRC**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_1_SRC**

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00584D50 SNOC_TPRB3_SPROF_COUNTERS_1_ALARMMODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_1_ALARMMODE**

Bits	Name	Description
1:0	COUNTERS_1_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00584D54 SNOC_TPRB3_SPROF_COUNTERS_1_VAL**Type:** R**Reset State:** Undefined**SNOC_TPRB3_SPROF_COUNTERS_1_VAL**

Bits	Name	Description
15:0	COUNTERS_1_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00584D60 SNOC_TPRB3_SPROF_COUNTERS_2_SRC**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_2_SRC**

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00584D64 SNOC_TPRB3_SPROF_COUNTERS_2_ALARMMODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_2_ALARMMODE**

Bits	Name	Description
1:0	COUNTERS_2_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00584D68 SNOC_TPRB3_SPROF_COUNTERS_2_VAL**Type:** R**Reset State:** Undefined

SNOC_TPRB3_SPROF_COUNTERS_2_VAL

Bits	Name	Description
15:0	COUNTERS_2_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00584D74 SNOC_TPRB3_SPROF_COUNTERS_3_SRC**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_3_SRC**

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00584D78 SNOC_TPRB3_SPROF_COUNTERS_3_ALARMMODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_3_ALARMMODE**

Bits	Name	Description
1:0	COUNTERS_3_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00584D7C SNOC_TPRB3_SPROF_COUNTERS_3_VAL**Type:** R**Reset State:** Undefined**SNOC_TPRB3_SPROF_COUNTERS_3_VAL**

Bits	Name	Description
15:0	COUNTERS_3_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00584D88 SNOC_TPRB3_SPROF_COUNTERS_4_SRC**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_4_SRC**

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00584D8C SNOC_TPRB3_SPROF_COUNTERS_4_ALARMMODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_4_ALARMMODE**

Bits	Name	Description
1:0	COUNTERS_4_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00584D90 SNOC_TPRB3_SPROF_COUNTERS_4_VAL**Type:** R**Reset State:** Undefined**SNOC_TPRB3_SPROF_COUNTERS_4_VAL**

Bits	Name	Description
15:0	COUNTERS_4_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00584D9C SNOC_TPRB3_SPROF_COUNTERS_5_SRC**Type:** RW**Reset State:** 0x00000000

SNOC_TPRB3_SPROF_COUNTERS_5_SRC

Bits	Name	Description
5	EXTEVENT	When set to 1 counts the cycles where ExtEvent[IntEvent] = 1. It exists when nExtEvent > 0.
4:0	INTEVENT	Internal packet event

0x00584DA0 SNOC_TPRB3_SPROF_COUNTERS_5_ALARMMODE**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_5_ALARMMODE**

Bits	Name	Description
1:0	COUNTERS_5_ALARMMODE	Register AlarmMode is a 2-bit register that is present when parameter statisticsCounterAlarm is set to True. The register defines the statistics-alarm behavior of the counter.

0x00584DA4 SNOC_TPRB3_SPROF_COUNTERS_5_VAL**Type:** R**Reset State:** Undefined**SNOC_TPRB3_SPROF_COUNTERS_5_VAL**

Bits	Name	Description
15:0	COUNTERS_5_VAL	Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

0x00584DB0 SNOC_TPRB3_SPROF_COUNTERS_6_SRC**Type:** RW**Reset State:** 0x00000000**SNOC_TPRB3_SPROF_COUNTERS_6_SRC**

Bits	Name	Description

0x00587008 SNOC_MSS_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_MSS_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0058700C SNOC_MSS_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_MSS_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x00587010 SNOC_MSS_QOS_BANDWIDTH**Type:** RW**Reset State:** 0x00000000

SNOC_MSS_QOS_BANDWIDTH

Bits	Name	Description
15:0	BANDWIDTH	Defines the bandwidth threshold in 1/256th-byte-per-cycle units. In other words, the desired rate in MBps is divided by frequency in MHz of the NIU, and then multiplied by 256.

0x00587014 SNOC_MSS_QOS_SATURATION**Type:** RW**Reset State:** 0x00000000**SNOC_MSS_QOS_SATURATION**

Bits	Name	Description
9:0	SATURATION	Defines the size of the bandwidth counter, that is, the measurement window, in 16-byte units. In other words, the desired number of bytes divided by 16.

0x00587018 SNOC_MSS_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_MSS_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x00588008 SNOC_MSS_NAV_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_MSS_NAV_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0058800C SNOC_MSS_NAV_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_MSS_NAV_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x00588018 SNOC_MSS_NAV_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_MSS_NAV_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0058B000 SNOC_WCSS_QOS_ID_COREID**Type:** R**Reset State:** 0x49117304**SNOC_WCSS_QOS_ID_COREID**

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.

SNOC_WCSS_QOS_ID_COREID (cont.)

Bits	Name	Description
7:0	CORETYPEID	Field identifying the type of IP.

0x0058B004 SNOC_WCSS_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_WCSS_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0058B008 SNOC_WCSS_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_WCSS_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0058B00C SNOC_WCSS_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0058B010 SNOC_WCSS_QOS_BANDWIDTH**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_QOS_BANDWIDTH**

Bits	Name	Description
15:0	BANDWIDTH	Defines the bandwidth threshold in 1/256th-byte-per-cycle units. In other words, the desired rate in MBps is divided by frequency in MHz of the NIU, and then multiplied by 256.

0x0058B014 SNOC_WCSS_QOS_SATURATION**Type:** RW**Reset State:** 0x00000000**SNOC_WCSS_QOS_SATURATION**

Bits	Name	Description
9:0	SATURATION	Defines the size of the bandwidth counter, that is, the measurement window, in 16-byte units. In other words, the desired number of bytes divided by 16.

0x0058B018 SNOC_WCSS_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_WCSS_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0058C000 SNOC_PCNOQ_QOS_ID_COREID**Type:** R**Reset State:** 0x70A2B704

SNOC_PCNOC_QOS_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x0058C004 SNOC_PCNOC_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_PCNOC_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0058C008 SNOC_PCNOC_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_PCNOC_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0058C00C SNOC_PCNOC_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0058C010 SNOC_PCNOC_QOS_BANDWIDTH**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_QOS_BANDWIDTH**

Bits	Name	Description
15:0	BANDWIDTH	Defines the bandwidth threshold in 1/256th-byte-per-cycle units. In other words, the desired rate in MBps is divided by frequency in MHz of the NIU, and then multiplied by 256.

0x0058C014 SNOC_PCNOC_QOS_SATURATION**Type:** RW**Reset State:** 0x00000000**SNOC_PCNOC_QOS_SATURATION**

Bits	Name	Description
9:0	SATURATION	Defines the size of the bandwidth counter, that is, the measurement window, in 16-byte units. In other words, the desired number of bytes divided by 16.

0x0058C018 SNOC_PCNOC_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_PCNOC_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0058D000 SNOC_JPEG_QOS_ID_COREID**Type:** R**Reset State:** 0x86FB7004

SNOC_JPEG_QOS_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x0058D004 SNOC_JPEG_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_JPEG_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0058D008 SNOC_JPEG_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_JPEG_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0058D00C SNOC_JPEG_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0058D010 SNOC_JPEG_QOS_BANDWIDTH**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_QOS_BANDWIDTH**

Bits	Name	Description
16:0	BANDWIDTH	Defines the bandwidth threshold in 1/256th-byte-per-cycle units. In other words, the desired rate in MBps is divided by frequency in MHz of the NIU, and then multiplied by 256.

0x0058D014 SNOC_JPEG_QOS_SATURATION**Type:** RW**Reset State:** 0x00000000**SNOC_JPEG_QOS_SATURATION**

Bits	Name	Description
9:0	SATURATION	Defines the size of the bandwidth counter, that is, the measurement window, in 16-byte units. In other words, the desired number of bytes divided by 16.

0x0058D018 SNOC_JPEG_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_JPEG_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x0058E000 SNOC_MDP0_QOS_ID_COREID**Type:** R**Reset State:** 0xD1CE1F04

SNOC_MDP0_QOS_ID_COREID

Bits	Name	Description
31:8	CORECHECKSUM	Field containing a checksum of the parameters of the IP.
7:0	CORETYPEID	Field identifying the type of IP.

0x0058E004 SNOC_MDP0_QOS_ID_REVISIONID**Type:** R**Reset State:** 0x01222B00**SNOC_MDP0_QOS_ID_REVISIONID**

Bits	Name	Description
31:8	FLEXNOCID	Field containing the build revision of the software used to generate the IP HDL code.
7:0	USERID	Field containing a user defined value, not used anywhere inside the IP itself.

0x0058E008 SNOC_MDP0_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_MDP0_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0058E00C SNOC_MDP0_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x0058E010 SNOC_MDP0_QOS_BANDWIDTH**Type:** RW**Reset State:** 0x00000000**SNOC_MDP0_QOS_BANDWIDTH**

Bits	Name	Description
16:0	BANDWIDTH	Defines the bandwidth threshold in 1/256th-byte-per-cycle units. In other words, the desired rate in MBps is divided by frequency in MHz of the NIU, and then multiplied by 256.

Bits	Name	Description
9:0	SATURATION	Defines the size of the bandwidth counter, that is, the measurement window, in 16-byte units. In other words, the desired number of bytes divided by 16.

0x00590018 SNOC_VFE_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_VFE_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x00591008 SNOC_QDSS_ETR_QOS_PRIORITY**Type:** RW**Reset State:** 0x00000000

Priority register.

SNOC_QDSS_ETR_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0059100C SNOC_QDSS_ETR_QOS_MODE

Type: RW

Reset State: 0x00000000

SNOC_QDSS_ETR_QOS_MODE

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x00591018 SNOC_QDSS_ETR_QOS_EXTCONTROL

Type: RW

Reset State: 0x00000000

External inputs control.

SNOC_QDSS_ETR_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

0x00592008 SNOC_QDSS_BAM_QOS_PRIORITY

Type: RW

Reset State: 0x00000000

Priority register.

SNOC_QDSS_BAM_QOS_PRIORITY

Bits	Name	Description
3:2	P1	In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
1:0	P0	In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

0x0059200C SNOC_QDSS_BAM_QOS_MODE**Type:** RW**Reset State:** 0x00000000**SNOC_QDSS_BAM_QOS_MODE**

Bits	Name	Description
1:0	MODE	Functional Mode: 0=Fixed, 1=Limiter, 2=Bypass, 3=Regulator.

0x00592018 SNOC_QDSS_BAM_QOS_EXTCONTROL**Type:** RW**Reset State:** 0x00000000

External inputs control.

SNOC_QDSS_BAM_QOS_EXTCONTROL

Bits	Name	Description
2	INTCLKEN	Replace the External reference by the local clock.
1	EXTTHREN	ExtThr input controls Low/High priority instead of bandwidth threshold.
0	SOCKETQOSEN	Combines the Socket QoS with Regulator QoS.

15 Top Level Mode Multiplexing

15.1 TLMM_MPU1132_16_M22L12_AHB

15.2 TLMM_CSR

TLMM control and status

15.2.1 TLMM_CSR

TLMM control and status

0x01000000+ TLMM_GPIO_CFGn, n=[0..121]
0x1000*n

Type: RW

Clock: GCC_TLMM_AHB_CLK

Reset State: 0x00000001

The GPIO_CFG[n] controls the GPIO Output Enable, Drive strength, Pull and Alternate Function for GPIO[n]. The default PULL can vary for different GPIOs and can be found in the pinout spreadsheet. The default drive setting for all GPIOs is '000' (2 mA).

TLMM_GPIO_CFGn

Bits	Name	Description
10	GPIO_HIHYS_EN	Controls the hihys_en for GPIO[n]
9	GPIO_OE	Controls the OE for GPIO[n] when in GPIO mode.

TLMM_GPIO_CFGn (cont.)

Bits	Name	Description
8:6	DRV_STRENGTH	Controls the GPIO pad drive strength. This applies regardless of the FUNC_SEL field selection. 0x0: DRV_2_MA (Sets the drive strength to 2mA. When in RFFE mode, sets output cap to 5-26 pF) 0x1: DRV_4_MA (Sets the drive strength to 4mA. When in RFFE mode, sets output cap to 27-45 pF) 0x2: DRV_6_MA (Sets the drive strength to 6mA. When in RFFE mode, sets output cap to 46-60 pF) 0x3: DRV_8_MA (Sets the drive strength to 8mA. When in RFFE mode, sets output cap to 61-79 pF) 0x4: DRV_10_MA (Sets the drive strength to 10mA. When in RFFE mode, it is a don't care) 0x5: DRV_12_MA (Sets the drive strength to 12mA. When in RFFE mode, it is a don't care) 0x6: DRV_14_MA (Sets the drive strength to 14mA. When in RFFE mode, it is a don't care) 0x7: DRV_16_MA (Sets the drive strength to 16mA. When in RFFE mode, it is a don't care)
5:2	FUNC_SEL	Many of the GPIO pads have one or more functional hardware interfaces behind them. This field controls how the pad is used. Set this to the appropriate value for the function desired.
1:0	GPIO_PULL	The pad can be configured to employ an internal weak pull up, pull down, or keeper function. This applies regardless of the FUNC_SEL field selection. 0x0: NO_PULL (Disables all pull) 0x1: PULL_DOWN (Weak Pull-down) 0x2: KEEPER (Weak Keeper) 0x3: PULL_UP (Weak Pull-Up)

**0x01000004+ TLMM_GPIO_IN_OUTn, n=[0..121]
0x1000*n**

Type: RW

Clock: GCC_TLMM_AHB_CLK

Reset State: 0x00000000

The GPIO_IN_OUT[n] controls the Out and In on the GPIO[n]. The GPIO_IN bit is read-only.

TLMM_GPIO_IN_OUTn

Bits	Name	Type	Description
1	GPIO_OUT	RW	Controls the value of the GPIO Output
0	GPIO_IN	R	Allows you to read the Input value of the GPIO

**0x01000008+ TLMM_GPIO_INTR_CFGn, n=[0..121]
0x1000*n**
Type: RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x000000E2

The GPIO_INTR_CFGn controls the summary and direct interrupt settings for GPIO[n]. Additional settings for direct connect interrupts can be found in the DIR_CONN_INTR_CFGn_* registers

TLMM_GPIO_INTR_CFGn

Bits	Name	Description
8	DIR_CONN_EN	This bit tells the TLMM that GPIO[n] is being used as a Direct Connect Interrupt. 0x1: ENABLE (Enable the GPIO as direct connect interrupt) 0x0: DISABLE (Disable the GPIO as direct connect interrupt)
7:5	TARGET_PROC	This field determines which processor a summary interrupt from GPIO[n] should get routed to. 0x0: WCSS (Route the GPIO[n] signal to WCSS summary interrupt) 0x1: SENSORS (Route the GPIO[n] signal to SENSORS summary interrupt) 0x2: Reserved 0x3: RPM (Route the GPIO[n] signal to RPM summary interrupt) 0x4: APSS (Route the GPIO[n] signal to APSS summary interrupt) 0x5: MSS (Route the GPIO[n] signal to MSS summary interrupt) 0x6: TZ (Route the GPIO[n] signal to TZ summary interrupt) 0x7: NONE (Don't route to any processor subsystem. Default)
4	INTR_RAW_STATUS_EN	This enables the RAW status for the summary interrupt on this GPIO. This is a power saving mechanism. Leave this disabled unless it is needed. 0x1: ENABLE 0x0: DISABLE
3:2	INTR_DECT_CTL	Controls the Edge or Level Detection of the Interrupt Controller 0x0: LEVEL (Level sensitive. INTR_POL_CTL should be set to '1' for active-high, '0' for active-low) 0x1: POS_EDGE (Positive-edge sensitive. INTR_POL_CTL should be '1') 0x2: NEG_EDGE (Negative-edge sensitive INTR_POL_CTL should be '1') 0x3: DUAL_EDGE (Sensitive to both edges. INTR_POL_CTL is a don't care for this case)
1	INTR_POL_CTL	Controls the Polarity Detection of the Interrupt Controller. Polarity 1 corresponds to active high and Polarity 0 corresponds to active low. 0x1: POLARITY_1 (Active-high) 0x0: POLARITY_0 (Active-low)

TLMM_GPIO_INTR_CFGn (cont.)

Bits	Name	Description
0	INTR_ENABLE	Controls if this GPIO generates a summary interrupt. 0x1: ENABLE 0x0: DISABLE

**0x0100000C+ TLMM_GPIO_INTR_STATUSn, n=[0..121]
0x1000*n**
Type: RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The GPIO_INTR_STATUS[n] indicates the status of the summary interrupt for GPIO[n].

TLMM_GPIO_INTR_STATUSn

Bits	Name	Description
0	INTR_STATUS	When read it returns the status for the interrupt on GPIO[n]. When written with a 1 in this position, it sets the interrupt for GPIO[n]. When it is written with a 0, it clears the interrupt

0x01100000 TLMM_CLK_GATE_EN**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can enable the clock gating in the TLMM. By default, the clock gating is disabled.

TLMM_CLK_GATE_EN

Bits	Name	Description
2	AHB_HCLK_EN	Enables the Clock Gating on the AHB Clock. 0x1: ENABLE 0x0: DISABLE
1	SUMMARY_INTR_EN	Enables the Clock Gating on the Summary Interrupt Demets. 0x1: ENABLE 0x0: DISABLE
0	CRIF_READ_EN	Enables the Clock Gating on the Read Data Register on the CRIF interface. 0x1: ENABLE 0x0: DISABLE

0x01100004 TLMM_IE_CTRL_DISABLE**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000001

This register can enable/disable control of the pad input enable within the TLMM. By default the IE control is disabled. When disabled, the IE for all GPIOs is always high and the input path is always enabled. When IE_CTRL is enabled, the input path can enabled/disabled based on the direction of the function that is configured for the GPIO. This register only affects GPIOs. Some loopback tests require the IE to always be high. As such, this bit is required functionality for certain test modes.

TLMM_IE_CTRL_DISABLE

Bits	Name	Description
0	IE_CTRL_DISABLE	Enables control of the pad IE within TLMM. When disabled, the IE is tied high. 0x1: DISABLE 0x0: ENABLE

0x01100008 TLMM_MPM_WAKEUP_INT_EN_0**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the input enable for the HV input path from the pad. Interrupt enables are present within the MPM. This register is specifically used to gate the HV path from the pad to the MPM for power savings.

TLMM_MPM_WAKEUP_INT_EN_0

Bits	Name	Description
31	GPIO_115	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
30	GPIO_114	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
29	GPIO_113	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
28	GPIO_112	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE

TLMM_MPM_WAKEUP_INT_EN_0 (cont.)

Bits	Name	Description
27	GPIO_111	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
26	GPIO_110	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
25	GPIO_109	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
24	GPIO_108	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
23	GPIO_107	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
22	GPIO_98	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
21	GPIO_97	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
20	GPIO_69	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
19	GPIO_62	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
18	GPIO_54	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
17	GPIO_52	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
16	GPIO_51	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
15	GPIO_50	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE

TLMM_MPM_WAKEUP_INT_EN_0 (cont.)

Bits	Name	Description
14	GPIO_49	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
13	GPIO_38	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
12	GPIO_37	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
11	GPIO_36	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
10	GPIO_35	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
9	GPIO_34	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
8	GPIO_31	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
7	GPIO_28	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
6	GPIO_25	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
5	GPIO_21	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
4	GPIO_20	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
3	GPIO_13	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
2	GPIO_12	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE

TLMM_MPM_WAKEUP_INT_EN_0 (cont.)

Bits	Name	Description
1	GPIO_5	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
0	GPIO_1	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE

0x0110000C TLMM_MPM_WAKEUP_INT_EN_1**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the input enable for the HV input path from the pad. Interrupt enables are present within the MPM. This register is specifically used to gate the HV path from the pad to the MPM for power savings.

TLMM_MPM_WAKEUP_INT_EN_1

Bits	Name	Description
12	GPIO_68	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
11	GPIO_66	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
10	SDC2_DATA_3	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
9	SDC2_DATA_1	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
8	SDC1_DATA_3	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
7	SDC1_DATA_1	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
6	SRST_N	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE

TLMM_MPM_WAKEUP_INT_EN_1 (cont.)

Bits	Name	Description
5	GPIO_121	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
4	GPIO_120	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
3	GPIO_9	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
2	GPIO_118	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
1	GPIO_117	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE
0	GPIO_11	This is used to enable the HV interrupt path to the MPM: 0x0: DISABLE 0x1: ENABLE

0x01110000 TLMM_INT_JTAG_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000007

The TLMM_INT_JTAG_CTL register controls which processor TAP(s) are enabled for the primary JTAG port.

TLMM_INT_JTAG_CTL

Bits	Name	Description
3	APSS_TAP_ENA	Enables APSS JTAG
2	QDSS_TAP_ENA	Enables QDSS JTAG (Default set to 1)
1	ACC_TAP_ENA	Enables ACC JTAG (Default set to 1)
0	MSM_TAP_ENA	Enables MSM JTAG (Default set to 1)

0x01110004 TLMM_ETM_MODE**Type:** RW**Clock:** CC_TLMM_CLK**Reset State:** 0x00000000

The TLMM_ETM_MODE register is spare register.

TLMM_ETM_MODE

Bits	Name	Description
1:0	TRACE_OVER_SDC2	Spare bits 0x0: MODE0 0x1: MODE1 0x2: MODE2 0x3: MODE3

0x0111001C SPARE1**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The SPARE1 register is a miscellaneous register for spare register bits and is reserved

SPARE1

Bits	Name	Description
31:0	MISC1	These bits are reserved.

0x01110020 SPARE2**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The SPARE2 register is a miscellaneous register for spare register bits and is reserved

SPARE2

Bits	Name	Description
31:0	MISC2	These bits are reserved.

0x01110010 TLMM_HW_REVISION_NUMBER**Type:** R**Clock:** GCC_TLMM_AHB_CLK**Reset State:** Undefined

The HW_REVISION_NUMBER register contains the hardware revision number for the **MSM**. This information is identical to that stored in JTAG ID, which contains chip revision chip ID (including 'variant'), Qualcomm manufacturing ID, and a start bit.

TLMM_HW_REVISION_NUMBER

Bits	Name	Description
31:28	VERSION_ID	Version ID 0x0: FIRST_TAPE_OUT (will be 0 for the first tapeout)
27:12	PARTNUM	Future variants can be created through efuse blowing.
11:1	QUALCOMM_MFG_ID	00001110000
0	START_BIT	Always set '1'

0x01108000 TLMM_RFFE_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the RFFE sr_ctl_en/sen_en TLMM outputs. Its purpose is to control the clock and data pads for RFFE on GPIO. It is used to enable/disable slew rate control for the RFFE pads. When used for RFFE, slew rate control must be enabled by setting the SR_CTL_EN bits must be set to '01'. When used for other purposes, slew rate control should be disabled. When disabled, the pad behaves in a similar manner to a regular GPIO pad. The default value is to keep the slew rate control disabled.

TLMM_RFFE_CTL

Bits	Name	Description
29	RFFE5_DATA_SEN_EN	Reserved
28:27	RFFE5_DATA_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
26	RFFE5_CLK_SEN_EN	Reserved
25:24	RFFE5_CLK_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
23	RFFE4_DATA_SEN_EN	Reserved

TLMM_RFFE_CTL (cont.)

Bits	Name	Description
22:21	RFFE4_DATA_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
20	RFFE4_CLK_SEN_EN	Reserved
19:18	RFFE4_CLK_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
17	RFFE3_DATA_SEN_EN	Reserved
16:15	RFFE3_DATA_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
14	RFFE3_CLK_SEN_EN	Reserved
13:12	RFFE3_CLK_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
11	RFFE2_DATA_SEN_EN	Reserved
10:9	RFFE2_DATA_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
8	RFFE2_CLK_SEN_EN	Reserved
7:6	RFFE2_CLK_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
5	RFFE1_DATA_SEN_EN	Reserved
4:3	RFFE1_DATA_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode
2	RFFE1_CLK_SEN_EN	Reserved
1:0	RFFE1_CLK_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '01' for RFFE mode

0x0110D000 TLMM_RESOUT_HDRV_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000001

This registers controls the HDrive value for the resout pin.

TLMM_RESOUT_HDRV_CTL

Bits	Name	Description
2:0	RESOUT_N_HDRV	RESOUT_N HDrive Value

0x0110C000 TLMM_JTAG_HDRV_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x000003DB

This register controls the HDrive and Pull value for the JTAG pins.

TLMM_JTAG_HDRV_CTL

Bits	Name	Description
9:8	TDI_PULL	TDI Pull Value
7:6	TMS_PULL	TMS Pull Value
5:3	TMS_HDRV	TMS HDrive Value
2:0	TDO_HDRV	TDO HDrive Value

0x0110B000 TLMM_PMIC_HDRV_PULL_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x003C5800

This register controls the HDrive and Pull values for the PMIC interfaces pins.

TLMM_PMIC_HDRV_PULL_CTL

Bits	Name	Description
21:20	PMIC_SPMI_DATA_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '11' for SPMI mode.
19:18	PMIC_SPMI_CLK_SR_CTL_EN	Select whether slew rate control is enabled/disabled. Set to '11' for SPMI mode.
17	PMIC_SPMI_DATA_SEN_EN	Reserved
16	PMIC_SPMI_CLK_SEN_EN	Reserved
15:14	PMIC_SPMI_DATA_PULL	SPMI PMIC Data Pull Value
13:12	PMIC_SPMI_CLK_PULL	SPMI PMIC Clock Pull Value
11:9	PSHOLD_HDRV	PSHOLD HDrive Value
8:6	CXO_EN_HDRV	CXO_ENABLE HDrive Value
5:3	PMIC_SPMI_DATA_HDRV	SPMI PMIC Data HDrive Value
2:0	PMIC_SPMI_CLK_HDRV	SPMI PMIC Clock HDrive Value

0x0110A000 TLMM_SDC1_HDRV_PULL_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000BDB

This register controls the HDrive and Pull values for the SDC1 interface pins.

TLMM_SDC1_HDRV_PULL_CTL

Bits	Name	Description
14:13	SDC1_CLK_PULL	SDC1 CLK Pull Value
12:11	SDC1_CMD_PULL	SDC1 CMD Pull Value
10:9	SDC1_DATA_PULL	SDC1 DATA Pull Value
8:6	SDC1_CLK_HDRV	SDC1 CLOCK HDrive Value
5:3	SDC1_CMD_HDRV	SDC1 CMD HDrive Value
2:0	SDC1_DATA_HDRV	SDC1 DATA HDrive Value

0x01109000 TLMM_SDC2_HDRV_PULL_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000BDB

This register controls the HDrive and Pull values for the SDC2 interface pins.

TLMM_SDC2_HDRV_PULL_CTL

Bits	Name	Description
15:14	SDC2_CLK_PULL	SDC2 CLK Pull Value
13	SDC2_HYS_CTL	Enable/Disable for additional pad hysteresis. 0x0: DISABLE 0x1: ENABLE
12:11	SDC2_CMD_PULL	SDC2 CMD Pull Value
10:9	SDC2_DATA_PULL	SDC2 DATA Pull Value
8:6	SDC2_CLK_HDRV	SDC2 CLOCK HDrive Value
5:3	SDC2_CMD_HDRV	SDC2 CMD HDrive Value
2:0	SDC2_DATA_HDRV	SDC2 DATA HDrive Value

0x01107000 TLMM_MODE_PULL_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000005

This register controls the Pull values for the Mode Interface pins.

TLMM_MODE_PULL_CTL

Bits	Name	Description
3:2	MODE_1_PULL	Pull Value for mode_1 pin
1:0	MODE_0_PULL	Pull Value for mode_0 pin

0x0119D000 TLMM_QDSD_BOOT_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the configuration for the QDSD and this register being written during PBL.

TLMM_QDSD_BOOT_CTL

Bits	Name	Description
15:0	QDSD_BOOT_REG	BOOT FROM SD CARD OR QDSD DISABLE FEATURES IS WRITTEN BY SW

0x0119E000 TLMM_QDSD_CONFIG_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the configuration of QDSD modes,IO pad power and debounce value.

TLMM_QDSD_CONFIG_CTL

Bits	Name	Description
31:0	QDSD_CONFIG_REG	QDSD CONFIGURATION REGISTER

0x0119F000 TLMM_QDSD_STATUS_CTL**Type:** R**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x13000081

This register contains the status of current mode and card detect GPIO used in QDSD.

TLMM_QDSD_STATUS_CTL

Bits	Name	Description
31:0	QDSD_STATUS_REG	QDSD STATUS REGISTER.If fuse for NIDnT disable is not blown, POR value will be 13000081. If fuse is blown, POR value will be 13000002.

0x011A1000 TLMM_QDSD_GPIO_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This QDSD register configures the card detect GPIO

TLMM_QDSD_GPIO_CTL

Bits	Name	Description
15:0	QDSD_GPIO_REG	GPIO, POLARITY TO BE USED FOR CARD_DETECT IS PROGRAMMED BY SW

0x011A2000 TLMM_QDSD_INTR_ENABLE_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This is a QDSD register.

TLMM_QDSD_INTR_ENABLE_CTL

Bits	Name	Description
15:0	QDSD_INTR_ENABLE_REG	QDSD INTERRUPT ENABLE REGISTER

0x011A3000 TLMM_QDSD_INTR_CLEAR_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This is a QDSD register.

TLMM_QDSD_INTR_CLEAR_CTL

Bits	Name	Description
15:0	QDSD_INTR_CLEAR_REG	QDSD INTERRUPT CLEAR REGISTER

0x011A5000 TLMM_QDSD_SPARE1_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This is a QDSD spare register.

TLMM_QDSD_SPARE1_CTL

Bits	Name	Description
31:0	QDSD_SPARE1_REG	QDSD SPARE REGISTER

0x011A6000 TLMM_QDSD_SPARE2_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This is a QDSD spare register.

TLMM_QDSD_SPARE2_CTL

Bits	Name	Description
31:0	QDSD_SPARE2_REG	QDSD SPARE REGISTER

0x011A4000 TLMM_QDSD_TIMEOUT_VALUE_CTL**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This is a QDSD register.

TLMM_QDSD_TIMEOUT_VALUE_CTL

Bits	Name	Description
31:0	QDSD_TIMEOUT_VALUE_REG	SW programs the timeout value of the QDSD timer to this register

0x0110F000 RESERVED**0x01106000+ TLMM_DIR_CONN_INTRn_CFG_WCSS, n=[0..1]
0x4*n****Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000100

This register is used to select the GPIO to be routed to this direct connect interrupt and to control the polarity for each interrupt. The default polarity is active-high.

TLMM_DIR_CONN_INTRn_CFG_WCSS

Bits	Name	Description
8	POLARITY	Controls the Polarity Detection for the Direct Connect Interrupt. Polarity 1 corresponds to active high and Polarity 0 corresponds to active low. 0x1: POLARITY_1 (Active-high) 0x0: POLARITY_0 (Active-low)
6:0	GPIO_SEL	This field selects which GPIO is to be routed to direct connect interrupt 'n'.

**0x01105000+ TLMM_DIR_CONN_INTRn_CFG_SENSORS, n=[0..9]
0x4*n****Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000100

This register is used to select the GPIO to be routed to this direct connect interrupt and to control the polarity for each interrupt. The default polarity is active-high.

TLMM_DIR_CONN_INTRn_CFG_SENSORS

Bits	Name	Description
8	POLARITY	Controls the Polarity Detection for the Direct Connect Interrupt. Polarity 1 corresponds to active high and Polarity 0 corresponds to active low. 0x1: POLARITY_1 (Active-high) 0x0: POLARITY_0 (Active-low)
6:0	GPIO_SEL	This field selects which GPIO is to be routed to direct connect interrupt 'n'.

0x01104000+ RESERVED

0x01102000+ TLMM_DIR_CONN_INTRn_CFG_APSS, n=[0..7]
0x4*n

Type: RW

Clock: GCC_TLMM_AHB_CLK

Reset State: 0x00000100

This register is used to select the GPIO to be routed to this direct connect interrupt and to control the polarity for each interrupt. The default polarity is active-high.

TLMM_DIR_CONN_INTRn_CFG_APSS

Bits	Name	Description
8	POLARITY	Controls the Polarity Detection for the Direct Connect Interrupt. Polarity 1 corresponds to active high and Polarity 0 corresponds to active low. 0x1: POLARITY_1 (Active-high) 0x0: POLARITY_0 (Active-low)
6:0	GPIO_SEL	This field selects which GPIO is to be routed to direct connect interrupt 'n'.

**0x01101000+ TLMM_DIR_CONN_INTRn_CFG_MSS, n=[0..1]
0x4*n****Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000100

This register is used to select the GPIO to be routed to this direct connect interrupt and to control the polarity for each interrupt. The default polarity is active-high.

TLMM_DIR_CONN_INTRn_CFG_MSS

Bits	Name	Description
8	POLARITY	Controls the Polarity Detection for the Direct Connect Interrupt. Polarity 1 corresponds to active high and Polarity 0 corresponds to active low. 0x1: POLARITY_1 (Active-high) 0x0: POLARITY_0 (Active-low)
6:0	GPIO_SEL	This field selects which GPIO is to be routed to direct connect interrupt 'n'.

0x01200000 TLMM_GPIO_OUT_0**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output values of GPIO[31:0]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OUT_0

Bits	Name	Description
31:0	GPIO_OUT	Output values for GPIO[31:0].

0x01200004 TLMM_GPIO_OUT_1**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output values of GPIO[63:32]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OUT_1

Bits	Name	Description
31:0	GPIO_OUT	Output values for GPIO[63:32].

0x01200008 TLMM_GPIO_OUT_2**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output values of GPIO[95:64]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OUT_2

Bits	Name	Description
31:0	GPIO_OUT	Output values for GPIO[95:64].

0x0120000C TLMM_GPIO_OUT_3**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output values of GPIO[115:96]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OUT_3

Bits	Name	Description
25:0	GPIO_OUT	Output values for GPIO[121:96].

0x01200020 TLMM_GPIO_OUT_CLR_0**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to clear the output values of GPIO[31:0]. Once the CLR bit is written to '1', the output of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_CLR_0

Bits	Name	Description
31:0	GPIO_OUT_CLR	Clear bits for GPIO[31:0] output values.

0x01200024 TLMM_GPIO_OUT_CLR_1**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to clear the output values of GPIO[63:32]. Once the CLR bit is written to '1', the output of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_CLR_1

Bits	Name	Description
31:0	GPIO_OUT_CLR	Clear bits for GPIO[63:32] output values.

0x01200028 TLMM_GPIO_OUT_CLR_2**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to clear the output values of GPIO[95:64]. Once the CLR bit is written to '1', the output of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_CLR_2

Bits	Name	Description
31:0	GPIO_OUT_CLR	Clear bits for GPIO[95:64] output values.

0x0120002C TLMM_GPIO_OUT_CLR_3**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to clear the output values of GPIO[115:96]. Once the CLR bit is written to '1', the output of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_CLR_3

Bits	Name	Description
25:0	GPIO_OUT_CLR	Clear bits for GPIO[121:96] output values.

0x01200040 TLMM_GPIO_OUT_SET_0**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to set the output values of GPIO[31:0]. Once the SET bit is written to '1', the output of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_SET_0

Bits	Name	Description
31:0	GPIO_OUT_SET	Set bits for GPIO[31:0] output values.

0x01200044 TLMM_GPIO_OUT_SET_1**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to set the output values of GPIO[63:32]. Once the SET bit is written to '1', the output of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_SET_1

Bits	Name	Description
31:0	GPIO_OUT_SET	Set bits for GPIO[63:32] output values.

0x01200048 TLMM_GPIO_OUT_SET_2

Type: W

Clock: GCC_TLMM_AHB_CLK

Reset State: 0x00000000

This register can be used to set the output values of GPIO[95:64]. Once the SET bit is written to '1', the output of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_SET_2

Bits	Name	Description
31:0	GPIO_OUT_SET	Set bits for GPIO[95:64] output values.

0x0120004C TLMM_GPIO_OUT_SET_3

Type: W

Clock: GCC_TLMM_AHB_CLK

Reset State: 0x00000000

This register can be used to set the output values of GPIO[115:96]. Once the SET bit is written to '1', the output of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple output bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OUT_SET_3

Bits	Name	Description
25:0	GPIO_OUT_SET	Set bits for GPIO[121:96] output values.

0x01200060 TLMM_GPIO_IN_0**Type:** R**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register allows the input values for GPIO[31:0] to be read. This register is designed to read multiple input bits.

TLMM_GPIO_IN_0

Bits	Name	Description
31:0	GPIO_IN	GPIO[31:0] input values.

0x01200064 TLMM_GPIO_IN_1**Type:** R**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register allows the input values for GPIO[63:32] to be read. This register is designed to read multiple input bits.

TLMM_GPIO_IN_1

Bits	Name	Description
31:0	GPIO_IN	GPIO[63:32] input values.

0x01200068 TLMM_GPIO_IN_2**Type:** R**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register allows the input values for GPIO[95:64] to be read. This register is designed to read multiple input bits.

TLMM_GPIO_IN_2

Bits	Name	Description
31:0	GPIO_IN	GPIO[95:64] input values.

0x0120006C TLMM_GPIO_IN_3**Type:** R**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register allows the input values for GPIO[115:96] to be read. This register is designed to read multiple input bits.

TLMM_GPIO_IN_3

Bits	Name	Description
25:0	GPIO_IN	GPIO[121:96] input values.

0x01200080 TLMM_GPIO_OE_0**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output enables of GPIO[31:0]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OE_0

Bits	Name	Description
31:0	GPIO_OE	GPIO[31:0] output enables.

0x01200084 TLMM_GPIO_OE_1**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output enables of GPIO[63:32]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OE_1

Bits	Name	Description
31:0	GPIO_OE	GPIO[63:32] output enables.

0x01200088 TLMM_GPIO_OE_2**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output enables of GPIO[95:64]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OE_2

Bits	Name	Description
31:0	GPIO_OE	GPIO[95:64] output enables.

0x0120008C TLMM_GPIO_OE_3**Type:** RW**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register controls the output enables of GPIO[115:96]. This register is designed for bit-bang or fast configuration of multiple output bits.

TLMM_GPIO_OE_3

Bits	Name	Description
25:0	GPIO_OE	GPIO[121:96] output enables.

0x012000A0 TLMM_GPIO_OE_CLR_0**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The GPIO_OE_CLR_0 register bits can be used to clear the output enables of GPIO[31:0]. Once the CLR bit is written to '1', the OE pin of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_CLR_0

Bits	Name	Description
31:0	GPIO_OE_CLR	Clear bits for GPIO[31:0] output enables.

0x012000A4 TLMM_GPIO_OE_CLR_1**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The GPIO_OE_CLR_1 register bits can be used to clear the output enables of GPIO[63:32]. Once the CLR bit is written to '1', the OE pin of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_CLR_1

Bits	Name	Description
31:0	GPIO_OE_CLR	Clear bits for GPIO[63:32] output enables.

0x012000A8 TLMM_GPIO_OE_CLR_2**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The GPIO_OE_CLR_2 register bits can be used to clear the output enables of GPIO[95:64]. Once the CLR bit is written to '1', the OE pin of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_CLR_2

Bits	Name	Description
31:0	GPIO_OE_CLR	Clear bits for GPIO[95:64] output enables.

0x012000AC TLMM_GPIO_OE_CLR_3**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

The GPIO_OE_CLR_3 register bits can be used to clear the output enables of GPIO[115:96]. Once the CLR bit is written to '1', the OE pin of the corresponding GPIO is cleared to '0'. The CLR bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_CLR_3

Bits	Name	Description
25:0	GPIO_OE_CLR	Clear bits for GPIO[121:96] output enables.

0x012000C0 TLMM_GPIO_OE_SET_0**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to set the output enables of GPIO[31:0]. Once the SET bit is written to '1', the OE pin of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_SET_0

Bits	Name	Description
31:0	GPIO_OE_SET	Set bits for GPIO[31:0] output enables.

0x012000C4 TLMM_GPIO_OE_SET_1**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to set the output enables of GPIO[63:32]. Once the SET bit is written to '1', the OE pin of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_SET_1

Bits	Name	Description
31:0	GPIO_OE_SET	Set bits for GPIO[63:32] output enables.

0x012000C8 TLMM_GPIO_OE_SET_2**Type:** W**Clock:** GCC_TLMM_AHB_CLK**Reset State:** 0x00000000

This register can be used to set the output enables of GPIO[95:64]. Once the SET bit is written to '1', the OE pin of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_SET_2

Bits	Name	Description
31:0	GPIO_OE_SET	Set bits for GPIO[95:64] output enables.

0x012000CC TLMM_GPIO_OE_SET_3

Type: W

Clock: GCC_TLMM_AHB_CLK

Reset State: 0x00000000

This register can be used to set the output enables of GPIO[115:96]. Once the SET bit is written to '1', the OE pin of the corresponding GPIO is set to '1'. The SET bit then automatically returns to '0' so that it can be used again. This register is designed for bit-bang or fast configuration of multiple OE bits and alleviates the need for a read-->modify-->write operation.

TLMM_GPIO_OE_SET_3

Bits	Name	Description
25:0	GPIO_OE_SET	Set bits for GPIO[121:96] output enables.

16 Low Power Audio Subsystem

16.1 LPASS_LPA_IF

0x07708004 LPASS_LPAIF_HW_CONFIG

Type: R

Clock: CC_LPAIF_HCLK

Reset State: 0x06AC2902

LPAIF HW configuration for DMIC/SIF/I2S/PCM

LPASS_LPAIF_HW_CONFIG

Bits	Name	Description
30	SIF_EN	If SIF module is present in LPAIF
29	SEC_PCM_EN	Secondary PCM present
28	PRI_PCM_EN	Primary PCM present
27:26	QUAD_I2S_LINES	Number of lanes for Quaternary interface -1
25:24	QUAD_I2S_DIR	Quaternary interface direction: 0 - SPKR setting 1 - MIC setting 2- Bidirectional
23	QUAD_I2S_EN	Quaternary interface present
22:21	TER_I2S_LINES	Number of lanes for Tertiary interface -1
20:19	TER_I2S_DIR	Tertiary interface direction: 0 - SPKR setting 1 - MIC setting 2- Bidirectional
18	TER_I2S_EN	Tertiary interface present
17:16	SEC_I2S_LINES	Number of lanes for Secondary interface -1
15:14	SEC_I2S_DIR	Secondary interface direction: 0 - SPKR setting 1 - MIC setting 2- Bidirectional
13	SEC_I2S_EN	Secondary interface present

LPASS_LPAIF_HW_CONFIG (cont.)

Bits	Name	Description
12:11	PRI_I2S_LINES	Number of lanes for Primary interface -1
10:9	PRI_I2S_DIR	Primary interface direction: 0 - SPKR setting 1 - MIC setting 2- Bidirectional
8	PRI_I2S_EN	Primary interface present
7:6	SPKR_I2S_LINES	Number of lanes for Speaker interface -1, has to be less than Primary interface
5:4	SPKR_I2S_DIR	Speaker interface direction: 0 - SPKR setting 1 - MIC setting 2- Bidirectional
3	SPKR_I2S_EN	Speaker interface present
2:1	NUM_DMIC	Number of DMIC modules -1, meaningful if DMIC_EN=1
0	DMIC_EN	DMIC present

0x07708008 LPASS_LPAIF_HW_CONFIG2**Type:** R**Clock:** CC_LPAIF_HCLK**Reset State:** 0x00000009

LPAIF HW configuration for Read DMA/Write DMA/ Rate auto detect circuit

LPASS_LPAIF_HW_CONFIG2

Bits	Name	Description
7	SEC_RATE_DET_EN	Secondary Rate Auto-detect module present
6	PRI_RATE_DET_EN	Primary Rate Auto-detect module present
5:3	NUM_RDDMA	Number of Read DMAs -1
2:0	NUM_WRDMA	Number of Write DMAs -1

0x07709000+ LPASS_LPAIF_I2S_CTLa, a=[0..3]**0x1000*a****Type:** RW**Clock:** CC_LPAIF_HCLK**Reset State:** 0x000F0004

LPASS_LPAIF_I2S_CTLa

Bits	Name	Description
31	RESET	0x0: DISABLE 0x1: ENABLE
22	EN_LONG_RATE	Allow for frame size to be longer than I2S sample bit width, BIT_WIDTH 0x0: DISABLE 0x1: ENABLE
21:16	LONG_RATE	Used as WS rate when EN_LONG_RATE=1
15	LOOPBACK	SW: RW, HW: R Loopback control bit. 0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE (only applicable to a=1=codec_mic, a=2=mi2s, & a=4=sec mic. If ENABLE is set for a=1, codec speaker is looped back to both wires of codec mic. For a=2, mi2s is looped back on itself. For a=4 sec speaker is looped backed to sec mic))
14	SPKR_EN	SW: RW, HW: R Enable for the speaker direction operation (out of the MSM). I2S interface will start transmitting serial data when enabled and trying to access a read DMA channel. Set the enable after the other control bits (speaker related, bit_width, ws_src) are configured. Disable before changing the other bits. 0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE)
13:10	SPKR_MODE	SW: RW, HW: R Controls which I2S lines are used (if supported by HW) and multichannel operation 0x0: NONE (NONE) 0x1: SD0 (SD0 (data sent to SD0 only- stereo or mono)) 0x2: SD1 (SD1 (data sent to SD1 only- stereo or mono)) 0x3: SD2 (SD2 (data sent to SD2 only- stereo or mono)) 0x4: SD3 (SD3 (data sent to SD3 only- stereo or mono)) 0x5: QUAD01 (QUAD01 (SD0 & SD1 = quad channel mode)) 0x6: QUAD23 (QUAD23 (SD2 & SD3 = quad channel mode)) 0x7: ENUM_6CH (6CH (SD0, SD1 & SD2 = 6 channel mode)) 0x8: ENUM_8CH (8CH (SD0, SD1, SD2 & SD3 = 8 channel mode))
9	SPKR_MONO	SW: RW, HW: R In mono mode, the speaker path of I2S (out of MSM) will take each mono sample from memory and transmit it during both the right and left portions of the word select. Only applicable when a single I2S line is used in SPCR_MODE. 0x0: STEREO (STEREO) 0x1: MONO (MONO)

LPASS_LPAIF_I2S_CTLa (cont.)

Bits	Name	Description
8	MIC_EN	SW: RW, HW: R Enable for the microphone direction operation (into the MSM). I2S interface will start capturing data when enabled and trying to access a write DMA channel. Set the enable after the other control bits (mic related, bit_width, ws_src) are configured. Disable before changing the other bits. 0x0: DISABLE (DISABLE) 0x1: ENABLE (ENABLE)
7:4	MIC_MODE	SW: RW, HW: R Controls which I2S lines are used (if supported by HW) and multichannel operation 0x0: NONE (NONE) 0x1: SD0 (SD0 (data taken from SD0 only- stereo or mono)) 0x2: SD1 (SD1 (data taken from SD1 only- stereo or mono)) 0x3: SD2 (SD2 (data taken from SD2 only- stereo or mono)) 0x4: SD3 (SD3 (data taken from SD3 only- stereo or mono)) 0x5: QUAD01 (QUAD01 (SD0 & SD1 = quad channel mode)) 0x6: QUAD23 (QUAD23 (SD2 & SD3 = quad channel mode)) 0x7: ENUM_6CH (6CH (SD0, SD1 & SD2 = 6 channel mode)) 0x8: ENUM_8CH (8CH (SD0, SD1, SD2 & SD3 = 8 channel mode))
3	MIC_MONO	SW: RW, HW: R Controls whether only the left word is stored in memory (mono) or the left and right words are stored (stereo). In mono mode, the data in the right portion of WS is ignored. Only applicable when a single I2S line is used in MIC_MODE. 0x0: STEREO (STEREO) 0x1: MONO (MONO)
2	WS_SRC	SW: RW, HW: R Controls the source of the word select, internally generated or taken from outside. Does not affect the clock. Master/Slave bit clock mode is controlled in LPASS clk_ctl. 0x0: INT (INT (master mode)) 0x1: EXT (EXT (slave mode))
1:0	BIT_WIDTH	SW: RW, HW: R Controls the bit width of the I2S samples 0x0: ENUM_16 (16) 0x1: ENUM_24 (24) 0x2: ENUM_32 (32) 0x3: ENUM_25 (25)

16.2 LPASS_CODEC_CORE

0x0771C000 LPASS_CDC_CLK_RX_RESET_CTL

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000000

RX Interpolation Path Reset Control Register. This register enables or disables RX1 ->RX3 filter register states.

LPASS_CDC_CLK_RX_RESET_CTL

Bits	Name	Description
2	RX3_RESET	Specifies RX Interpolation Path Reset State 0x0: DISABLE 0x1: ENABLE
1	RX2_RESET	Specifies RX Interpolation Path Reset State 0x0: DISABLE 0x1: ENABLE
0	RX1_RESET	Specifies RX Interpolation Path Reset State 0x0: DISABLE 0x1: ENABLE

0x0771C004 LPASS_CDC_CLK_TX_RESET_B1_CTL

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000000

TX Decimation Path Reset Control Register. This register enables or disables TX1 ->TX4 filter register states.

LPASS_CDC_CLK_TX_RESET_B1_CTL

Bits	Name	Description
1	TX2_RESET	Specifies TX Interpolation Path Reset State 0x0: DISABLE 0x1: ENABLE
0	TX1_RESET	Specifies TX Interpolation Path Reset State 0x0: DISABLE 0x1: ENABLE

0x0771C008 LPASS_CDC_CLK_DMIC_B1_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_CLK_DMIC_B1_CTL**

Bits	Name	Description
3:1	DMIC0_CLK_SEL	Specifies the clock frequency of the input DMIC data samples in the TX path. Div6 is only valid for mclk=12.288 0x0: DIV2 0x1: DIV3 0x2: DIV4 0x3: DIV6 0x4: DIV16
0	DMIC0_CLK_EN	DMIC0 Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C00C LPASS_CDC_CLK_RX_I2S_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000013

RX I2S Control Register. This register is required for I2S operation. The I2S master mode select register bit is not present in **APQ8016**. Instead the I2S master mode selection is done via a hardware port which is controlled by LPASS software settings.

LPASS_CDC_CLK_RX_I2S_CTL

Bits	Name	Description
5	RX_I2S_MODE	0x0: MODE_32 0x1: MODE_16
4	RX_I2S_CLK_EN	0x0: RX_I2S_CLK_DIS 0x1: RX_I2S_CLK_EN
2:0	RX_I2S_FS_RATE	0x0: F_8_KHZ 0x1: F_16_KHZ 0x2: F_32_KHZ 0x3: F_48_KHZ 0x4: F_96_KHZ 0x5: F_192_KHZ

0x0771C010 LPASS_CDC_CLK_TX_I2S_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000013

TX I2S Control Register. This register is required for I2S operation. The I2S master mode select register bit is not present in **APQ8016**. Instead the I2S master mode selection is done via a hardware port which is controlled by LPASS software settings.

LPASS_CDC_CLK_TX_I2S_CTL

Bits	Name	Description
5	TX_I2S_MODE	0x0: MODE_32 0x1: MODE_16
4	TX_I2S_CLK_EN	0x0: TX_I2S_CLK_DIS 0x1: TX_I2S_CLK_EN
2:0	TX_I2S_FS_RATE	0x0: F_8_KHZ 0x1: F_16_KHZ 0x2: F_32_KHZ 0x3: F_48_KHZ 0x4: F_96_KHZ 0x5: F_192_KHZ

0x0771C014 LPASS_CDC_CLK_OTHR_RESET_B1_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

Connectivity Block Control Register.

LPASS_CDC_CLK_OTHR_RESET_B1_CTL

Bits	Name	Description
1	CONN_RESET	This reset is applied to both the connectivity block and the pdm (serializer/deserializer) blocks 0x0: DISABLE 0x1: ENABLE

0x0771C018 LPASS_CDC_CLK_TX_CLK_EN_B1_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

TX Decimation Path Clock Control Register. This register enables or disables MCLK to TX1->TX2

LPASS_CDC_CLK_TX_CLK_EN_B1_CTL

Bits	Name	Description
1	TX2_CLK_EN	TX Clock Enable 0x0: DISABLE 0x1: ENABLE
0	TX1_CLK_EN	TX Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C01C LPASS_CDC_CLK_OTHR_CTL

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000004

Connectivity Clock Control Register. This register enables or disables MCLK to the connectivity block.

LPASS_CDC_CLK_OTHR_CTL

Bits	Name	Description
2	CONN_CLK_EN	Connectivity Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C020 LPASS_CDC_CLK_RX_B1_CTL

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000000

RX Interpolation Path Clock Control Register. This register enables or disables RX1->RX3

LPASS_CDC_CLK_RX_B1_CTL

Bits	Name	Description
2	RX3_CLK_EN	RX Clock Enable 0x0: DISABLE 0x1: ENABLE

LPASS_CDC_CLK_RX_B1_CTL (cont.)

Bits	Name	Description
1	RX2_CLK_EN	RX Clock Enable 0x0: DISABLE 0x1: ENABLE
0	RX1_CLK_EN	RX Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C024 LPASS_CDC_CLK_MCLK_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

Master Clock Control Register. This register enables or disables the MCLK input to Codec Core.

LPASS_CDC_CLK_MCLK_CTL

Bits	Name	Description
0	MCLK_EN	Master Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C028 LPASS_CDC_CLK_PDM_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

PDM Clock Control Register. This register enables or disables PDM Clock Output and PDM FB Clock selection. Switching of the PDM FB Clock can only occur and when PDM Clock is DISABLE

LPASS_CDC_CLK_PDM_CTL

Bits	Name	Description
1	PDM_CLK_SEL	PDM Clock Selection 0x0: PDM_CLK 0x1: PDM_CLK_FB
0	PDM_EN	PDM Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C02C LPASS_CDC_CLK_SD_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

SideTone Reset and Clock Control Register. This register enables or disables reset/clocks to the SideTone Path.

LPASS_CDC_CLK_SD_CTL

Bits	Name	Description
5	IIR2_RESET	IIR Reset 0x0: DISABLE 0x1: ENABLE
4	IIR1_RESET	IIR Reset 0x0: DISABLE 0x1: ENABLE
1	IIR2_CLK_EN	IIR Clock Enable 0x0: DISABLE 0x1: ENABLE
0	IIR1_CLK_EN	IIR Clock Enable 0x0: DISABLE 0x1: ENABLE

0x0771C02C+LPASS_CDC_RXn_B4_CTL, n=[1..3]**0x20*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_RXn_B4_CTL**

Bits	Name	Description
2	RESERVED	Reserved
1:0	CUT_OFF_FREQ	Specifies the Cutoff frequency for the DC blocker inside the RX chain. 0x0: CF_NEG_3DB_4HZ 0x1: CF_NEG_3DB_75HZ 0x2: CF_NEG_3DB_150HZ

0x0771C030+ LPASS_CDC_RXn_B5_CTL, n=[1..3]**0x20*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000068

LPASS_CDC_RXn_B5_CTL

Bits	Name	Description
7:5	FS_RATE	Specifies the sampling rate of the incoming PCM samples in the RX chain. 0x0: F_8_KHZ 0x1: F_16_KHZ 0x2: F_32_KHZ 0x3: F_48_KHZ
3	RESERVED	Reserved
2	HPF_BP_SEL	Specifies if the DC blocker needs to be bypassed. 0x0: NO_BYPASS 0x1: BYPASS
1:0	RESERVED	Reserved

0x0771C034+ LPASS_CDC_RXn_B6_CTL, n=[1..3]
0x20*n
Type: RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

Specifies the enable signals for the Gain multiplier (Volume controller). This register should be updated only once per 5 mclk cycles for well-defined operation.

LPASS_CDC_RXn_B6_CTL

Bits	Name	Type	Description
3	GAIN_UPD_STATUS	R	Specifies if the gain update has been completed. Automatically resets to IN_PROCESS when gain is updated. When the gain has been applied, changes state to COMPLETE. Read only bit. 0x0: IN_PROCESS 0x1: COMPLETE
2	MODE	RW	Specifies the mode in which gain is updated. 0x0: AUTOMATIC 0x1: MANUAL
1	HALF_DB	RW	Specifies the addition of a half db to the original gain. When set(1) and If the actual gain is 1, a gain of 1.5dB is applied. When set(1) and If the actual gain is -1, a gain of -0.5dB is applied. 0x0: DISABLE 0x1: ENABLE
0	MUTE_EN	RW	Specifies if the output of the volume controller needs to be muted. 0x0: DISABLE 0x1: ENABLE

0x0771C038+ LPASS_CDC_RXn_VOL_CTL_B1_CTL, n=[1..3] 0x20*n

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000000

RX Timeout value for gain multipliers.

At 48KHz sampling rate (Fs), the maximum timeout is 1.37s $((256 * \text{TIMER_VAL} + 255) / \text{Fs})$

11111111 => $(256 * 255 + 255) / 48k = 1.365s$; $(256 * 255 + 255) / 8k = 8.19s$

10000000 => $(256 * 128 + 255) / 48k = 0.69s$; $(256 * 128 + 255) / 8k = 4.13s$

01000000 => $(256 * 64 + 255) / 48k = 0.347s$; $(256 * 64 + 255) / 8k = 2.08s$

00000000 => Immediate gain update without timer expiration and zero crossing detection. SW control mode.

LPASS_CDC_RXn_VOL_CTL_B1_CTL

Bits	Name	Description
7:0	TIMER	Specifies the Volume Controller timeout period in Fs cycles.

0x0771C03C+ LPASS_CDC_RXn_VOL_CTL_B2_CTL, n=[1..3] 0x20*n

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000000

RX Channel Gain. The gain is approximate to +/- 0.3dB.

LPASS_CDC_RXn_VOL_CTL_B2_CTL

Bits	Name	Description
7:0	GAIN	Specifies the Volume Controller gain. The value is a twos complement number.

0x0771C0A0 LPASS_CDC_TOP_GAIN_UPDATE

Type: RW

Clock: csr_wr_clk

Reset State: 0x00000000

This register should be updated only once per 5 mclk cycles for well-defined operation.

LPASS_CDC_TOP_GAIN_UPDATE

Bits	Name	Description
0	UPDATE	When Manual mode is used to update Volume Controllers. When this bit is set(1) to high, starts the update process across all volume controllers configured in manual mode. 0x0: DISABLE 0x1: UPDATE

0x0771C0A4 LPASS_CDC_TOP_CTL**Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000001**LPASS_CDC_TOP_CTL**

Bits	Name	Description
0	DIG_MCLK_FREQ	Indicates the source or frequency of the MCLK 0x0: F_12_288MHZ 0x1: F_9_6MHZ (default)

**0x0771C0C0+LPASS_CDC_IIRn_GAIN_B1_CTL, n=[1..2]
0x40*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_IIRn_GAIN_B1_CTL**

Bits	Name	Description
7:0	GAIN1	Specifies the gain for the first Volume Controller. The value is a twos complement number.

**0x0771C0C4+LPASS_CDC_IIRn_GAIN_B2_CTL, n=[1..2]
0x40*n****Type:** RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_IIRn_GAIN_B2_CTL**

Bits	Name	Description
7:0	GAIN2	Specifies the gain for the second Volume Controller. The value is a twos complement number.

0x0771C0C8+LPASS_CDC_IIRn_GAIN_B3_CTL, n=[1..2]
0x40*n
Type: RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_IIRn_GAIN_B3_CTL**

Bits	Name	Description
7:0	GAIN3	Specifies the gain for the third Volume Controller. The value is a twos complement number.

0x0771C0CC LPASS_CDC_IIRn_GAIN_B4_CTL, n=[1..2]
+0x40*n
Type: RW**Clock:** csr_wr_clk**Reset State:** 0x00000000**LPASS_CDC_IIRn_GAIN_B4_CTL**

Bits	Name	Description
7:0	GAIN4	Specifies the gain for the fourth Volume Controller. The value is a twos complement number.

0x0771C0D0+LPASS_CDC_IIRn_GAIN_B5_CTL, n=[1..2]
0x40*n
Type: RW**Clock:** csr_wr_clk**Reset State:** 0x00000000

This register should be updated only once per 5 mclk cycles for well-defined operation.

LPASS_CDC_IIRn_GAIN_B5_CTL

Bits	Name	Type	Description
3	GAIN1_UPD_STATUS	R	Specifies if the gain update has been completed. Automatically resets to IN_PROCESS when gain is updated. When the gain has been applied, changes state to COMPLETE. Read only bit. 0x0: IN_PROCESS 0x1: COMPLETE
2	MODE1	RW	Specifies the mode in which gain is updated for the first Volume Controller. 0x0: AUTOMATIC 0x1: MANUAL

LPASS_CDC_IIRn_GAIN_B5_CTL (cont.)

Bits	Name	Type	Description
1	HALF_DB1_EN	RW	Specifies the addition of a half db to the original gain. When set(1) and If the actual gain is 1, a gain of 1.5dB is applied. When set(1) and If the actual gain is -1, a gain of -0.5dB is applied. 0x0: DISABLE 0x1: ENABLE
0	MUTE1_EN	RW	Specifies if the output of the first volume controller needs to be muted. 0x0: DISABLE 0x1: ENABLE
